be called a great one. His *Bridge of Glass*, *For Her Sake*, *Little Kate Kirby*, *Poor Humanity*, etc., are known to all readers of novels and frequenters of circulating libraries. And every new issue of his pen is eagerly caught up by a certain and not inconsiderable class of readers—those who seek novels for mere rest, refreshment, and recreation. His *Second-Cousin Sarah* (Harper and Brothers) has the characteristics which belong to all his writings. The reader who wants a novel to be a medium-sized electric battery, and to administer to him a series of shocks of greater or less power, will not find it here. The reader who wants a poem, and is willing to study it somewhat for the sake of the beauty which study will extract, will not find it in this novel. The reader who wants a book of current history, a description of new phases of life and manners, an introduction to scenes and customs with which he is unfamiliar, will find in Robinson no second Trollope. The reader who looks for a parable in every novel will be puzzled if he asks himself the question, What does *Second-Cousin Sarah* teach? But he who looks for a novel to while away an afternoon that lies heavily on his hands, or to help along a journey, or to eke out the recreations of his vacation, or to rest his mind and brain from care and worry by giving him just enough mental activity to prevent the intrusion of business or household cares in hours devoted to rest, will find in this entertaining story a capital instrument for his purpose.

Prudence Palfrey, by T. B. ALDRICH (J. R. Osgood and Co.), is a thoroughly pleasant novel for summer reading. The writer is not ambitious either in his plot or his style; yet there is sufficient excitement in the former to sustain the reader's interest to the end, and the latter has piquancy and finish. Mr. Aldrich is an artist, and is not satisfied with saying any thing in a bald style. He tries to please the reader, and he is always successful.

Editor's Scientific Record.

SUMMARY OF SCIENTIFIC PROGRESS.

WE are denied the usual pleasure of recording the discovery during the month of May of any new member of the solar system; but just as our review closes comes a dispatch from Mr. Lewis Swift, of Rochester, New York, a well-known searcher for comets, stating that on the 8th of June he discovered a new comet in the constellation of the Camelopard: it is quite bright, and has a tail about one degree long. Unfortunately Mr. Swift has been anticipated in this discovery by Coggia; but his announcement has sufficed to call attention in America to what promises to be one of the most interesting comets of this century.

Otto Struve announces that the faint companion star to the bright star Procyon, discovered by him, is in the place predicted by Auwers, and that therefore it must be the disturbing body about which Procyon moves.

Five of the parties to observe the transit of Venus have already sailed for their destination, in the United States steamer *Swatara*, which vessel left New York on the 7th of June for the

Southern Pacific Ocean. The persons in command of these five parties are Captain Raymond, United States Army, Lieutenant-Commander G. P. Ryan, United States Navy, Professor William Harkness, Professor C. H. F. Peters, and Mr. E. Smith, of the Coast Survey.

The three remaining parties, i. e., those for Peking, Nagasaki, and Nicolaievsk, will leave during the coming month.

General instructions to all the observers have been printed, and show how carefully the Transit of Venus Commission has planned out the work to be done.

Should the astronomers arrive safely, and the weather be favorable, it is safe to predict that the results deducible from the American observations alone will be of very high value.

Among the numerous investigations that have been instituted in connection with the preparations for this transit we notice one by Bakhuyzen, of Leyden, who advances reasons for believing that the annoying phenomenon of the "black drop" is mostly a phenomenon of diffraction, having its origin in the telescope. The photo-

graphic processes that the American parties propose to use will, however, be in great part entirely free from any trouble on this score, as the Commission have decided not to rely to any great extent on the observation of contacts.

In connection with the study of the phenomena of the solar atmosphere Lohse has instituted a series of attempts to determine the depths of the solar spots by observation according to Wilson's method, and is led to the conclusion that there must exist a very appreciable amount of refraction in the solar atmosphere.

The special series of observations of the satellites of Uranus, to which the powers of the great Clark refractor at Washington have been first directed by Professor Newcomb, has incited his assistant, Professor Holden, to a critical examination of the early observations of Sir William Herschel, the discoverer of this planet. Holden concludes that the two inner satellites discovered by Lassell had been previously observed by Herschel, and that there are no other satellites than the four now commonly accepted.

The investigations that have during the past hundred years had reference to the greatest of all astronomical subjects, the construction of the universe of stars and nebulae, have been based principally on the following classes of observations, i. e., (1) the general apparent distribution of bright and faint stars; (2) the distribution of true nebulae and true clusters; (3) the resolvability of clusters or nebulae; (4) the apparent proper motions of stars; (5) the approach or recession of stars or nebulae. To these Secchi made, some years ago, a very important addition of a sixth method, in that he examined the spectra of many hundreds of stars, and showed that there were four pervading types of spectra. In this last field D'Arrest is now at work. He states that he is examining the spectra of all the stars belonging to the Milky Way, and that in the course of this examination he has come upon some stars whose light is of a very remarkable character.

In *Optical Science* we notice the observations of Hirn and others on the polarization of the light reflected from a sheet of flame when a beam of sunlight is allowed to fall on it. Results are obtained tending to show that the glowing solid particles that give the flame its brightness are themselves transparent or nearly so when in this condition.

In *Acoustics* the brilliant investigations of Tyndall on fog-signals have called forth two memoirs, one by Reynolds, of Manchester, and one by Everett. The former thinks that fog has a decidedly deadening influence on sound, and attributes this to the friction between the fog particles and the sound waves. Everett, on the other hand, very lucidly explains the effect of layers of dense and rarefied air in refracting sound as well as light, and shows that distant sounds, such as the fog-signals, thunder, etc., may easily be and in fact are frequently so refracted as to pass above our heads, leaving the observer on the ground, as it were, in an acoustic shadow.

Professor Mayer, of Hoboken, announces briefly that he has been able to experimentally demonstrate the heating effect of sound waves, and, indeed, to determine their mechanical equivalent.

In *Molecular Science* Professor Clarke, of

Washington, communicates the first results of an interesting study into *atomic heat*, showing that the specific heats of allied chemical compounds vary slightly from Dulong and Petit's law, as though they depended on the temperature at which the determination is made. The extended researches of Plateau on the phenomena presented by thin films of liquids have been gathered together in two volumes and supplemented by numerous additional studies, forming, on the whole, a very important contribution to our knowledge of the statics of liquids. A theory of magnetism that has much to recommend it is promulgated by Gore, of London, who has himself added considerably to our knowledge of this obscure property of matter. According to him, magnetism is an attribute of every substance, its development being a consequence of a special arrangement of the atoms that compose its molecules.

Professor Thurston, of Hoboken, by means of a self-recording apparatus for testing the strength and elasticity of materials, has been so fortunate as to discover a new and highly important law, i. e., that after removal of pressure the body acted on is stronger than before, and that its strength may be increased by successively applying and removing a force.

The theory of the action of the galvanic battery is elucidated by Fleming, who maintains the so-called contact theory. Cazin has continued his studies into the magnetism of iron bars, and shows by a very beautiful experiment that if opposing currents surround a bar so that an attempt is made to give opposite magnetism to the same portion of the bar there is produced only an evolution of heat.

In *Terrestrial Physics* Mallet announces an approximate determination of the rate of contraction of the earth's crust; the result is only 8.5 inches in 5000 years, which he finds sufficient to account for all volcanic and seismic phenomena.

In *Meteorology* perhaps the most important item is the steps that have been taken in Europe—Holland, Germany, and Russia—toward the organization of work in reference to maritime meteorology, and the appointment of a maritime conference.

In America much attention has been drawn to the importance of fixing the paths of steamers on the ocean, for the purpose of lessening the dangers of collision. The first annual report of Dr. B. A. Gould, as director of the Meteorological Institute of the Argentine Confederacy, shows that from this country we shall soon receive valuable contributions to our knowledge of the meteorology of the southern hemisphere.

The law of diminution of heat as we ascend in the atmosphere has been investigated by Mohn in reference to the neighborhood of Christiana, Sweden, and he finds notable instances of the complete inversion of the ordinary rule that it grows colder as we ascend. In fact, there are frequent occasions when a mass of cold air pushes eastward, and uplifts the warm moist air of the low lands. It results that the coldest air, being the densest, keeps its level, and the hill-tops enjoy the warmer atmosphere. In connection with this should be noted Dove's recent memoir, showing that the extreme colds of Europe come from the east, advancing westward, quite con-

trary to the rule in America; but in both countries the true statement of the case is that cold dry air flows outward from the interior of continents, and downward from mountains and plateaus. Of special branches of study now being carried on it may be noted that the French Association for the Advancement of Science has allowed quite an appropriation of money to assist in balloon ascents for the investigation of atmospheric currents, temperature, etc. On the other hand the Scotch Meteorological Society is continuing the study of deep-sea temperatures in their connection with sea fisheries, especially the herring fishery, and have made an interesting report. A most important work by Cunningham, of Madras, is announced. He has prosecuted with thoroughness a microscopic examination of the dust floating in the air, and finds that distinct infusorial animalcules, their germs or ova, are almost entirely absent.

A valuable discussion between several European meteorologists as to the proper method of using the barometer in connection with weather map and storm predictions has tended to throw some additional light on that subject. Finally, it would be improper not to mention the publication of what promises to be one of the most valuable text-books on meteorology that have been issued for many years. This work (*Climatology*, by Lorenz and Rothe) pays special attention to the connection between meteorology and agriculture and forestry, and will supply a want long felt by all interested.

In *Chemistry* there is little of special interest to record for the present month. In organic chemistry the ordinary amount of routine work has been published, the most noteworthy, perhaps, being the continuation of Gladstone and Tribe's researches with the "copper zinc couple." W. H. Perkin describes a new dye-stuff, brom-alizarine, which, as its name indicates, is a brominated derivative of alizarine. As a colorific agent it is much like the latter substance, giving equally fast dyes, only its reds are less purple and its purples less blue.

Sonstadt, still investigating sea-water, finds in it vanadium, and something else which seems to be osmium. On the latter point, however, he is not yet quite sure.

In the discovery of new minerals the month has been particularly rich, no less than six having been described. Three of these are American. Oscar Loew, chemist to the Wheeler expedition, has found a new fossil resin in the lignite beds of New Mexico. He names it Wheelerite, in honor of his chief. Dr. F. M. Endlich, of Hayden's survey, has discovered two new species from the Red-Cloud Mine in Colorado. One, a telluride of lead and iron, he names Henryite, after Professor Joseph Henry; the other, a telluride of gold, silver, and iron, he calls Schirmerite, thereby complimenting the director of the mine. Liversidge describes, but does not name, an apple-green hydrated silicate of nickel and magnesium from New Caledonia, a mineral much resembling the "emerald nickel" of Lancaster County, Pennsylvania. Kararfvetite, from Kararfvet, Sweden, is described by Radominski as occurring in large brown imperfect crystals. It is a phosphate of cesium, containing fluorine. Guanovulite, as its name indicates, is from some of the fossil eggs found among the guano of the

Chincha Islands. It is a very beautiful crystalline salt, containing the sulphates of ammonium and potassium, plus water. Wibel is its discoverer.

Mr. Henry W. Elliott, of whom we have already spoken in connection with the exploration of the fur-seal islands in Alaska, has started on his mission of investigation of the habits of these animals in the northern seas, having proceeded to Port Townsend, where he takes a revenue-cutter, under the command of Captain J. G. Baker, for his further researches. As far at least as the Pribilof Islands he will be accompanied by Lieutenant Maynard, of the Navy, who has more especially as his mission the investigation of the affairs of the Alaska Commercial Company, and of its good faith toward the United States.

Considerable progress has been made in reference to the proposed new physical and natural history survey of Massachusetts, the recommendations of the American Academy and of other institutions of the commonwealth having induced a consideration of the subject by the Legislature. It is forty years since the first survey was completed, and much improvement has since been made in regard to methods of research. The new survey, if undertaken, will be conducted in the most exhaustive manner, and, like the first, will doubtless be the subject of imitation by other States.

The first fasciculus of the topographical atlas of the War Department survey of the region west of the hundredth meridian has been published by Lieutenant Wheeler, containing details of four of the ninety-five squares into which the region has been divided, together with several important physical maps. A Congressional committee has been engaged in examining into the work done by the expeditions under the different departments of the government with reference to the propriety of their being consolidated under one, and has reported that consolidation is not expedient, and that the work should be divided between the War and the Interior departments, the former to have more particular charge of the topographical and military surveying, and the latter to devote its attention more particularly to the geology and natural history of the West.

The most important *Geographical* fact that we have to chronicle from the Old World is the return of Gerhard Rohlfs from his survey of the Libyan Desert, reaching Cairo on the 17th of April. Although he did not succeed to the extent of his anticipations, he was yet able to add very largely to our knowledge of the physical geography, ethnology, and natural history of the region examined.

There appears to be a general movement among students of *Ethnology* toward summarizing the great mass and variety of material which has been gathered at different times from so many fields. Two methods are pursued, the one general, the other special. The former is that of the "Leipziger Museum of Ethnology," whose aim is to bring together objects illustrating anthropological and ethnological facts of all times and places, to exhibit every phase of culture in the development of humanity out of a condition of savagery up to the highest civilization with respect to food, fire, weapons, tools and crafts, clothing, orna-

ments, vessels, dwelling, furniture, pastimes, traveling equipments, music, letters, notation and reckoning, fine arts, social customs, public life, and religion. The latter, adopted by the "Daschkow Museum of Ethnology" at Moscow, aims to illustrate, by manikins in costume at the usual occupation of their originals, as well as by characteristic implements and accessories, the stages of civilization, the manners and customs, of all the peoples who make up the vast empire of Russia. These manikins are so arranged in groups, and the groups are so arranged with reference to each other and to the exhibition halls, as to present to the mind of the intelligent observer at a single glance the ethnological condition of the Russian empire. The whole collection is epitomized and explained by an ethnographic chart, the work of Professor Köppen.

In pursuance of the same general object, the French Anthropological Society has issued a volume of *Instructions sur l'Anthropologie de l'Algérie*, by General Faidherbe and Dr. Topinard. General Faidherbe gives the following estimate of the proportions of the various races: Berbers, 0.75; Phœnicians and Romans, 0.01; Vandals, 0.005; Arabs, 0.15; negroes, 0.05; Jews, Turks, and European runaways, 0.035. The same society has offered a prize of 500 francs to the author of the best manuscript on the ethnology of the population of any part of France. The prize will be awarded in 1876, as well as prizes of less amount to the papers next in value. Special attention is to be directed to the origin, anthropological characters, language, and geographical distribution of the races, and to any particular customs or beliefs.

In addition to very many public and private collections illustrative of special branches of human culture, the Smithsonian Institution has lately fitted up a large hall for the purpose of combining the two methods, the general and the special—on the one hand to classify and exhibit a splendid collection of American antiquities, gathered by many hands from all parts of the continent, and on the other hand to supplement these by similar objects from all parts of the world. There are four surveying parties to take the field this summer for the government, nearly all of whose "material" will find its way to this collection, while fresh supplies from other lands, the gifts of thoughtful friends, will gather around this nucleus, and enhance the value of the museum.

An exceedingly interesting result of the researches into general culture is the "International Congress of Archaeology and Prehistoric Anthropology," which will hold its seventh session at Stockholm this year, August 7-16. The programme, so far as perfected, is as follows:

- August 7. Opening meeting.
- August 8. Stone Age, Paleolithic Epoch.
- August 9. (Sunday.) A visit to the museums of Stockholm.
- August 10. Stone Age, Neolithic Epoch.
- August 11. Excursion to Upsala, a visit to the museums of the university, and to a necropolis of the Iron Age.
- August 12. The Bronze Age.
- August 13. Excursion to Björhoe (Iles de Bouléaux), to visit the remains of a city of the Iron Age, the remains of a "kitchen," and a necropolis of over 2000 tumuli.
- August 14. The Iron Age.
- August 15. Prehistoric Anthropology.
- August 16. (Sunday.) Closing meeting, and an excursion to the dolmens of the province of Visigothia.

In addition to this we have the announcement of the meeting of an "International Congress of Orientalists," to be held in London, "the capital of the great Oriental Empire," from the 4th to the 19th of September, the object of which is "to bring together those interested in the languages, literature, arts, sciences, and ethnography of the East." Six sections have been formed, and the following presidents elected:

Aryan section, president, Professor Max Müller; Semitic section, president, Sir Henry Rawlinson, K.C.B.; Turanian section, president, Sir Rutherford Alcock, K.C.B.; Hamitic section, president, Dr. Birch, LL.D.; Archaeological section, president, M. E. Grant Duff, M.P.; Ethnological section, president, Professor Owen, C.B.

Dr. Birch will act as president of the Congress.

The various geographical explorations of Russia, Germany, France, England, and the United States sent to arctic regions, to Central and Southern Asia, to the Pacific isles, but most especially to all parts of Africa, have had an especial bearing upon ethnology. The Ashantee war, the explorations by the Khedive of Egypt, the efforts of the British to extinguish the African slave-trade, in addition to increasing our knowledge of the resources of the continent, will bring before us a vast mass of material to be worked up in the general result.

The second part of the great work by Quatrefages and his colleague, entitled *Crania Ethnica*, has recently been published; and while the first part was devoted to the consideration of the so-called Canstatt race, or the earliest known in European civilization, the present one discusses what the authors call the Cro-Magnon race, including the people of the reindeer period. This race, like that first mentioned, is believed to be represented at the present day by people in various parts of the world, although quite local and limited in their distribution.

The discovery of the first-known kitchen-middings, or prehistoric shell-heap deposits, in Norway has lately been announced. These are stated to be of much the same character as those of Denmark and other parts of the world, with perhaps a greater proportion of stone implements.

For the benefit of those interested in *Microscopical Science* we have to state that in the April number of the *Quarterly Journal of Microscopical Science* Professor Wright commences a translation of Ernst Haeckel's "Gastrea Theory." It is a remarkable paper, and will be closely studied by those interested in the question of development and descent. This name, "Gastrea," was first applied by Haeckel, in his "Philosophy of the Calcareous Sponges," to what he considers the primitive root form, long extinct, which existed in the earlier primordial time (Laurentian period), represented, therefore, by the *Eozoon canadense*. This theory is a bold attempt at a fundamental remodeling of the whole system of zoology, and is, it is claimed, the first attempt to lead to a causal knowledge of the most important morphological relations, and the principal typical differences in the structure of animals, as well as at the same time to discover the historical sequence in the origin of the animal organization. Inheritance and adaptability are the only "two mechanical causes" with the help of which the gastrea theory explains the origin of the leading natural groups of the animal kingdom and the characteristic relations of their or-

ganizations. Haeckel's views have been subjected to sharp criticism, and in many respects are supposed to conflict with the Darwinian theory of descent.

In the May number of the *Monthly Microscopical Journal* we find an interesting communication from Dr. D. H. Schmidt, of New Orleans, on "The Construction of dark or double-bordered Nerve Fibre;" the paper is illustrated by three plates, and upon the whole confirms Max Schulte's discovery of the fibrillous structure of the axis cylinder, differing, however, in this, that whereas Schulte considered the fibrils *smooth*, Schmidt finds them to consist of *minute granules* about $\frac{1}{1000}$ millimeter in diameter, arranged in regular rows, and united by a homogeneous inter-fibrillous substance. One is reminded of Mr. Slack's resolution of the hitherto considered smooth pinnæ of pinnularia into a granular structure, and also of Dr. Pigott's "Podura beads." All these appearances are produced by the use of extreme oblique light, and we are by no means convinced that they indicate the true structure.

In the same journal Mr. Wenham describes a little instrument designed to exclude all light entering from within the plane of the focus, in measuring angle of aperture of objectives—a very necessary precaution if we would determine the really effective and true angle. The importance of cutting off these rays even for ordinary work is demonstrated in the use of the "Hartnack diaphragm," so called, but dating earlier, and originally applied by Nachet and Oberhauser.

The effect of the crystalline lens upon polarized light is well known from Brewster's experiments. Professor Clerk Maxwell, applying this test to the transparent jelly-like body of the sea-nettle, found that neither the spontaneous contractions of the living animal nor the application of considerable pressure produced any effect; proving what, indeed, he might have learned by dissection, that the sea-nettle is not a true jelly, but consists of cells filled with fluid.

At a recent meeting of the Microscopical Section of the Academy of Natural Sciences at Philadelphia Dr. J. G. Hunt presented a communication respecting the curious alga which had rendered the water of the reservoir of the Camden water-works unfit for use. He decided that it belonged to the Nostochaceæ, and was possibly a variety of *Trichornius thompsoni*.

It is now pretty generally agreed that Bacteria are almost invariably present in the blood, but Dr. Eberth (in *Centralblatt*, No. 20, 1873) has found them in ordinary perspiration; in spots covered with hair they attach themselves to the hair, often forming thick layers. He thinks they are very likely to produce certain chemical modifications of sweat.

Dr. H. C. Bastian has returned to the subject of the evolution hypothesis and the origin of life in the last number of the *Contemporary Review*, and after stating that there are only two possible modes of accounting for the fact that "certain of the most minute living things are known to appear in some fluids independently of pre-existing visible germs," one of these modes being the actual existence nevertheless of those germs, the other archebiosis, presents his *crucial* test thus, first defining what we are to understand by "life." He says all living matter is killed at 140° F., but

certain fluids heated much higher (212° F. and upward), and subsequently exposed to certain conditions free from all possibility of contamination with living matter, will shortly swarm with living things. Hence the man of science is compelled (as he believes) to conclude that such living organisms must have originated independently of living germs.

Under the head of *Zoology* proper an interesting fact is announced by Mr. C. J. Maynard, namely, that the Cuban crocodile (*Crocodilus acutus*) is quite abundant in the rivers of Florida emptying into the Gulf of Mexico. Its occurrence on the east coast was signalized several years ago by Professor Wyman; and Mr. Maynard gives a graphic account of an encounter with a second specimen in the same neighborhood. It is said to be a much more fierce and powerful animal than the alligator; and Mr. Maynard thinks that the notices of the occurrence in Florida of "alligators" of greater length than ten or twelve feet may be referred to this species. It may be stated here, for the benefit of those who wish to know the difference, that in the crocodile the long tooth in the side of the lower jaw fits into a hole or complete perforation in the upper jaw, while in the alligator this hole is replaced by a notch which allows the tooth to be distinctly visible from the side.

While Professor Marsh has with much success, from the large amount of material collected by himself in the Rocky Mountains, been enabled to discuss the ancestry of the horse, and improve on the suggestions of Owen and Huxley, Kowalewsky, the distinguished Russian zoologist, has, in a paper read before the Royal Society of London, treated of the genealogy of ruminants and pachyderms. He considers, as have others, that the *Anoplotherium* and *Xiphodon*, of the Paris basin, are the ancestors of all our living ruminants. But the common ancestors of these last and the *Anoplotherium* must have had four-toed feet. Such animals had not been discovered; but Kowalewsky thinks that they occur in a group of animals contemporaneous with the *Anoplotherium*, and called *Hyopotamus*. These last creatures are found fossil in the lower eocene, and die out in the lower miocene tertiary. The species are very numerous, and very variable as to form and size; some only as large as a rabbit, others rivaling the hippopotamus in stature.

An important paper on the classification of the weevils (*Rhynchophora*) was read at the April meeting of the National Academy of Sciences by Dr. J. L. Le Conte. He regards this group of coleoptera, usually mentioned as one family, as susceptible of division into three series, each equal to the Lamellicorn or Clavicorn series, for example, and divisible into a number of families. He had already in a previous communication to the Academy placed the weevils at the base of the coleoptera.

As a result of Dr. R. Von Willemoes-Suhm's researches on the *Challenger* we have, besides the discovery of a blind astacus-like crustacean, that of a blind deep-sea *Tanaia*. He also describes, in a paper sent to the Linnean Society, a new species of *Nebalia* from the Bermuda Islands. Professor S. I. Smith finds (*American Journal of Science*) in the tube-building *Amphipoda*—small crustacea, resembling the sand or beach flea—a peculiar opaque glandular struc-

ture filling a large portion of the third and fourth pairs of thoracic legs, in other amphipods occupied with muscles. The terminal segment of these legs is not acute and claw-like, but truncated at the tip, and apparently tubular. These glands undoubtedly secrete the cement with which the tubes or homes of these animals are built.

In the same journal (June number) Mr. O. Harger indicates a new genus (*Asellopsis*) of crustacean from Lake Superior, differing from *Asellus* in wanting palpi to the mandibles.

The singular fact is brought out in Claparède's remarkable posthumous work on worms that in several families (*Serpulidae*, *Ammocharidae*, *Aricidae*, and *Chaetopteridae*) the intestine is inclosed in a vascular sac, which acts as a dorsal vessel, there being no true heart. This reminds one of the mollusca in which the intestine normally passes through the heart.

The deep-sea polyzoa, or moss animals, dredged by Count Pourtales in the Floridan channel have been worked up by Professor F. A. Smitt, of Stockholm. He observes that the deeper waters contain species which have survived from the tertiary and even the cretaceous period. Some are cosmopolitan in range.

One of the most elaborate and exhaustive monographs ever attempted in America has just been brought to completion, in the fourth part of his revision of the *Echini*, by Mr. Alexander Agassiz. This occupies between seven and eight hundred pages, small folio, with numerous illustrations of exquisite perfection, many of them being nature-printings from original photographs.

A paper by Mr. Dall on the shells of Behring Straits is also worthy of note.

The long-pending controversy in regard to the nature of *Eozoon canadense* has been continued by an attack upon its animal nature on the part of Mr. H. J. Carter and others, and a defense by Dr. William B. Carpenter.

In continuing his researches on the evolution of the ammonites Professor Hyatt finds that throughout the group we observe every where instances of two methods of development: one by a slow accumulation of differences, according to the Darwinian theory, the other by their quick or sudden production, according to the law of acceleration, as explained by Cope and himself, and subsequently by Mivart. The gaps between forms or species may be largely explained by the latter mode of development if the necessary care is taken to study the earlier stages, which should show the close genetic connection of the distinct adult forms, and explain thereby the absence of the intermediate varieties. For example, by carefully observing these principles it is possible to trace the entire family of *Arietidae* to one original variety of one species, the smooth variety of *Psiloceras planorbis*. He finds that a series of species has, like an individual, a certain store of vital power, which enables it for certain periods, more or less prolonged, to evolve new forms and new characteristics, but which in the end fails; and in place of farther progress in that direction we find an evolution of degraded forms, which compare exactly with the retrograde metamorphoses of the individual. Size, which indicates vegetative growth, and the power to take in and assimilate large quantities of nutritive matter, which is usually called vital power, cor-

roborates the above. The size of the individual increases from *Psilonotus*, which rarely exceeds four or five inches, to *Conybearia*, which attains the enormous diameter of over three feet. Again, in the *Arnioceras* branch the forms first appearing are very small, only an inch or two in diameter, and steadily increase to *Coroniceras trigonatum*, sometimes two feet in diameter, and then decrease in *Asteroceras* gradually to *Collenotia*, which, again, hardly exceeds two inches. The individual grows by constant addition of characteristics or parts, and declines by the loss in those characteristics or parts, first of the power to perform their functions, and then by their obsolescence. Series of species, on the other hand, progress by the evolution of forms, which, in their adult condition, add certain common or parallel characteristics in regular order, and then decline by the evolution of a series of forms exhibiting the obsolescence of the same parts or organs, each form inheriting at an earlier age the old age characteristics of the parent, until finally none of the adult characteristics remain even in the young.

As relating to the subject of *Agriculture and Rural Economy*, we may remark that the discovery of valuable deposits of guano on the mainland of Peru, already referred to, has been substantiated by later examinations, and the danger of a diminution in or exhaustion of the supply of this important fertilizer has been removed to quite a distant future.

The announcement is made of the discovery in the alluvial soil of Auvergne, in France, of lithia in large percentage, certain springs in the same district being found to contain it in unusual quantity, and to owe to its presence their supposed medicinal virtues.

A somewhat interesting fact has been announced in reference to the influence of camphor water upon germination, the simple application of this manure bringing sickly plants up to a condition of health, and inducing blossoming and the perfecting of seeds or fruit in many instances, which had been unattainable under other influences.

An important contribution to the history of the potato disease has lately been made by Mr. Worthington Smith, who shows, as the result of a long series of experiments, that although no potato can be considered absolutely proof against contagion, yet there are a few varieties which are more to be relied on in this respect than others, and are consequently worthy of consideration.

In the department of *Engineering* we may report that the question of tunneling or bridging the Detroit River is still undecided. An influential meeting in opposition to the bridge project was lately held, and a new plan for a tunnel on the line of the Cheesebrough survey was presented by W. D. Rich. This gentleman estimates the cost of his plan at \$4,000,000, and engages to complete the work by December, 1875. Of the Illinois and St. Louis Bridge we may state that the iron-work has been completed by the Keystone Bridge Company. The bridge was opened for foot passengers May 23, and was to be ready for vehicles about June 3. Workmen are now laying the railroad tracks across the bridge and through the tunnel at the western end, but no date has as yet been set for the passage of

trains. The bridge proper consists of three arches, each over 500 feet in length. Its cost, including tunnel and approaches, will not be less than \$10,000,000. It is a wonderful specimen of engineering art, and this, as likewise its immense size and cost, will give it a place among the foremost structures of its time. We record likewise the approaching erection of another bridge, which will span the Mississippi at Quincy, Illinois. The American Bridge Company, of Chicago, have been awarded the contract.

The number of miles of new railroad constructed in the United States during the year 1874, up to May 31, is placed at 427.

On the 13th of May the iron steam-ship *City of Tokio*, a sister vessel to the *City of Peking*, was successfully launched from the Delaware River iron ship yard of John Roach, at Chester, Pennsylvania. This vessel, like the last-named, was built for the Pacific Mail Steam-ship Company. The following are her principal dimensions: Extreme length 423 feet, by forty-eight feet breadth of beam. She is of 5500 tons burden, has four decks, and six water-tight compartments, with accommodations for 150 cabin and 1800 steerage passengers, and is built throughout of American materials. The following day witnessed the launch at Wilmington, on the Delaware, of another iron screw-steamer, the *Hudson* (dimensions 300 by 34.5 feet), built for the Cromwell line. This makes an aggregate of twenty-eight iron steam-ships, of 63,500 tons, that have

been built on the Delaware within the past two years.

As indicating the continued depression of American iron industries, we note that the Bulletin of the American Iron and Steel Association contains weekly notices of the stoppage of mills and works, and the blowing out of furnaces.

The Patent Congress recently held at Washington, with the view of securing governmental action in the matter of effecting a unification of the patent systems of various countries, has been followed by a very influential meeting in England with a similar object in view.

An apparatus has been devised in Europe by which an engineer on a railroad train can determine whether the track in front of him is perfectly clear and unobstructed. Should this prove to be practically available it will undoubtedly add greatly to the safety of travelers by preventing collisions and other accidents.

A careful experiment has been made as to the economy of wetting coal to create heat in blacksmiths' forges, now almost universally the practice. By this it has been shown that there is actually a waste of heat as the result, and that the practice is not to be commended.

Of deaths since our last record the most important are those of Professor J. H. Müller, of Munich; Mr. Richard Brenner, the African traveler; Sivert Tobiesen, one of the intrepid Norwegian whalers who of late years have done so much for the advancement of science; and Professor J. Phillips, of England.

Editor's Historical Record.

OUR Record is closed on the 23d of June.—Congress adjourned June 23. The Civil Rights Bill still remains on the Speaker's table; it was passed by the Senate, May 23, by a vote of 29 to 16.

The final action of Congress on the financial question is represented by the Currency Bill passed just before the close of the session. This bill, which was reported by the conference committee after the disagreement between the two Houses on the bill first reported by the committee, fixes the legal tender circulation at \$382,000,000, the amount already issued; forbids the retirement of any portion of this circulation by the Treasury Department; makes no provision looking to a resumption of specie payments at any time in the future; provides for the redistribution of the national bank-note circulation, that is, the withdrawal of about \$55,000,000 of circulation from New England, New York, and other sea-board States, which they hold in excess of their proper quota, and giving it to the West and South, which at present are that amount short of their share according to wealth and population, and releasing the banks from keeping a reserve to secure the redemption of their circulating notes. Besides giving the form of law to the illegal issue by the late Secretary of the Treasury of \$26,000,000 of legal tender notes and forbidding their recall, this act inflates the currency to the extent of the released reserves of the banks. The Senate passed the bill June 19; the House, June 20.

The bill to repeal moiety to informers was finally passed by both Houses June 18.

Both Houses agreed to the conference report on the Geneva Award Bill June 22. Only uninsured losses are provided for.

The House, on the 19th, passed a bill reducing postage, after January 1, 1875, to two cents per pound on newspapers issued once a week or oftener, and three cents per pound on periodicals issued less frequently, the postage to be prepaid by the publishers.

The committee appointed to investigate the conduct of the government of the District of Columbia reported a bill, June 9, to abolish the present government and substitute for it a commission to have charge of the affairs of the District. It provides for the appointment of a joint committee, consisting of two Senators and two Representatives, to sit during the recess, and frame laws for the future government. The bill has been passed by both Houses.

The new Bankruptcy Bill has been passed by both Houses. The House inserted a modification of the section of the Senate bill relating to voluntary bankruptcy. As the section now stands, it provides that a voluntary bankrupt shall be discharged upon the payment of thirty per cent. of his indebtedness, with the consent of one-fourth of his creditors, representing one-third of the value of the indebtedness.

The new Canadian Reciprocity Treaty was sent by the President to the Senate June 18.

A bill has been passed by both Houses reliev-

ing savings-banks having no capital stock from the tax on deposits.

The House, June 5, passed a bill authorizing the construction of the Fort St. Philip Canal from the east side of the Mississippi River to Breton Pass, in the Gulf of Mexico, under the direction of the Secretary of War.

The President, on the 1st of June, accepted the resignation of Mr. Richardson, Secretary of the Treasury, and nominated General Benjamin H. Bristow, of Kentucky, to succeed him. He also nominated Mr. Richardson to be one of the judges of the Court of Claims. Both nominations were confirmed by the Senate June 2. The Assistant Secretary of the Treasury, Mr. Sawyer, resigned June 4. The President has made and the Senate confirmed the nomination of Mr. J. C. Bancroft Davis to be minister to Germany.

The New Hampshire Legislature, June 3, elected James A. Weston (Democrat) Governor of that State. The Oregon State election resulted in the election of Lafayette Grover (Democrat) for Governor by a majority of about 4000.

Republican State Conventions were held, June 17, in Illinois, Indiana, and Vermont. In Illinois Mr. Ridgeway was nominated for State Treasurer. In Indiana W. W. Curry was nominated for Secretary of State. In Vermont Judge Asahel Peck was nominated for Governor. The Republican State Convention of Maine, at Augusta, June 18, renominated Governor Nelson Dingley. The Democratic Convention of Maine, at Portland, June 23, nominated Joseph A. Tipton for Governor.

The new constitution of Ohio, to be submitted for ratification August 18, provides for the election of the Legislature by the cumulative vote in all counties where more than two members are to be elected. It gives the Governor the veto power (he has never had it before), and his veto can only be overruled by a three-fifths vote in both Houses. The veto can apply to any item, or to the whole bill.

In the State of Sinaloa, Mexico, April 4, two persons were burned alive for witchcraft. Other executions followed. The authorities and all persons implicated in the outrage were arrested and imprisoned.

The French situation has materially changed since our last Record was written. After M. Goulard's failure to organize a new ministry, President M'Mahon constituted the cabinet as follows: Minister of War, General De Cissey; Minister of Foreign Affairs, Duc Decazes; Minister of the Interior, M. De Fourton; Minister of Finance, Pierre Magne; Minister of Public Works, Eugène Caillaux; Minister of Commerce, Louis Grivart; Minister of Public Instruction, Vicomte de Cumont; Minister of Justice, Adrien Failland; Minister of the Marine, Marquis de Montaignat. The Municipal Bill was passed to a second reading, 394 to 298, June 1. On the 4th similar progress was made with the Electoral Bill. About this time the Left Centre issued a manifesto calling for the proclamation of a definitive republic or the dissolution of the Assembly. On the 10th, by a vote of 348 to 337, the Assembly adopted an amendment to the Electoral Bill fixing the age of electors at twenty-one years instead of twenty-five, as proposed by the government. On the 15th a constitutional bill was introduced by the

Left Centre providing that the government shall consist of a Senate and Chamber of Representatives, confirming Marshal M'Mahon's Presidency until 1880, and providing for the partial or total revision of the constitution by such constitutional bills as may be hereafter submitted and adopted. The motion was declared "urgent" by a vote of 345 to 341. The bill was referred to the Committee of Thirty. A resolution moved by M. De la Rochefoucauld, declaring the government a monarchy, was defeated by a majority of 100. The Municipal Organization Bill was debated June 20. The bill was presented in a modified form, maintaining the present system of municipal elections for two years, providing that the nomination of the mayors shall be made by the government. This compromise was adopted, 358 to 329.

The Prussian Diet was prorogued June 21. The federal Council of State has invited Prince Bismarck to frame a new law providing for the extension to all the states of the empire of the provisions of the law passed by the Prussian Diet for the civil registration of births, deaths, and marriages.—The German press, through a recent law, has obtained some important concessions from the government. The deposit of 1000 thalers as caution money is no longer required of political papers, and the tax upon these organs is removed. Again, judgment must be rendered within forty-eight hours of the seizure of a journal for publishing offensive matter.—The new ecclesiastical law passed by the German Parliament places the Roman Catholic Church under the control of the government in certain respects. No bishop appointed to a vacant see can exercise episcopal functions who does not possess the qualifications specified in the law of May 11, 1873, or who refuses to swear fealty to the king and obedience to the law of the land. An important feature of the law is that in certain cases powers hitherto exercised by the bishops alone may be transferred to the congregations.

DISASTERS.

June 23.—In Syracuse, New York, during a strawberry festival in the parlors of the Central Baptist Church, the floor gave way, precipitating hundreds of people into the lower story. Thirteen persons are known to have been killed, and a large number were seriously injured.

May 31.—The ship *British Admiral* stranded on King's Island. Seventy-three lives lost.

June 20.—Intelligence reaches Constantinople of a collision on the Sea of Marmora, and the loss of a Turkish vessel, with three hundred and twenty lives.

OBITUARY.

May 23.—In Chicago, Professor Joseph Haven, the distinguished divine and author, in his fifty-ninth year.—In Washington, Hon. David B. Mellish, Representative from New York, aged forty-three years.

May 27.—In Washington, Rear-Admiral W. B. Shubrick, senior officer on the retired navy list, aged eighty-four years.

June 9.—In France, Jean François Landriot, Archbishop of Rheims, aged fifty-eight years.

June 19.—In France, Jules Janin, a celebrated French journalist, aged seventy years.

June 20.—In London, the Rev. J. M. Bellew, the elocutionist, aged forty-eight years.

Editor's Drawer.

WHILE at school, nearly half a century ago, writes a veteran contributor to this Magazine, I encountered a youth by the name of F——e, who hailed from one of the most sequestered and unfrequented districts of the Southwest, where opportunities for education and social culture were rare, and where literary and scientific attainments were but little appreciated. The appearance of this untutored tyro as he entered the school-room, dressed in a suit of butternut-colored clothing of home manufacture, is most vividly stamped upon my memory, for he certainly was about as awkward and ungainly a specimen of backwoods juvenility as it has ever been my fortune to meet with. Uncouth as he was in his deportment, yet he possessed many of the instincts of a gentleman, and was naturally amiable and clever; indeed, he traced his ancestry directly back to one of the most distinguished statesmen and orators our country has ever produced. I became quite well acquainted with the young man during our stay at the institution, and appreciated his many excellent traits of character. When we separated he returned to his forest home, while my career led me in another direction, so that I soon lost sight of him, and it was only within a few weeks past that I accidentally stumbled upon him at the Arlington Hotel, in Washington city, where he was engaged in an important scheme for the improvement of the navigation of the Mississippi River.

As may be imagined, our gratification was mutual at so unexpected a reunion after a lapse of over forty years, and of course we had a great deal to say to each other about the events of the past, and our prospects and anticipations for the future. Some of the details in the history of his remarkably eventful life, as he narrated them to me, interested me so much that I venture to rehearse one or two of them for the benefit of the reader.

It seems that the subject of my sketch, after the completion of his academic course, united himself with the Episcopal Church, studied theology, and received orders for the priesthood; and being eminently cosmopolitan, he resolved to commence his labors in the then infant colony of Texas, which at that early period was just beginning to attract attention among the erratic population of our border settlements. Accordingly he bade adieu to his friends at home, and with a scanty wardrobe, and but a few dollars in his pocket, set out upon his protracted pilgrimage across the country, and for many weary days he traversed alone and on foot the wild regions that lay in his track, and after numerous mishaps and hard knocks by the way, he at length arrived at Austin, then but a small village, with a heterogeneous population of whites and Mexicans, made up for the most part of gamblers, robbers, refugees from justice, and other men of desperate fortunes, who had nothing to lose, and entertained but little regard for religion or morality. Yet these very men were then struggling manfully to achieve an existence as an independent republic.

During this era of anarchy and individual sovereignty no man considered his life safe unless

he carried a bowie-knife and revolver in his belt, and personal encounters in which these weapons were used without the slightest hesitation or apprehension of law were of daily occurrence. Hence considerable personal courage was required for a minister of the Gospel to exercise the functions of his calling either in the way of admonition or by attempting to control the unbridled propensities of such reckless adventurers.

The hero of our memoir, however, was a valiant soldier of the Cross. He had enlisted in a great and good cause under the banner of an omnipotent leader, and could not be intimidated by any thing mortal man could do. He possessed a genial disposition, and readily adopted many of the rude habits of the people, associating familiarly with them, and by a kind and conciliatory demeanor soon ingratiated himself into their good opinion; but he never allowed an opportunity to escape for dropping good seed wherever he perceived the slightest chance for its germination.

For the information of those who are not familiar with the history of Texas I remark that outside of San Antonio there was not at this period a single edifice within the entire limits of the republic exclusively dedicated to religious purposes, and I think it perfectly safe to hazard the conjecture that one-half the occupants of that section had never seen a church. Moreover, I doubt if one in fifty had ever witnessed the ceremonies of the Episcopal Church service, to which denomination, as I said before, my friend belonged.

Much curiosity was therefore evinced by the people to learn something about the character of this new sect, and shortly after his arrival at Austin Mr. F——e was invited to preach in the Capitol, a primitive structure, which was opened for the occasion; and after a closely packed audience was assembled therein, the parson, attired in full canonicals, with a huge surplice starched very stiff, and standing out on every side and inclosing a large area, entered the door, and edged his way through the multitude toward the Speaker's desk, while all eyes were, with seeming astonishment, directed toward his novel costume. And as he passed along they gave expression to their curiosity by remarks and interrogatories of the most singular character. For example, he heard one man ask another, "What in thunder's that thar kivrin the parson's got on?" To which his neighbor replied, "Wa'al, now, Uncle Abb, the Lord Almighty knows, but" (pointing to the expanded surplice) "that thar's the great-grand-daddy of all the shirts, sure's yer borned!"

This unique suggestion rather disconcerted the preacher, but he safely reached the Speaker's desk, and commenced the impressive services of his Church. He had not proceeded far, however, before he was interrupted by loud talking, tobacco-spitting, and other annoying demonstrations indicative of a total lack of interest in or attention to the sermon, all of which he endured with quiet resignation for some time; but at length this indecorous conduct became so unbearable that he suddenly suspended his discourse, and after a moment's deliberation remarked:

"I beg to observe, my friends, that I am not responsible for the arrangements that have been made for this occasion. I was invited by certain gentlemen to hold divine service here to-day, and I have no doubt those gentlemen believed they had provided every thing that was necessary for the accommodation of all; but had they consulted me, I would have suggested that another house might have been selected so far distant from this that those persons who desire to discuss politics or other worldly affairs on the holy Sabbath would not have been molested or disturbed by the preaching or singing attendant upon the worship of God."

This ironical admonition was received with marked approbation by a majority of the audience, and there was the most profound silence for a moment, during which a stalwart and very rough-looking individual, dressed in buckskin throughout, arose from the midst of the assembly, and after ejecting through his teeth upon those in his vicinity a copious shower of tobacco juice, he deliberately drew from his belt a huge revolver, then casting his eyes around with a most determined expression of countenance, he said:

"Look-a-yere, parson, you jist propel an' give tongue agin, an' ef I git sight o' any other pollytick sign crossin' your trail, I'll be on the runway with this yere shootin'-iron, and I be dog-oned ef I don't sorter reckon she kin bark some when Al Jeemes hies 'er on."

He then subsided, and the services were not interrupted afterward.

MEMBERS of the editorial "corpse" are proverbially men sedate. Of such is Mr. Faxon, who evolves from the depths of his inner consciousness the mental Champagne that spurts through the hydrant of the Paducah *Kentuckian*. In accepting an earnest call from "many voters" to become a candidate for coroner, he says that "an experience of several years within the precincts of Cairo renders me an excellent judge of a dead man."

OLIVE LOGAN, in one of her piquant articles on the stage, describes with minute detail that branch of public amusement which she denominates "the leg business." But the dancing she describes—the "pirootin," as the Arkansas man called it—is a very different thing from the ball that is given in Wyoming Territory, and in the Territorial region of this favored country of ours generally. Our city readers will read with pleasure a description of the toilettes worn at a recent ball at Sandy Run, which was attended by the "e-lite" of that place and towns round:

"Miss —, from Wilder's Gulch, was elegantly attired in a handsome buff gros-grained buckskin dress with army-blanket over-skirt, bottom looped up with buckskin strings cut bias. Hair dressed à la Red Cloud, in which was twined a few sprigs of sage brush, the whole secured behind in a bunch with a handsome pin made with a pine splinter and a buffalo's ear. She wore an elegant mountain-cat-skin cap, festooned with antelope tails, secured under the chin with a rattlesnake's skin. Her feet were incased in buckskin moccasins, ornamented with beads and soldier buttons.

"She created a big sensation as she entered the

hall hanging upon the arm of Mr. H. Barton, of Hallville, who was dressed in the style of his locality—buckskin breeches in boots, hunting shirt of the same, ornamented with beads and tobacco juice, an army belt of the latest pattern around his waist, securing a pair of six-shooters and a huge bowie-knife, which set off his gallant figure to good advantage.

"Envious glances from both sexes followed this handsome couple round the hall. Several ladies and gentlemen from the mining districts were present, and expressed themselves well pleased with the manner in which the party was conducted. Their frequent exclamations of delight, such as 'Red hot, you bet!' 'Ain't it fruit, though?' 'Hoop la!' etc., plainly indicated that they were enjoying themselves in the best possible manner."

A CLERICAL friend in Oregon sends the following:

As a minister's wife in —, Oregon, was about to go out one evening, one of the children expressed a little uneasiness that he and his sisters should be left alone. The mother replied: "It is important for me to attend a Woman's Suffrage meeting to-night, so be good children. I will not stay late." On returning home at an early hour the mother met little six-year-old Charlie as she entered the door, who, with a sad, inquiring look, said,

"Mamma, is the woman dead?"

"What woman, child?"

"Why, the—the woman that was *suffering* so—the one you went to see?"

The "woman" still lives, and makes much noise, though she is not so strong as some of the women would like.

AN Eastern contributor writes:

In an adjoining village not long since there lived a couple whose lives had been one prolonged quarrel. The wife finally was taken very sick. The doctor called several times, and at length one night said to the husband he feared the woman would not live the night out. The old man went to the house of a neighbor, and rapped loudly. Mrs. W— came to the door. Said he, "Can you come up to my house and lay out my wife?"

"Is your wife dead?" asked the good woman.

"Oh no," he replied, in a subdued voice, "but she'll be dead enough by the time you get there."

Nothing like time-saving and forethought.

A CLERICAL gentleman from whom the Drawer is always pleased to hear sends the following:

As I was paying pastoral visits some years ago, in the State of Tennessee, a lady said to me,

"I'm very glad you've come. I was reading in the Bible the other day about Moses marrying a nigger, and I wish you would explain the matter."

"It don't read that way in my Bible," I replied; "it reads that Moses married an Ethiopian woman."

"Well, doesn't that mean a nigger?"

"I will tell you how it was," I answered.

"There was a terrible war waged by the Ethiopians against the Egyptians, and two great armies sent from Egypt against them had been

destroyed. The Ethiopians were governed by a magnificent queen, something like Semiramis, who led out her own armies, and knew how to gain a victory. But when Moses was sent with a third Egyptian army against her, he asked help of God, and managed so wisely that the queen agreed to surrender all her forces to him, and become tributary to Egypt, provided he would marry her."

"Well," said the old lady, "*I was sure it wasn't any common nigger.*"

THE same contributor adds:

A Christian friend of mine had a husband passionate and profane, but who had a conscience, and sometimes expressed regrets that he failed so egregiously in self-government. His good wife remarked to her "aunt Dude" (as he called her) that "she sometimes thought William was a Christian."

"Wa'al, now," replied Aunt Dude, "if William is a Christian, don't you think *grace works him mighty queer?*"

It was characteristic of the clergy as a class, until within a few years back, that they were, on the average, a lean race, or at least not a fat one, and physiologists attributed it to the fact that, as a general thing, they were underfed. The luxuries of the table—the fat of the land—was not compatible with paucity of pence. This by way of preface to an anecdote, illustrative of the point, of a young Aberdeen minister, good-looking, and agreeable in manners and appearance, but thin and delicate. After an introduction to one of his hearers, the latter, as he went away, said to his wife:

"Jean, woman, I dinna ken what to mak o' eor new minister. He's weel-faured, and I maist think he'll be weel liket here; but, waes me, *he's been ill-wintered where he cam frae.*"

ANOTHER anecdote fresh from Scotia:

When Sir George Sinclair was chosen member of Parliament for his native county, a man came up to him and said:

"Noo, Maister George, I'll gie ye some advice. They've made ye a Parliament man, and my advice to ye is, be ye aye tak-takin' what ye can get, and aye seek-seekin' until ye get mair."

The Scottish precept has been the American practice, "maistly," for—well, for a long time past.

A FEW years since, in P——, Maine, a "gassy" young doctor buried his wife, and shortly after his only child. The good old Methodist minister who officiated on both occasions sought, in a conversation after the last funeral, to turn the doctor's mind to seeking religion, and reminded him of the irreparable loss he had met with. "Yes, elder," said the bereaved man, "they have cleaned me out this time, but I sha'n't give it up yet."

EIGHT diversities of kisses are mentioned in the Scriptures: the kiss of salutation, 1 Samuel, xx. 41; valediction, Ruth, ii. 9; reconciliation, 2 Samuel, xiv. 33; subjection, Psalms, ii. 12; approbation, Proverbs, ii. 4; adoration, 1 Kings, xix. 18; treachery, Matthew, xxvi. 49; affection, Genesis, xiv. 15. There are some other

kinds of kisses which the Scriptures do not mention—neither do the young ladies.

FIVE-AND-THIRTY years ago there appeared in a little publication in Glasgow—*The Penny Songster*—a little poem that has not hitherto found its way into print in this country, the delightful humor of which will be appreciated by the readers of the Drawer:

THE DAINTY BIT PLAN.

Our May had an ee to a man,
Nae less than the newly placed preacher,
An' we plotted a dainty bit plan
For trappin' our spiritual teacher.

Oh! but we were sly,
We were sly an' sleekit,
But ne'er say a herrin' is dry
Until it's weel reestit an' reekit.

We treated young Mr. M'Gock,
An' we phied him wi' tea an' wi' toddy,
An' we praised every word that he spoke,
Till we put him maist oot o' the body.

Oh! but we were sly, etc.

Frae the kirk we were never awa',
Except when frae hame he was helpin',
An' then May, an' aften us a',
Gaed far an' near after him skelpin'.

Oh! but we were sly, etc.

We said aye what the neebors thoct droll,
That to hear him gang through wi' a sermon
Was, though a wee dry on the whole,
As refreshin' the dew on Mount Hermon.

Oh! but we were sly, etc.

But to come to the heart o' the nit,
The dainty bit plan that we plotted
Was to get a subscription aft,
An' a watch to the minister voted.

Oh! but we were sly, etc.

The young women folk o' the kirk
By turns lent a han' in collectin',
But May took the feck o' the wark
An' the trouble the rest o' directin'.

Oh! but we were sly, etc.

A gran' watch was gotten belyve,
An' May wi' sma' priggin' consentit
To be anc o' a party o' five
To gang to the Manse an' present it.

Oh! but we were sly, etc.

We a' gied a word o' advice
To May in a deep consultation,
To hae something to say unco nice,
An' to speak for the hale deputation.

Oh! but we were sly, etc.

Takin' present an' speech baith in han',
May delivered a bonny palaver,
To let Mr. M'Gock understan'
How zealous she was in his favor.

Oh! but we were sly, etc.

She said that the gift was to prove
That his female friends valued him highly,
But it couldna express a' their love,
An' she glinted her ee at him slyly.

Oh! but we were sly, etc.

He put the gowd watch in his fah,
An' proudly he said he wad wear it,
An' after some flatterin' gab
He tauld May he was gaun to be marriet.

Oh! but we were sly,

We were sly and sleekit,
But Mr. M'Gock was nae gowk,
Wi' our dainty bit plan to be cleekit.

May cam hame wi' her heart in her mouth,
An' frae that hour she turned a Dissenter,
An' noo she's renewin' her youth
Wi' some hopes o' the Burgher Precentor.

Oh! but she was sly,

She was sly and sleekit,
An' cleverly opens ae door
As sune as anither is steekit.

At B——, in the western part of this State, a few weeks since, two little girls, one ten, the other eight, were talking together, when the former,

whose parents were Presbyterians, said to the latter, whose parents were Episcopalians, "We have had a great awakening in our church."

"Have you?" replied the little Churchwoman; "why, in our church they never go to sleep."

THERE was much mirth in Congress, a few days before the adjournment, on the Diplomatic Appropriation Bill. Mr. Cox, in calling attention to certain of our foreign representatives, and their vast official value to the country, said:

"Members will perhaps have observed a voluminous correspondence from a minister at Santiago by the name of Root. He is a doctor. Being thoroughly vaccinated, he managed to catch the small-pox, got well easily, and turned his sanitary condition into the State Department. Although the press of Chili intimated that Mr. Root is radically wrong in intermeddling in their hospitals, yet I always forgive the physician when he has something to propose for the human race, especially in South America, for it is a sickly continent. In writing to Mr. Fish, he says that he performed the following remarkable marvel:

"I daily medicate great numbers by proxy." "My system of treatment is a great success." "The grand idea is to destroy the poison." "A new street has been named after me here." [Laughter.] "I generally prefer an enema rather than a purge; a favorite one is composed of oil of turpentine," etc. "In case of constipation, lemonade or other acidulated drinks." "I forward to the department directions for a purge." [Laughter.] "When an alcoholic stimulant is indicated, it should be one with as little acid as possible."

"This gentleman has been considered the most remarkable plague in South America. Yet we pay for his performances, salary, exchange, and contingencies, over \$11,000!

"This brings us to my friend Colonel Steinberger, and his report of the South Sea Islands. I think nobody will suspect him of being particularly pious. He is a scientist, a man of observation, rhetoric, and enterprise.

"In all that I say I mean to support him as the proper candidate for the governorship of the distant islands which he has surveyed. He is suddenly called from his duties at Washington to the South Sea; why, no one can guess.

"We are told by Shakspeare that

On such a full sea are we now afloat;
And we must take the current when it serves,
Or lose our ventures.

"I suppose that on this authority the colonel sails to the south pole. As Great Britain is now annexing the Friendly Isles, must we be idle? Why may we not seek for the Navigator's Isles? Thus our old jealousies are aroused.

"Well, Sir, my interest in these South Sea Isles does not come out of the bubbles of history which the English missionaries and John Law blew in the last century. It has a gentler fountain. I once knew a girl, whom I traveled with in Africa, from the Grisons in Switzerland, who told me her grandmother had a lover along with Captain Cook in the good ship *Endeavor*, and was eaten in the Friendly Islands by the gentle savage! Hence my absorbing and romantic interest in those lands. [Laughter.]

"Where, then, are these isles? I thought I had a map. But I have been hurried into the debate to-day, and my friend from Maryland [Mr. Swann] must have captured my missionary volume. No? [Laughter.] Some one has tak-

en it, and hence I am embarrassed; but, Mr. Chairman, if I am called on in fancy to bound these isles, without my pious volume [laughter], I should point first to the isle of Juan Fernandez. Well, about eight thousand miles west, just above the tropic of Capricorn, and forty degrees east of Australia, you will find them. [Laughter.] Robinson Crusoe was one of the nearest neighbors, and Botany Bay another. [Laughter.] The islands are considerably conducive to solitude, but not so much so as the isle of Crusoe. There are thirty-five thousand men and women of the Friday family on the islands. Already I seem to feel that we have annexed them. Contiguity of territory makes them so near in the light of humanity, yet so far, when we come to reflect. Cowper sang of Selkirk and his isle:

When I think of my own native land,
In a moment I seem to be there;
But alas! recollection at hand
Soon hurries me back to despair.

I can only travel to these distant coralline shoals in these pages of the gallant colonel.

"But how, Sir, shall we bound them? On the north by the aurora borealis? [Laughter.] On the east by sunrise? On the south by the south pole? On the west by—"

A VOICE. "By Sunset." [Laughter.]

Mr. Cox. "That is personal. No. By the Day of Judgment? Yes, that will do, as the map does so isolate them. They are situated in the midst of an inexpressible watery waste. They are, to be accurate, seventy-two hundred miles from Juan Fernandez [laughter], the same distance from San Francisco, and the same distance from Loo-Choo, and the same from the seat of the Achen war."

Mr. Cox goes on to show the resources of the isles:

"This will answer for the physical description. As a resort for coral, these islands are a success. But why did not our commissioner describe in scientific phrase how the sweet little Simians—ordinarily called monkeys [laughter]—with the prehensile grip of the extended *os coccygis*, swing from the *Callophyllum inophyllum*, in the sunshine upon the upper slopes of Upolu and Savaii? [Laughter.] As they swing some eight thousand miles from us, and as a Darwinian, and a friend of man and science, why should we hinder them? Let them swing! [Great laughter.]

"Still we should not complain, for has not our commissioner given us the yellow *Artocarpus* or bread-fruit-tree, and the *Cocos nucifera* or cocoa-nut which the intelligent monkey drops upon the head of the juvenile islander?"

THE Hon. John W. Ward, of the minute metropolis of Floreyville, Mississippi, is a man of jocular turn. Weary of municipal greatness, he recently tendered to Governor Ames his resignation of the office of Mayor in the words following, to wit, *i. e.*: "I hereby beg leave respectfully to tender my resignation as Mayor of Floreyville, to which office I was appointed by your high-headed predecessor, which, with the infernal greediness for office so characteristic of the American people, I was green enough to accept. In thus drawing off the judicial ermine I am governed alone by the haunting fear of being inordinately rich if I continue to hold this lucrative

position. Perhaps some other man and brother may be inveigled into the acceptance of this position, but your humble servant prefers to retire to the gushing serenity of private life."

Among the many quaint epitaphs that have found their way into the Drawer we do not remember one upon a watch-maker, nor do we remember to have seen elsewhere one upon a member of that delicate trade. Therefore have we pounced upon the following, from an English journal just received:

Here lies one who strove to equal time,
A task too hard, each power too sublime;
Time stopped his motion, o'erthrew his balance wheel,
Broke all his springs, the verge of life decayed,
And now he is as though he'd ne'er been made;
Not for the want of oiling; that he tried;
If that had done, why, then, he'd never died.

A DELVER in things ancient and modern, copies from his readings the following for the Drawer:

A Cambridge under-graduate being asked about the Emperor Titus, replied that he wrote the Epistle to Timothy, and that his surname was Oates.

A still more felicitous respondent, upon being questioned as to which were the major and which the minor prophets, answered that he declined to draw invidious distinctions.

KISSING.

When we dwell on the lips of the girl we adore,
What pleasure in nature is missing?
May his soul be in heav'n—he deserves it, I'm sure—
Who was first the inventor of kissing.

Master Adam, I verily think, was the man,
Whose discovery can ne'er be surpast;
Then since the sweet game with creation began,
To the end of the world may it last!

In the neighboring duchy of New Jersey a new and frightful mode of punishment has been proposed by a committee on the work-house of Morris County as a means of scaring away bad people from that region. We commend it especially to the consideration of the clergy:

Conclusion of a Report to the Morris County, New Jersey, Board of Freeholders.

Your committee would further say that they have been complained of by justices of the court for the lenient manner in which prisoners have been treated; that they were sent there to be punished, but are simply deprived of their liberty, fed, clothed, and warmed at the expense of the county, and go away with so favorable an opinion of the accommodations of the prison at the end of their confinement that in many cases they will designedly and deliberately commit the offense of getting drunk, and a job is made for our petty officials to commit them to the charge of the county for three months; and for the county to pay some thirty odd dollars to feed each of that class of persons is, in our opinion, a useless expense.

It is further suggested that a minister of the Gospel should be employed, or otherwise obtained, to hold frequent and protracted discourses in the jail, and that the prisoners be locked in their cells as much of their time as their health will admit of, that the character of their food be diminished in quality, and all with a view of making the prison a place of punishment.

A CONNECTICUT correspondent contributes the following:

My late old and intimate friend Lewis Gaylord Clark many years ago related to me the following anecdote of his brother, Willis G., who, when visiting an old acquaintance, a farmer, at a time when albans were all the rage, was handed by

the daughter a superannuated account-book, ruled for pounds, shillings, and pence, in which he was requested to write something pretty for her; with which request he complied in the following manner:

	£	s.	d.
This world's a scene as dark as Styx,			
Where hope is scarce worth		2	6
Our joys are borne so fleeting hence			
That they are dear at			18
And yet to stay here many are willing,			
Although they may not have	1		

TOM TURNER.

AN EPIC BALLAD.

A FISHERMAN was Tom by trade;
He slept on briny planks;
And though not rich, he often made
A run upon the banks.

On fish he lived from day to day—
Fish caught by his own hand;
And when he did not land his prey,
He did not praise the land.

When he had seen a shoal of shad,
Their struggles were in vain;
The fish might hop around like mad,
And soon they were in-seine.

He led a happy life; content,
He never thought to roam;
And every day he fishing went,
And brought his net gains home.

Tom loved a girl, so tall and slim,
The fairest in the town;
But Sal would not take up with him,
So he was taken down.

By passion's power now racked and worn,
He called on Sal, a swain forlorn,
Led on by Love's suggestion.
He found that she was popping corn,
And so he popped the question.

She was the sweetest girl in town,
And playful as a kitten;
For her Tom threw the gauntlet down—
And she gave him the mitten.

Then Tom was mad! He kicked a lad!
His heart was sad! His head was bad!
His language was still badder!
And he who once had lived on shad
Soon faded to a shadder.

To be a man he swore to try;
He left that town of woe;
He went out West to do or die;
He met an Indian six feet high—
Of course it was not Lo!

The Indian saw the Yankee small;
The Yankee saw the Sioux:
At once they knew that one must fall,
At once they both fell to.

The Indian struck a mighty blow;
By Tom's good luck it missed the foe;
The Indian was forlorn.
Tom tried the Indian to lay low;
Tom dropped a rock upon his toe,
And crushed his Indian corn.

The Indian paused: this blow so rude
Had caused him great solicitude;
He thought he would no more intrude;
He thought he'd fly, if none pursued;
The white man next he slyly viewed,
And then began to beller.
Tom deemed all Indians copper-lined,
But this one proved a yellor.

Tom seized a log to make a thrust,
To lay the Indian in the dust;
The Indian ran away—
So swift he cut his stick, he must
Have been a Chip-away.

And thus was fought and won the fight,
In which Tom took great pride:
Then home he went to Sally bright,
And won her for his bride:
But on that night his hair turned white,
And staid so till he died.

HARPER'S NEW MONTHLY MAGAZINE.

No. CCXCII.—SEPTEMBER, 1874.—Vol. XLIX.

ON NEGRO SCHOOLS.
ILLUSTRATED BY PORTE CRAYON.

SCHOOL'S OUT—HURRAH!

"'Twas in the prime of summer-time,
An evening calm and cool,
And four-and-twenty happy boys
Came bounding out of school;
There were some that ran and some that leapt
Like troutlets in a pool."

THIS charmingly descriptive verse of Tom Hood's rose to our lips the other day as we heard the sudden gush of an outpouring school, joyous as the voice of sparkling wine gurgling from an uncorked bottle.

On turning the next corner we were conscious of a smart shock of surprise, and even disappointment, for instead of the anticipated troop of blue-eyed, flaxen-haired, and rosy-cheeked Anglo-Saxons, we beheld an animated picture "en silhouette," black on a light ground, not such a picture as had probably inspired the poet's pretty stanza—and why not? Are there any artistic reasons, or do we still look through our old social spectacles? "Philosophy reasons, but habit governs." This is an Old-World proverb, but in America we profess to have changed all that; so let us pocket our tinted glasses, and view the subject with the naked eye.

There is something attractive and sympathetic in the gambols of all young animals; and of all our human types the face of the infantile negro expresses most touchingly the capacity for pure sensuous felicity, the simple joy of animal existence. The dimpled roundness of his swarthy features, the shadowy fringes of his tropical eyes, the flashing smile, the unspeakable jollity of his laughter, mark him as a child of the sun, tractable, emotional, amiable, thought-

less, unconscious yet of the life before him, and of that inexorable tyrant, "necessity," who may prove a sterner master than those from whom his race have recently been liberated. And with these reflections we fall into a sympathizing strain, like Coleridge,

"Poor little foal of an oppressed race,
. I hail thee, brother!"

Now this, we aver, was genuine and disinterested sentiment; not being nor proposing to become a candidate for any office, it had not occurred to us even that we were addressing a rising generation of voters. With the remembrance came a twinge of conscience at our having so long disregarded a subject fraught with interest to every citizen and well-wisher of our great republic.

Here was the opportunity to amend the neglect, and we proceeded to do so without further delay. Arresting a little four-year-

POOR LITTLE FOAL.

Vol. XLIX.—No. 292.—31

CHARLEY.

old, we commenced our examination abruptly:

"Halloo, Charley! what are you learning at school?"

The boy stared a moment, and then replied, with an air of subdued complacency, "I nothe my A B T."

"Prodigious! And do you like to go to school?"

The answer was a dutiful, "Yet-tir."

"And do you like to play?"

"Yet-tir," with a trifle more emphasis on the final word.

"Well, which do you like best?"

The little fellow hesitated a moment, corrugated his brows, scratched his head, and with a smile of infinite subtlety, answered, "I likes to do bote."

"Answered like an embryotic statesman and philosopher. And now wouldn't you like to have ten cents?"

"Yet-tir," responded the young scholar, with a grin, only checked and limited by some dimples of doubt that lingered about the corners of his mouth. But when his fat fingers had actually closed upon the two nickles that made up the named sum, the grin took undisputed possession of the field.

"And now what will you do with your money?"

"Buy tandy," he exclaimed, and, with a shout, started at full speed to realize that vision of felicity.

It might have been more satisfactory to

our scientists if we had reported measurements of the facial angle or crural curvatures, but from the intellectual and moral developments of our brief examination, people generally will be satisfied that Charley is a very good imitation of a white school-boy done in bronze.

Seeing a stranger apparently interested in his vocation, the teacher sent us a polite invitation to visit the school next day during the hours of recitation. The invitation was accepted, and the visit was altogether gratifying.

The building, which is of brick, has a neat but unpretending exterior, and within is better arranged for convenience, cleanliness, heating, and ventilation than is usual with

Virginia school-houses. The room will accommodate a hundred and thirty pupils, with seats and desks, and in winter is always full to overflowing. In summer the attendance is reduced one-half, owing to the necessity of the older pupils going out to service, or engaging in remunerative labor of some sort. The children were of both sexes, ranging from three to twenty years of age, neatly and comfortably clad, well fed, healthy, and cheerful, with an uncommon array of agreeable and intelligent countenances peering over the tops of the desks. They were also remarkably docile, orderly, and well mannered, without a trace of the barbaric squalor and rudeness pertaining to the street-corner brat of former days, occasionally found nowadays among those who don't go to school.

The teacher, Hamilton E. Keyes, is an ex-slave, born in Front Royal, Warren County, Virginia, who commenced his education at the Harpers Ferry school, and completed it at the Maine State Seminary, at Lewiston, on the Androscoggin River. He is about twenty-seven years of age, of prepossessing aspect, quiet and dignified in manner, and intelligent in conversation, with a decided talent for organization and order, as exhibited in the conduct of his school.

Every thing moves by the silvery tinkling of a small table-bell. The boys and girls are seated in separate columns, and make their entrées and their exits by opposite doors—

school call, recitations, back to places, recess, recall, etc., all by the tintinnabulary signal, musical and sweet. What a contrast to the blasting tin horn or the ear-piercing whistle of the "old-school" days! Indeed, one might have supposed the millennium near at hand but for a single suggestion, grimly reposing beside the busy little bell,—a long limber apple switch, barked and slightly frayed at the end, reminding us of the still unexpiated sin of our first parents, the common ancestors of black and white. While the majority of the pupils have come into existence since the Emancipation Proclamation, there is still a number older than that event, and some whose recollections antedate the great war. Yet in their career of schooling they have all started even, and it is rather curious and amusing to remark the utter absence of any thing like gradation in size or equality in years as the different classes from A B C to moral philosophy are paraded for recitation. It may also be observed that the "great scholars" are usually outstripped by the little ones, which only goes to confirm the generally received opinion that

DON'T GO TO SCHOOL.

"young plants are more easily transplanted and trained than older ones"—more ab-

THE GREAT SCHOLAR.

A COLLEGIAN.

solutely true in mind and morals than in horticulture.

This school has been in existence about six years, and is annually growing in attendance and solid popularity. It appertains to the common-school establishment of West Virginia, which provides for the separate education of whites and blacks. Notwithstanding the snarls of an impracticable philanthropy, this provision is more eagerly desired and approved by the blacks themselves than even by the whites, for reasons which we may touch upon hereafter. The County Commission of Examiners report most favorably of the general intelligence exhibited by the colored pupils, and of their progress in all the elementary branches of common-school education. In regard to order, organization, and general good conduct, this school is named at the head of the roll.

In visiting several other colored schools in the district we observed the same commendable characteristics in a greater or less degree belonging to them all. That at Charlestown, the county seat of Jefferson, is conducted by a Mr. Wilson, an ex-slave, born in the county, and a graduate of Harpers Ferry College, which is only eight miles distant.

Pursuing the subject to its source, we then visited the High School at Harpers Ferry. This institution owes its origin, incidentally, to old John Brown. During the war that followed his famous raid the United States arsenals and armories at Harpers Ferry were completely demolished, and at the conclusion the government donated the public lots and officers' houses still standing on Camp Hill to found a school for the education of the recently emancipated race. The late John Storer, of Maine, aided the enterprise by an endowment of ten thousand dollars, and in 1868 it was chartered by the Legislature of West Virginia with the title of "Storer College."

The property comprises five large buildings, containing about eighty good rooms, occupied by the teachers and families, and a considerable number of the students, who lodge and live there. One building contains ample recitation-rooms, the library, reading-room, and chapel. The locality is eminently healthful, and one of the most beautiful that can be imagined. From the rounded summits of those

breezy bluffs which overlook the town of Harpers Ferry we may see the crystal waters of the Shenandoah sparkling for miles through its deep and rocky gorge, and just below, where they meet and mingle with those of the Potomac, we may see, from a point midway between base and summit, the tremendous gateway through which the married rivers, now one stream forever and indissoluble, hurry down to meet the ocean tides at the federal city. Here the professors and teachers are whites; and the principal, Rev. N. C. Brackett, is universally esteemed throughout the district for high personal character, as well as the tact, patience, and ability with which he fulfills his difficult and responsible mission.

It requires three years to complete the collegiate course, and the curriculum is substantially the same as those of the village schools—reading, writing, and arithmetic forming the basis of the studies from first to last, varied with some preliminary glimpses at history, geography, political economy, literary composition, and declamation, and finally instruction in the art of teaching. And here we can not fail to commend the sincere good sense exhibited in the arrangement of this course, which offers to the

needy freedman only the substantial necessities of education, without undertaking to dazzle and delude him with its luxuries, vanities, and pretenses, which have for so many years emasculated and discredited the educational system of this country.

In pursuance of the same idea the expenses of schooling at Harpers Ferry have been reduced to the lowest practical figures, costing for tuition and living about twelve dollars per month, all told, and something less to those who board themselves. To this end facilities are furnished students for doing their own washing and cooking, and in this way the annual cost of living (clothing excepted) ranges from fifty to one hundred dollars.

We have the example of a man and wife who supported themselves respectably for a school year of nine months on eighty-one dollars and seventy-five cents, the greater part of the money having been earned by

manual labor during the term, and without losing a single day from the school.

It is so common for married couples to apply for admission to the school that a building has been set apart for their especial accommodation. Parents and children used frequently to come together and stand up side by side in the same class, but the rising generation so far outstripped their ancestors that the old folks became ashamed of themselves, and gave it up, or, out of pure filial respect, were forced by their children to retire from the unequal contest. We all know practically the difficulty of teaching "new tricks to an old dog," and we have been divinely cautioned against the attempt to put "new wine into old bottles;" but it is still a common and rather touching incident in Southern life to see a gray-haired Nestor of the corn field, coach-box, or dining-hall refusing to believe that he was born too soon, and with eager persistence still endeavoring to squeeze a few drops of the "long-forbidden" wine of liberty into his dried and wrinkled old noddle.

As most of the students are obliged to earn their own subsistence by manual labor or going out to service, the attendance at the school varies with the seasons, is frequently interrupted for a term, and very often permanently curtailed for lack of means to pursue the course undertaken.

The report for 1873 shows the

PRIVATE TUTOR.

MATHEMATICS.

CLERICAL.

number of students for the fall term to be eighty; for the winter term, one hundred and sixty-seven; for the summer term, one hundred and twenty-four.

There is a library of about fifteen hundred volumes pertaining to the college, made up by donations from the heirs of John Storer and others. The collection contains many valuable works, both entertaining and useful, and there are yet many empty shelves awaiting the contributions of a wise and thoughtful patriotism.

In visiting the different recitation-rooms we remarked that the pupils were quiet, earnest, and apparently much interested in their work. In the earlier years of the school, and just after the war, they were discouragingly rude, unmannered, and disorderly, loud, coarse, and given to brawling and fighting. Judicious discipline and the civilizing influence of books have already wrought a marked and radical change. A more decent, orderly, polite, and self-restrained collection of young people can not now be seen any where.

In all those exercises where memory and the perceptive faculties are mainly relied on the younger pupils seem fully up to the standard of the whites of equal ages and opportunities, but the race has not yet developed much talent for mathematics or abstract science of any sort, which is probably just as well for them at present.

Being aware of their strong predilection for music, we inquired if it was taught in the school. In response a chorus of boys and girls was called up, and sang several airs very agreeably, with the accompani-

ment of a seraphina played by the colored music-teacher. Some of the voices were wildly sweet and of very peculiar quality. The tones forcibly reminded us of some music we heard in Richmond of the olden time. We were visiting a tobacco factory, where we saw a hundred or more men, women, and children manipulating tobacco, apparently in constrained and gloomy silence. One asked the superintendent if they could sing. "Sing!" said he; "they would do nothing else if permitted, but it wasted so much time that we have been obliged to suppress it. Would you like to hear them now?"

"Certainly—yes."

The superintendent raised his finger, and there was a quiet rustle of attention throughout the large hall. Another signal, and there was a burst of music swelling so harmoniously from sweetness to grandeur that the hearers thrilled with emotion that nothing could express but tears. The theme was changed from solemn to sentimental, from grave to gay, and the singing was continued for half an hour without palling or losing any of its impressiveness. We had enjoyed several years of familiarity with the choicest vocal and instrumental music of Europe, and have since had opportunities of appreciating the best native and exotic talent our own country affords, yet can sincerely say we have never heard any thing more profoundly and exquisitely emotional than the minstrelsy of that gloomy Richmond factory. We have never heard nor heard of it since, and have sometimes wondered if the voices which thrilled that wild and wailing anthem, *De Profundis*, might not have lost •

something of their quality in the hurry-scurry of freedom and civil rights.

The especial mission of the Harpers Ferry school at present is to educate colored teachers for the Southern States. These are believed to be the most efficient and trustworthy, as they are certainly the most acceptable, missionaries to the people of their own race, and in consequence the demand is far beyond the capacity of the college with its present means and endowments to supply. Many have already been sent out, and more are being sent annually, hastily and imperfectly prepared indeed, but from all reports are still doing good service with their dim lamps, cheering and lighting the utter darkness of their people in many localities.

With the teacher goes the preacher, very frequently the two functions combined in the same person. The negro is characteristically susceptible to religious impressions, and the emotional services of praying and singing are among his highest enjoyments. Being weak in the so-called "exact sciences," he is still a devout believer in the devil, and

is consequently more controlled by his religious professions than the average white man of the day seems to be. He has a fondness as well as talent for declamation, and is capable of attaining a high place in oratory, of which we have already several notable examples in the country. When in orders, the ecclesiastical dignity of his appearance and manners is impressive. The preference for preachers and teachers of their own race is almost universal among the blacks. Their aversion to co-education and mixed schools is more decided and better supported by reason than is the prejudice of the whites.

The undeveloped and untrained mind naturally shrinks from competition with real or imagined superiority, and even the humility engendered by ages of slavery and ignorance will unwillingly endure, certainly not desire, the open scorn or contemptuous tolerance which it must face in this forced companionship. The proposed plan he believes to be unwise, undesirable, impracticable; but the statesman and philanthropist may find ample scope for their zeal in the cause of country and humanity by encouraging,

THE NEGRO PREACHER.

THE NURSE.

sustaining, and multiplying such institutions as the Storer College at Harpers Ferry.

Since his emancipation the negro has been a surprising success. He has passed from the slavery of centuries to free citizenship without a crime, and indeed we may say without a serious error. It is true that he amiably shared with his deliverers in the passing hallucinations of red breeches, rolling drums, and freedmen's bureaus; it is true that in politics he shows himself equally gullible and incompetent with the masses of his white brethren, and endures being victimized by politicians with the meekness of a free-born Democrat; yet in all these sudden and tremendous changes he has exhibited a capacity for self-sustenance which has gratified as it has surprised his most sanguine well-wishers.

While his educated white brother is still muddling in politics, or vainly dreaming of some legislative protection against the "want that cometh like an armed man," the negro has quietly shouldered his hoe, and resumed the practice of all those little arts which he had acquired in his passage through the valley of humiliation. Though Freedom found him naked and penniless, she also found him untrammelled by traditions of luxury and pride. Though ignorant and unlettered, he was still essential to domestic civilization in the South, and on his race the white man had been accustomed to lean from the cradle to the grave. The puling baby must have a nurse, and who can be found to undertake it but Dinah? The land must be tilled, and who can hold a plow like Big Barney? And when a dance is proposed, what French or Teutonic music can stir the heart or "put life and mettle in the heels" like the rhythmic lilt of Nace Coleman's fiddle? Or, in case of a wedding, who can make cake equal to Aunt Sarah's, or who serve at

a state dinner with more zeal (and less discretion) than Milly and Peterson? And then some time or another there is a grave to be dug— But why follow the subject further? The world down here would have to stop turning on its axis without the negro. The possession of all these simple and hitherto despised occupations has assured him a living, with some ready money to spare, and has left him master of the situation. The old ship is sinking, and Latin, Greek, belles-lettres, philosophy, and statesmanship are going down with it. The freedman alone knows how to swim.

The relations still existing between the ex-slave and his late lord (aside from politics) are in the general most friendly. It exhibits the black man devoid of rancor, treasuring up kindness, and oblivious of injuries. It suggests, too, that, after all, the oppression was not so grievous and unmitigated as some have supposed, and the readiness with which the evil has been forgotten and the good remembered is highly creditable to both parties.

Not long ago a country gentleman and one of his old slaves met in a store, where they had gone to transact some business and make purchases. They had parted in 1862, but recognized and greeted each other with the cordiality of ancient friendship, instinctively the while taking stock of each other's appearance and deportment. The negro was hale, sleek, and well dressed, and in settling up a smart account which stood against him on the merchant's books he showed a portemonnaie plethoric with the results of a summer's steady work. The master's heart was warmed at the evident prosperity of his old servant. He used to think him drunken, lazy, and tricky, and had prophesied his ruin when left to his own devices. Unlike Jonah and most other prophets of evil, he was not embittered at the non-fulfillment of his predictions, but cordially invited "Harry" out to see the family and the old place.

The freedman's observations had not been so satisfactory. The old master was roughly clad in ex-Confederate gray, faded, stained, threadbare, and frayed at the button-holes; his hair and beard grizzled to suit.

MORE ZEAL THAN DISCRETION.

and his face haggard and care-worn. His pocket-book resembled a dried North Carolina herring. In making his purchases he was scrutinizing and skimpy, and once obscurely hinted at credit, which the shop-keeper failed to hear. That afternoon Harry walked out to the old place, and it saddened his heart to see it. The noble woodland that used to be so jealously preserved, and was always teeming with 'possums and 'coons, had been hacked and haggled until it had nearly disappeared. The barn was gone, and only some charred and blackened stumps indicated where it once stood. The house was paintless and dilapidated, the inclosures broken, gates off their hinges, or rudely mended with rails or boards; the shade

trees worm-eaten and dying at the top, the lawn and borders hirsute with weeds and suckers. But still, as of yore, a hospitable smoke was pouring out of the kitchen chimney, and the proprietor was ready with a cheerful and friendly welcome.

Harry respectfully dropped his hat upon the porch floor, while he nervously fumbled for a package in his coat pocket. "I say, Mister Charles, does you still use baccy?" (The negro now carefully abstains from the *master* and *mistress* in his address.)

"Oh yes, Harry. And that reminds me—here's a pound of tobacco and a pipe I got for you in town."

Harry looked confounded, and then, shaking with deferential hilarity, excavated a package of like character from his own pocket.

"Why, Mister Charles, dat is so like old times, and it's mighty queer we should have been rememberin' adzactly 'bout the same thing. Why, here's a pound of baccy I jist fetched you. I jist was a-thinkin'— Well, now, that's comical—ke-he." They exchanged presents and compliments, and as the negro retired toward the promised sup-

THE COOK.

per in the kitchen, he muttered to himself, "Mighty sorry I left de ole place. Things wouldn't 'a run down dis way ef I'd 'a staid."

So much for the negro of the "ancien régime," the race that has come up out of the house of bondage, indued with the virtues and imperfections pertaining to their former condition. Their child-like ignorance and apathetic patience, their humility and trained capacity for labor, have conjointly served to carry them creditably through a period of transition fraught with trials and dangers. They have passed the Red Sea in safety, and yet a few more years and the race of freedmen itself will have passed away. We may flatter ourselves that in their regard the problem is already and favorably solved. But what are freedom and the schools doing for the coming generations of the colored race in the Southern States? This is now the important question for the consideration of the statesman and philanthropist, and we are sorry to say we can't throw much light upon it. In so wide a field the direct observation of any single individual must of necessity be limited, and when we undertake to discuss the subject with others, we

GIVE IT UP.

are surprised and disappointed at the very small amount of enlightened consideration it has received even by those whom we would suppose most capable and most nearly interested in its elucidation.

The teacher will most intelligently estimate the negro's capacity for acquiring the diverse branches of learning, and lament the poverty or inconstancy which so frequently brings his scholastic career to a premature conclusion, as if scholarship was in his case an ultimate object of existence.

The clergyman is absorbed in the discussion of doctrinal subtleties or the development of religious sentiment, and in his commendable zeal for the future welfare of his neophyte takes no thought of what he shall eat, or what he shall drink, or wherewithal he shall be clothed in the mean time.

The statesman seems to regard the brains, body, and soul of his recent fellow-citizen with sublime indifference, but focuses his intellectual telescope on the mysterious and uncertain future of the negro vote, and the means of securing it for the salvation of the country. You and I, intelligent reader, know very well what that means.

The average Southerner still gauges the intellectual, moral, and political value of the negro by his capacity for self-sustaining

P'S AND Q'S.

labor. This view may strike some as narrow and materialistic, but "the nigh penny darkens the sun," and under the shadow of a hard and impending necessity we may sometimes get clearer insights into practical matters than can be obtained through the luxurious haze of a distant sentimentality.

Shortly after the war an ancient freedman of our own house called upon us to ask advice in regard to the education of his children. He had been all his life a steady and industrious shoe-maker, and besides rearing a large family, had deposited with us from time to time his little savings, until they amounted to some three hundred dollars. He could read and write quite fluently, talked intelligently and well, and was altogether a useful and respectable citizen. He had seven or eight hearty girls and boys, all grown, or nearly so. We complimented him on his good fortune, and, in reply to his confidence, advised him at once to put all his children to trades, extolling the value of skilled labor, and enlarging on the dignity and independence of the productive arts. His

RIVALRY.

countenance fell, for although he had long been free from legal bonds, his mind was completely enslaved by the traditions of the land. *His* children work at trades! Why, they could have aspired to more under the old system. Now, he wanted to make his daughters ladies, and have them learn on the piano, and send his sons to college, with a hint at the learned professions. So he drew his funds and departed, a sadder but not a wiser man.

There is a vague belief among the unlettered classes that "an education" is a sort of talisman which can protect its possessor against the curse of Adam, and insure a life of dignified ease and gentility. The negro believed it was the white man's fetich that gave him wealth, power, and supremacy. Hence the wild rush for the schools when the barriers were first removed. Here the elders soon discovered they had undertaken something harder than hoeing corn, and

HUSTLE CAR

that the legal disability had not been the only difficulty in their way to Parnassus; so they dropped off, confused, discouraged, ragged, and hungry, and fell back on their trained muscle. But the movement was only checked temporarily, and the hope of the parent was delegated to the children. The strong arm sustains the young brain as it advances with steadier and better assured steps, and in another decade the race will have nearly outgrown one of the marks of its former condition. Not only in the schools, but elsewhere, do we already observe the ameliorating influence of letters on the manners, tastes, and habits of the colored population.

Our domestic servants are more scrupulous in regard to the rights of property in small matters than formerly, when they felt and acted like common owners of the household stuff or farm products. They are losing their tastes for the midnight dances and barbaric sports in which they once delighted. The 'possums, 'coons, and eels are left in peace, while they devote their evening leisure to books and learning. Our gardener spends half his wages in stamps and stationery, and the cook lets her bread

sour while she is agonizing over her long-tailed literary p's and q's. Their manners are more respectful and self-respecting, evincing greater deference for the educated superiority of their employers than they ever did for the ownership of their former masters. On the other hand, their cookery has degenerated, their skill in the manual arts is generally decreasing, and their weakness for genteel

BIDDY.

occupations increasing. They are less disposed to grapple with tough jobs, and seem to understand that the following text is apocryphal: "Hate not laborious work, neither husbandry, which the Most High hath ordained."

In communities where they are numerous we may still too frequently see groups of adults idling about the market-places at the eleventh hour, or even later, and in obscure alleys observe gangs of unlicked boys brawling over hustle cap or other sinful games of chance. Humane attempts to reclaim these juvenile wildings and train them to usefulness sometimes succeed, but as often result in lamentable failure. But New York has her Biddies and beggar beats, and, all things considered, we may have the advantage in the comparison.

In conclusion, we may sum up the results of our observations in a brief paragraph:

There has been a decided improvement in the morals, manners, and social habits of the

colored race since the emancipation, operated by the simple consciousness of freedom. The influence of books and letters has been most favorable as far as it extends, but the schools are too few and too limited in means to cover so vast a field. They need reinforcements both of men and money. For a people (as for an individual) to maintain a status in this country a fair share of the solid property is essential, acquired neither by donation, legislation, nor speculation, but by honest industry. The education most needed by the negro is that which will most directly develop his capacity for self-maintenance and accumulation. We would suggest industrial schools, and leave to statesmen and philanthropists to provide the ways and means. The Southern country, with all its natural wealth, is now in the market, and in twenty years will belong neither to speculators, politicians, nor thieves, but to those who may earn it by intelligent and persistent labor.

ONE of the idiosyncrasies of our common nature is that we seem to have more consideration for man after he is dead than while he is alive. Very often we neglect and disparage him in the flesh, and esteem and eulogize him in the grave. Exanimation has more power than great deeds to make heroes, for the shadow of the tomb is a glamour to the living. Perfect appreciation belongs to obituaries. The earliest murmur of fame is frequently the echo of the first earth thrown on the coffin lid.

This disposition to delay honor and with-

hold affection for the advent of the undertaker, this propensity to retain chaplets for the sake of employing them as immortelles, is witnessed in mortuary celebration. We must compound with our conscience for our disregard of the living by our attention to the dead. By some irrational casuistry we must conclude that we make amends to kind hearts we have rejected by piling marble mockeries above their silent pulses. Only by such assumption can we explain the solicitude and veneration that have been shown in all countries and in all ages for the lifeless

body. Race, clime, or creed has made little difference in what might be called the universal corporeal superstition. However hostile, unjust, or cruel human nature may be to one of its co-heirs, its tendency is to the benignant, even to the sentimental, when good offices have been made superfluous by a funeral. Respect may be slender or null for the breathing, thinking, sensitive, sympathetic form, but a certain sacredness

attaches thereto the moment it becomes clay. The divine spark, the godlike element, as it is styled, appears to count for nothing, save by its absence.

Pagans and Christians, Socinians and Scripturalists, agree in this post-mortem veneration. No people have as yet been discovered, whatever their wildness or antiquity, who have not had sepulchral rites, and associated them with a certain degree of solemnity. Indeed, sepulture may be regarded as the mark of the human species. Where that is omitted the trace of humanity is lost, since no order of the lower animals evinces care for the dead. The annals of the race are revealed by the vestiges of tombs which antedate by ages the historic period, and which still puzzle the most learned of archaeologists. We are connected with the past, the dimmest and remotest, by an endless line of graves, and all we know of countless nations is that they died and were buried. This revolving ball, with its hun-

EGYPTIAN MUMMY.

dreds of millions of inhabitants, is but a vast grave-yard. The living bear but an infinitesimal proportion to the dead, whose remains are incorporated with every foot of soil we call our own. We are as a handful of men standing between the billions gone and the billions yet to come—on one hand the inheritors of Time, on the other the heirs of Eternity.

Interments, reasoning by induction, have almost always been associated with some form of religion, and their rites have often been preserved when the faith which inspired them has been forgotten. Not a few of the funeral ceremonies of the present day are anachronistic, because they have been borrowed without understanding from a different past, and are meaningless because the link is broken that bound them to significance.

The three principal modes of disposing of the dead have been by embalming, by incineration, and by interment.

The first process was not confined, as is often thought, to the Egyptians. Mummies have been found in Mexico; and the ancient Peruvians, as Garcilasso de la Vega witnessed, and as Prescott chronicles, preserved the bodies of their Incas after the Eastern fashion. In the Temple of the Sun at Cuzco these monarchs sat, natural as life, in chairs of gold, attired in royal state, their hands crossed upon their breasts, and their heads inclined as if in obeisance to their

PERUVIAN MUMMIES.

PERUVIAN SEPULCHRAL TOWER.

anointed queens, ranged opposite in the grim dignity of death. The Guanches, the aboriginal inhabitants of the Canary Islands, also rudely embalmed their corpses by removing the entrails, drying them in the air, covering them with varnish, and consigning them to a wooden case, after wrapping them closely in goat-skin.

The Egyptians, however, carried their process to perfection by introducing antiseptics into the vacated interiors of their dead, thus embalming in their catacombs, it is estimated, not less than 400,000,000 persons. Herodotus and Diodorus Siculus, especially the former, have minutely explained the method of preservation, and from them we learn that it was a regular trade. The embalmers removed the brain and the intestines, supplying the emptiness with myrrh, cassia, and other spices, and then placed the body in natron for seventy days. Subsequently it was carefully laved and wrapped with bandages of fine linen smeared with gum, and put in a wooden case shaped after the human figure.

There were other modes of embalming less expensive, the rate varying from \$1800 to \$400 in our currency, which was so much money in those days that we can not now see how Egyptians of the ordinary class could possibly afford to die. They doubtless lived longer than they would have done otherwise, prompted by a prudent economy to avoid the extravagance of burial as long as possible.

The cheapest way

of embalming, adopted usually by the poor, was to free the abdomen of the intestines by means of a clyster—commonly the oil of the cedar-tree—and let the body lie in natron until the flesh was impregnated. Recent investigations indicate that heat must have been applied to the corpses after they had been filled with some bituminous substance, and creosote generated and diffused through all the tissues. The reason that heat was not mentioned by the ancient authorities is supposed to be their desire to keep the process secret, and enhance the dignity and mystery of the art.

Embalming is still employed. The means adopted by Chaussier and others have been to eviscerate the body and keep it constantly saturated with protochloride of mercury. The salt, combining with the flesh, not only gives it firmness, but renders it incorruptible either by internal or external agencies. The injection into the veins of a concentrated solution of sulphate of alumina, or of chloride of mercury and wood-vinegar, or of sulphate of zinc, has been found very effective not only for anatomical purposes, but also for embalming.

We might attain to the preservative excellence of the Egyptians were we so minded; but as embalming, except for temporary convenience, is not deemed desirable with us, and forms no part of our theological system, we have no ambition to rival them in mummification. Our sepulchral vanity manifests itself in grandiloquent epitaphs and sculptured monuments, instead of in desiccated carcasses and pigmental disguises of death. The æsthetic element alone would prevent us from imitating the dwellers on the Nile, who made death more hideous to the eye than it could be to the supremest superstition.

At what time the custom of incremation

INTERIOR OF TOMB AT BENI HASSAN, EGYPT.

CINERARY URN, KINGS NEWTON, ENGLAND.

INVERTED SEPULCHRAL URN, NEAR WARDLOW, ENGLAND.

began we have no means of determining, though it probably preceded history. The ancient Hebrews seem to have practiced it somewhat; but interment was their general rule. The Greeks were, so far as known, the first to adopt it to any great extent; and yet they followed the habit of inhumation likewise, the verb *θάπτειν* meaning to dispose of the body in either way.

When the body was to be consigned to the earth it was put into a coffin either of baked clay or earthenware, and carried beyond the town, in consequence of the belief, then prevalent, that the presence of the dead brought moral infection to the living. (We now prohibit intramural burial, interpreting the former superstition hygienically, and profiting by the interpretation.) If burning were preferred, the remains were placed upon a pyre, which was ignited in the presence of the relatives and friends of the deceased. After the flames had been extinguished, the calcined bones were collected and deposited in urns, which were preserved in tombs erected at the side of roads leading from the city.

The denial of obsequies was considered a disgrace and punishment, and was restricted to certain criminals, whose bodies after death were cast into receptacles designed to that end, and left exposed to the action of the elements.

Rome during the republic buried its dead, although incineration was not infrequent. Lucius Cornelius Sylla—his self-pronounced epitaph was that he had repaid every kindness from a friend and every wrong from a foe—is said to have been the first of the Cornelian family whose body was burned. This was done at his own request, made just as he had completed his memoirs, two days before his death, with a full consciousness of his approaching end. During Augustus's reign incineration became general, continuing to the close of the fourth century,

when the spread of Christianity caused its disuse.

The burning was very nearly the same as with the Greeks, except the ceremony was often more expensive. A law of the Twelve Tables ordered that the pile, generally built with four equal sides in the form of an altar, should be composed of wood untouched by the axe; but this rule was not strictly adhered to. With averted face, the nearest relatives kindled the pyre, and precious perfumes, oils, ornaments, and articles of raiment were thrown upon and consumed in the flames. The ashes of the whole were sprinkled with wine, accompanied with an invocation to the manes, and collected in an urn of brass or bronze. One of the sharers of the ceremony purified those present by sprinkling them thrice with water from an olive-branch; then the *præfex* pronounced the word "*Illicet*," the friends exclaimed, "*Vale, vale, vale*," and returned home to a sumptuous feast.

The kinsfolk of a man of rank burned the body on the ground purchased for the sepulchre, but the poor had a public place (*ustrina*) for incineration, because it was so much less expensive.

The tombs of the wealthy and titled were often spacious and costly, the walls containing niches in which the urns were deposited, as may still be seen in the tombs lining the Appian Way.

Interment has a hundredfold the variety of embalming or incineration. It has been practiced over all the globe, in every land, in every time. It was the earliest mode of burial; it is the present, and will be probably the future mode.

The study of mortuary architecture is of the widest range. So many theories and hypotheses have been held concerning it that, even now, in spite of the most zealous and labored researches, archaeologists are unable to agree whether certain dolmens are mon-

TUMULI, DENOMINATED THE FIVE BROTHERS, IN THE ORIMEA.

uments of the dead or sacrificial altars; whether the mysterious aboriginal mounds are tombs or law courts; whether the strange circles so generally discovered are temples or places of burial. Investigation has shown numerous opinions on this subject to be absurdly fantastic; that the antiquary who believes himself absorbed in search of facts is more liable than most men to become the dupe of baseless speculation or vagrant imagining.

Burial-places, as embraced in inhumation, comprehend tumuli, dolmens, circles, avenues, and menhirs. Albeit, without any positive information, we may assume that man, in providing for the dead, must primarily have dug a hole in the earth and placed the body therein, raising a mound over the grave if the person buried were of consequence enough to merit a mark of any kind. He could hardly have remained very long satisfied, however, with so simple a sepulture. His development must have increased his care for departed friends, and created a desire to protect the corpse in some way. Hence coffins of some description, made of wood doubtless in wooded regions, and of stone in stony countries. The wooden inclosures, of course, decayed and left no trace; but the stone lasted, and is still seen in the rude cists taken from ancient graves. Such simple tombs must have grown more complex with the advance of civilization, finally requiring means of access to relatives or descendants, many of whom in the earlier ages believed that the dead had urgent needs during the interme-

diate state preceding the translation of the soul.

Burial, as I have said, antedates the earliest times that we have the slightest suggestion of. The Great Pyramid of Gizeh must have been erected at least two thousand years before what is known as the Christian era, and it must have been a direct outgrowth of a rugged tumulus or cairn, having external access to the chambers. The oldest tumulus outside of Egypt for which we have any absolute authentic date is that which Alyattes, the father of Cræsus, King of Lydia, built for himself, 561 B.C. Herodotus described it, and of late years it has been thoroughly explored. It is 200 feet high and 1180 feet in diameter, the upper part composed of alternate layers of clay, loam, and a species of rubble concrete, supporting a mass of brick-work surmounted by a platform of masopry.

Another group of tombs near Smyrna is called the Tombs of Tantalais. They must be as old as the eleventh or twelfth century B.C., the predecessors of the tombs of Sardis; and as they still stand on the plain of Troy, many zealous antiquaries feel confident they cover the remains of warriors who fell during that apocryphal siege. The tombs or treasuries of the Atridae at Mycenæ, referred to by Pausanias, are profoundly interesting. The best preserved of these is a circular chamber forty-eight and a half feet in diameter, covered by a horizontal vault, and having a sepulchral chamber on one side.

In the older cemeteries of the Etrurians

TUMULUS OF ALYATTES, FATHER OF CRÆSUS.

are tombs supposed to be contemporaneous with these. One of the largest of the Etrurian remains is the Cocumella, at Vulci. It is two hundred and forty feet in diameter, and must have been originally some hundred and twenty feet high. Two unsymmetrical steles rise near the centre, and mar the completeness of the design. Regolini Galeassi's tomb at Caere is very rich and remarkable. One of the chambers is filled with vessels and furniture, mainly of bronze, very highly wrought. The patterns so closely resemble the still older ones discovered at Nineveh that they go far toward fixing the date of the tomb in the tenth century B.C.

These and many other tumuli on the northeastern shores of the Mediterranean clearly indicate that they belong to the age of bronze. Iron may have been known too at that time, though Hesiod, in his *Works and Days*, declares that brass preceded it in respect to use. The famous iron pillar at Kutub, near Delhi, still continues to be in all probability the largest mass of forged iron in the world; and the skill shown in its workmanship is good evidence that the Hindoos extracted iron from its ore in the primeval period. The fact that iron has not been found in early graves, though there is ground for thinking that Egypt had made its acquaintance three thousand years B.C., simply goes to show how slow was the progress of the arts from the East to the West, and that the knowledge of the most useful of metals took from fifteen to thirty centuries to travel across the continent of Europe.

Dolmens, or tables of stone, within or without graves, represent another kind of tomb, and are chiefly found among the relics of the Celts. They seem to begin with the rude stone cists (kistvaens) which are discovered in sepulchral tumuli. The cists are sometimes composed of but four, though generally of six or more, stones set edgewise, and covered by a cap-stone, so as to protect the body. By degrees the kistvaen extended to a chamber, and received more than one deposit, making it necessary to keep the top open until the last burial. This inconvenience evidently led to the formation of a passage communicating with the outer air,

CHAMBER OF REGOLINI GALEASSI'S TOMB AT CAERE.

the best example of which is in the tumulus of Gavr Innis, in the Morbihan. Many dolmens, especially in Great Britain, were above-ground, as that in Castle Wellan, Ireland. It certainly never could have had walls, and the cap-stone is carefully poised on three points. This tripod dolmen is presumed to be more modern than the walled variety. In Ireland, Denmark, and France are numerous instances of dolmens surmounting tumuli, that of De Bousquet, in the Aveyron Department of Southern France, being the most celebrated.

Some of the interments during the Celtic period show that the bodies were frequently buried in strange positions. Skeletons have been found lying on the side, the head inclined a little forward, the knees drawn near the chest, and the heels to the thighs, the elbows being brought close to the knees, and the hands to the face. Just such a skeleton was exhumed from a barrow on Smerril Moor. It had been laid on its left side in an irregularly formed cavity, on the surface of a natural rock, over which, as usual, the

THE COCUMELLA, VULCI.

IRON PILLAR AT KUTUB, NEAR DELHI.

mound was formed of loose stones and mould. Behind the skeleton was a handsome drinking cup, with a meshing rule (made from the rib of a horse), a dagger, an arrow-head, and some other implements of flint.

In an oblong oval cist in North Wiltshire was found a skeleton in a contracted position, the head resting on the left hand, and with it a bronze dagger, a barbed arrow-head of flint, and a beautiful drinking cup.

In Derbyshire, in 1862, a mound some twenty-two feet in diameter and about three feet high was dug into, exposing a cist formed partly of natural rock and partly of stones set on edge, and covered with a large flat stone. Clearing away the rubbish revealed the remains of a young person lying on the right side with the knees drawn up. In front of and near the hand of the skeleton was a richly ornamented food vessel, the diagonal and herring-bone lines formed by twisted thongs impressed on the soft clay

of which it was composed. Two other cists were disclosed, each of them containing a skeleton in much the same position, with the same weapons and utensils. At the side of the cist were a heap of burned bones and a few flakes of burned flint, and within it a large quantity of rats' bones and snails' shells.

Some skeletons have been discovered in a sitting posture, leaning back against the side of the cist, roughly covered in with large limestone slabs; others again in a kneeling position; others buried in pairs side by side and shoulder to shoulder, but facing opposite ways. In a cist composed of four upright slabs were discovered the skeletons of a man and woman and two children. The presumption is that they were members of the same family, and the head having died, the wife and offspring were immolated, and all interred together.

Circles, another interesting species of monuments, are scarcely known in France, though very common in Algeria,

as they are in Denmark and Sweden, and notably on the British Islands. The stone circles in Europe seem to have superseded the circular earthen mounds surrounding the early tumuli. They encompass the tumuli in several rows, sometimes as high as seven, and frequently inclose dolmens, either standing on the level plain or on the tumuli. The larger circles, instead of girding tombs, are generally thought to be either cenotaphic or marking the site of temples dedicated to the honor or worship of the dead.

Avenues are of two classes—those leading to circles, and those representing externally the passages in tumuli that lead to the central chamber. They are merely rows of stones from nowhere to no place, so far as accurate investigation has as yet been able to prove. What their particular purpose was is beyond conjecture; but that they formed a conspicuous part of the sepulchral monuments of the past can hardly be disputed. The theories of archaeologists re-

DOLMEN AT CASTLE WELLAN, IRELAND.

specting avenues have been innumerable. Some have contended that they marked plans of battles; others, that they are the outlines of temples; and others again, that they indicate the march of the Druid priests. In sooth, one can scarcely conceive of any idea too ridiculous not to have been evolved from the inner consciousness of an antiquary cudgeling his addled brain over avenues.

At Cas Tor, on the western edge of Dartmoor, is a series of avenues some six hundred yards long; and on Dartmoor are sev-

eral others, from which learned blockheads have for years been striving to unfold certain mysteries of the Druidic faith. They may succeed eventually, though there is no more need of their contemplating the enigmatical avenues than there is of looking for the poetic ideal of a Scotch lassie in the strapping queans of the Highlands.

The menhirs or tall stones are the last division of the Celtic relics of sepulture, and are more mysterious than any of the others. The weight of evidence, however, seems to

INTERMENT, HITTER HILL, ENGLAND.

THE KENNET AVENUE

SCALE

PLAN OF AVEBURY CIRCLE
AND KENNET AVENUE, EN-
GLAND.

be in favor of the opinion that they are merely head-stones—that they superseded the barrow as more enduring and distinctive than the mere mound, and have been continued to the present time by all nations who bury instead of burning the dead. The Ogham inscrip-

tions on the menhirs in Ireland, Wales, and Scotland, so far as deciphered, appear to answer to our inscriptions, recording names, date, and age, accompanied by some tribute to the deceased. In France the menhir was early adopted by the Christians, who surmounted it with a cross, as they did at the Lochrist menhir in Brittany.

The cists throughout Britain vary much in formation as well as in the quality of the contents found. One in Middleton, fashioned from rough masses of stone, surrounded the skeleton of a woman lying on her left side. About the neck were the beads of a fine jet necklace, and above her lay the remains of an infant.

A cist in Liff's-Low was composed of eight large limestone slabs set edgewise, making a compact and almost octagonal chamber. In it was a masculine skeleton, partly contracted; a hammer-head of deer's horn behind the knees, and behind the head several flint arrow-heads, flint knives, and wild-boar tusks.

In England tree coffins have been discovered in barrows, some of the bodies of the dead having evidently been wrapped in the skin of beasts, and sometimes in woolen cloth.

Lead coffins have not infrequently been found in the cemeteries of London, York, Colchester, Kingsholme, and elsewhere. They are usually ornamented with amulets, beaded mouldings, and raised scalloped shells. A lead coffin discovered some time since in Hampshire was five feet six inches long, and sixteen and a half inches broad. The metal was much corroded, and plain on the outside. The skeleton, that of a woman, was nearly perfect. Small glass bottles, supposed to be lachrymatories, were in the cist, the glass being thin and of a pale green color.

Dolmens are numerous in Spain, the finest being the dolmen of Antequera. The chamber is somewhat oval, measuring internally

SCALE
STONEHENGE RESTORED.

about eighty feet from the entrance to the front of the stone closing the rear, while the width is some twenty, and the height ten feet. The whole, consisting of thirty-one stones, more or less shaped by art, was originally covered by a mound one hundred feet in diameter.

A very remarkable dolmen is inclosed in a church at Arrichinaga, in the province of Biscay. It is called San Miguel, and is thought to have been made a species of shrine in consequence of a superstitious sacredness attaching to dolmens in the early days of Christianity. Dolmens exist in Portugal, Italy, Scandinavia, North Germany, Algeria, Tripoli, in the Mediterranean islands, even in Western Asia and India, many very interesting specimens having been discovered in each of those regions.

In India is a curious class of sepulchral monuments known as dagobas, those of Ceylon being peculiar to that island. One of these, the Lanka Ramayana, was built A.D. 231; is a nearly hemispherical dome, surmounted by a square box-like appendage, called a tee, and surrounded by three rows of tall stone pillars. The dome of the dagoba was probably borrowed from the tumuli or cairns, so common in Northern Asia,

LEAD COFFIN, OOLCHESTER, ENGLAND.

which must have existed in India in primeval times. It is thought that the Buddhists converted the dome into a relic shrine, and then added a square box to the top, which is still seen in all the rock-cut and sculptured tombs of India. The box must primarily have represented a wooden casket, inasmuch as it is quite certain that there were no hewn-stone buildings in India before the year 250 B.C. Travelers in that enigmatical land will remember how even the best and most intelligent Brahmins will romance in regard to the beautiful cave temples of Elora or Elephanta. They will be gravely informed that the temples in those cities, as well as in Benares, Delhi, and elsewhere, were erected by the Pandus more than 3000 B.C., and if they doubt it, the sacerdotal Munchausens will add 15,000 or 20,000 years in order to make their story interesting. Time has neither value nor significance in India,

THE STANDING-STONES OF STENNIS, IN THE ORKNEYS.

DOLMEN OF SAN MIGUEL, AT ARRICHINAGA, SPAIN.

where the remotest past is as the present, and the most vivid present as the remotest past.

The Senbya Pagoda, in Burmah, is an external mound encircling the tope, with a complicated rail—unquestionably the supersession of the circles of rude stones—and a simulated dagoba replacing the simulated cist. These are great changes from the old monuments, though not more than might have been expected, considering that the pagoda was built less than sixty years since. This single instance clearly shows the steady improvement made in tombs throughout the

world, and how ready all nations have been to honor the dead with fitting monuments when they had acquired sufficient architectural knowledge.

This continent contains no rude stone monuments of sepulture, though there are extensive earth-works, analogous to those in the Old World, and some of them peculiar to the New. These mounds, as they are usually called, are divided into defensive inclosures, sacred and miscellaneous inclosures, mounds of sacrifice, mounds of burial, temple mounds, and animal mounds. The commonest mounds in the Mississippi Valley are incontestably

INTERIOR OF DOLMEN AT ANTEQUERA, SPAIN.

SENBYA PAGODA, BURMAH.

raised over the dead, their size probably being in proportion to the importance of the deceased. A tumulus of this sort near Parkersburg, in West Virginia, is seventy feet high, and another at Miamisburgh, in Ohio, is sixty-eight feet high, evincing the consequence of the personages commemorated. The mounds occasionally contain two or more skeletons; but this is rare, except where the Indians in later times have deposited their dead therein, under an impression of the sanctity of the place. The theories and opinions about these mounds have been as numerous and contradictory as those cherished respecting Celtic and Druidic remains in Europe. Whether they were built by the aborigines of this country or by an entirely different race still seems to be an open question. The mound-builders must have been a settled people, pastoral, and even agricultural, and they appear to have had a higher civilization than the red men—always more or less nomadic, and never rising beyond the condition of fighters and hunters. The strange heaps are generally known as Indian mounds; and to whomsoever they may owe their origin, many of them are certainly burial-places, though no link of connection between them and the transatlantic tumuli can be established.

Some of the aborigines—certain tribes of

the Sioux, for instance—instead of burying their dead, wrap them in skins or blankets, and place them on a rude wicker-work made of boughs and saplings laid across poles resting upon others notched and driven into the ground. The corpses are left to the sunshine and the storm, hawks and vultures, the Indians being careless of that, convinced that the spirit has been gathered to Manitou, the protector of the happy hunting-grounds.

The Guebers, Parsees, or Fire-Worshippers, as they are indifferently named, have extraordinary funeral ceremonies, being almost if not the only people known who fail, strictly speaking, to bury their dead. The disciples of Zoroaster, and primarily Persians, they are numerous in Western India, where they are called Parsees, from the country in which they originated. They recognize one omnipotent and invisible God, Ormuzd, and regard the sun as his eye. Consequently they reverence it and fire as emblems of the glory of the Supreme Deity. The sacred fire which Zoroaster, as they claim, brought from heaven is kept perpetually burning in consecrated places, and fed with the rarest wood and choicest spices. Their temples are erected over subterranean fires; one of their sacred cities being at Baku, in Russia, upon the Caspian Sea, where for ages, without intermission, flames have issued from calca-

INDIAN BURIAL TREE.

reous rocks. Such is their veneration for fire that they never blow out a light, believing that their breath pollutes it; while their priests pretend to pass their entire time in prayer, chanting hymns, burning incense, and tending the flames upon sacred altars. I mention all this to show how natural and consistent it would be for the Guebers to follow the old habit of incrimation. No one would imagine that a soul, from their point of view, could be more directly transmitted to Ormuzd than when its fleshy tenement was consumed by fire. Instead of adopting incrimation, however, their cemeteries are smoothly paved, built in a circular form, and surrounded by high walls. In the centre is a pit, to which the pavement slopes, and on this pavement the corpses are laid, naked, to be devoured by birds of prey. When the flesh has all been eaten the bones are swept into the pit, and after sufficient accumulation are removed by subterranean passages. There are several Parsee cemeteries in the vicinity of Bombay, and all the carnivorous birds of Western India seem to have become acquainted with the fact. They are constantly wheeling in the air in the immediate neighborhood, and it is surprising with what rapidity the unwholesome creatures will reduce a dead Gueber to a heap of bones.

The Mohammedan manner of burial varies in different countries and with different tribes. Sometimes it is above instead of below ground, the tombs being, as in New Orleans, made of stone or brick, full of arched cavities large enough to admit a coffin. Into these cavities the dead are thrust, and then the entrance is sealed up. There are

often three or four rows of these apertures, and the tomb may contain from nine to fifteen bodies, or even more. Certain Moslems hold, it is said, that the earth is contaminating, and hence they are unwilling the true believers should be interred therein. They make a distinction in souls, as respects women, for instance, not denying to them the possession of immortal spirits, but placing them in a lower grade than those of men; consequently inferior creatures might be laid without psychological harm where superior beings would suffer.

Most of the followers of Islam, however, especially those in Turkey and Syria, have no prejudice against inhumation, which is generally practiced every

where for the common people. When these are buried they are deposited in the ground without coffins, and boards placed over them to prevent the earth from falling upon and covering the remains. This is the same with us, and the fact, vaguely understood, may have given rise to the belief already stated that some of the Mussulmans deem contact of the body with the earth to be defilement. It is a cardinal article of faith with all the Mohammedans that the corpse and the grave are sacred, and the result is that, neither being disturbed, their cemeteries stretch over vast tracts, often altogether disproportioned to the cities or towns from which they are nourished. Constantinople is surrounded by immense grave-yards, suggesting to the mind of a stranger that the principal business of Stamboul, as indeed of all civilization, has been for ages entirely of a mortuary character. They present a strange and extremely gloomy appearance, their white marble columns, surmounted by turbans, shimmering like ghosts through and above the groves of cypresses that always mark the last repose of the Moslem sleepers. The shape of the carved turbans indicates the condition of the dead. The pillars marking the graves of women are turbanless, those over the unmarried having a sculptured rose at the top. The rose monuments almost invariably denote young girls, since celibacy is thought discreditable in Mussulmanic countries, and the highest province of the opposite sex to be the bearing and rearing of children. The inscriptions are in letters of gold, and abound in such hyperbole of commendation that an English-speaking person might naturally

suppose some of the epitaphs of his own race had been translated into the Turanian tongue. Few carved eulogies are bestowed upon women, and the unwedded are treated with the silence of charity, because, to the Ottomanic mind, their loftiest functions have been unfulfilled. Sepulchres of particular families of wealth and distinction are railed in and environed with the omnipresent cypress, and the tombs of eminent dignitaries are lighted with lamps kept constantly burning, a certain sanctity having been associated with fire by numerous schools of theology before and since the days of the Roman vestals.

Not a single stone is removed under any circumstances from a Mohammedan grave, for such removal is considered the deepest sacrilege, and no amount of piastres could purchase a rood of a Mohammedan burial-place. The Orient is not yet sufficiently enlightened to see the advantage which we so clearly perceive of turning old grave-yards into building sites, and using the dust of our forefathers as a basis for profitable speculation.

The Chinese are extraordinarily devoted to their dead, quite eclipsing us in sepulchral solicitude. They have no cemeteries of any extent, as families are in the habit of burying their members in private grounds, though sometimes districts and even provinces combine to purchase land for interment. In thickly settled parts of the country every family provides its own burial-place, and

the graves of the distinguished are carefully chosen, and adorned with much taste and care. The sides of the low hills or undulations are frequently selected for interment, and flowers, shrubs, and trees are particularly affected. Some of the tombs and their vicinity near Chung-zu are very attractive, and it is commonly remarked by travelers that the fairest spots in the Flowery Kingdom are appropriated to sepulture. A Celestial thinks far more of his grave than his house; and though he be wealthy, he will spend his days in a miserable hovel with a view to securing an attractive couch after death. If he can only be convinced that he will be interred in the midst of flowers and under a delightful grove, he will not care for the scourges of circumstance or the blows of adversity. Buddhism is the prevailing religion among the Chinese, and as they expect to lie long in the earth, it is natural they should desire to be well disposed. Their parental and filial affection is of the strongest, and the greatest consolation fathers and mothers can have in their last moments is that they will be buried in a coffin of their own selection, and that their children or grandchildren will cherish and honor their ashes. Not infrequently they keep their coffins, of which they are pretty fastidious in the purchase, under their own roof, and no piece of furniture receives more zealous care. They know that they shall want it some time, and they believe, in a very practical way, in preparation for the

PARSEE BURIAL-GROUND NEAR TEHERAN.

CHINAMEN BEARING A COFFIN.

(White cock on a coffin, luring home one of the spirits of the dead.)

mysterious future. They bear their burial-cases with them whenever they change their residence—very much as the ancient Romans bore their lars and penates. When they sell land for building purposes, the transfer is always accompanied with an explicit covenant to exhume the numerous departed through a series of generations. The bones are gathered, placed in earthen vessels, and labeled—a process irreverently styled preserving ancestors, because they present the appearance of druggists' jars. These are reburied elsewhere with the greatest economy of space, though a house is never erected over them, owing to a superstition that the outraged ghosts would destroy the desecrating residents, and torture them through all eternity.

Outside the walls of Pekin are many tombs of prominent families, accompanied by immense though decayed marble sculptures of men and animals. Such carved figures in limestone are not uncommon throughout the empire, and not a few, as is evident from their crumbling, are centuries upon centuries old.

Wherever a Chinaman dies, it is the earnest wish of his relatives and friends to send home his remains for interment, reckless of convenience, time, and distance. Some money is required to accomplish this, and if it can not be had, poverty becomes more grievous to bear than under any other circumstances. Death is so much more than life to a Celestial that, with all his repose and self-containment, he beats his breast in anticipation of an unlamented and unhonored grave. The San Franciscans have greatly ridiculed John because he has so much anxiety concerning his body, and wonder that his remains are shipped from the Pacific coast to his native land over thousands of miles of uncertain sea. John is, in this respect, no more obnoxious than Jonathan, who, approaching his end at the antipodes or in Australasia, expresses an ardent desire

to be embalmed and transmitted to the distant Eden where the right of every freeman is to do as he profanely pleases.

The catacombs of Rome are more interesting to the fancy than to exploration. They appeal to the mind at a distance; but to the examining eye, aided by a wax taper and a gibbering monk, they are merely subterranean passages drearily monotonous, and

hardly worth the seeing. They are supposed to underlie every one of the seven hills; but their romantic historians have overlaid far more than they could ever underlie. Originally quarries, they are said to have received, in all, the remains of at least sixty millions of persons, and much reverence has been paid to them because they are associated with the persecutions of the early Christians. Their whole number is reported to be sixty, so that they must have averaged a million of interments each. It is highly probable that they were the general burial-place of the Romans for centuries, and so holy were they thought to be, through the martyrs who had inhabited them, that several of the popes and emperors were, at their own request, laid there after death. Only two or three of the catacombs are open now to visitors—St. Sebastian's being generally shown—for no reason that I can divine except that almost all the skeletons have been taken away. I remember a stolid, gray-haired priest who pointed out to me various niches which prominent personages had once occupied. The garrulous old fellow, rather infirm in his history, put Abraham and St. Luke, Jacob and Julius Cæsar, Cleopatra and Constantine, down there, and gravely informed me they were all leading saints of the Church.

The catacombs of Naples, or rather those parts of them known as the Catacombs of San Gennaro, are not subterranean, like those of Rome, but are excavated in the volcanic tufa on the flanks of the hill of Capodimonte. They form a long series of corridors and chambers arranged in three stories, communicating with each other by flights of steps. Along the walls are numerous niches or loculi, in which may still be seen perfect skeletons, and rude delineations of the dove, the fish, the olive-branch, and other symbols of the primitive Christians. The niches were formerly closed with slabs of marble, many of them having inscriptions. These

slabs now compose the pavement of the Church of San Gennaro, through which is the sole entrance to the vault.

The catacombs of Syracuse are more spacious, better preserved, and less gloomy than any others. They are a vast subterranean city—a genuine necropolis, whose innumerable tombs, cut out of the solid rock, contain the dead of all ages, creeds, and climes. As the Sicilian town was founded more than 700 B.C., once had a population of 200,000, now sunk to 12,000, and was the residence at different periods of Plato, Simonides, Zeno, Cicero, Theocritus, Moschus, Archimedes (the mathematician lost his life at its capture by the Romans), and many other celebrities, the conclusion is both natural and just that the most interesting portion of Syracuse is under-ground. Its past history may be read in myriads of bones and an endless series of tombs.

The catacombs of Malta, also subterranean, are small, but in good condition, and seem to have been places of worship as well as of sepulture.

The catacombs of Paris are simply the receptacle of the bones of a number of the grave-yards of the city, removed to the vast quarries in the southern part of the town, and consecrated with great solemnity in 1786. They are thought to contain the remains of at least 3,000,000 of human beings. The long galleries, lined with bones from top to bottom—the arm, leg, and thigh bones, and the grinning skulls piled in front—make up one of the ghastliest exhibitions I have ever witnessed. When I had gone through those dismal corridors, and extinguished my torch as I emerged from the darkness, I fancied that all the people of the Continent must have been interred there. Those hideous vaults are really dangerous. There are many chasms yawning along the journey, and the roof looks as if it might fall in at any moment. There is imminent peril, too, of being lost, unless you keep close to your guide, and once lost, there is slender hope of your recovery. The effect of the light and shade cast upon the skulls and bones and dreary walls by the burning tapers was such as to make it appear that the broken skeletons were getting themselves together, and striving to join in a

hideous dance of death. Some of the jaws seemed to wag, and the eyeless sockets to wink at our melancholy procession as it filed by, our voices awaking dismal echoes that sounded startlingly unnatural. There is something grimly grotesque in the journey through the catacombs, and persons of a nervous temperament seldom feel tempted to repeat the experiment. I am not surprised that men who have been lost there for less than twenty-four hours have been made insane by the indefinable horror of their situation.

The three principal cemeteries of Paris are Père la Chaise, Mont Parnasse, and Montmartre. The first has the most reputation, and is the least attractive in itself of the three, its columns, pyramids, obelisks, and funeral vases being so overcrowded and so tawdry often as to create serious disappointment. But its undulations are pleasant, and the view it commands of the city and country is picturesque. The principal entrance to Père la Chaise is a semicircle adorned with censers and torches, and a chapel stands in the middle of the grounds on the site of an ancient castle. The most attractive tomb is that of the perfidious Abélard and the devoted Héloïse, a Gothic dais covering the reclining figures of the lovers. It was much injured during the war; but is now in proce-

INTERIOR OF CORRIDOR, CATACOMBS OF ROME.

BONES IN THE OSSUARY—BATTLE-FIELD OF SOLFERINO.

ess of restoration. Among the other conspicuous monuments are those of Visconti (the architect), Alfred de Musset, Arago, Bellini, Cherubini, Talma, Casimir Périer, Racine, Molière, Ney, Massena, Balzac, La Place, La Fontaine, and scores of immortal poets, artists, composers, scientists, and soldiers.

Mont Parnasse has a circular promenade in the centre, and walks laid out at right angles to each other. It contains but twenty-five acres, and the tombs of the surgeon Lisfranc, the chemist Orfila, the painter Gérard, the people's representative Auguste Tourné, the poet Camille Bernay, the philosopher Jouffroy, and the actor Bocage.

In Montmartre, including some thirty acres, sleep Paul Delaroche, the artist; Henri Murger, the clever chronicler of Bohemia; Armand Marrast, the revolutionary journalist, and editor of the *Tribune*; Henri Beyle, the supremely gifted but little read novelist; Legouré, the dramatist; Nourit, the singer; and Jenny Colon, the actress, for grief at whose loss the brilliant Gérard de Nerval committed suicide; Prince Ernest of Saxe-Coburg, Duchess d'Abrantes, and the Duchess de Montmorency.

In another old cemetery (there are fifteen grave-yards in the capital), that of Picpus, are the remains of General Lafayette and

his wife, and several hundred persons belonging to the first families of France.

The privilege of burying the dead of Paris is exclusively enjoyed by a company—the Enterprise of Funeral Ceremonies—in consideration of a large sum annually paid to the city. This organization has a right to every corpse within the municipal limits, and applications for obsequies are made to an agency established in each district of the capital. To accommodate all purses, the ceremonies are graduated; those of the first class costing, with high mass and other theological formulæ, about eleven thousand francs. This sum provides a superb hearse, drawn by six black horses, and from forty to fifty carriages, provided with drivers draped in suits of solemn woe. As the rate lessens, the hearses become plainer, the carriages and priests fewer (priests' services are fixed at so much per head), and the mass less imposing, until the ninth and cheapest class of funeral is reached, the expense being barely seven francs, and the body being borne on the shoulders of four shabby fellows to the commonest of graves.

The price of funerals in Paris is almost as limitless as in New York. A man may exhaust his patrimony by his mortuary pomp, or be carried to his resting-place for

the worth of a breakfast. One may be respectably hidden in the earth, however, for five hundred francs on the banks of the Seine, and on the borders of the Hudson it will cost his heirs, executors, and assigns at least twice as much.

There are three kinds of graves in the principal cemeteries of Paris. The first are sold for five hundred francs, with a perpetual title; the second are granted for five years, for fifty francs; and the third is the democratic ditch (*la fosse commune*)

into which the unrecognized poor are thrown without fee or favor. More than two-thirds of the entire population of the gayest and most brilliant of the world's capitals are buried in rude pine coffins so closely huddled that they soon break or burst, and mingle their cadaverous contents promiscuously and unrecognizably together. Every five years these unhonored and forgotten bones are dug up to give place to others, and removed to the catacombs. The poor Parisians can not be said to be at rest after death, since their remains must so soon be disturbed. Some of the noblest and purest of Frenchmen have been interred in the common ditch; among others, the renowned Abbé de Lamennais, who so truly loved the people that his dying request was to be buried with them.

The Campo Santo of Pisa is the most renowned of all the Italian burial-places. The Pantheon of the Pisans, and abounding in famous monuments, it is a handsome oblong court, surrounded by marble arcades ornamented with ancient Etruscan and Greek sculptures and paintings—some of them grotesque enough—of the pre-Raphaelite artists. Certain frescoes representing Death, the Final Judgment, and Future Punishment, though designed to excite awe, are supremely ludicrous, but interesting, because they reveal the spirit of the barbarous the-

INTERIOR OF ANCIENT TOMB IN THE CRIMEA.

ology of the Middle Ages. Shrouds, skeletons, apparitions, imps, and devils play their many-hued parts on the walls, and, as religious symbols, are caricatures of nineteenth century liberality. In the centre of the cemetery is a mound of earth reputed to have been brought from Palestine during the Crusades, and formerly used as a place of interment for the spiritual benefit such sacred soil was presumed to impart.

The cemeteries of Russia are for the most part at considerable distance from villages and towns, and are marked by groves of tall pines, which seem as emblematic of death to the Muscovite as cypresses are to the Mohammedan mind. The funeral services in the Greek Church appear to be copied from the Roman Catholic, a great effort being made to render them impressive.

In the cemeteries of Mainz, Frankfort, Munich, and other German cities the dead are exposed for a certain number of days before interment, to guard against premature burial. The bodies lie in the coffins, with the lids removed, in a large dead-house, a wire attached to the extremities of the corpse, and connected with a bell, so that the least motion would reveal animation, and bring aid and succor at once. Certain medical watchers are within call both day and night, should the bell be rung, and thus every possible assistance is secured toward resuscitation.

Marvelous tales are told by the common people of sudden resuscitation and premature burial, and these tales are widely and firmly believed. They have, however, very little foundation, as it is extremely rare, at least nowadays, that persons prepared for the grave are not actually dead. But still signs of death are so fallacious that the custom adopted by the Germans must be regarded as a wise precaution. A celebrated anatomist, Winslow, had two such narrow escapes from ante-mortem sepulture that he published a treatise on the subject, expressing the opinion that incipient putrefaction is the sole trustworthy symptom of physical dissolution. I have

TOMB OF CHARLOTTE CANDA, GREENWOOD.

made diligent inquiry in Germany respecting cases of suspended animation, and I have learned that in not a single instance has a body placed in the dead-house proved aught but a corpse.

Thus we see in every time and country that all peoples, savage or civilized, polytheistic or monotheistic, beauty-adoring or fire-worshipping, sectarian or latitudinarian, practice and reverence burial in some form; that they cherish a certain superstition for the lifeless body, and honor clay equally with spirit. Man may be styled, by way of distinction, the burying animal, and advocates of the development theory, to supply their links and complete their analogies, must show a gradation of interment between the brute and the human. In all funeral rites, from the primitive to the present time, we detect sufficient similarity to indicate the unity of the race. Never has the tenement from which vitality has escaped been held so precious as it is to-day. We make a fetish of it, though it turns to loathing under

our sorrowing eyes. We perpetuate our wretched vanity in honoring insensate dust, and carve marble with sonorous fiction to hide the sordid facts of life.

But of the disposition of the body after death, what matters it? No one may say who was wisest—the Egyptian who embalmed, the Greek who burned, or the Celt who buried. It is of no import to the departed whether they be exposed to the birds of the air, or their tombs be covered with immortelles. Let us anticipate mortuary devotion by kindness to the living. Let us put our prospective monuments into generous deeds this side the grave. Let us be so charitable and tender to our fellow-travelers as they halt and bait on this paltry planet to gather strength for their journey through the universe that, meeting them in the immeasurable future, they may remember us not by storied urns or eulogistic epitaphs, but by the gentleness and sympathy and helpfulness we have shown them when little, both in time and action, counted much.

ROSES OF FLORENCE.

I.—BY THE ARNO.

She came in sunlight, merrily calling,
 "Who'll buy my roses? Damsels, who'll buy?
 Open at dawn when the bright dew were falling!
 Who'll buy my roses? Ladies, who'll buy?
 Who'll buy my roses? Florentine roses!
 Born of the breeze and the floweret's reply!
 Subtle the power in their heart that reposes—
 Love-laden roses! Gallants, who'll buy?
 Florentine roses!
 Gallants, who'll buy?"

He came in splendor, haughtily glancing,
 Passing the flower-girl carelessly by;
 Stayed he his courser, so daintily prancing:
 "Bring me the buds, then; none else I'll buy."
 She brought her roses, Florentine roses,
 Holding them up with a smile and a sigh;
 Gave that a ray of the sunlight discloses
 Caught the wild glance of her roving black eye.
 "Florentine roses!"
 Still did she cry.

Glittered the poniard, gaudily sparkling
 Under his belt as the courtier drew near;
 Over the fold of his doublet lay darkling
 One little ruby, red-gleaming and clear.
 He caught the roses—Florentine roses—
 Fast in his gloved hand, reining his steed.
 Cunning the smile on his lip that reposes:
 "Beauty a poniard sometimes must need.
 Florentine roses—
 Lovely indeed!"

Ah! the moon rises! See the girl creeping,
 Furtively, silently, but with no sigh.
 Near the bright Arno, 'neath the dew's weeping,
 Who glides so stealthily, warily nigh?
 "I come to gather Florentine roses;
 Paler they seem 'neath the gleam of the moon.
 Red and white roses, fresh-budding roses,
 Need to be gathered, sweet! deftly and soon!
 Florentine roses
 Perish at noon."

Clinging at parting, softly complaining,
 Why must he ever, oh! ever depart?
 "Scarcely the moonlight seems yet to be waning,
 Lightly may sever the light-beating heart!"
 He said: "Cull roses, Florentine roses;
 Wear in your bosom the poniard I gave;
 Instant the poison its plique incloses,
 He whom it woundeth must sleep in the grave.
 Florentine roses
 Temptingly wave."

"Say you'll return, love, faithfully seeking
 Her who hath given her heart to your care.
 Should you deceive me, to other ties keeping,
 Fear me in sleeping, and waking beware!"
 He laughed: "Oh, roses, Florentine roses,
 Live in the sense as their hue in the eye!
 Kiss me once more o'er the pearl ere it closes
 With your red mouth, love, and, sweetheart, good-by.
 Florentine roses,
 Rita, still cry."

II.—IN SANTA CROCE.

In Santa Croce, Mary imploring—
 Gems on his vesture, gems in her hair—
 Fond lovers came now, lovers adoring:
 Never had knelt there a lovelier pair.
 Filling the silence, "Florentine roses!"
 Suddenly falls on the fond bridegroom's ear;
 No more her soft hand his clasp incloses
 Whom he is vowing for aye to hold dear.
 "Florentine roses!"
 Still doth he hear.

Troubled and startled, fearfully glaring,
 Wildly she looks at the wedded in turn.
 Who in the cortège seems frightened and staring,
 Meeting that frigid eye, cruel and stern?
 Haughtily cries she: "Florentine roses!
 Roses the birth of a kiss and a sigh!
 Who'll buy my roses? Red and white roses!
 Born of the breeze and the floweret's reply!
 Florentine roses!
 Gallants, who'll buy?"

III.—AT THE CASCINE.

They came at noonday, gayly carousing,
 Jeweled and plumed in the sun and the breeze,
 Down the Cascine, echoes arousing,
 Gallants and dames beneath wide-spreading trees.
 "Yon Fioraja's Florentine roses,"
 Murmur the lips of the Milanese bride;
 "Tempt me to see what her basket incloses;
 Summon her hither, love; call her aside."
 "Florentine roses!"
 Still the girl cried.

What grazed your hand then, airily tracing
 On white patrician a plebeian red,
 Haughty Marchese, so loftily gracing
 By your obeisance the words you have said?
 Was there a steel in the Florentine roses?

What could so wound in the touch of a flower?
 Why, they were culled where the Arno reposes,
 Lazily glides by a rose-laden bower!
 Florentine roses—
 Only a flower!

Lofly Vaudini turned him in dying,
 Tossed back the waves of his death-damp'ning hair:
 "Weep not, Carlotta; waste not your sighing;
 Wed with another; you're young, love, and fair.
 Yon Fioraja's Florentine roses,
 Gentles, I warn one and all, ere we part—
 Mortal the venom their fold that incloses;
 Gather no rose with a worm at the heart!
 Florentine roses,
 Poison at heart!"

THE SOUTH SEA ISLANDS.

SCENE IN BANKS ISLANDS.

FEW more absorbing pages will be found in the annals of travel and discovery than those which relate to the distant archipelagoes of the South Pacific. Brilliant in coloring and replete with dramatic incident, they offer exciting visions of wild adventure to the ardent boy and fascinating studies to the grown man. From the first chapter to the last they are packed with stories of the exploits of brave explorers, the conquests of heroes of youthful idolatry, the patient labors of scientists, and the vicissitudes of an advancing civilization. The outrages of the infamous "labor" trade recently brought to light give them a still greater interest from a humanitarian point of view, and it would not be easy to write about them without being entertaining. Comprised in several distinct groups scattered across the wide southern ocean, the islands are populated by diverse races, and in formation and vegetation are also varied. In some the women are perfect nymphs, with soft brown complexions, wavy black tresses, and as delicate forms as sculptor ever imitated in marble. They have musical voices, amiable manners,

and sharp minds; while the men are muscular fellows, of friendly and courageous dispositions. In others the men and women alike are black, dwarfed, ignorant, and ferocious, with beastly customs and manners. The land of one is a fruitful paradise, and of the other a lava bed. But whether intelligent or savage, nearly all the islanders have been blessed with a soil that yields without tillage, and encourages generosity, indolence, and sweetness of temper. Most have submitted to the emollient influence of the missionary, and of those who have not it is only fair to say that they are less inherently cruel than resentful of the wrongs they have suffered for a century at the hands of white traders. Both sides are guilty of atrocities; but robbed, kidnaped, and enslaved, the savage has too often wreaked his vengeance upon the first European he has encountered, without discriminating between enemy and friend. We read of a village inhabited only by widows and orphans, the men having been carried away by slavers, and on the next page of a massacre of whites. From this division of crime obsta-

cles are met with in inflicting punishments, and it is not an easy matter to decide whether the savages have not been incited to their acts in the spirit of retaliation. It will be observed that the consequential problem is not without a resemblance to our own Indian question.

In the interests of science, and in the adjudication of offenses connected with the "labor" trade, the British government has repeatedly sent out expeditions. The steam-frigate *Curaçoa*, Admiral (then Commodore) Sir William Wiseman, sailed from Sydney, Australia, on June 4, 1865, and made a cruise lasting about five months. She lay off Norfolk Island when news arrived of the assassination of President Lincoln. Not only was the influence of the British flag extended during the voyage, but valuable discoveries and collections were made by the competent scientific corps on board. The *Rosario*, Captain Albert Hastings Markham, a wooden sloop of 673 tons, sailed from Sydney on October 19, 1871, with the object of obtaining trustworthy information respecting the numerous murders of British subjects which had recently taken place, and also respecting the alleged kidnaping of natives which was supposed to have been the cause of these crimes. Throughout his voyage Captain Markham acted with wise moderation, and his journals prove that nearly every atrocity committed by the natives was in revenge for outrages committed upon them by slavers. As we pick our way in some good ship over the cobalt blue waters of these sun-lands it will be our fate to hear of deeds done by men of our own language and civilization quite as revolting as the worst rites of cannibalism. Our cruise will embrace the tracks of the *Curaçoa* and the *Rosario*, and in turn we shall make the acquaintance of both the lovely and truculent denizens of the islands.

Passing far to the east of the Society group, we first touch at lonely Niue, which Captain Cook christened Savage Island, in revenge for the inhospitable reception he met with on attempting to land in the year 1774. Since then the island and its inhabitants have changed, and our first impressions of life in the South Sea, which we receive here, are sure to be favorable. But the island is less beautiful and fertile than the land farther north. It is a coral formation, covered with a layer of vegetable earth five or six feet in depth, which grows the cocoa-nut-tree, the guava, the orange, the banana, and the melon. A road thirty-three miles long girds it, and is kept in repair by native con-

FINGASA OR MASSAURE BAY.

victs. A missionary of the London Society, with his wife and children, has been settled here for ten years, and occupies a tastefully built house, divided into three compartments, with a pretty roof of sugar-cane and a veranda. The natives meet the traveler with the greeting, "Alofa," which means love, a word also used in Hawaii. They are stalwart, strongly knit, and handsome, still superior to trowsers, and wear no other dress than an abbreviated skirt made of bark. The women have exquisite teeth, and small soft hands with fine taper fingers. For South Sea Islanders they are exceptionally moral, faithfully complying with stringent marriage laws, and limiting their offenses to occasional violations of the eighth commandment.

We do not stay long at Niue, where the attractions are less than those yet in store for us, but set sail for the Samoan group farther north, where the grandeur of the scenery excites rapturous admiration in every traveler, and fairly introduces us to the wonders of the tropics. The coral walls around these islands; the low stretches of silver sand, fringed with the luxuriant foliage of the cocoa-nut, palm, and banana trees; the wooded mountain slopes, threaded by flashing cascades; the magnificent cloud forms and colors; the yellowish haze in the atmosphere, produce an enchanting effect, which a judicious painter alone might attempt to describe. There are tints and forms, bewildering in their variety, that the eye is unaccustomed to, that wrap us in ecstatic contemplation, and silence us by their majesty. Seaward, a fleet of feathery-looking canoes are curving and darting swiftly among the purple crests of coral, many occupied by supple beauties, who laugh and chatter with unconstrained joyousness; landward, lines of white cottages, with mis-

sion-houses, English and American consulates, and churches prominent among them, give promise of a civilized reception. But we do not need the assurance, as all testimony has proved the Samoans the gayest and kindest of their race. We shall drink kava with them, which intoxicates and sends us in a twenty-four hours' sleep, but does not brutalize and leave us with a headache. We can not avoid flirting, though we consider it very wicked, for the effervescing belles of the island will madly charm us into it; we shall be led into the round of harmless dissipation which is ever turning in Samoa, and when we leave that far-off archipelago it will be with regrets, benedictions, and a cabin full of keepsakes from a dozen of our brown enchantresses. Twice a year there is a sport called polulu-fishing, which engages all the inhabitants, and has been cleverly described by a recent traveler. The polulus resemble worms, and vary in length from two inches to two feet. Baked in banana leaves, seasoned with oil, vinegar, and Cayenne, and eaten on toast, they are said to be very good; but it is the fun of the fishing, and not the value of the spoil, that will attract us. We skim out into the harbor at daylight—polulu-fishing only lasts two days, and we are obliged to be early—and are soon among an excited, babbling, laughing, and singing crowd of natives, who are splashing and dabbling about the coral reefs for the strange fish that are pullulating in the shallow water. At each dip the net is filled with an ugly black mass, which is put into a calabash. This goes on until sunrise, with flirtations, jokings, squeezings, and duckings. You knock against a young lady's canoe, and in retaliation she splashes you with water, and you splash her in return, without danger of spoiling her clothes. Then follows a race homeward, and polulu is served to you in the manner referred to.

Tutuila, with its volcanic peaks, is the first island in the Samoan group seen from the prow as we bear up from Niue. Several officers and men of the expedition commanded by the gallant La Perouse fell here, at Massacre Bay; but the natives are changed and peaceful now. The men tattoo themselves after a fashion which gives them the appearance of being clothed, but neither they nor the women have any covering except a

NATIVE TEACHER, UPOLU.

small skirt fastened around the loins. Their houses are very pretty, with large, dome-shaped roofs. Nearly all the children attend school, and in 1864 the natives contributed \$5000 to the support of foreign missions. Several books have been printed in their language, including a work on geography, a dictionary, and a Bible. Among the residents is an American blacksmith, who has grown rich in making harpoons and fish-hooks, and an American carpenter, who deftly fashions the precious woods of the island into furniture. One tree has been named iron-wood by this worthy on account of its hardness, and is used for tomahawks, spears, and clubs. The public buildings at Pango-Pango, the principal harbor, include a church, a school-house, and a large hall. The total population of the island is 3948 souls, comprising 1293 men, 1191 women, 765 boys, and 699 girls. About eighty are Mormons, thirty Roman Catholics, and the remainder Protestants. Tutuila is from two to five miles in width and seventeen miles in length, and includes forty-three villages, each governed by an independent chief. One hundred and thirty tons of cocoa-nut oil, and a large variety of fruits and vegetables, are produced annually.

The splendid port of Apia, in the island of Upolu, is only distant a day's sail from Tutuila. Many Americans are settled here, and

STONE MONUMENT, TONGATABU.

on the visit of the *Curaçoa* they were celebrating Independence-day with foot-races and other sports, which gave the natives the utmost delight. At Apia fashionable balls and dinners are common occurrences. The traveler and sailor, weary of the oppressive routine of sea life, find in it a glorious change of scene. Society exists on a sound basis. There are plenty of whites to visit, and the native girls are the most animated and handsome in the group. When a chief receives a visitor he at once loads him with presents. A large house, called a fela-tele, is maintained for the reception of travelers, and here, too, the public council meets. The decorum of this assemblage is very parliamentary, the Samoan chief being in bearing and manners a perfect gentleman. It is considered an offense to walk across the circle formed by the chiefs while they are deliberating, and when a white man has insolently done so the only remark made has been, "Never mind the poor white pig; he knows no better." The dress of the chiefs is a graceful robe of native cloth, leaving the neck and shoulders bare; but Malietoa, the head chief, whose authority is recognized by all the islands of the group, Tutuila excepted, disports himself in swallow-tails and trowsers of European cut. The Samoans are indolent and pleasure-loving, working no more than is necessary for the supply of their immediate needs, but the men relieve the old people and women of all drudgery. They even do the cooking, the women only preparing the food. A Roman Catholic bishop is stationed at Apia, and has built an imposing church of stone there. The strong hold the religious instructors have obtained upon the natives is shown by the scrupulous respect for Sunday. Devoutness is said to seem incarnate in the native teachers. The population of

the whole Samoan group is estimated at 40,000 souls, and of Upolu at 15,000 souls. In 1869, 13,472 tons of shipping were entered and cleared at Samoan ports, 5402 tons being British, 3690 American, 3230 German, and 1150 Tahitian. Two years later this grand total had increased nearly fifty per cent. Among the trees and plants indigenous to the island are the banana, the mountain plantain, the bread-fruit, the Brazilian plum, the

cocoa-nut, and the yam and taro. The products include bêche de mer, cocoa-nut oil and fibre, arrowroot, and cotton. The exports of the latter are valued at \$200,000 annually. The average temperature of the islands is 82° Fahrenheit. Sudden rain-storms of great severity are frequent, but you do not suffer if you have forgotten an umbrella, as one of the broad banana leaves, to be picked up any where, will amply protect you.

On the coast of Vavau, an island of the Tonga group, are some curious caves, which deserve a visit. One has a spacious opening above water; but that in which we might

QUEEN OF TONGA.

KING GEORGE OF TONGA.

be expected to be most interested has a tantalizing submarine entrance only to be passed by expert divers. Two sticks mark the entrance; above which is an overhanging cliff, and you must be courageous and long-winded if you decide to explore. After jumping overboard from the canoe, two natives take you by the hand, and direct you to the entrance, the roof of which is bristling with sharp projections. Several times you bob up against them, receiving slight wounds, but at last you rise to the surface of the water in the cavern. Had the natives been alone, they would have dived to the entrance, and then, turning on their backs, used their hands to keep away from the roof. The phosphorescent light caused by the movement of the water is very brilliant, and the roof and walls are indescribably grand in form and color;

but a person of ordinary respiratory powers returns from the expedition in an exhausted and almost dangerous condition. The cave is said to be accurately described in Byron's poem entitled *The Island*, and a pretty native legend attaches to it. The Tonga, Hapai, and Vavau groups are included under the general name of the Friendly Islands, and are governed constitutionally by King George of Tongatabu. This monarch is a civilized gentleman, about sixty-five years of age, and in his youth was a distinguished warrior. His palace is a primitive but very neat structure, divided into three compartments by coconut leaves, and furnished with sofas, tables, and chairs of German manufacture. His private secretary is an Englishman, who writes shorthand, and his wife is a portly lady, as well bred as her husband. At a banquet given on board the *Curaçoa* King George appeared in a handsome military dress; his deportment was grave, and though he enjoyed the wines, he drank only moderately. Another banquet was given by him at his palace to the officers of

the ship, and several courses were in European style, accompanied by Champagne and English bottled beer. The regal island is thirty-six miles in length and eight miles in width, an excellent road passing through it, and branching to several villages. There still exists a peculiar stone monument consisting of two perpendicular rectangular blocks

KING GEORGE'S HOUSE, TONGATABU.

POOLS AT THE WATER-FALL OF WAITOBA.

of stone, across which is a large slab holding an immense bowl, supposed to have been used in ancient kava ceremonies. The total population of Tongatabu is nearly 9000 souls, and the commercial products include 100 tons of cocoa-nut oil, arrowroot, tapioca, cotton, and coffee. The natives are Malayans, robust, and of light complexion. With such

an exemplary chief as King George, they are naturally well-behaved, and were the first of the South Sea Islanders to recognize the Christian church, although cannibalism was formerly practiced by them. All know how to read, but not one has learned the handicrafts of the American and English artisans settled in the country.

All the water in the ocean would not wash out the

blood that has saturated the Feejee Islands. This inviting statement is often made by the natives themselves; but cannibalism and its rites are passing away. As we enter Levuka, the port of Ovalau, the prospect is calmly beautiful, and very different from what might be expected in a land so dark in its traditions. About the entrance to the har-

LEVUKA.

bor are many small islands of strange forms, some barren and some fertile, some flat and some attaining an elevation of 2000 feet. The coast of Levuka itself is very romantic; the high lands are rich in outline and deeply wooded, and at their base strips of white villages shine out in the noonday flood. A coral reef incloses the harbor, and within its bounds the water is of a bright blue color, and as smooth as a sheet of polished glass. Not far from the settlement there is a succession of waterfalls among the hills, each terminating in a deep pool. It is a favorite pastime of the natives to plunge from one pool to another, until a descent of several hundred feet is thus made by water. The men and women at pretty Levuka are exceedingly ugly and avaricious, and demand exorbitant prices for every thing they have to sell. This trait is common throughout the groups, the islanders being so lazy that they overvalue every little exertion. The reader is now to be introduced to a famous old cannibal, who has certainly renounced the flesh, and also, the missionaries would have us believe, the world and the devil. King Thakumbau of Mbau committed murders without number once upon a time, and was celebrated for his ferocity; but we now find him a dignified old gentleman, with whom it is safe to abide any length of time. His appearance has always been prepossessing, his wickedness notwithstanding, and you search his face in vain for indications of a savage temperament. He is benign and cheerful, in stature imposing and nobly proportioned. His majesty's subjects are stunted and ill-favored, however. At the foot of a pleasant knoll, near the mission-house in the port Mbau, is the old dancing-ground, where, with frightful orgies, thousands of victims have been sacrificed. Akautabu, or the tree of forbidden fruit, overshadows the site, and from its branches certain parts of the bodies of men and women in times past depended. Near by there is a row of upright slabs, resembling grave-stones, used for braining. The victim was seized by two powerful natives, who grasped an arm and a leg at each side, and ran with him across the dancing-ground,

KING THAKUMBAU AND SON.

dashing his head against the stone with such violence as to split it open. The edge of one stone has been worn smooth from this usage, and all verdure has been obliterated from the ground by the numberless feet that have madly danced upon it. In a double row of raised seats on the hillock the chiefs sat and applauded the ceremonies. Old King Thakumbau on one occasion cut out the tongue of a captive who begged for a speedy death, and ate it before his face. Another favorite crime of his was the braining of children. The origin of cannibalism is uncertain, and several travelers ascribe a religious significance to it. It is an act of supreme revenge, and one man, wishing to express the utmost wrath, says to another, "I will eat you." The chiefs are obliged to avenge an insult offered to their nation by eating the perpetrators. The reason given for attaching the ceremonies to religion is, that all the implements are used for this one purpose only, and that the natives are reluctant to allow strangers to handle them. Cannibalism, it is believed, will soon be extinct in all parts of Feejee, and the missionaries and consuls find its suppression all the more easy from the fact that many of the natives disapprove of it. The common people have never been permitted to participate in it, and the chiefs have had an unenviable monopoly of the revolting practice. Contradictory statements are made about the moral characteristics of the Feejee-

ans, and it would appear that they are not deficient in courage, although it is hardly credible that they are naturally hospitable and humane, in view of the deeds done by Thakumbau in his savage state. Many of their proverbs decry cowardice. One runs,

"Oh, what a vallant man you are,
Who beat your wife, but dare not go to war!"

And in answer to the questions, "Where is the coward?" and "Where is the brave man?" are answered, "The coward is talking of his deeds in the town," and "The brave man is being dragged to the oven."

Moalo, Matakau, and Vanua-Levu, three islands in the Feejee group, belong to the Tongans, and are populated by a mixed race, superior in intelligence and customs to the pure Feejeeans. The entire group, situated nearly half-way between Australia and Tahiti, is exceedingly fertile, and man may live there with as little labor as any where in the world. The largest island of the group is Viti-Levu, the area of which is about 3750 square miles, and the next largest Vanua-Levu, with an area of 3000 square miles. The population is about 150,000 souls, including many white settlers, who are engaged in the production of cotton, tobacco, and coffee, among other things. Vegetation is wonderfully rapid. Turnips, radishes, and mustard appear above-ground twenty-four hours after being sown; and melons, cucumbers, and pumpkins in three days. In 1864 the value of exports was \$100,000, and was then increasing at the rate of at least thirty per cent. The cultivation of cotton is one of the principal concerns of both natives and settlers. The variety known as "sea-island" flourishes luxuriantly, and the grower is enabled to compete successfully in European markets. Sheep-farming and sugar raising have also been tried profitably. The supply of cocoa-nut oil and fibre is abundant, and the coffee-tree, introduced from Tonga, yields well. Land is purchasable at low figures; the climate allows a European to work out-of-doors the year round, the hottest months

being January and February, when the thermometer occasionally registers 100° Fahrenheit, and life and property are secure. The incurably idle natives find all their wants supplied by the bread-fruit-tree, the wild yams, beans, arrowroot, and the fruit of the mangrove; but labor is said to be plentiful. The importation of the people of other islands to the Feejee group for labor on the cotton plantations, under legal contracts or as slaves, forms a chapter to which reference will be made anon.

The New Hebrides and Solomon groups were discovered by Spanish and Portuguese navigators over three hundred years ago, and bright as is their history in parts with the scintillations of brave actions, it is not without the stains of many an outrage almost too black for belief. The natives are woolly-haired, short, and ugly; they belong to the Melanesian or Papuan race—vastly inferior in moral and physical attributes to the Polynesian, and accused of perfidy, dishonesty, and cowardice. Missionaries, sailors, and travelers without number have died with the poisoned arrows of the natives in their hearts. Sickening stories of cruelty are told, but the blacks have not been the only offenders. For generation after generation they have been audaciously cheated and maltreated in a variety of ways, with tireless and diabolical ingenuity; and however easy the task of conciliation might have been in the first place, an exacting animosity has grown with years, and has sought and found white victims. The earliest attempt to "conciliate" them was that of the playful old Spaniard, who, under the impression that if he honored the chiefs by making them look like himself he would succeed, forcibly seized one of their number, put him in irons, shaved his head, and dressed him in a wig, hat, and lace doublet. This was one of the gentlest measures of conciliation ever adopted; others recall the atrocities of the African slave-trade. The cotton fields in Feejee and in Queensland have created a demand for black labor, which has been supplied from the New Hebrides and the Solomon

islands, and an act "to regulate and control the introduction and treatment of Polynesian laborers" was passed in March, 1868, by the colonial Parliament. Its provisions would appear well-considered and thorough. It is stipulated that every native taken must understand and consent to the contract, and be

NATIVE HOUSE, VITI.

clothed, victualed, and paid. But before its passage the natives were kidnaped, and its effect alone has not abated the abuses. The class of men who enter into the "labor" trade are neither reputable nor responsible, as a rule; the bonds they give to the colonial secretary for good behavior

are usually worthless, and in practice the law itself is inadequate. Several times the captains and owners of slave-ships have been brought before the courts at Sydney, and abundant testimony has been produced to show their infamous dealings, but they have been acquitted, and their captors condemned in heavy damages. One reason for this is that the act has no effect whatever when the natives are landed at places outside of Queensland; and a better and more comprehensive law was passed by the home government in June, 1872, providing for the punishment of all British subjects who engaged in the traffic illegally. Several war vessels of the Royal Navy are now in commission for the prevention of outrages, but it has been well said that "until the islanders are raised in the scale of intelligence, and either better understand our language or we theirs, it is in the highest degree doubtful whether the labor trade, however regulated and watched, can ever be carried on without an admixture of deceit, fraud, and oppression sufficient to condemn the system absolutely."

That the natives are rarely consenting parties to the contract, and do not view the traffic favorably, is clearly proved by their shyness of all vessels entering their harbors until it is discovered whether or not they have come for labor. Since the traffic began they have been induced to emigrate by false statements in some cases, and in others they have been violently carried away. On November 17, 1871, H.M.S. *Rosario*, while cruising off the island of Api, in the New Hebrides group, sighted a brig under close-reefed top-sails on her weather quarter. In answer to the signal, "heave to," the stranger hoisted the British ensign, and continued on her way. The *Rosario* then fired a gun, which had the desired effect. The fugitive proved to be the *Carl*, of Melbourne, bound for Feejee with seventy natives. A careful investigation was made of the ship and her papers, but they appeared formal and correct, and she was allowed to proceed. One of her owners, Dr. James Patrick Murray, who was on board at the time, gave

HAT ISLAND, ENTRANCE TO HAVANNAH HARBOR.

Queen's evidence, when the vessel was subsequently seized, describing deeds almost without a parallel for wickedness. After leaving Melbourne the ship went to Palmer Island, in the New Hebrides, and failed to get labor legitimately, as was desired. One of the crew was then disguised as a missionary—a ruse often practiced by slavers—and sent ashore to allure natives to the vessel; but he also failed, and the *Carl* moved to other islands. Here, as the natives swarmed about the vessel, pig-iron was dropped from the deck into their canoes, and the poor fellows were fished out of the water, made insensible from a blow on the head, hauled on board, and cast into the hold. Eighty men were collected in this manner, and as the ship went to sea they attacked the main hatchway. The crew then began to fire on them, and did so incessantly for eight consecutive hours, Murray singing, as he loaded and reloaded his musket, *Marching through Georgia*. When the natives were quiet, they were invited to appear on deck. Fifty were dead, and all the others were wounded. Sixteen of them, whose wounds were considered bad, were immediately thrown overboard; the ship was carefully whitewashed, her papers were revised, and when the *Rosario* met her she appeared in legal order. Murray escaped punishment, and the sentence of death pronounced on two others of the crew was commuted. The natives place a high value on the heads of their enemies as trophies, and some chiefs were persuaded to contract to supply slavers with laborers in return for an equal number of heads. Canoes were decoyed out and upset, and as each unfortunate native was fished up, his head was cut off over the gunwale of the boat. The islanders punish the tribe of the offending individual, and such noble men as Bishop Patteson and John Williams, happening to visit an island after the committal of an outrage, have been inconsiderately slain in revenge.

In scenery and productiveness the New Hebrides group is fully equal to the islands we have already visited. Anuatom is the southernmost, and Espiritu Santo the farthest north. Many of the islets are very

TINAKORO.

singular in conformation. At the entrance to Havannah Harbor, in the Sandwich Island, or Vate, a rocky patch resembles a low-crowned hat, and the helmsman must be careful in sailing around its brim. The people are exceedingly fond of human flesh, and often violate the graves of the dead. They adore two divinities as the creators of all things, and attribute diseases and death to sorcerers. Some native missionaries from Samoa have converted many to Christianity, but the majority are immoral barbarians. They are fast dying out, and indeed scarcely one of the islands in the South Sea is increasing in population. If a cause is sought, it is found in the diseases and bad habits introduced by white men. Instances have been known where traders have intentionally brought epidemics for the purpose of killing the natives. In a few years the population of Annatom was reduced from 12,000 to 3500; and at some islands the natives greet every ship that arrives with wild oaths taught to them by English sailors. At Tanna and Erromango the islanders have been the readiest to avenge their injuries, and their shores are red with the traces of massacres. Punishment, when due, has been leniently meted out by the British government, with the main object of teaching the natives that they must not take the law into their own hands. The *Rosario* visited Nukapa, the island in the Swallow group where Bishop Patteson was murdered in November, 1871. An effort was made to establish friendly relations with the natives, and they waved green branches as a sign of good-will. But as soon as one of the ship's boats was near the shore a shower of arrows was treacherously

fired at the crew. Commander Markham decided that if he left the island without landing, the natives would think that they had frightened away a man-of-war, and that their hostility would be thus encouraged. He therefore fired six rounds of shot and shell into the village, and once more attempted to communicate with the natives, again without success. He then landed and set fire to the houses and surrounding brush. It was twilight when the *Rosario* again stood out to sea, and the flames arising from the inhospitable

island were visible long after dark. Treachery is unquestionably a characteristic of the Papuan race. At Aurora, a mountainous island in the New Hebrides, the crew of the *Rosario* were invited to land by the natives, and when they did so were mercilessly attacked from behind. The savages escaped in the brush, but their houses and canoes were destroyed, Commander Markham confessing in his account of the voyage that he did not inflict more serious punishment because the attack might have been made in requital for the previous kidnaping of some of the tribe.

Each island in our cruise seems more enchanting than that which came before it; and if you were asked to name the one most beautiful, you would be as bewildered as a child in a toy-shop when he has to select a single article from the hundreds that all seem especially desirable to him. You approach one through a net-work of tiny islets and reefs, clothed with wild grass, crimson and orange flowers, and ferns; and an active volcano, spouting an incandescent stream into the sea, guards the gateway of another. In all there is a wanton profusion of fruit and leaves and colors, which arrest our admiration at the portals, and hold it until a superior force carries it off. Aurora, with its fine outlines and deeply wooded highlands, surpasses in our memory until we reach the Banks Islands, when we incontinently award the palm to them. The in-

MOTA, OR SUGAR-LOAF ISLAND.

terior landscapes of this group have a trim, cultivated appearance, and the coast is varied by cliff, hill, and marsh. The islands are seven in number, Vannua-Lava being the largest, and all are mountainous. A high cone that rises from the table-land of one has afforded it the name of Sugar-Loaf.

The natives go about unarmed, and, unless their nudity shocks us, they are inoffensive. A commodious club-house is maintained at public expense for the reception of strangers. There is no government, and the head of each family is the autocrat of his own household. The population of Vannua-Lava does not exceed 800 souls, while on Sugar-Loaf Island, which is much smaller, there are about 10,000. The soil is marvelously fertile, but, owing to the marshes which line part of the coast, the climate is damp and unhealthy. The natives are troubled with chills, and shiver miserably in wet weather, without ever thinking of covering themselves with a garment. As we pass into the higher latitudes of the Solomon group we see the volcano of Tinakoro isolated in the sea, and emitting clouds of black smoke. Passing ships, when some distance from the volcano, often experience vibrations, caused by its action on the bed of the ocean.

The Solomon and Santa Cruz groups are almost the only islands in the South Sea where the natives decorate themselves. In Samoa the women make very pretty necklaces and head-dresses from flowers; but neither they nor their husbands devote any time to the design and manufacture of less simple articles of personal adornment. At Ulaka, one of the Solomon Islands, the natives ornament their arms, legs, fingers, necks, and noses, often with the best of taste, and keep a large stock of trinkets on hand for sale. The ingenuity and variety of the materials and designs are astonishing. Rings of tor-

TWO TREE ISLAND.

toise-shell are inserted in the cartilage of their nostrils; bands of white shells are worn across the forehead to protect the eyes, and similar bands, sometimes made out of human or sharks' teeth, around the neck. Shells of every color, plaited cocoa-nut fibre, seeds, dyed grass and leaves, the feathers of birds, and coral are wrought into novel and occasionally artistic patterns. Some necklaces are made out of pieces of boars' tusks, set with the tortoise-shell figures of birds, and others of black rings made from seeds, and varied with white and red shell-work. Ornaments are also made for the waist and the knee. The workmanship is of the most skillful and patient kind, and a high price is put upon it. We have no information of the agricultural development of the island, which is of coral formation; but the natives appear to give all their time to the manufacture of these ornaments. They are puny in stature, and excitable in disposition. Their teeth are black from chewing the betel-nut. When they are assured that strangers have not come for labor, they are inclined to be friendly, although they are reputed to be faithless and malicious. The largest island of this group is San Christoval, which is hilly and well wooded. The inhabitants are keen hunters and capital traveling companions. Their sight is remarkably good, and they discover birds hidden in the trees which other persons might look for in vain. They are cannibals, and preserve the bones of their victims in a public place. Twenty or thirty human skulls may be seen dangling at one time from the roof of a canoe-

house, and near by are several human jaws, from which the teeth have been torn for use in trinkets. Some queer customers reside at San Christoval. The king shows to all white visitors a certificate, written in English, that he is "an old bore" and "an old knave," and that "the

ASS'S EARS, FLORIDA ISLAND.

PORT DE FRANCE, FROM SIGNAL HILL.

less you have to do with him the better." A very black negro resident states to visitors that there is "only one other white man living on shore besides himself." The other white man is a Yankee, who belonged to a whale ship, wrecked on Indispensable Reef.

The approaches to Florida Island, in the same group, are marked by two curious products of nature's fantastic moods—one a rock shaped like the hull of a ship, with two trees growing in the position of masts, and the other two oblique peaks, which rise from the waters in the form of an ass's ears.

Life is three-quarters civilized at Port de France, in New Caledonia, and has a wicked flavor of the poorer boulevards. There are cafés and gayety, wine shops and casinos, gens-d'armes and dancing girls, abject misery and thrills of military glory. The harbor is a rendezvous for shipping, and at all times several vessels are in port to supply the inhabitants with new faces and gossip from the old hemisphere. There is a Government-house, a battery, a telegraph, an Imperial Hotel, and a governor's wife—a witty, sparkling little body, who gives soirées, balls, and receptions. The situation is picturesque, the streets are straggling, and the houses poorly built. Great changes have no doubt been witnessed since the large accession of Communists, and the partly extinguished flickerings of those vandal firebrands must have given a lurid aspect to the little penal town. How many conspirators must be waiting there for news from France, confident of a reversion of fate and ultimate liberation! Each turn of the fortune-wheel of home politics must be watched with intense eagerness, and how easy it is to imagine sinister dark groups filling dark corners of remote wine shops to discuss in fearful undertones their chances of the future! We can not hope that they will ever work their

problem out with the spade and plow, as did the Pitcairn Islanders. And alas for their *liberté, fraternité, and égalité!*

New Caledonia is one of the largest islands in the South Sea, being about 150 miles long. The land is sterile, but the natives take pains in its cultivation, and irrigate it with a fair degree of science. It is believed that a more advanced civilization once existed here, as remains of

ancient aqueducts, paved roads, and fortifications have been found. The natives are cannibals, and subjugate their women to a lower level than their own. It is said to be impossible to satisfy their appetite for human flesh, which is a staple article of their food. They have no intoxicating drinks, but consume great quantities of salt-water. The women and priests are obliged to go to battle, the former keeping in the rear, and rushing forward when an enemy falls to obtain the body for the oven, while the latter sit at a safe distance calling on the gods for victory.

The statements which have been made against missionaries in the South Sea Islands are not wholly baseless. But the sweeping condemnation that robust voyagers have expressed in the consciousness of their own superiority is undeserved and uncalled for. The achievements of the missionaries outnumber the failures a hundred-fold; and wherever the natives have been improved, it certainly has not been by travelers, sailors, or traders. Credit for the partial extinction of cannibalism, and the inculcation of habits of morality, sobriety, and industry, belongs entirely to the missions and missionaries.

SEA-GOING WAR CANOE.

SONG OF THE FLAIL.

By J. T. TROWBRIDGE.

"AS HE SWINGS THE SOUNDING FLAIL."

IN the autumn, when the hollows
 All are filled with flying leaves,
 And the colonies of swallows
 Quit the quaintly stuccoed eaves,
 And a silver mantle glistens
 Over all the misty vale,
 Sits the little wife and listens
 To the beating of the flail,
 To the pounding of the flail—
 By her cradle sits and listens
 To the flapping of the flail.

The bright summer days are over,
 And her eye no longer sees
 The red bloom upon the clover,
 The deep green upon the trees;
 Hushed the songs of finch and robin,
 With the whistle of the quail;
 But she hears the mellow throbbing
 Of the thunder of the flail,
 The low thunder of the flail—
 Through the amber air the throbbing
 And reverberating flail.

In the barn the stout young thresher
 Stooping stands with rolled-up sleeves,
 Beating out his golden treasure
 From the ripped and rustling sheaves :
 Oh, was ever knight in armor—
 Warrior all in shining mail—
 Half so handsome as her farmer
 As he plies the flying flail,
 As he wields the flashing flail?—
 The bare-throated, brown young farmer,
 As he swings the sounding flail?

All the hopes that saw the sowing,
 All the sweet desire of gain,
 All the joy that watched the growing
 And the yellowing of the grain,
 And the love that went to woo her,
 And the faith that shall not fail—
 All are speaking softly to her
 In the pulses of the flail,
 Of the palpitating flail—
 Past and Future whisper to her
 In the music of the flail.

In its crib their babe is sleeping,
 And the sunshine from the door
 All the afternoon is creeping
 Slowly round upon the floor;
 And the shadows soon will darken,
 And the daylight soon must pale,
 When the wife no more shall hearken
 To the tramping of the flail,
 To the dancing of the flail—
 When her heart no more shall hearken
 To the footfall of the flail.

And the babe shall grow and strengthen,
 Be a maiden, be a wife,
 While the moving shadows lengthen
 Round the dial of their life:
 Theirs the trust of friend and neighbor,

And an age serene and hale,
 When machines shall do the labor
 Of the strong arm and the flail,
 Of the stout heart and the flail—
 Great machines perform the labor
 Of the good old-fashioned flail.

But when, blessed among women,
 And when, honored among men,
 They look round them, can the brimming
 Of their utmost wishes then
 Give them happiness completer?
 And can ease and wealth avail
 To make any music sweeter
 Than the pounding of the flail?
 Oh, the sounding of the flail!
 Never music can be sweeter
 Than the beating of the flail!

"PAST AND FUTURE WHISPER TO HER
 IN THE MUSIC OF THE FLAIL."

RAPE OF THE GAMP.

CHAPTER I.

BOATS AND TEA-CUPS.

THE scene upon which our story opens is a calm, sun-lit reach of the pretty river Peddle, scarcely a mile above the ancient borough of Pedlington. On one side a wood of beech, alder, and willows slopes downward to the water's edge; on the other a few golden blossoms of the water-lily float dreamily beside a glistening rampart of rushes and arrow-headed reeds.

Two fair girls are making a preposterous attempt to propel a large pleasure-boat in the direction of the town. First one poises her light oar slowly on the rowlock, depressing the handle and elevating the blade, as if she were Ida Lewis or Grace Darling rowing in a heavy sea. Then down drops the blade into the smooth water, ever so deep, and up comes the handle to the young lady's forehead. At this inconvenient elevation she gives it a spasmodic twitch (if such a word there be; if not, *tant pis pour les mots*).

No other word will express it). Out into the unresisting air flies the blade, with a great shower of spray, and back the damsel falls, with a pretty cry, between a laugh and a scream. Then this movement is fatuously imitated by the other nymph; but the boat, insensate and unimpressionable, probably on account of its lymphatic antecedents, declines to accelerate its pace. In short, it is stationary, or perversely gyratory. But a fair youth, in charge of the steering apparatus, urges his blushing crew to renewed efforts in idiomatic English.

"Now, then, Janet!" the premature cynic cries; "flop yours in when Nelly's comes out. Bravo, Nelly! Do it again. You'll get there long before Janet. Jump out directly you get to the boat-house, and run home and tell them we're coming. Neyer say die, Janet! If Nelly *does* win the silver oar, you can pay for it, you know."

And so on, just as the fancy takes him. But to understand the latter morsel of encouragement administered to the elder of the

THE ROWING LESSON.

two girls we want to be behind the scenes, and to know that Janet and her elder sister Blanche (now Mrs. George Baily, Jun.) are heiresses. An eccentric old bachelor, their godfather, had summarily disinherited his nephew before quitting this unsatisfactory world, and had bequeathed the bulk of his fortune to his "dear godchildren, Blanche and Janet, second and third daughters of Walter Browne, Esq., solicitor, of Pedlington."

Still there the boat is, stationary, or per-versely gyratory. And there the two young ladies are, one rich, the other poor; both

passing merry, and persisting in their ludicrous attempt.

In the reach above, a pair of long blue-bladed oars are flashing in the sunlight. A keen outrigger boat is coming swiftly down the stream, when the gentleman plying the foremost oar (let us call him "Bow" for the moment) sings out,

"Ea-sy, Bedford! easy, my boy!"

And they both leave off rowing.

"My boy" is a man of Titanic proportions, muscular, bare-armed, bare-headed, with dense auburn locks clustering low down on his forehead and behind his ears.

The boat is gliding along too swiftly with its former impetus. Again Bow (a dark, active, wiry looking gentleman) assumes the command, this time in a lower tone of voice.

"Back water!" he says. "We should spoil their frolic."

His friend also hears the merry laughter of the girls, and obeys at once, so that the boat is stopped, and a bend of the river keeps it out of sight of the boat below.

"Merrily, merrily carol the gales," says Bow, quoting the Laureate. "What sweet, ringing laughter!" Then a shade of sadness comes over his face, which is bright and beaming with intellectual and moral energy, though dark and darkly bearded.

The shade of sadness seems to be in the air, for it falls also upon the face of the gentleman called Bedford, although his back is turned to his friend, in accordance with aquatic propriety. This man leans his dark red curly beard on the handle of his oar and listens moodily. Something more than a shade of sadness, something indescribable, which looks like a spasm of actual pain, flits across his bronzed face, leaving it motionless, colorless, statueque.

Presently he rouses himself, and says, "Phelps, you really must leave off calling me Bedford. I feel, every time you say it, as if that other dreadful word were coming out. You must remember that I have been 'Mr. Lane' for eight or nine years now, in English lips; and until you came to Göttingen the other day I had never heard myself called Bedford since—since—"

But Mr. Lane got no further. At that little word "since" he seemed to encounter an insurmountable barrier, and fairly broke down.

"I will tutor myself into calling you 'Mr. Lane,'" said his friend. "But as yet, whenever I try, *vox faucibus hæsit*. It goes against the grain."

"But we discussed the subject, and you promised," said Mr. Lane.

"You mean," the other amended—"you mean that you proved to be intractable, and I yielded rather than forego your companionship."

"One more boon," Mr. Lane said, presently, as they still rested upon their oars. And it might have been noticed that supplianee and dictation were strangely blended in the tone of his voice and the manner of his speech, as though he were so accustomed to command that he found it difficult to sue, and as though he were at once ashamed of his purpose and resolute to achieve it.

"Well?"

"I want you to treat me merely as a colleague, and not to speak openly about our old alliance."

"Well, yes," Bow assented, with less alacrity than resignation. "Yes, I certainly never made *Mr. Lane's* acquaintance till I

ascended that crazy turret of yours in Göttingen."

As he spoke a faint breeze ruffled the surface of the stream, and then died away, leaving for a few moments an almost audible stillness, out of the very heart of which there presently broke a livid blaze of lightning and a great crash of thunder. The sky was now overcast. Again the preternatural stillness reigned for a few seconds; then large drops of rain fell rapidly, and the whole surface of the water became a tumultuous crowd of bubbles, bursting as soon as formed.

"Are you ready? Row on," cries Mr. Lane, impetuously, catching the turbid water with his eager blade. His companion is no less alert; and in a few seconds the light pair-oar overhauls the lumbering pleasure-boat, and Mr. Lane, extricating a huge umbrella (or rather *umbra*) from under his thwart, hands it to the two young ladies, who are just settling in the stern seat while their brother prepares to row.

A confused interchange of polite words passes between the two boats. Then the pair-oar glides swiftly and noiselessly away in the world of waters.

Rain falls like a cascade, and beats upon the big *umbra* with the sound of rolling drums.

"What a nice, large, funny old gingham umbrella!" shrills Nelly, resting the butt end of the stout yellow stick on the seat between her and Janet, and grasping it midway with both hands, so as to shelter her sister as well as herself.

Janet, pursing up her little mouth, sits mum, looking out into the rain and upon the river with vacant blue eyes.

Nelly, utterly regardless of her silent humor, rattled on gayly: "They must be the Siamese Twins, or the Corsican Brothers, at least. Did I ever see any thing so like!"

Her little joke consisted in the fact that the two gentlemen who had so gallantly come to the rescue were singularly unlike each other, one being dark and slender, the other ruddy and massive.

Still gazing out abstractedly into the falling and mingling waters, Janet answered, with some asperity,

"Nelly, don't be *redic'lous*!"

"Yes, I shall," squeaked Nelly, nodding her head, and protruding the tip of her tongue from her pert little lips. "I *shall* be as ridiculous as I like. And how do you spell '*redic'lous*,' pray? I never saw two such ogres. Did you, Berty? The Wandering Jew in front (if there can be any front and any back to such a spider of a boat)—the Wandering Jew, I say, did condescend to grin through his bristles. And I noticed that his beard was all on one side, too. I don't believe he has half as many bristles on one side as on the other. But as for the hero of this" (tapping the great yellow stick

of the *umbra*), "did I ever see such a ferocious creature! Oh, if I were *his* wife, *shouldn't* I be glad to hear Hop-o'-my-thumb say, 'Ogress, Ogre can not come!'"

At this point Nelly broke out into peals of laughter. Had the elements been propitious, and gallants promenading the grassy margin of the river Peddle, one might have fancied she wished to captivate some swain by the glancing of her eyes and teeth, and the sweet coming and going of her dimples. But the only swain in sight was Hubert, her younger brother, and when did a younger brother experience raptures about a sister's charms? Without bestowing any attention upon her, he devoted his whole mind and body to his task.

Seeing Bertie thus patiently toiling at his oars, and taking no part in the unseemly merriment, Janet relaxed a little.

"Who is he, dear?" she cried.

"Which?" he asked.

"Whichever you like," interposed Nelly. "It's all the same."

"I wish you'd be quiet, Nelly," retorted her sister, "and let me ask a question." Then, raising her voice, "I mean the gentleman who lent us the umbrella, dear."

Hubert left off rowing for a minute, and putting his wet hand to windward of his watery mouth, shouted, in a preternatural bass, "Carrotty one, the Marquis of Westminster; him rowing bow, Baron Rothschild. On a visit at Pool Park!"

As the babble of a stream and the whispering of aspen leaves fall mute in the roar of thunder, so the squeaking of Nelly and the prattle of Janet were hushed by this tremendous lie.

Hubert, rowing on triumphantly, and chuckling at their credulity, conveyed them through the squadron of small river craft which floats on the broad expanse of water at the foot of Pedlington Cliff, thence accompanied them home afoot, and, taking the *umbra* at the door, said to Janet, "It's saved your black silk. What message shall I give the marquis?"

But Janet, spying in the future a cloud of chaff, bounced into the house and up stairs disdainfully, with a great rustling of silken skirts. Nelly, waxing incredulous, turned on the threshold. "Hubert," she said, "you're not going all the way to Pool Park with that horrid old green thing!"

"Ain't I?" replied Hopeful; "and I sha'n't faint if the baron tips me a fiver, or the marquis invites me to Westminster Palace."

His audacity had carried him too far.

"Westminster Palace, indeed!" cried Nelly, on the door-mat. "Why, you poor silly boy, you *don't* think any body lives in Westminster Palace!"

Hubert, being fair-haired, fair-skinned, and *ingenui vultus*, turned and walked rapidly away to hide a blush. Taking the *um-*

bra back to the boat-house, he discovered the address of its owner, and carried it home. But Nelly scampered up stairs after Janet, whom she found, with bonnet and mantle cast aside, sitting on the bed, disconsolate.

Shutting the door, Nelly leaned her back against it, shaking herself and it with shrill laughter, and nothing dismayed by Janet's expression of countenance, which became more and more cross while that young lady reluctantly listened.

"When is she going to leave off cackling?" thought Janet to herself, tearing a kid glove to pieces on her lap.

But Nelly had her laugh out, took off her bonnet, and knelt down in front of Janet, making a little grimace of mock penitence. Thus partially mollified, Janet stroked her sister's soft brown hair affectionately.

"Who is the baron, do you think?" Nelly asked, staring into Janet's eyes.

"I do' know," was the pettish answer.

"Why, the Baron von Habenicht, a poor creature like me, who uses a cotton umbrella because it's cheaper than silk."

This was a touching appeal, because, while Janet was an heiress in a small way, poor Nelly was dependent on their father.

"If you want to know more, dear," she continued, "I believe I have seen him before, only with his coat and hat on; and I think he is the new head-master of the Grammar School."

"But the other one lent us the umbrella," said Janet.

"Oh yes," Nelly rejoined. "My lord marquis, with a rent-roll of nothing a year, and all his tenants in arrears. I shouldn't wonder if he turned out to be Dr. Phelps's friend and second master, Mr. Lane."

"I thought papa said *he* was a German?" suggested Janet.

"No, dear, an Englishman, who has been a professor of something, perhaps of the science of rowing spider boats, at a German university."

Nelly was right in both the conjectures, except as to the subject of Mr. Lane's profession, and in supposing he had actually attained to the professorial chair.

Now, although Janet kissed Nelly, and stroked and patted her head, yet there was a dreamy languor in her large blue eyes, and the corners of her little mouth were resolutely pulled down, spoiling the tiny Cupid's bow; so Nelly understood that her humor was solitary and uncommunicative, and departed to her own room.

Then Janet locked the door after her, kicked off a diminutive pair of boots, took out her hair-pins, shook her head, and a dense shower of amber tresses came waving and streaming down over breast and back and shoulders. So she sat down before her mirror, silent, shrouded, and impenetrable—a mystery to herself, to her family, and to all

who knew her—rich, discontented, pampered, teased, flattered, peculiar Janet Browne.

Yet she can laugh and enjoy laughter; and at such times she likes to be in company, and in company likes funny people who know how to amuse her, but seldom goes beyond liking them; for Janet is not "gushing." Nor is she a flirt. If any combination of malign influences should hereafter make a flirt of her, she will be a dangerous one. Not sparkling on the surface with smiles and flattery, that exquisite delight which a woman can so easily confer upon a man, not defiant of conventionalities, nor given to those pretty imprudences which make a beautiful woman hated by her own sex and adored by men; but a flirt of the silent, prudent, watchful order—an enemy who seldom fires a gun, and never wastes powder. But why should we anticipate such formidable prowess for one who as yet has never fired a shot into the ranks of her admirers? Two or three rash young men have stolen a glance into the sapphire depths of her eyes, and felt unutterable things. One grave man of forty years, who has seen the women of many lands, has pronounced her peerless, and wished himself five-and-twenty for her sweet sake. But Janet is neither lavish of her glances nor fond of praise. If she is vain, hers is a subtle vanity. That affluence of tawny hair, which Edmund Spenser would have woven into a hundred sonnets, droops unheeded over a brow and neck and shoulders as white as swan's-down, cheeks tinted like a rose leaf, and the bust of Clytie. Knowing her beauty, she doubts its power for good or evil, and is neither proud of it nor happy on account of it. She knows that during the latter years of her childhood Blanche was undisputed belle of Pedlington, but that now the empire is at best divided between her and Nelly, while other pretenders are in the field. And why (she thinks) did Captain Lyte disinherit his nephew and leave half a fortune to *her*? It only makes things and people appear to her in a false light. She is never quite sure whether herself or the £12,000 forms the object of attraction. She has some compunctions, too, about that wicked young man. This is a subject of which she dare not speak. His name is forbidden. But did he really run away with poor Eleanor Baily (Blanche's sister-in-law)? Every one said that Captain Lyte had always disliked him because his mother had refused the captain, and married Mr. Lyte, a younger brother. Of this marriage a son had come, and the poor child, soon left an orphan, was sent by his uncle to the Bails, who had brought him up. Eventually he had quarreled with his uncle, and gone away. Soon afterward Eleanor Baily also disappeared; and it was received as proven that she was ruined by him. But the whole affair was wrapped in mystery. Janet had sound-

ed her brother Frank, and could get no evidence; and, strange as it will seem, it is a fact that this girl had a more legal and logical mind than her astute brother, and could not condemn this disinherited gallant at the bar of her own judgment without proof of his guilt. Moreover, two more feminine and romantic considerations induced Janet to entertain a sentiment of blended compassion and admiration for this unhappy man. In the first place, it must be recorded that she entertained a dislike, only qualified by contempt, for her brother-in-law, George Baily, Esq., Jun.; and much concurrent testimony certified her of the fact that when they were school-fellows at Harrow this young Lyte had inflicted upon young George Baily such a severe thrashing that it fell little short of manslaughter. She knew, or thought she knew, that George Baily's unkindness to his sister had been the secret cause of the animosity between Lyte and him; and she strongly suspected that her sister Blanche was not happy with Mr. George, who, she believed, had married her for the sake of her portion under Captain Lyte's will. The next item in her tender compassion for the disinherited man was founded upon this fact: a few months after the disappearance of Miss Baily, Sir Thomas Balbry, an Irish baronet who had paid her conspicuous attentions, died abroad, and a first report that he had encountered an accident while riding had been gradually but surely superseded by a dark rumor that he had received his death-wound in an encounter with young Mr. Lyte. Janet, pondering on these things in her silent way, and believing that every other member of her family was too prejudiced to direct her mind aright, concluded that whether the fault was his or not (and she doubted if it was), still there must have been something noble about the young man who first chastised a brother, and then killed a lover, for the sake of the girl he loved.

However these things might be, Janet was discontented with her lot, with her fortune, with herself. Oh, how she would like to go somewhere, and be of some use in the world—to be a nursery governess, or to found a charitable institution, or to be one of Miss Nightingale's aides-de-camp, or any thing but odious, useless little Janet Browne! But was it quite impossible that life should change for her, should become quite a different thing to her, without a change of place or station? This afternoon a wild thought came into her head, a new feeling into her heart. A sentiment too vague with inexpressible delight filled all the channels of her being for a few blissful moments. And in this gloom and silence of her chamber, only broken by the beating of the rain upon her windows, that feeling lived again, and all the little incidents that heralded and followed it passed and repassed through the

mirage of her mind: the falling of the breeze, the blaze of lightning, and the crash of thunder; a few rain-drops in the river, then more and quicker, till the wild shower thickened round her, in the midst of which a measured pulse of oars unseen came upon her swiftly from the unseen world; then a shock, a space of sweet bewilderment; then the gloom of the umbrella, the loud drumming of the rain upon it, and the plash, plash, drip, drip, drip, drip all around. In this solitude and amazement of the heart came another, an unpleasant shock—Hubert's fatal answer, "The Marquis of Westminster!" How angry she felt, with all the pettiness of every-day life closing around her, and chaff gathering cloud-like on the horizon!

But now the rain beats upon her darkened window, the gloom deepens round her, and the same scene repeats itself: a falling of the breeze, a darkening of the sun, a roll of distant thunder; rain-drops plashing in the water, the rapid swing and beat of oars unseen coming swiftly toward her, the quickening of her pulse, the beating of her heart—

Suddenly a loud knocking at the door interrupts her meditations. "Tea! tea!" shouts Hubert, and hurries away to satisfy the claims of hunger.

Gathering her fulvous fleece together, Janet ties it in a hasty knot at the back of her comely head, sponges her face and hands with cold water, and without lighting a candle or looking in the glass, marches solemnly down to tea.

Joan is presiding at the tray. Joan is permanently "sore" that Captain Lyte should have selected Blanche and Janet, though they were his godchildren, and left her and Nelly out in the cold. She used to be particularly severe on Blanche's faults, and now keeps a watchful eye on Janet. Joan is the eldest sister, five-and-thirty, beak-nosed, thin-lipped, with dark hair primly braided and pinned close to the head. Surveying Janet as she enters, Joan glances round at the company assembled, and smiles sardonically. The story of that green cotton umbrella has already gone the round, and has even received sundry emendations and various readings. The family Vehmgericht have been discussing Janet's temper, her love of solitude and brooding, her peculiarity and impenetrability. Albert, the charitable, has just wound up as follows: "Well, she's a rum girl, and we none of us understand her. That's the long and the short of it." Albert is the eldest son (about thirty), prematurely old, baldheaded, contemplative, and idle.

"A most becoming way of 'doing' your hair, dear!" says sister Joan, handing Janet a cup of tea.

"Really, my dear," Mrs. Browne adds, smiling,

"I think you *might* pay a little more attention to your toilet."

Mr. Browne, who, though presiding, has been a silent member of the Vehmgericht, now looks up from the *Quarterly Review*, smiling also. "The truth is," he says, "you're envious of Janet's golden locks, all of you."

"Golden!" exclaims sister.

"I wish I were as bald as Albert," says Janet, angrily.

"Ahem!" coughs Albert.

Frank, next to whom Janet has seated herself, whispers in her ear, "You'd have to wear a false plait, like Joan, if you were." Frank is the handsome second brother, himself partially bald, satirical, and languid, but keeping a vigilant eye open, and a clear head for business.

The bit of malice about Joan's doubtful tresses puts Janet in good humor. "More tea, please, dear," she says, handing her cup to Joan. *Mais il n'y a pas de rose sans épine*; and Frank, going to the table and cutting a piece of bread, draws out, "Oh, by-the-way, Janet; Hubert took back the parachute, and found the baron with his feet in a tub of hot water, and the Marquis of Westminster drinking a treacle posset."

"The Marquis of Fiddlestick," says Nelly, stamping her little foot on the ground, and then laughing with exquisite *abandon*.

This interruption of Nelly's is a relief to Janet. After all, matters are not so bad as fancy painted them. The umbrella was lent to Nelly as well as to her. The marquis and the baron, as they call them, are evidently not formidable, and if not, why—why—in short, there is no occasion for her to give herself airs and provoke suspicion. So she too laughs and blushes, as any young lady might do, hearing of gentlemen sitting and drinking possets, with their feet in tubs of water.

A stranger would notice that Albert, the charitable, is covertly watching his sister Janet with a curious attention. He has quite a habit of silently watching other people's thoughts and feelings; and unknown to his family is often behind the scenes when they are all in the dress circle. But, being inactive, he seldom makes use of his discoveries, and gains little credit for his penetration. Yet his good nature frequently induces him to create a diversion just at the right moment; and unconsciously his brothers and sisters, and even his parents, have learned to rely upon him for changing a disagreeable subject. Now a general feeling pervades the room that the story of the umbrella has gone far enough. So Albert clears his throat gallantly for a speech, and says, "I'll tell you what it is. If you girls keep going out without an umbrella this showery weather, you'll decimate the aristocracy."

"I wish some benefactor of his species would decimate the Brownes of Pedlington, beginning with the eldest son," draws Frank.

Frank's witticisms are small, but very neat. The Browne family at that time consisted of Mrs. and Mr. Browne, four sons, and four daughters; so that the removal of any one member would exactly "decimate the Brownes of Pedlington."

Again Janet smiles approval. You see there is nothing angelic about our little heroine. But ill-used Albert, on whom the hot tea is having its usual effect, only wipes his bald head with a white cambric handkerchief, and pushes his chair back toward the open door.

CHAPTER II.

HIGH AND DRY.

WALTER BROWNE, Esq., of Pedlington, solicitor, or "Old Browne with the pretty daughters," as the men at the cavalry dépôt and the young gentlemen in the surrounding country used to call him, was high and dry. The younger son of a small country gentleman in an agricultural county, he had been nursed in the very lap of Conservatism—none of your new-fangled philosophical Dizibright Toryism, but "fine old English" church and state Conservatism. After such a training in polite letters as the Pedlington Grammar School could afford, he was articled to an old-fashioned firm of conveyancers and Conservative election agents in that town. From clerk to head of the firm he had worked his way through the grades, and won golden opinions in every grade, from the time when "*omnes omnia bona dicere et laudare fortunam*"—i. e., when every body used to compliment—his father on his ability, till the time when the lord-lieutenant of the county assured him it was with the deepest regret that he was unable to nominate so estimable a gentleman to the clerkship of the peace, as the late lord-lieutenant had promised the nomination several years previously to Mr. Delavine. In the fruitful soil of Pedlington Mr. Browne had struck deep root, weathered storm and sunshine, and spread branches fair to look upon. Winds of doctrine might (and did) vary; ocean currents of opinion might (and did) set in and sway the surges round him; but he bent not to the storm, nor trembled at the mighty sea. Only the lichen of many years coated him over; byssus grew upon his chin; and as all things changed around him, and he remained unchanged, there was a tinge of sadness in his isolation.

Albert, the prematurely baldheaded, contemplative son, saw this. He doted on his father, and revered his opinions, contrasting

them with the more fluctuating and volatile sentiments in vogue, just as a lover of honest port-wine will condemn the vintages of Bordeaux and Johannisberg. Still he saw plainly enough that Bordeaux and Rhine wine were the beverages of the day, and he drew comfort from this consideration, "The good old opinions will last his time and mine: after us let Frank and the young world do their will." He had little faith in his brother's loyalty to the venerable code, though in reality Frank's liberalism never extended beyond the precipitate purchase of a broad-brimmed felt hat and a dozen "turn-down" or Byronic collars. It was a sad thought, that of burying their talents in graves of the past, and leaving no heritage for the future—sorry life work. Possibly it may have been this that saddened Albert's life. Doubtless it imbibed his father's also; but the old man was too proud to show it; his combativeness was in continual though unostentatious play, and that very opposition of opinion which gave the offense warded off melancholy by keeping his energies in active use.

Yet, far from being disputations or given to argument in social intercourse, Mr. Browne was one of those men of whom one does meet a specimen now and then—men who seem independent of sympathy, and who seek no real intercourse out of their family, and little in it. His opinions and sentiments (if he ever admitted so delicate a creature) were classified petrifications, requiring no warm contact of living thought and feeling. If from his professional experience, or from any literary source, he drew and made his own one more opinion, it was petrified and classified at once, so that he rather resembled a geologist's cabinet than the living, moving, sympathetic world of which every man should be a type. In the family circle and in general society, though not seeking it, he was courteous and even cheerful, seldom speaking without a smile which exhibited his whole system of artificial teeth. But what little he said on such occasions was invariably on a subject of mere ephemeral interest, or of none at all. Though politely disguising it with smiles, he would conceive a hearty dislike for any Sir Malaprop who pressed him with conversation on a debatable subject, especially if he was worsted in argument, or his position was regarded with scorn in the hearing of his own wife or children. The latter offense he never could be prevailed upon to forgive. His only friend since boyhood had been his quondam crony and school-fellow, the late Captain Lyte, of the Royal Navy, an eccentric Tory of what was lately called "the Sibthorpe school," in whose society Mr. Browne had doubtless tasted the insidious gratification of being considered a liberal-minded and progressive politician.

Captain Lyte's Toryism, however, had not compelled him to adhere faithfully to the spirit of his father's last will and testament. On the contrary, having been informed by his solicitors, Messrs. Baily, Blythe, and Baily, of London, that the deed in question was faulty, he set it aside on his own authority as heir at law, and made a new disposition of the property, leaving one moiety of it to his sister Philadelphia, and the other to be divided equally between his dear godchildren Blanche and Janet Browne. It must be stated here parenthetically, and in justice to the good Pedlingtonian lawyer, that he was entirely ignorant of this transaction until after the captain's death, and that in drawing the marriage settlement of his daughter Blanche he had made no provision or condition for securing this unexpected treasure.

Walter Browne, Esq., regularly perused the *Quarterly Review*, and daily skimmed the cream of Conservative journalism. But he disliked the modern spasmodic writers, whose style affected his sense of literary propriety much as the jaunty whistling of an errand-boy jars on the cultivated ear of a musician. Hume and Clarendon were his models of English prose, Pope his model poet. His novels were those of Sir Walter Scott. Grave English classics filled the lower shelves of his book-case; nor was his acquaintance with these limited to the titles on their backs.

Such a man was not one to be deficient in will or in the exercise of authority. Absolute master in his own house, he prudently abstained from interference with petty details, but settled all general questions with a decision against which there was no appeal.

To Frank and to Robert (the military brother) there seemed nothing melancholy in the isolation of fixed opinions. They thought it inevitable that radical views should gain ground in a populous borough; but the counties they regarded as strongholds of "fine old English" constitutional policy. The firm of Browne and Son had their stake planted firmly in the county. Its sturdy principal took care that he himself, each of his three adult sons, and each of his four Conservative clerks should be duly qualified and registered voters for the county. The whole firm regarded the Reform Bill of 1832 as the Moors in their gradual expulsion from Spain looked back upon the fall of Granada. But the past was irrevocable: the counties, a score of pocket boroughs, and a forlorn hope of loyal hearts still remained.

As to free trade, what good had it done? Weakened the agricultural interest, and enriched a legion of foreign traders. The country had grown more wealthy, it was said; that is to say, some thousands of hucksters

and cotton spinners had amassed fortunes, and were doing all that unfamiliar wealth and mushroom growth could do to upset the state coach. Free trade had struck at the root of the tree of English grandeur. And if it must be admitted that more land was in the market and conveyancing more brisk than formerly, on the other hand, radical solicitors, men of equivocal integrity and subversive opinions, were springing up in all directions. In short, Peel was a renegade, "Lord John" a crazy demagogue, all recent legislation a nuisance, and modern Solons busybodies who couldn't leave well alone. The County Court, too, was a contemptible little innovation. But the Brownes objected to it "on principle." It scarcely interfered at all with them. The firm were conveyancers and agents for the purple county candidates. W. Browne, Esq., was clerk to the county magistrates, clerk to the Board of Guardians, to the turnpike trust, the county lunatic asylum, and so forth. From such sources a fair professional income was derived, and the Reform Bill could scarcely bear the blame if Mr. Browne chose to bring up his boys and girls as young gentlemen and ladies.

On the whole, legal Frank and military Robert took a cheerful view of matters. It is only your dreamy, speculative Alberts who are melancholy. Robert had fought in India, and "lived to fight another day." Now, being adjutant of his regiment, he had the belts and pipe-clay to look after. Famously he did look after these small matters, too. H.R.H. the Commander-in-Chief had complimented him on the field of battle (a sham fight at Chobham), and his corps was the envy of a whole camp. Frank had plenty of office work and "vice work," as he called it, that is, acting for his father in one or other of the clerkships. Besides which, in his favorite character of a gay Lothario, he usually had one (or more) flirtation on hand; he devoted more time to his toilet than Janet did; and, as became a domestic, amiable member of polite society, had no objection to taking his ease in the bosom of his family, finding relaxation in the superintendence of little household broils, and animating the war of persiflage.

In matters connected with religion a strong family likeness prevailed between the four brothers. From Albert the bald to Hubert the fair-haired, one rule was law. In the morning and afternoon of Sundays they went regularly to church, wet or dry; in the morning of Christmas-day and of Good-Friday also; but on no consideration at any other time. For a wedding, indeed, they would repair to the sacred edifice; but in the true spirit of church and state Conservatism they regarded the holy table as a "hymeneal altar," and the whole ceremony as an entertaining performance merely subsid-

ary to the civil contract of marriage. Hitherto they had acquired no experience of the funeral rite. One brother had died of phthisis at the Cape of Good Hope, but the news of his death only came when his burial was a vague legend of the past. During the services of prayer and praise one look of importance reigned on the countenances of the four brothers; a religious silence commanded their tongue and lips. During the sermon they all gazed about the church, relieving the monotony of the occasion by sifting the behavior of their fellow-sufferers, and storing appropriate winnowings of chaff. Albert, Robert, and Hubert throughout service and sermon sat bolt-upright; Frank languished in graceful attitudes.

Between the sisters also a similar family likeness prevailed, especially between the three beauties, Blanche (now Mrs. George Baily, of Russell Square, Bloomsbury), Janet, whose face and fortune divided the Pedlingtonian hearts, and Nelly, whose face was her fortune. On "church days" the whole family used to produce its gala costumes. The girls used to lace extra tight, wear crackling silk dresses, marvelously small boots, and enormous bows of stiff silk ribbon under their little chins and cheeks; so that they had to carry their heads uncomfortably high, and to sit bolt-upright, like the military brother. The tight fit of their lavender kid gloves precluded any possibility of turning over the leaves of their prayer-books, or indeed of allowing their hands to assume any comfortable position. "*O, qu'il faut souffrir pour être belle!*" exclaimed Robert, who in his rare visits behaved with gallantry to these devoted virgins. But Frank ingenuously observed that they sat trussed like a row of chickens on a spit. Owing to the rigidity of this costume, and the absence of any particular interest in what was going on, these victims were tired out before the service was ended, and the endurance of the sermon was the crowning effort of their lives. In the retirement of the family circle it was whispered that Blanche, in the zenith of her glory, had lost the affections of an heir by relaxing this effort on one sultry occasion, and betraying the dreadful secret that a belle may snore.

Browne (*paterfamilias*)—and I beg the reader to observe that we now reach a climax—Mr. Browne himself was sedately splendid at church. He wore a blue swallow-tailed coat, of which the collar covered his whole cerebellum, while the cuffs of the sleeves confined the action of his thumbs. At stated intervals he blew his nose with a voluminous and variegated silk pocket-handkerchief, thus making a superb display of color, and producing a resonant blast, like that of a bugle. This instrument in its period of rest gratified those who worshiped behind Mr. Browne by depending from the tail

of his coat like a flag in calm weather. As Mr. Browne rarely blew his nose except at church and Petty Sessions, the "trumpet performance," as Frank called it, was considered by the family, and justly so, as a very appropriate and imposing part of the ceremony.

The religious duties of the younger Brownes were clearly defined and emphatically laid down by the elder. In his or her fourteenth year each of them was confirmed by the venerable primate of the English Church, as their forefathers had been since the Reformation; for both Mr. Browne's native parish and the borough of Pedlington lay within the limits of the archdiocese of Canterbury. As each succeeding Easter-Sunday came round, all the confirmed Brownes "staid the sacrament," and on no other occasion. The Brownes of Brownleigh and Farfield had done so from time immemorial, and the Brownes of Pedlington would continue the good old custom, let the clergyman of the district for the time being think and say what he would. One had beaten the "pulpit-drum ecclesiastic" for a few years who wanted no one to "stay" but hysterical penitents. Then another came who wanted every one to "stay" always, children and all. Now Mr. Marmaduke was sorely "exercised" on the subject, and didn't know what he wanted, but was more eager and urgent than those who did. It was all one to Mr. Browne. *Fiat* his good old custom, *ruat* parsondom.

In this well-regulated family no nonsense was ever uttered about week-day services, district visiting, Sunday-school teaching, Dorcas meetings, or prayer-meetings. Sermons were tacitly understood to be specimens of pious oratory, and only tolerable as such. A close scrutiny into the religious feelings or experience of any member of the family will scarcely seem to have been possible; yet once or twice, before the primate's visitation, such a thing was attempted by some overzealous curate, who was at once and forever forbidden the house. The temptation to make such a pretty convert must have been quite irresistible. But the requital was justice with a vengeance; for to have access to the Maison Browne was universally considered the blue ribbon of Pedlington society. Many a friend clave unto Frank, many a bottle of Moët Imperial (before the French treaty), and many a choice Cabaña cigar did Albert the contemplative enjoy at the cost of "impassioned youth" for the faint prospect of a smile from his sisters' lips.

So that, "on the whole" (this was a favorite expression with Frank Browne)—"on the whole," the Brownes, without any deep interest in life or any high moral purpose (in short, "without any humbug," as Frank aptly paraphrased it)—the Brownes of Pedlington were "a thoroughly respectable, happy, and united family."

CHAPTER III.

GEMINI.

THE two gentlemen whom Hubert had dubbed with illustrious names and titles would themselves have been slow to acknowledge the honor done to them. Not that they were disaffected to existing social distinctions, but simply that they belonged to the aristocracy of intellect, and appreciated the honors of their own class too highly to covet those of another. They were, indeed, Mr. Phelps (or Dr. Phelps, as the local newspapers called him in virtue of the cabalistic letters LL.D. affixed to his name), and his coadjutor Mr. Lane. The former had recently been appointed to his office by the Mayor and Corporation of Pedlington. He had conferred the inferior dignity of second master on his old friend and school-fellow. The contest for the recently vacant head-mastership had been a brisk one, and some of its details, which had since reached the ears of Mr. Phelps, caused much amusement to the two friends. The *Southeastern Gazette and Pedlington Advertiser* had trumpeted the intentions of the town council to the four corners of the realm. "No longer," it had written, "should the youth of their enlightened and conservative borough have to wander in search of education. A loyal and liberal municipality should cherish as the nucleus of its future greatness an institution in which the revered learning of antiquity and the advanced principles of our age might be inculcated and matured."

Cloudy phrases often obscure a clear purpose. In this case the burghers, who had long groaned under the incubus of an inefficient school-master for their sons, were resolved to have the best one they could get, whatever his politics or religious sentiments might be. Accordingly the town-clerk issued his advertisement, in which the aldermen sternly refused to be canvassed, or to take into consideration any thing but the relative fitness of the several candidates as set forth in their testimonials.

Sixty candidates rushed into the arena, and, as a matter of course, every one of the electors was briskly canvassed. In the little world of British school-masters, among whom such advertisements are discussed, it was broadly stated that effective management would soon draw a hundred boys to the Pedlington Grammar School. The capitation fee was advertised at six guineas for each boy. It was also probable that in such a wealthy and populous town from thirty to fifty boarders might soon drop in, at fifty guineas a year; so that the head-master's income could scarcely fall below £2000 a year. There was also a small endowment both for head and second master's salary, and an excellent house and garden for the former. But the burghers, just and tena-

cious of their purpose, hearkened not to the voice of the canvasser.

One hot morning in the merry month of May they assembled in awful conclave. The town-clerk sorted his papers. To his Worship he delivered sixty pamphlets, to each one of their Dignities sixty pamphlets, declaring each and every one of the said nine hundred treatises to be a true and accurate printed copy of authentic documents then in his keeping.

Every man regarded solemnly the mass of literature before him. SIXTY PAMPHLETS! fifty-nine of which were terrible to behold and bewildering to peruse, each containing many elaborate panegyrics on the character of one of the candidates.

Civic dignitaries are not invariably men of a literary or critical turn of mind. Knowing as these men did the frailty of human nature, it was hard for them to credit mortals with the surpassing excellence attributed to each candidate, impossible to discern between varieties of perfection. Summer was premature. The council-chamber was small and ill ventilated. The thermometer rose to eighty. The wisdom of the councillors was set at naught.

In this extremity, as the worthy men sat mopping their foreheads ruefully, each glancing at his neighbor only to see his own despair imaged in another face, first one, then another, then all, began to inspect the sixtieth pamphlet, that one which had the advantage of brevity. And now the furtive glances revealed a glimmer of hope to those who glanced. This tract contained copies of two documents only, one signed by the authorities of a well-known college in Oxford, the other by my lords of the Privy Council. At length each elector wrote a name on a slip of paper, folded it mysteriously, and passed it on to the town-clerk; and the next morning Henry Phelps, Esq., M.A., LL.D., formerly a fellow of — College, Oxford, and late one of her Majesty's inspectors of schools, received a polite note from that functionary, saying that he had been elected unanimously to the mastership of their old endowed school.

Thus it happened, to the horror and discomfort of many reverend gentlemen who had sought and obtained holy orders as a stepping-stone to scholastic preferment, that a layman was chosen for one of those offices which in England are almost invariably filled by a priest, and the nomination to which rested in the hands of men upright and disinterested, but who usually are slaves to precedent, and tremble at a divergence from the beaten track.

Both Mr. Phelps and his friend looked older than their years, and yet about them both hung a kind of youthfulness, the kind which attracts and fascinates boys, and which is the growth of real vigor united to kindliness

of nature. Each of them had *lived*, and one at least had *loved*. Phelps had been captain of a public school, fellow and classical lecturer of a college, a husband, a father, an inspector. Mr. Lane had been his friend's rival and competitor at school, but had since graduated at two German universities, had become a moderately good linguist, a geologist, and something of a chemist. A rare combination of chances (as we say) had reunited them now. Mr. Phelps, having resigned his fellowship in order to marry, had afterward resigned his office as inspector to give a delicate wife more of his company than he could otherwise have done. To replace the lost occupation he then undertook to write a treatise on the sources and structure of the English language. This soon drove him beyond his modern German, and urged him to acquire some knowledge of the semi-Saxon. About this time a heavy calamity befell him, and he was left a widower and childless at one blow. Partly to carry out his previous intention, and so distract his mind from its proper grief, and partly to get what solace he could in the society of a friend, Phelps then repaired to Germauy, and found Mr. Lane chewing the cud of bitterness over one of those minor evils which supply us with misery in the absence of real woes. For two or three years past he had been acting assistant professor of modern languages at an important centre of education, and his senior being infirm and aged, a large proportion of the work had devolved upon him. Recently the professor had died, and Mr. Lane, who was exceedingly popular with the students, not unnaturally anticipated his election to the vacant chair. The governing body, however, had passed him over in favor of a man whom he thought less qualified, and with less claim upon them. *Hinc illæ lacrymæ.* In these cases it is only for honor and position that an Englishman competes. The full emolument of that professorship in the oldest university in Europe was pecuniarily of less value than the modest salary which Mr. Phelps offered his friend.

"I'm glad they have served you so badly," said Phelps, when Mr. Lane had poured out the story of his wrongs.

"How so?" asked Lane.

Then Phelps unfolded his project that Mr. Lane should return with him at the end of their vacation, and take a humble desk in the Grammar School. At first Lane thought the scheme wild and chimerical. "It is quite impossible." There were powerful reasons why such a step might prove to have been rash and ill advised, bringing humiliation on himself and injury to Phelps. But the latter assured him that he had weighed the whole matter carefully in his mind, and saw just as powerful reasons in its favor as Mr. Lane saw against it.

"How passing strange it is that fate should

have guided your steps to Pedlington, of all places in the world!" said Mr. Lane, half to Phelps, half musing aloud.

"It is a call for you, Bedford, depend upon it. I am only an agent in the matter. I see events co-operating toward an end. And think what a comfort you will be to me."

"I fear not, my boy. The iron has entered into my soul."

"And not into mine?" asked Phelps.

Then Mr. Lane stood before him, looking at him with the old love-light in his eyes. They clasped hands, and the bargain was thus mutely struck between them. But the facts of the case more than justified all Mr. Lane had said. It did seem impossible to one who knew the secret of his life that he should settle safely in that English town. It was very strange that circumstances should have induced Phelps to take up his abode there. And the iron of grief had entered into Mr. Lane's soul, and rusted there like a blood-stained sword in its scabbard.

The two men had loved each other very dearly as boys. Perhaps their very competition in scholarly pursuits, and the generous rivalry which had existed between them, may have urged them to bestow more affection on each other than boys generally have to bestow. The rivalry between them had been very keen, and in my capacity as chronicler I may express an opinion that if Phelps had lost, the bitter would have drowned the sweet in his feeling toward his friend. But Phelps won, and the other lad, though burdened with a whole load of faults from which Phelps was free, was yet too generous, too massive in heart as in mould, to cherish a spark of malice. I believe he rejoiced in Phelps's triumph as sincerely as if it had been his own. Had he then remained in England and completed his education at Oxford, most likely the two friends would have occupied chambers together after their university course was over, and pursued their studies together or shared a common industry. The severance of their early bond left Mr. Phelps free to love and marry. The earthly close of that union of his had again given scope for the early friendship to revive and resume its functions in his life.

Yet a bond renewed is not a bond which has never been relaxed; and although human truth and constancy rebel at the assertion, it is a fact that marriage relaxes the bond of friendship between man and man. These two men still trusted each other with a singular confidence, and still felt a cordial satisfaction in each other's society; yet they were not the *Gemini* of old times, so named by their school-fellows from the close intimacy which bound them together, rendered more noticeable by their unlikeness in externals. Between them now lay a mysterious gulf, the presence of which both felt, but neither quite understood. Mr. Lane laid

the blame of it on himself, declaring that he had been the first to put that gulf between his friend and him, to divide their life, as it were. Nor was that all. In the first flush of manhood, and in the first blazing out of youthful passion, he had not been true to their ideal standard. This much he admitted to himself only. But he also dimly suspected (and would *not* admit to himself) that his friend was somewhat dwarfed in moral stature by a certain intellectual pride which seemed to grow out of him, and yet to adhere to him and to restrict his nobler parts. Whenever this suspicion took form it was a source of sincere grief to Mr. Lane, who esteemed his friend as the noblest of created beings, and at the same time had seen through the sham dignity of pride, and learned to know that humility is the true touch-stone, the real test, of moral grandeur.

Nor had their intercourse during those long years of separation been close enough for each to feel the pulse of the other's progress in thought and feeling. Upon all questions relating to revealed religion the difference between them, though as yet unspoken, was sure to make itself felt. Mr. Lane, after rebelling against the lessons of his childhood, and passing through various phases of rationalism and unbelief, was returning to a simple faith, and becoming "catholic" in a theological sense of the word. Mr. Phelps, growing more and more dissatisfied with all dogmatic expressions of faith, was advancing rapidly toward the conclusion that no satisfactory key to the mysteries of the spirit world had yet been vouchsafed to the human mind. But Mr. Phelps took the blame to himself, and said that he had never understood his friend's stronger physical organization, with its precipitate impulses, nor appreciated the manful simplicity of his nature. He accused himself of egotism and an excess of refinement, and in his own heart paid a certain homage to his Herculean friend, as one of a grander, more simple type than himself—one whose strength was not as his strength, but who had yet in boyhood pressed him hard upon his own ground; as a man of whom it would be impossible to say what he might *not* do, but safe to predict energetic action in whatever he undertook. That Bedford had sown his wild oats Mr. Phelps was quite sure; further, that the seed had been sown deep in a tenacious soil, and the crop a stiff one. Some clew to the circumstances he held in his hand, but was too generous to use it as long as his friend maintained this unbroken silence respecting an unhappy epoch in his life. Taking him as he found him on the renewal of their personal intercourse, Mr. Phelps concluded philosophically that, whatever his friend's experience had been, it was the fitting complement of his character and the trying position in which he had been placed; that,

with past experience become present wisdom, this man exercised a stronger control over circumstances than they upon him; and that, his heart being sound and his will strong, he would exert a healthy moral influence in a school, and his work would be thoroughly done.

CHAPTER IV.

BIRDS OF A FEATHER.

If Mr. Phelps had not clearly recognized before he applied for the mastership of the Pedlington school that work, hard work, and plenty of it, was absolutely necessary to prevent him from falling into a desponding lethargy, and that no other drudgery whatever could surpass the ineffable drudgery of an inspectorship, he might have been tempted to complain somewhat in his new set of harness. But having made up his mind on those two cardinal points, he omitted no effort now to enter into the spirit of the task which he had undertaken, and Happiness (of a sedate and sober kind) came to him toiling along the path of duty, as she will not come to those who scour the country undutifully in her quest. The school was not long in establishing such a number of urgent and conflicting appeals to his attention, judgment, and industry that the progress of the literary work during term time was almost entirely suspended. With a sigh he resigned himself to the inexorable machinery which he himself had set in motion, and to regarding his own powers and achievements as a portion of the system whose operation he directed and had the means of estimating. All men of critical faculty delight in any labor which they can test and weigh as it progresses, line by line, and page by page. Perhaps that is one of the fascinations of the "*ars poetica*." I do not mean the poem of that name, nor even the epic art itself, but the art of composing lyrical verses. Every ode or sonnet, every stanza, every line almost, is "something done." How widely different is the gyratory *manège* of school work! The most fiery Pegasus must be curbed, and harnessed to a ponderous hearse, which bears the dead bodies of Fancy and Humor to an untimely grave. Alas! poor innocents! Once they warmed the heart with joy, and sent the goose-quill flying over airy leaves, like a nautilus dancing on sun-lit waves. Now they lie low, smothered by the jealous hands of Duty, who piles upon them concords and quantities, gerunds and supines, genders, moods, and tenses, numbers and persons, till they die; and Pegasus, smeared with ink, spavined, broken-winded, with drooping crest, and a hearse plume tied to his mangy tail, drags their disfigured remains to the cemetery of oblivion.

As long as "the Doctor" (for so parents and boys alike conspired to call him) could fully carry out his preconceived idea of letting the boarders live with him on the paternal or family plan, he was well satisfied, because he was really so fond of young people that it was refreshing to him to be in their company both in their leisure hours and during the evening study, which was not a "regulation" school time. A system apparently rigid and exacting both as to work and behavior was pursued in the normal school hours. Neither the Doctor nor Mr. Lane ever relaxed an inch or took off the weight of one feather. But more regard was held to the quality than to the quantity of work done, and mere priggish decorum was not stuck up to be a model of generous and honorable conduct. The severity of the system "in school" was so tempered by affection and confidence "out of school" that the sensible boys soon learned to like the former, and really found it much easier to put their shoulders to the wheel (intellectually) when every boy in the room was exerting his wits to the utmost, when the very atmosphere was impregnated with classic dust, and a code of rules, simple but emphatic, was being enforced to the letter as to externals. The Doctor had not embraced the modern opinion that corporal punishment disgraces a boy. It was a part of his system, but a subordinate part. A third repetition of any offense on the part of the same boy was visited with the cane, a fourth with the loss of a half-holiday, a fifth with that loss extended to the whole class. This terrible event looming in the distance so enlisted public opinion on behalf of law that a besetting sin was generally resisted in its early stages. The subordination of the cane to a more grave punishment also robbed it of its "shameful" stigma, and avoided making brute force the ultimate appeal, which is undoubtedly demoralizing. Whether good, bad, or indifferent, the method pursued by the Doctor and Mr. Lane gave satisfaction on all hands, and sons of burghers who had been scattered broadcast all over the country were now brought back to their native town, and sent to the Grammar School either as day scholars, day boarders, or boarders. They soon had seventy in school, twenty-two of whom lived with the head-master. Then it became necessary to increase the staff, to which Phelps was very loath. He wished for an intruder neither between him and his saturnine colleague, nor between himself and his little boy family of an evening and in play hours. He confided this to Mr. Lane, who knew it well, and what more was in his mind, but made no suggestion.

"If you would only come now, Bedford," urged the Doctor, who had often expressed the wish before, but not recently. And then again, "If you would only leave that dismal

old abbey and that damp river-side church-yard, and come and pitch your tent with me, we could work it well enough. The senior monitor can take the evening study, and you might have almost as much time to yourself as you have now. Only we could sit together of an evening in the winter, or take a stretch over the hills together in the long summer twilights. I know you keep late hours all alone there. I see those black hollows deepening round your eyes. You are too much alone."

But Mr. Lane declined the proposal, and a third master was engaged, a younger brother of one of Phelps's college friends, who wanted to work for a year or two before matriculating.

A certain portion of the thriving borough of Pedlington has the appearance of a decayed town. It is the southwestern suburb, that most remote from the school, the barracks, the town-hall, banks, and principal shops. It lies on the southern shore of the river Peddle, before it passes the cliff. A church of the latest Gothic period, far too large for modern Protestant usages, yet with an old-world dignity and steadfastness of its own, stands on the brow of the little cliff, overlooking the river. On the opposite side of the river runs the barge path. The Peddle Navigation Company have a lock there, so that the voices of barges and boatmen sometimes break the silence, but the peculiar elegances of their diction are scarcely audible, for a broad weir separates the cliff from the lock.

Except about service times on Sunday, the southern bank is bereaved and silent. Beyond the cliff lies a deep sunk road which terminates abruptly in the river, and doubtless at one time was the abbey moat. Beyond this stand the ruins of an old collegiate building, called "The Abbey," which also looks down upon the river from a gentle elevation of its own. But a window in the old keep gives out across the sunk road on to the slope of the church-yard, which has crept so near the farthest edge of the cliff that many of the tombstones seem to be tottering on the brink. In this old ruin were Mr. Lane's apartments. Here an aged female ministered to his humble wants, assisted by the parish sexton—a functionary still more venerable than herself, still more exclusively belonging to those generations whose bones were mouldering hard by, and equally attached to their young master with the Titanic form and the visage of Barbarossa. The wags of Pedlington told strange stories of Mr. Lane's mediæval abode and following. The attachment existing between him and these strange domestics was singular, and made itself apparent to those who visited him by their readiness to meet his wishes, often before they were expressed, and by the respectful way in which they spoke of him

when absent. During the midsummer vacation at the end of Dr. Phelps's first year at the Grammar School, the Society of Antiquaries paid a visit to Pedlington. The ruined abbey was a centre of attraction. A search was set on foot for Mr. Lane, who was known to have mastered all the historical secrets of his retreat, and said to have opened up one or two secret passages in portions of the thick walls of his dwelling. He was nowhere to be found. The sexton also was absent from his post, and though the ancient woman showed her master's apartments, and even ventured to intimate the regret he would feel on hearing that he had missed the opportunity of enlightening them, she resolutely denied any knowledge of a secret passage. When further pressed, she admitted that Master Graves, the sexton, had turned his talents as an ex-stonemason to account about the premises now and again, but that it had only been to repair the masonry of the windows, and to keep the rain from soaking into the walls. My Lord Pontipool himself, to whom the ruin belonged, called for silence, and asked the gentlemen present whether any one had heard the note of a nightingale, apparently in the dead-wall on the river side of the larger apartment. No one but his lordship had heard the sound. Some one suggested that there must be a concealed defect in the wall, and that the sound came from the terrace walk without, for nightingales were known to build in the shrubs overhanging the river. But most people thought his lordship must have so far partaken of plebeian nature as to have erred in this matter, for July was now far spent, and the melodious bird never sings by night or day after hatching the eggs.

They gave up the riddle and repaired to the church. Some zealous genealogists rubbed the brasses, others descended to the crypt, while a chosen few ascended the tower stairs. Among the latter was Albert Browne.

Recounting the adventures of the day afterward in the peaceful seclusion of his family, he vindicated his character for activity on the score of this perilous ascent.

"But, my dear Albert," pleaded his mamma, "what antiquities *did* you expect to find at the top of the tower?"

"We found *one*, my dear mother," he replied, "who had been missing all the afternoon—old Graves, basking on the leads like a lizard, half awake and half asleep, with a short pipe in his toothless gums."

"What could have taken the antediluvian old thing up there?" asked Janet, who had been listening with affected indifference.

"Well, my dear," continued Albert, glowing with pride at having secured a little interest in his narrative, "I believe he must have risked his life up that narrow, dark, and tortuous staircase in the Oriental ca-

pacity of punkah-badár to his Serene Highness the Nawaub of the abbey."

This was double Dutch to all present.

"Come, you poor dear old pumpkin," said Nelly, "tell us all about it. We don't know who *Punkybadar* is."

"No, my dear, you misunderstand me," resumed the imperturbable. "A *punkah-badár* is the bearer of a *punkah*, or, in this variable climate, let us say an umbrella—a large green gingham umbrella, with a yellow stick, like Magog's club."

"You don't mean to say he had the impudence to take Mr. Lane's umbrella up there?" asked Janet.

"That useful implement," continued Albert, "which, it appears, does duty alternately as a parapluie and a parasol, was planted upright in a box of clay, and under its ample shade sat his Serene Highness the Nawaub—in point of fact, our friend Mr. Lane."

"Like a sparrow on the house-top," added Frank.

"And talking of birds, Frank," Albert resumed, "I noticed that when *we* emerged from the little trap in the beacon turret a great number of daws and crows took wing from the battlements, and flew round and round with a great clamor, as if *we* had disturbed them; from which I gather that they are pretty well acquainted with our friend, and receive *him* sitting."

Then the subject was allowed to drop; but perhaps none of the Brownes afterward, when they saw Mr. Lane, forgot the fanciful picture of the little group on the leads of the tower—Mr. Lane sitting with his book under the shadow of the *umbra*, the old sexton dozing at his feet, and the daws silently perched around them on the battlements.

Something silent and strange about Mr. Lane drew his two faithful dependents toward him with a bond which they would have been puzzled to define. It was really a fellow-feeling. He was not as the other men of his generation were. Something within him kept him much apart from the world. When he had some duty or object to achieve among his fellows, he went among them. When he came home again, or any one left him alone, he would sit still, apparently absorbed and content, little concerned with that which had just occurred, but falling back upon some private interests of his own. He was not a fussy, busy man, as English school-masters generally are. At school he dispatched his work quietly, without energizing; yet, judged of by results, his work was excellent. Certain boys of the upper school competed at the Oxford middle-class examinations, when Mr. Lane's pupils excelled in modern languages and chemistry. Mr. Phelps also, to the astonishment of some and indignation of others, had placed the school under government inspection, the

"HIS SERENE HIGHNESS THE NAWAUB OF THE ABBEY."

lower part of it being, as he said, little more than a commercial academy. Here, again, the inspectors' reports of Mr. Lane's work were records of the highest praise. Still in his own rooms he was seldom found at work, but would sit silently smoking by his fire-side, or in summer on a broad terrace that ran along the former front of the building, and commanded a view of the country beyond the river. The truth was that he was a night toiler, not working even then systematically, but because his mind wanted food and sustenance, whereas by resting in the leisure hours of the day he had more energy for his duties. Outside of these, all

he did was done dreamily and without a definite purpose. Persons who occasionally passed round the angle of the cliff at any hour of the night reported having seen the light in the window of that dismal room, which lay in the shadow of the tombs. The extent of his knowledge was a source of astonishment to many people. When asked to do so he would deliver a lecture at the Mechanics' Institute, leaving the committee to choose their own subject. Sometimes he had forgotten to look at their notice, and came without knowing what subject was allotted him. Then he would plead ignorance, and say he was only there to afford

them an hour's amusement, and would talk quite naturally and freely on the subject, managing to project himself into the position of the audience, and look at it with their eyes, and so would interest them more deeply than a professed lecturer would have done, and yet convey a great deal of information bearing either directly or indirectly on the subject.

One day Mr. Phelps was waiting in his room, and seeing a bill on the table, took it up listlessly and read. It was a bookseller's bill, a very long one, the items being a number of the best and most costly books published during the last year on a great variety of subjects.

"My dear fellow," said the Doctor, as Lane came into the room, "you don't mean to say you buy all these books?"

"Why not?" asked the other.

"But do you read them?" pursued Phelps.

"I believe so," was the answer.

"What on earth do you do with them?" asked Phelps, in astonishment, looking round the room, where many old but no new books were to be seen.

Then Mr. Lane, with a key which hung to his watch-chain, opened a very narrow door, which, being papered like the room, was indistinguishable when closed, and of which the key-hole was concealed by an almanac hanging over it. In the narrow apartment now disclosed stood a stiff upright desk with a book on it, and one end of the room from floor to ceiling was completely lined with books on plain deal shelves. Mr. Phelps had only time to notice that the back of most of these books looked almost new when his attention was drawn from them to a number of birds of various families perched on ramrods, walking-sticks, and joints of fishing-rods, which were stuck across a narrow window and across the corners of the room. They all seemed to watch Mr. Lane with their heads on one side.

"An enchanted aviary!" exclaimed Mr. Phelps, looking from birds to man, then back to the birds.

"They want to sing," said Mr. Lane. "Would you mind their tuning up a little?"

Here one little malefactor set up a shrill piping without leave, and Mr. Lane, taking up the whistle on his chain, blew a blast which immediately silenced him. Then the bully of the perch, a small goldfinch, gave the rebel a severe peck, and turned its back upon him unceremoniously, again cocking its little head sidewise, and fixing its eye on the master.

Mr. Lane now pointed with his finger to a German canary, which at once poured forth a liquid flood of melody, many parts of which were very similar to the nightingale's song.

Presently it died away. Silence ensued. And saying to them, "No, no more singing just now," as if they had been children,

Mr. Lane poured out some rape and hemp seed on the window-ledge, and presently there was a great fluttering and falling to at the delicacy. "Look at that!" he said to Phelps, who, looking, saw the little bird which had been rebuked still sitting disconsolate in the place of its humiliation. "Poor little fellow!" said the master, soothing it. Then, instead of joining in the revelry, the grateful creature flew on to his shoulder, and there plucked up courage and looked as bold as ever. But now a beautiful little English tomtit, with a yellow frill round its neck, fluttered out from the banquet, and kept flitting to and fro in front of Mr. Lane's face, and pretending to peck at his beard, until he gave it a finger, and caressed it with his other hand.

"I thought you left your canaries in Germany," said Phelps.

"So I did," replied Mr. Lane. "But the same sense of solitude which first made me take to them out there came over me here, and I got that old bird with her mate sent over. The mate died, but she had hatched eggs to continue his race, and all the others are men of Kent and women of Kent."

Perhaps he went on to say more, evidently wishing to obscure the acknowledgment of loneliness which had escaped him. But Phelps listened to no word beyond that, and when Mr. Lane ceased, said, "You told me, when I last begged you to join me, that you never felt lonely now."

"Nor do I, *now*," was the reply.

"But," urged Phelps, "you assuredly have been growing melancholy for a year or more."

"I assure you, it is my habit," pleaded Mr. Lane. "Your visit in Germany roused me out of it, and did really soothe me by awakening my deep sympathy for you. But after I had been here a while there came a relapse. Your burden, my boy, is not like mine. You are afflicted. You sorrow, and are chastened by sorrow. Your heart may be lonely, but your soul is not oppressed within you, as mine is. There is so much awful and horrible misery in the world, one must either be melancholy or—"

"Or what?"

"I don't know."

"Or sociable," said Phelps, and coming up to his friend he looked him eagerly in the face with dark splendid hazel eyes lit with the glow of a loving heart. Then added, "Come to me, Bedford, I will find a nook for your birds, and we will read all the new books together."

But Mr. Lane turned half aside, sadly, not caring to return that steady gaze with one less honest, less generous. "I know it must make you mad," he said, "to ask a wretched fellow like me so often to come and be happy, and to be refused. But remember, my dear old boy, you are the prince, I the churl."

"Then you *will* not come?" Phelps rejoined, with ill-concealed chagrin.

"No, I *will* not," returned Mr. Lane. "I tell you, Henry, you are a year older than I, and a century wiser, but you judge wrong in this matter. It would not be well for you or me that we should live together."

So far Lane spoke sincerely. Then by way of carrying conviction to his hearer's mind he became insincere. "Suppose," he said, "after I had become very dependent upon your society and intercourse, you were to marry again!"

At this point in the conversation the little blue tom-tit, which had a most insinuating way of moving its head and eye, and pecking with its tiny beak (looking at its master's eye between each peck), sprang with a flutter of its delicate wings from Mr. Lane's finger to Phelps's wrist, as if by some subtle instinct it knew that he suffered pain at the hand of its master. Lane's fiery black eyes, which contrasted strangely with his dark russet eyebrows and hair, now filled with sudden tears. "Forgive me, my dear boy!" he cried, passionately. Somehow or other he often called his senior a "boy." "I trifle with feelings which ought to be sacred to me above all men. I did not mean that. I am a brute as well as a churl. The truth is, my Henry, I'm—"

Here he paused for a long minute, and Phelps said, gravely, "You are neither brute nor churl, Bedford; but what *are* you, that you hesitate to say?"

"I am beginning—nay, more, I have begun—to believe things which you don't believe. Too close a companionship with you would unsettle what little faith I have. Even as it is I often get a chill from you

which throws me back, and makes things seem incredible which I have resolved to believe."

The little bird jumped, in its pretty, coaxing way, up the fore-arm of Mr. Phelps, and gazed steadfastly into his eye.

That learned and candid gentleman did certainly feel somewhat aggrieved. So he was a radical iconoclast, a disturber of faith, a quencher of smoking flax! He, H. P., M.A., LL.D., late H.M.I. of S., in the confidence of the Privy Council!

But the man who, not having yet attained to "self-knowledge," if he be still unwittingly a Jew, Turk, infidel, or heretic, yet having "self-reverence" and "self-control," will not give place to anger, but will allow the feeling to pass away, and then reason with his traducer.

"Let us go for a stretch on the hills," Mr. Phelps said now. "The fresh air will give us both a tone which this valley robs us of. And I shall meet my boys coming home with their boy-master."

And forth they went, saying no more just then about faith or heresy.

"That was a dear little bird that made those pacific overtures to me," Phelps observed, after they had walked in silence for some time.

"Yes," his friend answered. "My guardian angel inhabits that little form. The bird attached itself to me in the November after we came here, at a time when I was undergoing a fierce though unseen conflict. It was a wild bird then, but lost its mate, and came to live with me of its own free-will. Now it flies into my room every night, and roosts on the rail at the foot of my bed, just under the crucifix."

OBSERVATORIES IN THE UNITED STATES.—II.*

V.—CAMBRIDGE OBSERVATORY.

A LOOK into the earlier annals of the observatory of Harvard repays the inquirer at the outset by revealing the interest in astronomical pursuits which was felt in the old Bay State many years before the founding of an observatory was practicable in this country. In 1761 the *Province* sloop was fitted out at the public expense to convey a Harvard professor, Winthrop, to Newfoundland, to observe the transit of Venus of that year; and in the troublous times of 1780 the old "Board of War" fitted out the *Lincoln* galley to convey Professor Williams and a party of students to Penobscot, to observe a solar eclipse. At so early a day was

New England disposed to encourage scientific observations!

In 1805 Mr. John Lowell, of Boston, was consulting with Delambre, in Paris, on astronomical observatories, and forwarding his information to the Hollis professor, Webber, who even then indulged the hope of seeing an observatory founded. Ten years later a committee of the university, of which the celebrated Bowditch was one, gave Professor W. C. Bond detailed instructions of inquiries to be made on his visit to the Royal Observatory of Greenwich as to buildings and instruments. On Mr. Bond's return a model dome was constructed by him, and other models were obtained from Germany preparatory to establishing an observatory. The necessary funds, however, could not be raised until the year 1839, although the design was revived in 1822, and again the next year, under the urgency of John Quincy Adams,

* In this paper it is proposed to sketch the progress of such observatories only as have been enabled to make marked advances in independent research outside of their educational service. For numbers I to IV. see *Harper's Magazine* for March, 1874.

then Secretary of State, who offered conditionally \$1000 toward the object.

In 1839 an observatory was erected on the Dana estate, and the observations which had been authorized by the United States government to be made in connection with Lieutenant Wilkes's exploring expedition were conducted by Professor Bond until the year 1842.

A new issue now arose. The sudden appearance of the splendid comet of 1843 was, happily, the occasion of final success in the founding of the present institution. Cambridge was immediately appealed to for information about this strange comet.* But the observers had no parallactic instruments or micrometers of the least value for its observation. While they were endeavoring to obtain data to compute the comet's orbit, a meeting of citizens was held, under the sanction of the American Academy, to take measures for procuring a first-class equatorial. Lawrence, Pickering, Peirce, Appleton, Eliot, and Bowditch were names sufficient to insure success. Hon. David Sears offered conditionally \$5000 for a tower; and the needed amount of \$20,000 for the instrument was contributed in Boston, Salem, New Bedford, and Nantucket. The equatorial was ordered from Merz and Mähler, of Munich, and Harvard determined to erect a new observatory. The location selected was eighty feet above tide-water and fifty feet above the plain where the soil was found favorable for the stability of piers for the instruments. In 1844 the buildings were occupied, and an equatorial of forty-four inches focal length, and two and a half inches aperture, and a transit instrument loaned by the United States, were temporarily mounted for observations until the arrival of the great refractor. This was placed in position June 24, 1847.

Among the earlier objects on which systematic observations were made with the

CAMBRIDGE OBSERVATORY.

new instrument were the nebulae of Andromeda and Orion. "These nebulae," said Professor Bond, "were regarded as strongholds of the *nebular theory*; that is, the idea first suggested by the elder Herschel of masses of matter in process of condensation into systems." Orion's nebula had not yielded to either of the Herschels, armed even with their excellent reflectors, nor had it shown the slightest trace of resolvability under Lord Rosse's three-foot reflector. Bond announced, on September 27, 1847, that the Cambridge refractor, set upon the Trapezium under a power of 200, resolved this part of it into bright points of light, with a number of separate stars too great to be counted. With a power of 600, "Struve's Companion" was distinctly separated from its primary, and other stars were seen as double.

Within a few years yet more brilliant discoveries followed. Among them the inner ring of Saturn and its eighth satellite, the coincidence of which latter discovery on the same day (September 19, 1848) at Cambridge and in England in no wise detracted from the honor due each discoverer. It required, in those times, weeks before the discovery, indeed, could be mutually made known.

In 1850 Professor W. C. Bond, with his sons, invented the spring governor, which gave an equable rotary motion to the revolving cylinder of the chronograph. This was the first and most valuable improvement on Mitchell's horizontally revolving disk, the original of which is still to be seen at the Dudley Observatory. The observer at the telescope could now, by means of a break-circuit key in his hand, record his observation instantaneously on the paper covering the cylinder among the second beats of the clock marked on it, so that observations can afterward be easily read within the tenths of a second. The observatory having been placed in 1849 on a permanent endowment by the legacy of \$100,000 from Mr. E. B. Phillips, a young graduate of Harvard, and a fund for printing its results having been also provided by the will of Hon. Josiah Quincy, Jun., the reports of the first systematic zone observations appeared in 1855 as Part II. of Vol. I. of the *Annals*. This zone cat-

* In the wilds of South America the untutored Indian, looking on this same comet, exclaimed to a traveler, "This is the Spirit of the Stars, the dreadful Capishi! famine and pestilence await us." The same celestial visitor astounded the Mohammedans at Constantinople like the fiery spectre which four centuries before struck terror into Mohammedan and Christian. But as the visit of this stranger of 1843 secured to Harvard her observatory, and Encke's comet, the previous year, secured the Naval Observatory at Washington, we may be excused from joining any longer in the latter part of the prayer ordered for us by the Pope in 1456, "Save us from the devil, the Turk, and the comet!" We must not, however, forget that these visits were the occasions only of the good effected; the real causes were the astronomical work previously accomplished and the united influences working at this era of 1842-43 for the progress of astronomy.

CAMBRIDGE EQUATORIAL.

atalogue comprises 5500 stars, situated between the equator and $0^{\circ} 20'$ north declination. The second volume, published in 1857, embraced chiefly observations of the planet Saturn made during a period of ten years; of the measurement of its ball and rings; of the disappearance of its ring; the encroachment of the ball upon it; the discovery of the new ring, and of Hyperion, the eighth satellite. The text is illustrated by ninety-four drawings of the planet, as observed at different dates. The second part of this Vol. II. is a zone catalogue of 4484 more stars in the same zones as those observed before 1854. It was not printed until the year 1867. The splendid Vol. III., published in 1862, is a quarto of 372 pages, with fifty-one plates almost entirely illustrative of the great comet of the Italian astronomer Donati, which appeared in such different forms in this country from those seen in England. These plates were published by individual subscription.

The Great Nebula of Orion was the other chief object of the observatory up to the death, in 1849, of Professor W. C. Bond, the father, and thence to the death of the son, Professor G. P. Bond, in 1865. The observations of this constellation form the latest as yet published volume of the *Annals*, issued, in 1867, under the supervision of Professor T. H. Safford, then director of Dearborn Observatory, but formerly in charge at Har-

vard as assistant in the observatory.

This nebula has been the object of observations by the Earl of Rosse with his two great reflectors for the space of nineteen years—observations the results of which, with handsome drawings, are to be found in the *Transactions of the Royal Society for 1868*. For Mr. G. P. Bond's work on these, and especially for his observations on Donati's comet, he received a gold medal from the Royal Astronomical Society in 1865.*

Since the year 1866, in which the present director, Professor Joseph Winlock, took charge of the observatory, its work has been yet further most successfully extended into new fields of research. Besides what is known as routine work at all observatories, in the observations of the larger planets, comets, double stars, and nebulae, close attention has been given to the extension and completion of the zones, observations of which form part of the general work of determining star places in

the northern hemisphere, a work undertaken by the Astronomical Society of Germany, aided by many leading observatories. Spectroscopic observations of the sun and of stars and nebulae, and the most careful photographs of the sun, have been frequent. Five hundred drawings of the sun were made between January, 1872, and November, 1873, and five hundred careful drawings of solar prominences in the year 1873. To this work is to be added a great deal of labor given to the determination of longitude differences, and the observations, by Professor Winlock, of the solar eclipse of 1869, at Shelbyville, Kentucky, and that of 1870, at Jerez, in Spain. The general reader, as well as the astronomer, can not fail to be interested in the beautiful pictorial representations of these and

* Mr. Bond was the first American, we believe, to be thus honored with the gold medal of a foreign scientific society.

Professor Watson, of Ann Arbor, and more recently Professor Simon Newcomb, of the United States Naval Observatory, have been the recipients of like honors; the former from the Imperial Academy of Paris, the latter, within this year, from the Royal Astronomical Society of London. It will interest our readers to learn the character of the latest medal. It is equal in weight probably to a double eagle. On one face is the head of Newton, the date of the institution of the Royal Astronomical Society, and the Latin words *Nubem pellente Mathest*. On the obverse is Herschel's telescope, the Latin *Quicquid nitet notandum*, and the name Simon Newcomb, 1874.

of other astronomical phenomena which have been issued by subscription recently from Harvard. "Among them are photographs of the groups of sun spots, and of faculae in visible connection with solar prominences; drawings of a remarkable solar spot, visible from March 28 to April 4, 1872; of Jupiter and Saturn; of the lunar craters Torricelli, Agrippa, and others; and of the solar eclipses of 1869 and 1870. All the drawings have been carefully lithographed, the details, especially the lights and shadows of the lunar craters, exhibiting a very natural appearance." The Council of the Royal Astronomical Society of London, in the monthly notices for February, 1874, invite special attention to these in the language just quoted. The drawings are by Mr. L. Trouvelet.

The great equatorial, made in 1847 by Merz and Mähler, of Munich, has an object-glass of fifteen inches diameter, and a focal length of twenty-two feet six inches. The power of its eye-pieces ranges from 100 to 2000; the hour-circle is eighteen inches in diameter. The movable portion of the well-balanced instrument is estimated at three tons. Its original cost was about \$20,000. The sidereal motion given to this telescope is now secured by clock-work from Alvan Clark, which is spoken of by the observers as the only known "driving clock working with perfect steadiness." The telescope rests on a central granite pier, in constructing which five hundred tons of granite were used. It is forty feet high, and rests on a wide foundation of grouting twenty-six feet below the ground surface. Upon the top of the pier is laid a circular cap-stone ten feet in diameter, on which is the granite block, ten feet high, bearing the metallic bed-plate. This instrument is in the central "Sears Tower."

The meridian circle was mounted in the west transit-room in 1870. It has modifications, introduced by Professor Winlock, not usually found in transit instruments, chiefly, that the graduated circles are directly above the piers, the bearings of the pivots being carried by iron standards; the axis friction rollers rest on rods rising from the base of the piers and counterpoised below the floor. The pivot circles and reading microscopes are protected by glass casing; the object-

glasses of the transit and of each of its collimators, made by Clark, are each eight inches.

In the west dome is another Clark equatorial, made in 1870, with an object-glass of five and a half inches. In the east wing is the transit circle made in Professor Bond's directorship by Simms, of London. Its focal length is sixty-five inches, its object-glass four and one-eighth inches; its circles are four feet in diameter, read by eight microscopes to single seconds.

Cambridge possesses a number of more modern instruments, constructed to meet the wants of astronomical investigations at this day. The broken or "Russian transit," made by the mechanician of the Pulkova Observatory, under Struve's directorship, is the first of its kind introduced into this country. It has been in use during several campaigns for determining differences of longitude. By adding a simple attachment Professor Winlock has made it available as a zenith telescope.

The spectroscopes, photometers, and pho-

CAMBRIDGE MERIDIAN CIRCLE.

The photometer, or light measurer, made by Zöllner, has been used for three years by Assistant Professor C. S. Peirce. The design is the accurate measurement of the magnitudes of all stars in Argelander's *Uranometria* between 40° and 50° north declination, determining these magnitudes on a scale of uniform ratios of light, so that the probable error of one observation shall not exceed the tenth of a single magnitude. The great object of this is, that throughout Europe and the northern part of the United States there will be constantly enough of accurately determined stars near the zenith to serve as comparisons for any star visible to the naked eye whose magnitude is to be estimated. The secondary object is the prosecution of inquiries with regard to the distribution of the stars in space, their magnitudes and variability.

tographic apparatus are peculiar in form and power. The spectroscope used with the west equatorial in solar observations powerfully disperses the rays of light, which are carried twice through a train of prisms. In photographing the sun a lens of long focus is used, the light being thrown upon it by movable plane mirrors. This plan of Professor Winlock's has been adopted by the astronomers who have gone out under our government to observe the transit of Venus December next.

given from this observatory to the State-house and other places in Boston, and by means of the telegraph lines to the whole of the New England States. It is received directly at noon each day without the intervention of any operator; the various lines being merely switched into the time line, the same click is heard at the same moment over the Eastern States.

Much more, however, than this is done for securing accuracy of time at any hour of the

CAMBRIDGE STAR SPECTROSCOPE.

day. If any one wishes to learn not only what the true time is, but whether his own watch is a good time-keeper, he may readily do so by a visit to the State-house in Boston. The arrangement for this, introduced by Professor Winlock, is as follows: The observatory clock is put in circuit at one end of a telegraph line, connected with which, at the State-house and other points, is an ordinary telegraph sounder. When the clock breaks the circuit by every second swing of the pendulum, a click of the armature of the sounder is heard at each of these points. The clock being so arranged that at every fifty-eighth second the break ceases, and at every even five minutes twelve breaks cease (no clicks being then heard), any person can, by listen-

ing to the sounder, compare his own watch with the standard clock. He can tell whether his watch is fast or slow by watching when the sounder ceases, the first click after the short pause being always the beginning of the minute, and the first click after the long pause the beginning of an even five minutes, as shown by the face of the clock in the distant observatory.

This standard motor clock is of course regulated with extreme care. It is customary, for the government of its rate of motion, to use shot of different sizes, which, according to the size, produce a change in the rate of the pendulum varying between 0.05 and 0.10 of a second per day. These are used as the astronomical correction for clock error may require. The time given by the standard clock thus regulated is that of the meridian near the State-house, sixteen seconds east of the observatory. Professor Winlock considers that the use of the telegraph sounder gives a more satisfactory accuracy of time than can be given by other clocks which are put within the circuit and controlled, as is usual, by the standard clock; for in their case a variation in the strength of the electric current introduces an error in the beats of the pendulum, but the telegraph sounders must give the time with entire accuracy.

With so much before one at Cambridge of which interesting note could be made, one can do no more than attempt, in this article, to trace its early and munificent en-

CAMBRIDGE SPECTROSCOPE.

dowment, its earliest discoveries under its first laborers, and the steady and recently very rapid advances not only in the highest objects of an observatory—exactness throughout extended series of observations—but in the exercise of professional skill in the invention and manufacture of the best appliances of the day for carrying on these investigations.

VI.—OBSERVATORY OF DARTMOUTH COLLEGE.

Like most other institutions of a purely scientific character, Dartmouth Observatory owes its existence and progress chiefly to private munificence. Dr. George C. Shattuck, of Boston, in 1852 furnished the means for the erection of the buildings and the purchase of the instruments first used. The site of the building is on an elevation of about seventy feet above the college, from which it is fifty rods separated. It commands a fine view of the Connecticut Valley. The foundations of the building are of solid rock—sienitic gneiss. It was erected in 1853. It has double brick walls of fifteen inches, inclosing a continuous air-chamber of six inches. Care has also been taken to make it fire-proof. The cut shows the central two-story rotunda, twenty feet in diameter, and two of the three one-story wings, the eastern measuring thirty-five feet by sixteen, the north and the south wings each twenty feet by sixteen. To defend the instruments and their field of vision from the heating effects

DARTMOUTH COLLEGE OBSERVATORY.

of the sun (producing inequalities of temperature, currents of heated air, and consequent want of clear definition), the outside of the observatory has been recently painted white, while the inside of the dome is painted black, to facilitate the observation of faint portions of the solar spectrum. The present director, Professor C. A. Young, for several years past has made spectroscopic observations a specialty, attaining eminent success in his researches in solar and stellar physics.*

The transit-room, eighteen feet by fourteen, in the east wing, contains the meridian circle, made by Simms, of London. It is thirty inches in diameter, divided on silver to spaces of five minutes, with three reading microscopes. The telescope has a clear aperture of four inches, and a focal length of five feet. It has four positive eye-pieces, and one for collimating by means of a mercurial trough. The granite piers are of the T form, gradually diminishing upward to within ten inches of the top. They are thirty inches apart, rising five feet above the floor, and resting on granite based on the solid rock. The transit-room has a good sidereal clock, with compensation pendulum. It has also an iron-framed zenith sector, by Troughton, loaned to the observatory by the United States Coast Survey.

In the south wing is a complete telegraphic system of wires connecting the observatory with the lines of the Western Union

* The value of these in this day of the advance in spectroscopy prompts the following reference to the chief articles elaborating these researches: *Silliman's Journal*, November, 1869, and November, 1870; May, July, and November, 1871; February, March, and November, 1872; May, 1873. *Journal Franklin Institute*, August, October, December, 1869; July, October, November, 1870; February, November, 1871; October, 1872. *Nature*, March, 1870; February, August, October, 1871; June, November, December, 1872.

Telegraph Company; a printing barometer, of the kind invented by Professor G. W. Hough, late director of the Dudley Observatory; a good chronograph, by Alvan Clark; and an excellent mean-time clock, by Mähler, which runs a month with one winding.

In the central main building the pier of the equatorial rises through the centre in a square of four feet. It is disconnected from the flooring and ceiling. Its cap is

a cylindrical block of granite six feet in diameter.

The equatorial made by Merz and Sons, of Munich, and originally used by Dartmouth, was replaced in 1871 by one of nine inches and four-tenths aperture and of twelve feet focal length, in place of the six inches aperture and eight feet focus instrument of Merz. The new instrument, by our countryman, Alvan Clark, who has distanced all his foreign rivals, is considered by Professor Young to be unsurpassed in excellence and power by any instrument of equal size, and unequaled by any in regard to handiness and ease of manipulation. It is provided with a fine spectroscope, designed by him. For a full description of this instrument the reader is referred to Lockyer's *Solar Physics*, page 167.

The dome of the equatorial is a hemisphere of eighteen feet in diameter. Its entire weight is about twenty-eight hundred pounds, but the average force necessary to preserve a uniform velocity in rotation is about six pounds only. The dome revolves on six cannon-balls of six inches diameter, running in a circular channel three-eighths

SPECTROSCOPE USED BY PROFESSOR YOUNG, DARTMOUTH.

of an inch deep, grooved in a cast-iron rail three inches wide. The foundation of the dome is of circular segments of planks, bolted to the walls below, and covered by the cast-iron rail just alluded to.

The Dartmouth Observatory has been for years busied with independent astronomical research, notwithstanding the pressure on its director for the routine duties of class instruction. Professor Young took part in the observations of the memorable solar eclipse of August 9, 1869, using for this the observatory comet-seeker and spectro-scope. In the observation of the eclipse of December 22, 1870, he used, at Jerez, Spain, the six-inch telescope and the new spectro-scope. In 1872, under the auspices of the Coast Survey, he planted his new equatorial at Sherman Station, the summit of the Pacific Railroad, testing with great success the advantages which that elevation seemed to offer for observation in a rarity and clearness of atmosphere to be found at the height of 8300 feet.

It is pleasant to entertain the hope that this venerable institution of Dartmouth, which has graduated so many sons attaining eminence in the several learned professions, may separate the chair of astronomy from that of physics, and, by securing the endowment of the former, open the way for further success in astronomical research. Will any graduate or friend of Dartmouth take example from Phillips of Harvard?

VII.—DUDLEY OBSERVATORY.

In 1851, Professor O. M. Mitchel having accepted an offer to become the director of an observatory at Albany, the sum of \$25,000 was readily subscribed in the city, and a valuable site within its limits was donated by Stephen Van Rensselaer. An observatory had been first proposed by Dr. J. H. Armsby as one of the departments of a university for Albany.

The building, erected on a spacious and beautiful eminence, is in the form of a cross, eighty-four feet square, with east and west wings, each twenty-three feet square, for meridian instruments, and a north wing forty feet square, for a library, computing-rooms, and magnetic apparatus. There is a separate spacious residence for the director and his assistants.

In the second story the equatorial-room is a circle of twenty-four feet diameter, with revolving tower. Its pier rests on a bed of concrete and rubble of sixteen inches, its base being fifteen feet square, diminished to

GROUND-PLAN OF DARTMOUTH OBSERVATORY.

ten feet square from the level of the cellar; well built and well bedded. The foundations for the instruments are each six feet by eight, and each room is furnished with clock piers. The walls of the observatory are of brick, but the basement, portico, and cornices are of dressed freestone. The structure is an imposing one.

On entering the vestibule the visitor receives very pleasing impressions from its appropriate adornments. Facing the door is a fine marble bust, executed by Palmer, of Albany, with the inscription:

CHARLES E. DUDLEY,
BY BLANDINA, HIS WIFE.
Dedicated to Astronomy.

On the right is a handsome portrait of Professor Mitchel, with the inscription:

O. M. MITCHEL, Director of Dudley Observatory,
Major-General U.S.A.
Died at Beaufort, South Carolina, October 30, 1862.
"Love God, your country, and one another."

On the left of the vestibule is the portrait of the young astronomer, August Sonntag, who went out with Kane's and Hayes's expeditions. Under this are the sad words, "Perished in the ice at Port Foulke, latitude 78° 17' 14" north, December 28, 1860." On the faded United States flag draped above the young man's head you read the words, "From his class in Albany Female Academy, June, 1860;" and you will hear a sad story of one who is believed to have been sacrificed by the selfishness of a companion.*

* His death has been by some attributed to the treachery of the Esquimaux Hans; Dr. Hayes expresses doubts as to Hans's fidelity, but says it would be unjust to accuse him of deserting Sonntag. Hans accompanied the late *Polaris* expedition, under Cap-

DUDLEY OBSERVATORY.

Two marble tablets facing as you enter the library present the names of the chief donors, among whom are Dudley, Olcott, Rathbone, De Witt, Van Rensselaer, Armsby, and twenty-six others, of Albany; of Gerrit Smith; of Thayer and Gould, of Boston; and of Low, Law, Brown, Chauncey, Minturn, and forty-eight others, of New York city.

In the library you face a large painting representing the dedication of the observatory, August 28, 1856. The portraits of the chief donors, and of the State and city authorities who were present on that day, are said to be life-like; chief among them all stands the gifted Everett, delivering one of his finest orations.

In the east wing the meridian circle has an object-glass of eight inches, with a focus of ten feet. Its circles are thirty-six inches in diameter, divided to two seconds, read by eight microscopes to seconds of arc. This instrument is wholly of brass, and is a superior piece of workmanship from Pistor and Martins. Its piers are six feet by two, nine feet in height, each weighing seven and a half tons—among the largest to be found in observatories. By the device of Dr. Gould, they were covered with heavy cloth, and the cloth sheathed with wood, to protect the stone from sudden changes of temperature. The circle was the gift of T. H. Olcott, Esq.

The transit instrument has an object-glass of six inches and three-eighths; its focal length is eight feet. Its piers are seven and a half feet high, weighing each four and a half tons. Attached to this instrument is the star charting instrument, printing the declination and magnitude of the stars observed. The same telegraphic key which registers these, records accurately the right

ascension also on the chronograph. In this way three results are obtained at once with the exactness of a star chart.

tain Hall, and has an excellent name from its survivors. In the month of May, 1878, a party under Dr. Bessels and young Bryan, the astronomer of the expedition, visited Port Foulke, and discovered that the Esquimaux had desecrated Sonntag's grave for the wood of his coffin. They collected and replaced his remains, and renewed his simple epitaph.

The equatorial object-glass has thirteen inches aperture. Its focal distance is fifteen feet. Its mounting is of cast iron. It is supplied with six eye-pieces, the usual micrometers, and a driving clock. The comet-seeker is one of Clark's. Its focus is three and a half feet, and aperture four inches.

The mechanism of one of the astronomical clocks, made by Fasoldt, of Albany, has secured a more constant rate than is usual.

The printing chronograph was the invention of Professor G. W. Hough, until very recently the director of the observatory. It printed the observations on a slip of paper in minutes, seconds, and hundredths of seconds, saving the labor and time usually consumed in measuring up the work of a recording chronograph. In the library is the Schentz calculating machine, presented by Mr. Rathbone, of Albany. It is the first of its kind constructed, and is very useful in certain astronomical calculations. It has been used almost exclusively in producing a new set of refraction tables. From the mean-time clock, with its automatic apparatus by Hough, the time has been daily telegraphed over the lines as far west as Buffalo, and south to New York.

The Dudley Observatory was supplied with meteorological apparatus invented by Hough, and constructed under his supervision.

In 1872 Dr. Armsby, who has so steadily befriended the observatory, urged the propriety of observations in terrestrial magnetism, spectrum analysis, and celestial photography. Liberal subscriptions were again made in Albany, Mr. Olcott subscribing, among others, \$5000. Buildings for this work have been commenced. For observations in terrestrial magnetism an underground room is building, to secure uniformity of temperature. No metals whatever are to be used in this building.

For investigations in celestial photography, Mr. Clarence Sterling, of Bridgeport, Connecticut, an amateur astronomer, who has been for several years spending his time and means at this observatory, has been constructing in a well-furnished laboratory a reflecting telescope of Cassegrainian form, with silvered glass mirror of twenty inches diameter, and of heavy mounting.

The donations made to Dudley Observatory from the date of its establishment have been certainly liberal, exceeding in all \$200,000, Mrs. Dudley's gifts alone amount-

ing to \$105,000. And the observatory has not failed to do good service in its sphere. Recently, in expectancy of extending its usefulness, it has united itself with several professional schools in Albany, as designing to offer a post-graduate course in connection with Union College, Schenectady, under the name of the Union University of New York. It is to be hoped that, however promising such an arrangement may prove for educational and astronomical purposes, the original character and aims of the institution for independent discovery and research will be maintained. The Dudley Observatory was consecrated to these by the donations of its chief founder; the buildings were planned under the direction and supervision of Professor Mitchel; it was inaugurated by the masterly astronomical oration of Everett; and on that day three of the first astronomers in the land, Bache, Peirce, and Gould, extended their co-operation, and pledged their reputation that "scientific success should fill up the measure of the hopes and anticipations of its founders." Its future can not be permitted to disappoint these; it will be liberally sustained and efficiently directed. Plans for this are, we believe, now maturing.

VIII.—LITCHFIELD OBSERVATORY.

The erection of an observatory in connection with Hamilton College, Clinton, New York, grew out of the successful efforts of Professor Charles Avery, who secured in 1852-53 the sum of \$15,000 for a first-class telescope of American manufacture. The observatory was erected in 1854. It consists of a central main building twenty-seven feet square, two stories high, with a tower twenty feet in diameter, revolving on eight cast-iron balls on an iron track, and of two wings each eighteen feet square, one of which contains the transit instrument; the other is the director's office. Two handsome towers are now proposed for new instruments.

In the tower the great equatorial, made by Spencer and Eaton, has an object-glass of 13.5 inches in diameter, and focal length of nearly sixteen feet; it is provided with a full set of positive and negative eye-pieces, by Spencer, Tolles, and the Steinhilfs, and with a ring and a filar micrometer. For solar observations it has a prismatic polarizing eye-piece of original construction, by R. B. Tolles. The declination circle of twenty-four inches reads by means of four verniers to four seconds of arc; the hour-circle of fourteen inches

by the verniers reads to two seconds of time. The instrument is mounted on a granite shaft nine feet in height, resting on a pier of solid masonry. The clock-work, with Bond's escapement and governor, causes the telescope to follow the daily motion of the stars by acting on long arms attached to the equatorial axis.

The portable transit in the west room is of two and a half inches aperture, and has a cast-iron folding stand, invented by Würdeman, of Washington. It was the gift of Hon. A. S. Miller, of Rockford, Illinois. The transit-room has one of Bond's astronomical clocks, regulated for mean time, and provided with a break circuit, a Bond chronograph, a sidereal chronometer, with Hartnup's improved compensation balance, and a Morse telegraph apparatus.

The director of the observatory, Dr. C. H. F. Peters, during his late visit to Europe, procured a fine comet-seeker of five inches aperture, the work of the distinguished optician Mr. Hugo Schröder, of Hamburg. It is mounted on a tripod stand, with setting circles for altitude and azimuth; has powers ranging from 25 to 275, and a ring micrometer. The instrument was exhibited at the last meeting of the German Astronomical Society, and its defining power declared by competent judges to be of a beauty seldom reached in telescopes of so difficult construction as comet-seekers.

Among the astronomical labors of the observatory have been the following important and successful operations: In 1859, by the exchange of star signals with Harvard College Observatory, the longitude of Litchfield Observatory was accurately determined to be 17 minutes 6.46 seconds west of Cambridge. In its turn this observatory already has become the basis of several longitudes in the State, determined under the auspices of the Regents of the University, at Buffalo, Syracuse, Elmira, Ogdensburg; and the longitude of the Detroit Observatory at Ann Arbor, Michigan, which latter formed

OBSERVATORY AT HAMILTON COLLEGE.

the fundamental point for the longitudes of the Lake Survey by the United States, now under charge of General C. B. Comstock, United States Engineers. The longitude of the western boundary of the State of New York also has been determined.

The observatory took its share in the observation of the solar eclipse of August 7, 1869,

by using, at Des Moines, Iowa, a fine portable telescope, made by Steinheil, of Munich, which instrument was the liberal gift of Mr. Edwin C. Litchfield, who also defrayed the cost of the expedition organized for the observation. This telescope has a focal length of five feet, is mounted parallaxically on a solid iron tripod, with setting circles for right ascension and declination. It has two terrestrial and six astronomical eye-pieces, a ring and a scale micrometer, a sliding wedge for moderating the light, and a direct-vision spectroscope. The aperture of its objective is four (French) inches.

To the rapidly increasing number of planetoids discovered within the last ten years Dr. Peters has had the honor of adding the following twenty: in 1861, Feronia; in 1862, Eurydice and Frigga; in 1865, Io; in 1866, Thisbe; in 1867, Undine; in 1868, Ianthe and Miriam; in 1869, Felicitas; in 1870, Ate and Iphigenia; in 1871, Cassandra and Sirona; in 1872, Gerda, Brunhilda, and Alceste; in 1873, Antigone, Electra, and Vala; in 1874, Hertha.

It is pleasant to learn that the Hon. Edwin C. Litchfield, of Brooklyn, an alumnus of Hamilton College, in 1866 placed this observatory, by the gift of a liberal endowment fund, on a permanent footing, whence, by resolution of the trustees, it received its present name. Further improvements are now designed. Two towers are soon to be put upon it, and the building otherwise improved. The munificence of an intelligent benefactor secures the appliances for a brilliant future for Clinton.

IX.—OBSERVATORY OF MICHIGAN UNIVERSITY.

The erection of an astronomical observatory at Ann Arbor in connection with the University of Michigan is to be credited to the enterprise of Dr. Tappan, its chancellor in 1852, and to the liberality chiefly of citizens of Detroit. The original building was completed in 1854. It was thirty-four feet

UNIVERSITY OF MICHIGAN.

square, with two wings, each twenty feet by thirty-two, the east wing being designed for a meridian circle, the western for computers' rooms. In the main building a pier of solid masonry, with foundation fifteen feet below the ground surface, and disconnected from the building, rises thirty-five feet through the centre for the support of the equatorial. Its hemispherical dome is twenty-three feet in diameter, and is supported and moved on five cannon-balls. The telescope was constructed in 1857 by the late Henry Fitz, of New York. It is the second equatorial made by Mr. Fitz for Ann Arbor, the first instrument having an objective of somewhat smaller diameter, and being of less stability. The instrument which of late years has done such effective work in the hands of Professor Watson has a clear aperture of twelve inches and five-eighths, and a focal length of seventeen feet. It is provided with an achromatic finder, the usual complement of eye-pieces, positive and negative, a filar micrometer, and driving clock. It has circles larger and more carefully graduated; its polar axis is of bell-metal in place of iron, and it is mounted on a stone pier instead of the mahogany stand of the first equatorial. The director of the observatory, having under a variety of circumstances applied tests of its optical performance, considers it the *chef-d'œuvre* of Mr. Fitz's excellent workmanship. The whole cost has been about \$9500.

The east wing contains a meridian circle, by Pistor and Martins, of Berlin. Its telescope has six and a half inches clear aperture, and nine feet focal length. Its divided circles are thirty-nine inches diameter, divided on inlaid bands of silver to two minutes of arc. They are read by eight microscopes. The instrument is provided with collimators, reversing stand, parasol, and other appliances. The gift of Mr. H. N. Walker, of Detroit, it is considered one of the largest and best of its kind. The sidereal clock is by Tiede, of Berlin, having a

magnetic break circuit for record of observations on the chronograph.

The west wing contains a chronograph, with Bond's isodynamic escapement, for recording by the electro-magnetic method. It has also a four-inch comet-seeker, by Fitz, and a Negus sidereal chronometer.

The observatory is in direct connection with the lines of the Western Union Telegraph Company, and with those of the Michigan Central

Railroad; time signals are transmitted regularly to those companies, and to Detroit, Toledo, Chicago, and other cities.

In 1867 a residence for the director of the observatory was erected as an addition to the west wing, making of the whole a very handsome structure, finely located on an eminence one hundred and fifty feet above the Huron River, and about half a mile from the University Square. The horizon is unobstructed in all directions.

The new building is twenty-eight feet by thirty-six, with a height of three stories, and the whole structure has a front of one hundred and two feet east and west, with an average depth of thirty-four feet. The whole cost of erection of the observatory and residence has been about \$20,000; of the instruments, \$17,000.

The university contributed about one-third of the whole cost; \$2500 were donated by the city of Ann Arbor; and among the liberal contributors, besides Mr. Walker, we find the names of Hon. Lewis Cass, Hon. Z. Chandler, Hon. J. F. Joy, J. W. Brooks; and those of Messrs. Rice, Sheley, Owen, Baldwin, Bull, Litchfield, Waterman, Wight, Smith, and Dwight, and of Mrs. C. H. Jones, citizens of Detroit.

The observatory has had the best services of two eminent professors for its directors. Dr. F. Brünnow, from Berlin, now director of Dunsink Observatory, near Dublin, came over to America to enter on duty at Ann Arbor in 1854. He superintended the mounting of the instruments, and was professor and director from 1854 to 1859, and again from 1860 to 1863, when he returned to Europe. During his connection with the observatory, besides furnishing many valued contributions to the home and foreign astronomical journals, he published an enlarged edition of his *Spherical Astronomy* (*Lehrbuch der Sphärischen Astronomie*), also tables of Flora and Victoria. In 1859 he was associate director of Dudley Observatory, Albany.

OBSERVATORY OF MICHIGAN UNIVERSITY.

In 1857 James C. Watson, a student who had been assisting Dr. Brünnow, was appointed assistant observer; in 1863 he was made Professor of Astronomy and director. Since that year, besides the usual routine observation work, and that adapted for daily instructing the students of the university and resident graduates, Professor Watson has been eminently successful in his discoveries, resulting from the observations of small stars near the ecliptic.

The object of these observations has been the construction of star catalogues and charts, but in the progress of his work he has discovered of the group between the orbits of Mars and Jupiter the following named asteroids: in 1857, Aglaia; in 1863, Eurynome; in 1865, Io; in 1867, Minerva and Aurora; in 1868, Hecate, Helena, Hera, Clymene, Artemis, and Dione; in 1871, Thyra; in 1872, Althæa, Hermione, and Nemesis; in 1873, Æthra, Cyrene, and a third of twelfth magnitude not yet named. He also discovered two telescopic comets, deserving, as do all such observers, none the less credit for these (or for one or two of his asteroids) because other observers were *afterward* found to have seen them also.

These labors of the professor, besides his observations of the great solar eclipse of 1869 in Iowa, and that of 1870 at Carlentini, Sicily, and his preparation for his students* of the *Theoretical Astronomy* (now adopted as the text-book in several European universities), have given him high rank among American astronomers. For the observations of the transit of Venus, December 8, 1874, he has accepted the position of chief

* An examination of the latest rolls of the flourishing University of Michigan shows us the large number of eighty-eight young women as students in all the classes. The increase is remarkable; the strong commendations of President Angell of the system of their admission not less striking. Will a Somerville in the physical sciences, or a Caroline Herschel, adorn the institution and the professor's instructions?

of the party whose station will be Pekin, China.

X.—OBSERVATORY OF THE SHEFFIELD SCIENTIFIC SCHOOL, YALE COLLEGE.

The observatory occupies two towers, each sixteen feet square, recently added to Sheffield Hall. In one of these is mounted an equatorial telescope, in the other a meridian circle with a sidereal clock, both telescope and circle being the recent gifts of Mr. Sheffield.

The equatorial telescope, made by Messrs. Alvan Clark and Sons, of Cambridgeport, was mounted in 1866 in the revolving turret at the top of the front tower, eighty feet above the ground, where it commands a good horizon. It is supported by a freestone pier six feet in height, which stands on a massive floor of masonry arched in from the side walls just above the tower clock. The floor of the room, which is of wood, immediately above the stone floor, does not touch the pier.

The object-glass of the telescope has a clear aperture of nine inches, and a focal length of nine feet ten inches; the tube is of pine, ten inches in diameter; it is at once stiff and light. Seven Huygenian eye-pieces give powers ranging from 40 to 620. All but one of these fit a diagonal eye tube con-

taining a prismatic reflector. Another diagonal reflector—the first surface of an acute prism of glass—is used in observing the sun, the greater part of whose light and heat is transmitted, while the image formed by the reflected rays is viewed without inconvenience with the full aperture of the telescope.

The equatorial mounting is the German, or Fraunhofer's, the declination axis carrying a circle of twelve inches diameter, graduated on silver so as to read by two verniers to ten seconds, and the polar axis carrying an hour-circle of nine inches diameter, graduated to minutes of time, and reading by two verniers to five seconds.

Beneath the polar axis, in the curve of the U-shaped iron piece by which that axis is supported, is placed the driving clock. Its going is regulated by a half-second pendulum, and the intermittent motion of the scape-wheel is changed into a smooth and equable motion for the telescope by the simple and ingenious device known as "Bond's spring governor."

The performance of the telescope accords with the reputation of its makers. On favorable nights it shows easily such test objects as δ Cygni, the companion of Sirius, the sixth star in the Trapezium of Orion, and, with more difficulty, ν , Andromedæ.

The revolving turret, resembling in form that of a "Monitor," rests by a circular rail at its base on eight grooved iron wheels nine inches in diameter, the steel journals of which run in boxes of Babbitt's metal. It is turned by a crank, the pinion of which gears into a rack cast on the circular rail. The opening, three feet in width, extends entirely across through the roof and sides from base to base. It is closed or opened by eight hinged shutters with great facility.

The tower of the west wing was erected in 1866 specially for the reception of the meridian circle purchased of the United States government, and formerly used in the United States Naval Observatory. This instrument is mounted on the massive granite piers which came with it, the bases of which are imbedded in the upper part of a shaft of solid masonry thirty-six feet in height, nine feet in diameter at the base, and seven feet at the top. This shaft, rising independently of the building from a foundation ten feet below the ground surface, is surrounded at a few inches distance by a double casing made of tarred felt and matched sheathing boards—an effective protection against sudden changes of temperature.

The meridian circle has a five-foot telescope, with an object-glass of three and four-fifths inches aperture, and fifty-eight inches focal length. It has three Ramsden eye-pieces. At the focus is a system of one horizontal and eleven vertical spider lines,

OBSERVATORY OF SHEFFIELD SCIENTIFIC SCHOOL.

together with a micrometer thread, movable in declination only. The mean equatorial interval of the vertical threads is $14^{\circ} 16' 7''$.

The axis, thirty inches in length, terminates in steel pivots two inches in diameter, and to opposite faces of its central tube are bolted the two conical frusta forming the tube of the telescope. This tube is so constructed at the ends that the object-glass and eye tube are readily interchangeable. On the axis, within the piers, are two circles forty inches in diameter, graduated on silver; the one to read by a vernier to single minutes, the other by six micrometer microscopes to single seconds. Four of the microscopes are mounted at the corners, and two at intermediate points on the opposite sides of a square alidade frame, which is carried by the axis, and held in position by adjusting screws connected with the pier. The thirty-inch circle originally at each extremity of the axis outside of the piers has been replaced by forty-inch circles inside, by William J. Young, of Philadelphia. The original circle is fully described and illustrated in Vols. I. and II. of *Observations of the United States Naval Observatory*. The observatory is under the direction of Professor C. S. Lyman, and is chiefly used as a training school for students in practical astronomy. Some original observations have, however, been made of considerable interest, among which may be specially mentioned observations of the solar protuberances, and some observations of Venus when very near the sun. These researches will be doubtless much further extended on the observatory's coming into full possession of the very liberal endowments now maturing for its benefit.

OBSERVATORY OF THE ACADEMIC DEPARTMENT OF YALE COLLEGE.

As far back as 1830 Yale received from Dollond, of London, a telescope of five inches aperture and of ten feet focal length, the gift of Mr. Sheldon Clark. The object-glass was considered to be an uncommonly good one for that period, and the instrument pronounced by its maker to be "such a one as he was pleased to send as a specimen of his powers."

The mounting of this instrument was not equal to its optical character, which was excellent for objects requiring a fine light, as the nebulae and smaller stars; its definition was good. The unfortunate location of the instrument in the steeple of the college, from the low windows of which no object above thirty degrees of altitude could be seen, prevented much of the effective service expected from it.

As early as 1835, however, Halley's comet was observed by this instrument, by Professors Olmsted and Loomis, weeks before any observations of it in Europe were made

known in America. An excellent impulse was given by these observations to the plans already formed at Cambridge and in Philadelphia for obtaining superior instruments and the establishment of observatories.

Mr. William Hillhouse subsequently presented to Yale College a transit instrument of five feet focal length and four inches aperture. We are glad to learn from Professor Elias Loomis, formerly of Hudson Observatory, and now professor at Yale, that a dome similar to that on the observatory of the Sheffield Scientific School has been built on the tower formerly containing the Clark instrument. The elevation of the Clark telescope is now about twenty-five feet higher, and an unobstructed horizon has been secured. The telescope can now be readily pointed to any part of the heavens. Students of Yale in the astronomical course have free access to this observatory. Professor Loomis still keeps a lively interest in the pursuit which he embraced almost forty years ago, when he established one of the earliest observatories in the United States, that of Hudson, Ohio, in 1836.

As the concluding lines of these notices of our chief working observatories are written, notice is received by the *Alta Californian* of June 4 of the very liberal act of a Western gentleman, which proves how strong is the appreciation of scientific pursuits in that new section of our country. Mr. James Lick has made a *bona fide* donation of \$700,000 to endow an "observatory on the summit of the Sierra."

SPANISH SONG.

On lips of blooming youth
There trembles many a sigh,
Which lives to breathe a truth,
Then silently to die.
Thou, who art my desire,
Thy languishing sweet love
In sighs upon thy lips shall oft expire.

I love the sapphire glory
Of those starry depths above,
Where I read the old, old story
Of human hope and love;
I love the shining star,
But when I gaze on thee,
The fire of thine eyes is brighter far.

The fleeting, fleeting hours,
Which ne'er return again,
Leave only faded flowers
And weary days of pain;
Delight recedes from view,
And never more may pass
Sweet words of tenderness between us two.

The gentle breeze which plays
On the water murmuringly,
And the silvery, trembling rays
Of the moon on the midnight sea—
Ay! all have passed away,
Have faded far from me,
Like the love which lasted only one sweet day.

THE PURITAN BLOSSOM.

PROVIDENCE, 1640.

GOOD Master Roger Williams saith
I have a heavenly call:
Methinks if Richard Wilde could know
That Master Williams deemeth so,
Then could I bear it all.

Yea, though my mother, dearest soul,
Now I am like to die,
Doth labor with me day and night
To set mine earthly cares aright,
One care I must pass by.

O bitter-sweetening day of spring!
I shut my heavy eyes,
And see again your gracious bloom,
The mystery of your wildwood gloom,
The glory of your skies.

"Sweet Mistress Loveday, in thy prayers
I prythee give me part!"
O goodly voice that haunts me so,
O dear dark eyes, will ye not go
From out my failing heart!

'Tis many days that for mine end
A-longing I have lain.
My mother weeps and prayeth sore;
The more she prays I hear the more
That kindest voice again.

Our godly guide doth give me hope
That Heaven accepteth me;
Alas! I fain would joy in this,
Yet still one care forbids my bliss
And dims eternity.

I know not if he loveth me,
Yet lives he in my heart;
I can but turn me unto death—
And prayer, remembering what he saith—
Therein I give him part.

Good Master Williams whispers soft,
"She hath a heavenly call:"
Methinks if Richard Wilde could know
That Master Williams deemeth so,
Then could I bear it all.

WILLIAM MAKEPEACE THACKERAY.

Wm Thackeray

GIVEN the books of a man, it is not difficult, I think, to detect therein the personality of the man, and the station in life to which he was born. Genius creates, of course, and sympathizes with what it creates; it invents incidents which have never befallen its possessor, and conceives characters dissimilar to his own; still, when all is done, we are never so far imposed upon as to mistake its fancies for facts. There is something in truth that is not to be found in the most plausible of fictions—an air of genuineness that can never be successfully simulated. We feel what is true in books, as we feel what is true in men. I am not certain, indeed, that we do not feel it more surely, and with more pleasure to ourselves. We never fall out with books, for example; but where is the man who has not fallen out with a friend? I can imagine that I might have fallen out with Thackeray, though I have never fallen out with his books. They will not let me, they are so true, so large, so worldly-wise. They are not only the man Thackeray, but they are the epitome of his period and place—the England of the nineteenth century. Who was he who so faithfully depicted the manners of his countrymen, and what were his antecedents and his life?

He was, to begin with, a gentleman, and the descendant of gentlemen. The Thackerays came originally from Hampsthwaite,

near Knaresborough, in the West Riding of Yorkshire. The first member of the family of whom we have any account was Dr. Thomas Thackeray, the great-grandfather of our Thackeray, who was elected from Eton to a scholarship at King's College, Cambridge, in the beginning of the last century, where he took degrees, and reaped honors rapidly. He was a candidate for the provostship of King's in 1744, but was defeated by Dr. George, whose election was promoted by Sir Robert Walpole. Two years later he succeeded to the head-mastership of Harrow, the popularity of which increased under his rule. He is described in a letter of the time as being a great scholar in the Eton way, and a good one every way; and the estimation in which he was held by his superiors is shown by the following anecdote: "The Bishop of Winchester never saw this man in his life, but had heard so much good of him that he resolved to serve him in some way or other if ever he could, but said nothing to

any body. On Friday last he sent for this Dr. Thackeray, and when he came into the room my lord gave him a parchment, and told him he had long heard of his good character, and had long been afraid he should never be able to give him any serviceable proof of the good opinion he had conceived of him; that what he had put into his hands was the Archdeaconry of Surrey, which he hoped would be acceptable to him, as he might perform the duty of it yearly at the time of his leisure in the Easter holidays. Dr. Thackeray was so surprised and overcome with this extraordinary manner of doing him a favor that he was very near fainting as he was giving him institution." Dr. Thackeray seems to have been a prosperous man, for besides being made Archdeacon of Surrey, he was appointed chaplain to Frederick, Prince of Wales, the father of George the Third, and obtained several livings. He had need of them, without doubt, for he had sixteen children, six sons and ten daughters. The former took to the learned professions, as might have been expected, one being vice-provost and bursar of King's College, another a chaplain at St. Petersburg, while two others became doctors of medicine, and settled at Cambridge and Windsor. Two of the daughters married gentlemen in the service of the East India Company, and it was probably through the interest of their husbands that their young-

gest brother, William Makepeace Thackeray, the grandfather of our Thackeray, obtained an appointment in the same service. He married a Miss Webb, who, Mr. Hannay says, was of the old English family to which the Brigadier Webb of Marlborough's wars belonged, and whose portrait is drawn with something of the geniality of kinsmanship in *Esmond*. He returned to England with a competency, leaving his son Redmond to follow the same career. Redmond obtained a writership in 1797, and afterward officiated as judge and magistrate of Ranghyr, secretary to the board of revenue at Calcutta, and collector of the house tax at Calcutta. Here he married, and here, in 1811, our Thackeray was born. His father dying in 1813, he remained in Calcutta with his widowed mother until his seventh year, when he was sent to England. The ship touched at St. Helena on the passage, and he was taken to Longwood, where he saw the great Napoleon. "I came from India as a child," he wrote, years afterward, "and our ship touched at an island on our way home, where my black servant took me a long walk over rocks and hills, until we reached a garden, where we saw a man walking. 'That is he!' cried the black man; 'that is Bonaparte! He eats three sheep every day, and all the children he can lay hands on!'"

Young Thackeray was taken charge of by his relatives in England, and in his twelfth year was sent to the Charter-house School. It was a famous place long before he entered it, dating back to the fourteenth century, when the ground on which it stood was occupied by a monastery of Carthusians. Sir Thomas More devoted himself to meditation

and prayer in its cloisters; and early in the next century it was purchased by Thomas Sutton, a wealthy merchant of London, who endowed it as the Hospital of King James, "for the support of age and the education of youth." He died before he had perfected his good work, and was buried in the chapel. The anniversary of his death is celebrated every year, on the 12th of December, and an old Carthusian melody is sung, the chorus being given with a will:

"Then blessed be the memory
Of good old Thomas Sutton,
Who gave us lodging, learning,
And gave us beef and mutton."

Great men had been numbered among the scholars of the Charter-house. There was Richard Cradshaw, "poet and saint," as Cowley called him—sweetest of sacred poets; Sir William Blackstone, who was a poet before he became a lawyer; Barrow, the great divine; Tooke, the learned author of *The Pantheon*; and, better than all, Joseph Addison and Richard Steele. The memory of these last two worthies was ardently cherished by the young East Indian, who was never weary of recalling his school life at the Charter-house, which figures in his novels as "Grayfriars." It is a pleasant place, as it is described to us. The large central door is surrounded by stones bearing the names of former Carthusians; there are playgrounds for the "Uppers" and "Unders;" there is a gravel-walk by the wall of the old monastery; the head-master has a garden, with a fountain in it; and there are old cloisters, in which the boys play foot-ball and hockey. Thackeray was an inmate of the Charter-house until 1828, when he

became a day boy, or one who resided with his friends, and a first-form boy and a monitor. He does not appear to have distinguished himself, or not more than young Pendennis, who, he tells us, was in no way remarkable either as a dunce or a school-boy. He never read to improve himself out of school hours, but, on the contrary, devoured all the novels, plays, and poetry on which he could lay his hands. He was a better Latinist than Grecian, if we may trust the same veracious chronicles, and Horace was his favorite poet. "The Odes of Horace he knew intimately," Mr. Hannay informs us, "and there are subtle indications of the knowledge—the smell of Italian violets hidden in the green of his

THACKERAY'S HOUSE AT KENSINGTON.

prose—only to be truly enjoyed by Horatians. A quotation from Horace was one of the favorite forms in which he used to embody his jokes." His Greek slipped from him in after-life, but at this time, like Pendennis, he had galloped through *The Iliad* and *The Odyssey*, the tragic playwrights, and the charming, wicked Aristophanes, whom he vowed to be the greatest poet of all.

Thackeray's mother, who had married again, was now in England, and her husband, Major Carmichael Smyth, rented an estate near Ottery St. Mary, where traditions of the young Carthusian still linger. He used to visit the vicar, Dr. Cornish, when he was stopping at home, and borrow books of him, and among those which he is known to have read at this time was Cary's translation of *The Birds* of Aristophanes, which delighted him, and which he returned with three humorous illustrations. The scenery of Clavering St. Mary and Chatteris, in *Pendennis*, is said to correspond in minute particulars with that of Ottery St. Mary and Exeter; and there was a newspaper published in the latter place, the poet's corner of which was occasionally filled with Master Thackeray's verses.

As Pendennis went from "Grayfriars" to Oxbridge after his episode with the Fotheringay, so the future biographer of that sentimental young gentleman went from the Charter-house to Trinity College, Cambridge. Alma Mater could boast then of several children who have since distinguished themselves, chiefest among whom were Arthur Henry Hallam and Charles and Alfred Tennyson. The latter took the prize in 1829 for a poem in blank verse, entitled *Timbuctoo*, which was not a remarkable performance, though considerably better than his friend Hallam's dreary triplets, and the circumstance was celebrated by Thackeray in a burlesque poem on the same theme. It was published in a little humorous sheet, which was christened *The Snob: a Literary and Scientific Journal*, and which purported to be conducted by members of the university, though it was really conducted by Thackeray, who was its editor, and its staff of talented contributors. A vehicle for local squibs and personalities, *The Snob* resembled a hundred similar literary mushrooms, and is only interesting now on account of its editor.

Thackeray kept seven or eight terms at Cambridge, but took no degree. We hear of him next in his nineteenth year, when his man's life may be said to have begun. Understanding himself and his powers as little as any of his heroes, he determined to devote himself to art, and wasted a great deal of time in trying to become a painter. It was an obstinate up-hill struggle, and he persisted in it for years, learning much, accom-

plishing a little, but always falling short of his aims and his knowledge. He traveled where he would, following the phantom that lured him on, and in 1831 found himself at Weimar, with a number of young fellows like himself, whose business just then was pleasure, and with whom he led a jovial, rollicking life. He often recurred to it in after-years, when he was following the fortunes of his imaginary characters, and many an incident which happened to himself was transferred to them, Weimar being transformed into Pumpernickel, and William Makepeace Thackeray into Arthur Pendennis or Clive Newcome. Of literature as a profession he had no thought, but amused himself with drawing caricatures in the albums of the young ladies of Weimar, by whom, grown old and motherly now, they are still preserved with pride.

The delusion which led Thackeray to think that he could become an artist lasted for several years, and as he had a fortune of about £20,000 when he came of age, it was fostered by frequent visits to the art capitals of Europe. He visited Rome, of course, and resided for a considerable time in Paris. His friends used to find him in the Louvre, day after day, copying pictures, with what success we are not told, but probably none to speak of. His talent for drawing, which was undeniable, was never carefully cultivated, and was exercised more for the amusement of his friends than for his own artistic development. One is tempted to regard this period of Thackeray's life as lost time, though no time can be said to be lost that is afterward turned to account, as this certainly was. If it did not make Thackeray an artist, it gave him a keen insight into the nature of artists, and added to the profound studies of character which he was now unconsciously making.

Thackeray seems to have had an idea that literature, after all, might be his profession, for we find him dabbling in it in his twenty-second year, when he became the editor and, it is thought, in some measure, the proprietor of a weekly literary paper, *The National Standard, and Journal of Literature, Science, Music, Theatricals, and the Fine Arts*. The title was imposing, but the venture was not prosperous. He wrote largely for it—reviews, letters, criticisms, and verses. One of his friends has exhumed for us a specimen of the latter, which purports to be a sonnet by Wordsworth, and of which the theme is a drawing of a Jew's-harp in the sky, and the figure of Braham, the singer. It is dull and pointless. Thackeray's earliest known attempt at story-writing, "The Devil's Wager," was contributed to this paper, as well as his first mention of a class of men of whom he was the predestined enemy—*Snob*s. It occurs in a copy of verses under a portrait of Louis Phi-

THACKERAY'S STUDY.

lippe as Robert Macaire, which run as follows:

"Like 'the king in the parlor' he's fumbling his money;
Like 'the queen in the kitchen' his speech is all honey,
Except when he talks, like Emperor Nap,
Of his wonderful feats at Fleurus and Jemappe.
But, alas! all his zeal for the multitude's gone,
And of no numbers thinking except Number One!
No huzzas greet his coming, no patriot club licks
The hand of 'the best of created republics';
He stands in Paris, as you see him before ye,
Little more than a snob. There's an end of the story."

The National Standard soon expired, and its young editor became attached to the staff of *Fraser's Magazine*, at the request, it is said, of Dr. Maginn, its editor. He was a brilliant but erratic writer, was Maginn, and he made *Fraser* a power—such a power in England as *Blackwood* was in Scotland. Among his contributors were Coleridge, Southey, Carlyle, Hogg, Galt, Harrison Ainsworth, Barry Cornwall, Allan Cunningham, Theodore Hook, Edward Irving, and a young literary gentleman who insisted on pursuing art at Paris. What the latter wrote that justified his connection with *Fraser* for a considerable time has not been traced. His portrait—the portrait of a tall young gentleman, with juvenile features and a double eyeglass—appeared in the cartoon of *Fraserians* drawn by Maclise, and prefixed to the number for January, 1835; but his contributions are not recognizable until nearly three years later. They consisted probably of art criticisms, which possessed only a temporary value, and were soon forgotten. Thackeray's first book, if it can be called a book, was a small folio, which was published simultaneously at London and Paris, and entitled *Flore*

et Zephyr: Ballet Mythologique. It purported to be par Théophile Wagstaffe, who did not succeed in impressing the French or English mind with his drawings, of which six, illustrative of the pleasures and pains of ballet-dance, were lithographed on this occasion.

The spring of 1836 found Thackeray in London, at the house of his step-father, Major Smyth, who had conceived the not very original project of starting a daily newspaper. The time was thought to be ready for it, as it always is; the people were thought to be hungry for it, as they always are; so the two visionaries formed a joint-stock company, with a capital of £60,000, in shares of £10 each. This company bought *The Public Ledger*, a respectable old-fogy journal, and rechristening it *The Constitutional and Public Ledger*, started it afresh, with new men and new ideas. Lamont Blanchard was appointed editor, Douglas Jerrold dramatic critic, and Thackeray the Paris correspondent. Its programme embraced the freedom of the press, the extension of popular suffrage, vote by ballot, the equality of civil rights, and religious liberty—in short, the good of every body and every thing. It was too good, and it expired accordingly at the ripe age of nine months and a half. It was a costly bantling; for, though nominally supported by a joint-stock company, it was really supported by its original projectors, Major Smyth being the principal one, and Thackeray the most unfortunate one, in that he lost nearly all that remained of his fortune. Before this happened, and while he was still as unknown in art as in literature, he called one day upon a young man who was beginning to attract attention in the world of letters, and proposed to illustrate a work of his, then in

the course of publication. "I can remember," he said, years afterward, at a Royal Academy dinner—"I can remember when Mr. Dickens was a very young man, and had commenced delighting the world with some charming humorous works, in covers which were colored light green, and came out once a month—that this young man wanted an artist to illustrate his writings; and I recollect walking up to his chambers in Furnival's Inn, with two or three drawings in my hand, which, strange to say, he did not find suitable." The first meeting of Dickens and Thackeray—what would their feelings have been if each could have known then what the other was to be! Thackeray always admired Dickens. Did Dickens admire Thackeray?

Shortly after the demise of *The Constitutional*, which happened in the summer of 1837, and probably while he was at Paris, Thackeray married in that city a Miss Shaw, an Irish lady of good family. Before the close of the year he returned to London, and took up his abode in Great Coram Street, where he devoted himself to the only profession by which he was likely to earn his bread. He is said to have written for *The Times*, and for two short-lived periodicals, *The Torch* and *The Parthenon*, and he certainly began to justify his claim to be considered a *Fraserian*.

He set to work seriously, though not at first to serious work. A book which had lately been published was given to him to review. It was entitled *My Book; or, the Anatomy of Conduct*, and was the elaborated throe of the mighty mind of a Mr. John Henry Skelton, a whilom linen-draper of Regent Street, who had given dinners to the best company he could induce to come to them, and had run through his fortune. He was, in his own estimation, a model of deportment, an earnest old Turveydrop, whose perfectly fitting dress-coat, brown wig, dyed whiskers, white cravat (*à la Prince Regent*), and well-polished boots were unimpeachable testimonials to the character of the coffee-house at which he took his humble dinner daily. It was long known among his acquaintances that he was brooding over a great work, a treatise on etiquette, which should cause Chesterfield to hide his diminished wig. This immortal work was at last

Sorrows of Werther.

Werther had a love for Charlotte,

Such as words could never utter,

Would you know how first he met her?

She was cutting bread and butter.

Charlotte was a married lady,

And a moral man was Werther,

And for all the wealth of Indies

Would do nothing that might hurt her.

So he sighed and pined and ogled,

And his passions boiled & bubbled;

Till he blew his silly brains out,

And no more was by them troubled.

Charlotte, having seen his body

Botch before her on a shutter;

Like a well-conducted person

Went on cutting bread & butter.

FAC-SIMILE OF THACKERAY'S HANDWRITING.

produced, and placed in the hands of Thackeray, who instinctively perceived that the proper person to review it was a footman, who must be created for the purpose. His shaping imagination at once created Charles Yellowplush, Esq., who dated his review—"Fashionable Fax and Polite Annygoats"—from No. — Grosvenor Square (N.B.—Hairy Bell), and who wrote not as "common writin' creatures," but with the authority of a fashionable footman, who knew whereof he wrote. Yellowplush was a great success, even his spelling, which is inferior, I think, to the spelling of some of Hood's imaginary characters, who, by-the-way, may have helped Thackeray on his way to illiteracy.

The "Yellowplush Correspondence" was commenced in November, 1837, and was continued in monthly installments till August, 1838, when it terminated. It is interesting to read it chronologically, as every thing

written by Thackeray should be read, and to note the growth and change of his mind. His work was not serious yet, but it became serious as it proceeded; for, starting with Skelton, or "Skelton," as Yellowplush would call the unfortunate linen-draper, and the absurd sketch of "Miss Shum's Husband," he shows us next how a pair of sharpers fleeced a flat, and unfolds scene by scene the terrible tragi-comedy of Mr. Deuceace and his amours. It is a curious medley of rascality and grim humor, and the close is singularly tragic. "Deuceace turned round. I see his face now—the face of a devile of hell! First he lookt towards the carriage, and pintoed to it with his maimed arm; then he raised the other, and struck the woman by his side. She fell, screaming. Poor thing! Poor thing!"

Thackeray was not yet convinced that he was not an artist, but his readers were; for the illustrations which he drew for the "Yellowplush Papers" were atrocious. One of the features of *Fraser* was an occasional letter to some author of note, and Yellowplush signalized himself before he laid down his pen by an epistle to Sir Edward Lytton Bulwer, apropos to his unsuccessful play, *The Sea-Captain*, which he scored with criticism, remarkable alike for good sense and good humor. He claimed in a previous paper to have met Bulwer, or his counterfeit presentment, Mr. Edward Lytton Bulwig, at the table of his master, the Earl of Crabs, and to have enjoyed the honor of a conversation with him on literary subjects. His description of Bulwig recalls at once the early portraits of him: "The other was slim, with a hook nose, a pail face, a small waist, a pair of falling shoulders, a tight coat, and a catarrack of black satting tumbling out of his bum, and falling into a gilt velvet wesket." There could have been no personal animosity between the young satirist and his distinguished victim, but there must have been an intellectual one, arising from the natures of the two men. They made it up afterward, but I suspect that Thackeray enjoyed his caricature of Bulwer to the last.

Mr. Charles Yellowplush made his exit, and in May, 1839, a new personage appeared upon the scene. It was Mr. Ikey Solomons, Jun., keeper of a sponging-house, perhaps, who was disgusted with the condition of English fiction, and determined to bring it to shame by burlesquing it with realism. It was the period of literate and illiterate thieves and highwaymen which followed the publication of *Paul Clifford* and *Eugene Aram*, of *Rockwood* and *Jack Sheppard*, and, last, of *Oliver Twist*, which Dickens had lately finished. The popularity of these works was as great as their influence was baleful. They were not only read widely, but dramatized, and played to overflowing houses all over England and America. The sound, manly,

moral sense of Thackeray was shocked at the success of such literature as this, and he set to work to counteract it in the person of Ikey Solomons, Jun., who selected for the heroine of a story a heroine of the *Newgate Calendar*, Mrs. Catharine Hayes, a lady of the last century, who possessed most of the frailties that fall to woman, including the propensity to murder her husband, which she carried into effect, and was hanged therefor. The story of *Catharine* was not a success, we are told, but it ought to have been, considering its extraordinary power. As a reproduction of a past age it is as perfect as *Henry Esmond*, and remarkable as showing Thackeray's thorough familiarity, even at this time, with the manners and men in the days of Queen Anne. The *Beggars' Opera* is nothing to it. Farquhar never drew such an accomplished recruiting officer as Corporal Brock, nor such a scamp as Count Galgenstein. A more precious set of rascals than figure in it was never gathered together out of Newgate. They live, move, and have their being in villainy. But how they live and move, and what an air of reality there is about them, and the bustling drama they enact!

Catharine finished, Mr. Ikey Solomons, Jun., disappeared, and was succeeded by another shadow—Michael Angelo Titmarsh. He appeared in *Fraser* for June, 1840, in the rôle of an art critic of the Royal Academy, and a little later with *The Irish Sketch-Book*, which was dedicated to M. Aretz, tailor, 27 Rue Richelieu, Paris, whose generosity in loaning the writer a thousand-franc note when he was temporarily short is handsomely acknowledged. The *Paris Sketch-Book* is interesting as an exhibit of the sort of work that Thackeray was doing outside of *Fraser*, and as an evidence of his thorough knowledge of French life, literature, and art. He was as much at home in Paris as in London, and was often there with his wife. We get a glimpse of her in his charming ballad of Bouillabaisse:

"Ah me! how quick the days are flitting!
I mind me of a time that's gone,
When here I'd sit, as now I'm sitting,
In this same place—but not alone.
A fair young form was nestled near me;
A dear, dear face looked fondly up,
And sweetly spoke and smiled to cheer me—
There's no one now to share my cup."

While Mr. Titmarsh was trying to find readers for his book, he was finding them in *Fraser*, with "A Shabby-Genteel Story." It was a slight comic sketch of lodging-house life at Margate, but the people who animated it are cleverly drawn. The demoralization of the Gann family; the description of Gann, with his bald head, shabby shirt frills, and perpetual smell of gin; the airs of the elder daughters; the simplicity of poor little Caroline, the Cinderella of the house; above all, the dinner that is given to Swigby, are

worthy of Dickens. Brandon is good, Cinquars is better, and Andrea Fitch, with his velvet waistcoats, braided trowsers, and dilapidated Blüchers, his affectation, absurdity, and "hart," is better still. He is Thackeray's first attempt to satirize, good-naturedly, the profession that he loved, and which, perhaps, is more open to satire than most painters are willing to allow. The writing of "A Shabby-Genteel Story" was interrupted at a sad period of Thackeray's life, and was never resumed. "A dark shadow descended upon his household, making all the associations of that time painful to him forever. The terrible truth, long suspected, that the chosen partner of his good and evil fortunes could never participate in the success for which he had toiled became confirmed. The mental disease which had attacked his wife rapidly developed itself, until the hopes which had sustained those to whom she was most dear were wholly extinguished."* If the most pitiable episode in English literary history is the picture of Charles and Mary Lamb on their way to the mad-house together, leading each other and crying bitterly, the most tragic, in my way of thinking, is the picture which rises before me of the great, grave man writing alone in his chamber for his two little motherless girls.

At no period of his busy life was Thackeray more busy than now; for besides the works I have mentioned as contributed to *Fraser*, he wrote for other periodicals, and for newspapers, and certainly for one American journal, *The Corsair*, of which Mr. N. P. Willis was the editor. He went to Paris in December, 1840, and remained until the next summer. While there he saw the remains of Napoleon, brought from St. Helena, conveyed to the Hôtel des Invalides, and turned the event to account by writing a little book about it—or rather Mr. Titmarsh did—in the form of three letters to Miss Smith, of London. It was called *The Second Funeral of Napoleon*, and is chiefly memorable now as containing the most striking of all his poems, "The Chronicle of the Drum."

We owe to this visit to Paris the most charming of all Thackeray's shorter stories, *The History of Mr. Samuel Titmarsh and the Great Hoggarty Diamond*, which was refused by one magazine, and finally accepted for *Fraser*. It was unlike any that he had yet written, its humor being of a purer quality, and its pathos exquisite. Nothing can be more delicious than the interview between Mrs. Titmarsh and Lady Tiptoff. Her ladyship has a young child for whom she desires a nurse, and Mrs. Titmarsh, who has lately lost her child, applies for the situation. "Poor thing!" says my lady, taking Mrs.

T.'s hand, very kind, she seems very young. How old are you, my dear? "Five weeks and two days!" says your wife, sobbing."

The Hoggarty Diamond was a great favorite with Thackeray, but was not particularly well received by the public. He could not find a publisher for it when it was finished, and it remained in the pages of *Fraser* until he was celebrated. He republished it then, with a touching preface, in which he confessed that it was written when he was suffering the severest personal grief and calamity, which might account for a certain sobriety and melancholy in it. "As I read it myself, after a seven years' lapse, I can recall the circumstances under which it was written, and the thoughts, other than those on the paper, which accompanied the author through his work." *The Hoggarty Diamond* had one admirer, if no more—John Stirling, who wrote to his mother concerning it: "I got hold of the first two numbers of *The Hoggarty Diamond*, and read them with extreme delight. What is there better in Fielding or Goldsmith? The man is a true genius, and with quiet and comfort might produce masterpieces that would last as long as any we have, and delight millions of unborn readers. There is more truth and nature in one of these papers than in all —'s novels put together." Stirling wrote to Thackeray a letter which gave him great comfort and pleasure.

The next four years of Thackeray's life were crowded with work. Mr. Titmarsh gave way for a time in *Fraser* to another shadow—George Fitz-Boodle, who commenced his "Confessions" in June, 1842, and continued them at intervals for several months. The most important portion of them is the series entitled "Men's Wives," particularly the story of "The Ravenswing." It is a piece of light comedy, so to say, and is very amusing. The characters are rather caricatured, the most natural being Mrs. Crump, a once-popular actress of the Surrey Theatre, who is married to a well-to-do publican, and who sits behind the bar in a turban reading Cumberland's *British Theatre*. She is the mother of the Ravenswing, whose little ups and downs as Mrs. Walker lead her on the stage. It is, I believe, the first story of Thackeray in which he introduced theatrical and literary people—a class that he made very useful in his future fictions.

"Men's Wives" was followed by "The Luck of Barry Lyndon," which was as different as can well be imagined, and which showed an immense intellectual growth. It was as truly a representative story as *Catharine*, but its power was of a higher order. The villainy in *Catharine* is vulgar beside it, and the worst character there is human as compared with this conscienceless Irish adventurer. It is not pleasant reading, unless we can enjoy the narration of successful wick-

* *Thackeray, the Humorist and the Man of Letters*. Theodore Taylor. London, 1864.

edness, but for just what it is, it is unrivaled. It is superior to *Count Fathom* and *Jonathan Wild*;" and I agree with Dr. John Brown, of Edinburgh, in thinking that it equals the sarcasm and remorseless irony of Fielding's masterpiece, with a wider range and a more lively interest.

I have mentioned Thackeray's most important contributions to *Fraser*, but by no means all that he wrote for it. He occasionally made a journey to Paris, or elsewhere, and jotted down what he saw, generally as Mr. Titmarsh, who was always ready to state what he knew about art, politics, literature, the drama, and kindred themes. One of his most amusing papers, "Dickens in France," is a description of a translation of *Nicholas Nickleby*, as adapted to the Parisian stage; and there are two others, entitled "Little Travels," a record of travel in Belgium, which are delightful. Mr. Titmarsh was fond of traveling, and while his double, Fitz-Boodile, appeared for him in England, was junketing elsewhere himself. He made a run over to Ireland, for example, and published, in 1843, *The Irish Sketch-Book*. It was dedicated to Lever, and for the first time the mask of Titmarsh was dropped, for the name of W. M. Thackeray was signed to the dedication. The whim of traveling seized Mr. Titmarsh again in the summer of the following year, and he started off on a tour to the East. He was not animated by any grave purpose, but traveled for the amusement of others, who, in this instance, represented a larger class of readers than he had obtained in *Fraser*. The result of this tour was published at Christmas, 1845, as *Notes of a Journey from Cornhill to Grand Cairo*. The author of this *jeu d'esprit* was Mr. Titmarsh; the writer was another and bulkier shadow—"The Fat Contributor" of *Punch*.

Precisely when Thackeray commenced his contributions to *Punch* we are not told, but it was when that substantial elderly gentleman with the "slight dorsal irregularity" was young and struggling, and needed just such a pen as Thackeray wielded. If *Fraser* was his first opportunity, *Punch* was his second, and he embraced it. He had not yet discovered where his true strength and greatness lay, but he was "burning," as the children say when their mates are nearing the object hidden. He took a place on the staff of *Punch*, and soon made himself felt, now as "The Fat Contributor," and a little later as Charles Jeames de la Pluche, Esq., whose "Diary" set all England in a roar. It was somewhat in the vein of Mr. De la Pluche's humble relative, Yellowplush, but more amusing, I think, and more effective, in that it helped to break the enormous railway bubbles of Hudson.

Thackeray's next venture in *Punch* not only confirmed the judgment which Stirling passed on *The Hoggarty Diamond*, that the

man was "a true genius," but proclaimed to the world that a great satirist had arisen. "The Book of Snobs" had no prototype in English literature, and can have no successor. No element of good writing in his earlier works is wanting in it, and it contains new elements of strength and sarcasm. Its satire is irresistible and merciless. Thackeray's observation of character is so keen, and his sense of justice so sure, that one almost pities his victims. He is at once detective, judge, and executioner. There is nothing left of a snob when he takes him in hand: he is blasted as if by lightning.

Thackeray's next contribution to *Punch*—I mean of any importance—was "Punch's Prize Novelists." As burlesques they are fair imitations of the popular novelists of the period. They are funny, and they are good-natured—it is impossible not to laugh at them—but one feels all the time that a lesser writer than Thackeray might have written them. Only Thackeray could have written "Mr. Brown's Letters to his Nephew." He is an old man of the world, is Brown—the first of his species that I recall in the writings of Thackeray. We shall meet others of his set before long, but none so genial and so lovable. He is selfish, no doubt, and his advice is selfish advice, but let us not quarrel with it for all that. It will do us no harm, as he puts it, for it teaches us to love and to practice the gracious amenities of life. All women ought to love Brown for the beautiful and tender things that he says about them. One passage in these admirable letters possesses a melancholy interest. Brown the elder takes Brown the younger to the club of which he is a member, and moralizes about some of his old friends. "Where is poor Ned? Where is poor Fred? Dead rhymes with Ned, and Fred too. Their place knows them not. Their names one year appeared at the end of the club list, under the dismal category of 'Members Deceased,' in which you and I shall rank some day. Do you keep that subject steadily in your mind? I do not see why we shouldn't meditate upon death in Pall Mall as well as in a howling wilderness. There is enough to remind one of it at every corner. There is a strange face looking out of Jack's old lodgings in Jermyn Street; somebody else has got the club chair which Tom used to occupy. He has been sent for, and has not come back again. One day Fate will send for us, and we shall not return, and the people will come down to the club as usual, saying, 'Well, and so poor old Brown's gone.' Indeed, a smoking-room on a morning is not a cheerful spot."

I have traced the early literary career of Thackeray at some length, because it is unique in English biography. It is unique, all things considered, because so much of it was apparently wasted in teaching him what

he could do best, and because it was so singularly unsuccessful. The young Dickens, his contemporary, sprang into popularity at a bound; the young Thackeray was ten or twelve years writing himself into notice. It would almost seem as if the gods had conspired to keep him back. But he was not to be discouraged, this brave, hard-working man of genius, for he wrote on, and wrote on,

"With a light and a heavy heart,"

till he became, and was acknowledged to be, one of the most illustrious masters of English fiction.

While writing the papers I have mentioned in *Punch*, Thackeray laid the foundation of his fame. He had sketched some time before several chapters, entitled "Pencil Sketches of English Society," and offered them to Mr. Colburn, the proprietor of the *New Monthly Magazine*, to which he had been an occasional contributor. They were declined. Whether they were offered to *Fraser*, and likewise declined, we are not told. Thackeray soon recast them in the form of a continuous story, and resolved to publish it in monthly numbers, as Mr. Dickens did his stories, and try his luck that way. He hit upon a happy title for the work—*Vanity Fair*—and launched his first monthly installment on the 1st of January, 1847. His friends at once saw its surpassing excellence, but the critical journals received it rather coldly. When eleven numbers had been published, there appeared in the *Edinburgh Review* a thoughtful and well-considered article on *Vanity Fair*, which determined the intellectual status of Thackeray. There was no longer any doubt about the place that he filled. It was second to that of no living writer.

Those who are curious in regard to localities may like to know that *Vanity Fair* was written at No. 13 Young Street, Kensington, where Thackeray resided for some years, and where Mr. James Hannay, one of his biographers, first had the pleasure of meeting him. "*Vanity Fair* was then unfinished," Mr. Hannay says, "but its success was made, and he spoke frankly and genially of his work and his career. *Vanity Fair* always, we think, ranked in his own mind as best in story of his greater books; and he once pointed out to us the very house in Russell Square where his imaginary Sedleys lived—a curious proof of the reality his creations had for his mind."

If I were called upon to name the saddest incident and the most tragic touch in modern fiction, I should select the close of the thirty-second chapter of *Vanity Fair*. "No more firing was heard at Brussels—the pursuit rolled miles away. The darkness came down on the field and city, and Amelia was praying for George, who was lying on his

face, dead, with a bullet through his heart." One would like to know what Thackeray thought as he dropped the pen after writing that. We know, through Mr. Hannay, what he thought of another passage in a later chapter. "When we congratulated him, many years ago, on the touch in *Vanity Fair* in which Becky 'adores' her husband when he is giving Lord Steyne the chastisement which ruins her for life, 'Well,' he said, 'when I wrote the sentence, I slapped my fist on the table, and said, *That is a touch of genius!*'"

It was from Edinburgh that the greatness of Thackeray was first sounded abroad, and it was in Edinburgh that the excellence of his contributions to *Punch* was most widely recognized. Dr. Brown relates a pleasant little incident in connection with this recognition that took the shape of a silver statuette of *Punch*, which one of Thackeray's admirers, probably himself, saw in a jeweler's window in Edina, and which was purchased by eighty Scotchmen, and sent to Thackeray, with a short note telling the story. Thackeray acknowledged the gift in a characteristic and serious way. Such tokens of regard and sympathy, he said, were very precious to a writer like himself, who had some difficulty still in making people understand what they had been good enough to find out in Edinburgh, that under the mask satirical there walked about a sentimental gentleman who meant not unkindly to any mortal person. "I assure you," he added, "these tokens of what I can't help acknowledging as popularity make me humble as well as grateful, and make me feel an almost awful sense of the responsibility which falls upon a man in such a station. Is it deserved or undeserved? Who is this that sets up to preach to mankind, and to laugh at many things which men reverence? I hope I may be able to tell the truth always, and to see it aright, according to the eyes which God Almighty gives me. And if, in the exercise of my calling, I get friends, and find encouragement and sympathy, I need not tell you how much I feel and am thankful for this support. Indeed, I can't reply lightly upon this subject, or feel otherwise than very grave, when people begin to praise me as you do."

Vanity Fair was an impersonal, objective book; *Pendennis*, which speedily followed, was a personal one. It was personal, that is to say, as *Copperfield* was personal; in other words, it was written from the experience of the writer. Thackeray's first and last object, if I understand it, was to draw character, and to paint life as he saw it. Whose character he drew, and what life he painted, was of no consequence, provided they were worthy of his art. He would as soon draw himself as another. The history of Arthur Pendennis was in a certain sense the history

of William Makepeace Thackeray. Had Thackeray's early life been other than it was, we should not have had *Pendennis*—as we have him now. He represents the young literary man, and the life that is depicted in his history is the literary life, of course with episodes of another nature. Thackeray drew his own young face and tall figure in the illustrations which he made for *Pendennis*.

There are three different types of the literary man in *Pendennis*—Warrington, Pendennis, and Shandon. Maginn was said to have been the original of the last, and Thackeray was censured by the friends of this erratic writer for what they called his caricature of him. It was not a caricature, however, as any one may satisfy himself by reading the *Life of Maginn*, but a truthful portrait drawn by a firm but not harsh hand. Pendennis pitied Shandon, but Warrington did not. "A fiddle-stick about men of genius!" he exclaimed. "If a lawyer, or a soldier, or a parson outruns his income, and does not pay his bills, he must go to jail; and an author must go too. If an author fuddles himself, I don't know why he should be let off a headache the next morning; if he orders a coat from the tailor's, why he shouldn't pay for it." I see no harshness in this, especially when I remember that it was written by one who lent—or, as Mr. Hannay puts it, "in plainer English, gave—five hundred pounds to poor old Maginn, when he was beaten in the battle of life, and, like other beaten soldiers, made a prisoner—in the Fleet." Thackeray's own experience in the diverse characters of a reviewer, a correspondent, an editor, and an author is partly reflected in the history of Pendennis, and partly in the history of Warrington. It cost him some thousands of pounds, but it was not dear at the price. *Pendennis* was a larger book than *Vanity Fair*, and while there was no one character in it so sharply drawn as Becky Sharp, there were several that demanded greater skill in the drawing. Blanche Amory was one, and the Fotheringay another. I never heard that Thackeray lost any money by the stage, but if he did, it came back with interest in the conception of the Fotheringay.

One would like to know what Thackeray's contemporaries thought of him, and probably one's children will have that curiosity, if they have it, gratified when the biographies of his contemporaries shall have been written. We know what Charlotte Brontë thought of his genius, the greatness of which she was among the very first to perceive. She was not influenced by any personal feeling, for he was an entire stranger to her when she dedicated the second edition of *Jane Eyre* to him. She must have astonished most of her readers in assigning to him the rank that she did. "Why have I alluded to this man?" she asked. "I have alluded to him, reader,

because I think I see in him an intellect profounder and more unique than his contemporaries have yet recognized; because I regard him as the first social regenerator of the day—as the very master of that working corps who would restore to rectitude the warped system of things; because I think that no commentator on his writings has yet found the comparison that suits him, the terms which rightly characterize his talent. They say he is like Fielding; they talk of his wit, humor, comic powers. He resembles Fielding as an eagle does a vulture; Fielding could stoop on carrion, but Thackeray never does. His wit is bright, his humor attractive, but both bear the same relation to his serious genius that the mere lambent sheet-lightning, playing under the summer cloud, does to the electric death-spark hid in its womb." This was written in January, 1848, before *Vanity Fair* was finished. They met for the first time—the little lady from the Yorkshire parsonage, and the great man of the London clubs—in December of the following year. She was puzzled by him, so much so that she could not decide whether he was speaking in jest or in earnest. "Thackeray is a Titan of mind," she wrote to a friend. "His presence and power impress one deeply in an intellectual sense." She read all that he wrote after her return to Haworth, as her correspondence shows, and remarked in regard to *Pendennis*, which was interrupted by a severe illness, and in which, when it was resumed, she felt that the pen had been guided by a tired hand, "but Thackeray still proves himself greater when he is weary than other writers are when they are fresh."

Thackeray was a great reader, and the literature in which he most delighted was the literature of the eighteenth century, extending, say, from the days of Queen Anne down to the days of the third George. Two noted writers of the earlier period had been Carthusians, and that, we may be sure, did not lessen them in his esteem. "I take off my hat to Joseph Addison," he used to say. There is a canceled scene at the end of the last chapter of *Catharine* in which some of Queen Anne's men would have figured: Barry Lyndon is introduced at the Club to Dr. Johnson, Goldsmith, and "a Mr. Buswell, of Scotland." I can not begin to remember the allusions to his favorite authors in Thackeray's early writings. His admiration for these old worthies, and for the England of the past, withdrew him for a time from the men and manners of his own day, and impelled him to write a series of lectures upon the English Humorists, and that wonderful reproduction of a by-gone generation, *Henry Esmond*. He delivered these lectures in London with great success. The correspondence of Miss Brontë shows that she was one of his audience. "I came here," she wrote

on the 2d of June, 1851—"I came here on Wednesday, being summoned a day sooner than I expected, in order to be in time for Thackeray's second lecture, which was delivered on Thursday afternoon. This, as you may suppose, was a genuine treat to me, and I was glad not to miss it. It was given in Willis's Rooms, where the Almacks balls are held—a great painted and gilded saloon, with long sofas for benches. The audience was said to be the cream of London society, and it looked so. I did not at all expect the great lecturer would know me or notice me under these circumstances, with admiring duchesses and countesses seated in rows before him; but he met me as I entered—shook hands—took me to his mother, whom I had not before seen, and introduced me. She is a fine, handsome, young-looking old lady, and called with one of her granddaughters next day. Thackeray called too, separately. I had a long talk with him, and I think he knows me now a little better than he did, but of this I can not yet be sure. He is a great and strange man. There is quite a *furor* for his lectures. They are a sort of essays, characterized by his own peculiar originality and power, and delivered with a finished taste and ease, which is felt but can not be described." Thackeray had told some of his friends that she was present, and just before the lecture began Lord Carlisle and Mr. Monckton Milnes came up and introduced themselves, on the plea that they were Yorkshire men. "The lady who accompanied Miss Brontë to the lecture of Thackeray's alluded to," writes Mrs. Gaskell, "says that, soon after they had taken their places, she was aware that he was pointing out her companion to several of his friends, but she hoped that Miss Brontë herself would not perceive it. After some time, however, during which many heads had been turned round, and many glasses had been put up, in order to look at the author of *Jane Eyre*, Miss Brontë said, 'I am afraid Mr. Thackeray has been playing me a trick;' but she soon became too much absorbed in the lecture to notice the attention which was being paid to her, except when it was directly offered, as in the case of Lord Carlisle and Mr. Monckton Milnes. When the lecture was ended, Mr. Thackeray came down from the platform, and, making his way toward her, asked her for her opinion." We may be sure that she gave it frankly—the honest little Yorkshire woman—and that it pleased him.

Henry Esmond, which was given to the world complete, should be read, if possible, at a sitting, when its completeness, as a whole, will, I think, be felt. As a work of art, it is Thackeray's masterpiece; as the reproduction of a past age—as a historical novel—it is unrivaled. There is nothing like it, nothing so perfect, in English fiction. The characters are drawn with surprising

strength and delicacy, and truth to nature. Congreve could not have drawn the Viscount Castlewood better, though he saw his like every day of his life; he could not have drawn him so well, for he could not have given him the little heart that he has. Nobody but Thackeray could have drawn Lady Castlewood and Beatrix. The ladies do not like her ladyship, I believe. Charlotte Brontë did not, and Mrs. Jameson did not. "As usual, he is unjust to women, quite unjust," the former writes. "There is hardly any punishment he does not deserve for making Lady Castlewood peep through a key-hole, listen at a door, and be jealous of a boy and a milkmaid." The latter sums up her ladyship and Thackeray as Jeffrey summed up *The Excursion* and Wordsworth: "Oh, Mr. Thackeray, this will never do! Such women may exist, but to hold them up as examples of excellence, and fit objects of our best sympathies, is a fault, and proves a low standard in ethics and in art." I am sorry to disagree with these good ladies, but I do, for to me Lady Castlewood, with all her faults, is a thoroughly womanly woman—her faults being as much a part of her nature as her beauty and goodness. They don't like her marrying Esmond, I suppose; others do not. One of Thackeray's friends is said to have remonstrated with him for having made Esmond marry his mother-in-law. "I didn't do it," he replied; "they did it themselves." The way in which Thackeray enters into the spirit as well as the letter of the time he describes is wonderful. He never for a moment forgets himself; his allusions, his illustrations, his style, are always in exact keeping. And how delightful his literary personages are!—the thickset, good-humored trooper, Dick Steele, construing Latin, and arguing points of faith with the lad Esmond at Castlewood; St. John bantering simple-minded Mrs. Steele at the dinner-table of Lady Castlewood; the famous Mr. Addison, who invites Esmond to his humble lodging while he is writing *The Campaign*—we know these worthy gentlemen, dead long since, as well as we know our living brothers of the quill, thanks to the loving and life-giving genius of William Makepeace Thackeray.

The success which attended his lectures in England and Scotland led Thackeray to think that we might like to hear them in America, and he accordingly determined to visit us. He arrived in Boston on a frosty evening in November, 1852, and went to the Tremont House, where rooms had been engaged for him. "I remember his delight in getting off the sea," says Mr. James T. Fields,* "and the enthusiasm with which he hailed the announcement that dinner would be ready shortly. A few friends were ready to

* *Yesterdays with Authors.*

sit down with him, and he seemed greatly to enjoy the novelty of an American repast. In London he had been very curious in his inquiries about American oysters, as marvelous stories, which he did not believe, had been told him of their great size. We apologized—although we had taken care that the largest specimens to be procured should startle his unwonted vision when he came to the table—for what we called the extreme *smallness* of the oysters, promising that we would do better next time. Six bloated Falstaffian bivalves lay before him in their shells. I noticed that he gazed at them anxiously with fork upraised; then he whispered to me, with a look of anguish, 'How shall I do it?' I described to him the simple process by which the free-born citizens of America were accustomed to accomplish such a task. He seemed satisfied that the thing was feasible, selected the smallest one of the half dozen (rejecting a large one, 'because,' he said, 'it resembled the high-priest's servant's ear that Peter cut off'), and then bowed his head as if he were saying grace. All eyes were upon him to watch the effect of a new sensation in the person of a great British author. Opening his mouth very wide, he struggled for a moment, and then all was over. I shall never forget the comic look of despair he cast upon the other five over-occupied shells. I broke the perfect stillness by asking him how he felt. 'Profoundly grateful,' he gasped, 'and as if I had swallowed a little baby.' He made a pleasant evening and a late night of it, in spite of the large oysters, and went to bed happy.

The lectures were a success in Boston, and Thackeray was delighted, boisterously so, according to the chatty Boswell just quoted, who assures us that he shouted and danced when he was told that the tickets to his first course of readings were all sold. And the whim seized him—if we may credit the same authority, who rode with him to the lecture-room—to thrust both his long legs out of the carriage window, in deference, as he said, to his magnanimous ticket-holders! If Thackeray does not appear to advantage in gossip like this, it is the fault, I suspect, of the gossip. Nothing is more easily misunderstood than the boyishness of great men, and no one was more easily misunderstood than Thackeray. For whether we study nature or study man, "we receive but what we give."

Thackeray came to New York, and read his lectures before the Mercantile Library Association with great success. That terror of the public man, the interviewer, was not as yet, but his place was partially supplied by the inaccurate biographer and the imaginative word-painter. Every characteristic of Thackeray was noted, and once, at least, he was well described: "As for the man himself who has lectured us, he is a stout,

healthful, broad-shouldered specimen of a man, with cropped grayish hair, and keenish gray eyes, piercing very sharply through a pair of spectacles that have a very satiric focus. He seems to stand strongly on his own feet, as if he would not be easily blown about or upset, either by praise or pugilists; a man of good digestion, who takes the world easy, and scents all shams and humbugs (straightening them between his thumb and forefinger) as he would a pinch of snuff." There was something in Thackeray's reading which no one caught. It defied analysis, and evades memory. His voice, as I recall it, was at once low and deep, with a peculiar and indescribable cadence; his elocution was matchless in its simplicity. His attitude was impressive and tranquil, the only movement of his hands being when he wiped his glasses as he turned over the leaves of his manuscript. He read poetry exquisitely.

Thackeray was more widely read at this time in America than in England, for when it was known that he was coming over to visit us there was a rapid disinterment and republication of his early writings in *Fraser* and *Punch*. His *avant-couriers* were Mr. Yellowplush, Mr. Titmarsh, Mr. George Fitz-Boodle, and that prince of swindlers, Barry Lyndon. He was not consulted with regard to their appearance, for he would doubtless have objected to one or two whom he had not set eyes upon for years. The Yellowplush who had lampooned Bulwer was one. After his arrival in New York, Thackeray wrote a preface to "Mr. Brown's Letters," in which he expressed contrition for these wild performances of his early years, as he called them, and hinted that the retrospect they awakened was any thing but gay. "The old scenes return, the remembrance of the by-gone time, the chamber in which the stories were written, the faces that shone round the table. Some biographers in this country have been pleased to depict that homely apartment after a very strange and romantic fashion; and an author in the direst struggles of poverty, waited upon by a family domestic in 'all the splendor of his menial decorations,' has been circumstantially described to the reader's amusement as well as to the writer's own. I may be permitted to assure the former that the splendor and the want were alike fanciful, and that the meals were not only sufficient, but honestly paid for."

Thackeray was dined and wine until he was more than content with American hospitality. He took naturally to men of his own profession—authors and artists—and in their society was the gayest of the gay. The Century was a favorite place of resort with him in the winter evenings, and he used to say it was the best club in the world. As the creator of Brown the elder and the an-

thor of "The Book of Snobs" was a notable club man, we Centurions were, and still are, inclined to believe that he was correct in his estimate of it. He came and went when he would, and his moods were respected; if he was solitary, he sat down in some unfrequented corner, and nobody molested him; if he was communicative, he pulled his chair up where his friends were conversing, and joined in the conversation. He was a delightful talker, because he never talked for effect; and as the night wore on, and only a few Centurions remained, he would tell stories, and sing songs, and set the table on a roar. Now it was the ditty of the Reverend Dr. Luther that he sang, with its rollicking chorus,

"Who loves not woman, wine, and song,
He is a fool his whole life long;"

and now it was his inimitable ballad of *Little Billee*, and his miraculous escape from the cannibalistic hunger of guzzling Jack and gorging Jimmy. The geographical outlook toward the close was immense:

"Billy went up the main-top-gallant mast,
And down he fell on his bended knee;
He scarce had come to the Twelfth Commandment,
When up he jumps—'There's land, I see.

"'Jerusalem and Madagascar,
And North and South Amerikee;
There's the British flag a-riding at anchor,
With Admiral Napier, K.C.B.'"

"So when they got aboard of the Admiral's,
He hanged fat Jack and flogged Jimmee;
But as for little Bill, he made him
The captain of a seventy-three."

Thackeray was invited on one occasion to a dinner at the house of a prominent Centurion, who was soon to rank among "Members Deceased." Fitz-Greene Halleck was present, and Hackett the comedian, and *Sparrow-grass* Cozzens, and half a dozen other good fellows of that ilk. The host was aware of Thackeray's curiosity in regard to our oysters (which does not appear to have been allayed by his Boston experience), and he procured from the immortal Dorton, of Fulton Market, some of the largest and fattest ones that he could obtain. A plate of them was, of course, placed before the guest of the evening. "Thackeray, what do you think of our oysters?" asked Cozzens. Thackeray did not reply. "Press that question," said Halleck to his next man, who repeated it, in the words of Cozzens. He smiled, and placing his spectacles on his nose, looked down upon his plate. "Why, they are perfect beasts of oysters!" They were eaten, nevertheless. This anecdote is trivial, no doubt, but it is not more trivial than some of the apocryphal anecdotes of Shakespeare which are handed down to us, and which we are fain to believe, because we think they are characteristic of that myriad-minded man.

Thackeray made many warm friends in

America during his first tour, in the different cities in which he lectured, but none by whom he was more valued than Mr. William B. Read, of Philadelphia, who has collected his reminiscences of this great writer in a charming little monograph. "He seemed to take a fancy to me and mine," writes Mr. Read, "and I naturally loved him dearly. He used to come to my house, not the abode of wealth or luxury, almost every day, and often more than once a day. He talked with my little children, and told them odd fairy tales. And I now see him (this was on his second visit) one day in Walnut Street, walking slowly with my little girl by the hand—the tall, gray-haired, spectacled man with an effort accommodating himself to the toddling child by his side; and then he would bring her home. And one day when we were to have a great dinner at the club given to him, and my wife was ill, and my household disarranged, and the bell rang, and I said to him, 'I must go and carve the boiled mutton for the children, and take for granted you do not care to come,' he got up, and, with a cheery voice, said, 'I love boiled mutton, and children too, and I will dine with them.' And we did; and he was happy, and the children were happy, and our appetite for the dinner was damaged. Such was Thackeray in my house."

I met Thackeray twice when he was in this country, once at a press dinner, which was given to him at the Astor House, and to which he came late, having just arrived from a journey. He was too ill to seat himself, though he entered the room in which the dinner was held, and my remembrance is that he shook hands cheerily with the friends who were nearest him, and was then borne off to bed. He was liable to sudden attacks of severe illness, and his sufferings on these occasions were terrible. We all regretted his absence—none more than myself, for I wanted to see and hear the satirical historian of the Four Georges. (It was during his second visit here, in 1855, I have forgotten to say.) We had a dull evening—at least I did, for I came to be introduced to Thackeray, and the genial, friendly talk of Washington Irving, to whom I was introduced instead, did not console me for my disappointment.

A few days later I was in the editorial rooms of *The Tribune*, where I met my good friend Bayard Taylor, who had been disappointed, like myself, at the press dinner, and he told me that he was going to give Thackeray a breakfast at Delmonico's on the Sunday morning following—Sunday being the only day that was at his disposal—and he asked me to be present. How well I remember that memorable morning, and how little

* "Thackeray in America." *Blackwood's Magazine*, June, 1872.

I brought away from it! It was late in December—a bright, sharp morning, and the walk from my rooms to Delmonico's was inspiring. We met in Delmonico's parlor, some eight or ten of us—the Howadji, I think, was one—and waited until Thackeray, who was stopping at the Clarendon, came. I was introduced to him informally. He gave me the grip of his hearty hand, and we proceeded to the breakfast-room. I forget how we were placed at the table, nor does it matter. It was Thackeray that I came to see—that I wish to remember—not my right or left hand man, who, I have no doubt, was an author or an artist. It was the author of *The Newcomes* that I wished to hear talk. As I am not a gourmand, I can not remember whether the oysters were large or small, nor the order in which the wines were brought on, though I can remember that the proper order was discussed while we were sipping them. Breakfast over—and it was a long one—we lighted our cigars, changed chairs with each other, and chatted in groups of twos or threes. I took an empty chair beside Thackeray, as he motioned me to do, detecting, no doubt, the admiration that I felt for him, and we had a pleasant chat. He had no idea that I hoped to be a man of letters some day, so we talked like men of the world, on whatever topic presented itself. Something that I said about theatricals (I was a dramatic critic at the time) led him to say that he had written a comedy, which he had left in Webster's hands—I think it was Webster's, though it may have been Wigan's—with but small chance of its acceptance. I very honestly told him that I could not understand how he should have a play refused. He said he could, he had had so many things declined—*Vanity Fair*, for example; besides, he added, there might be some defect in the play which would prevent its successful representation. Dumas was mentioned, and I noticed that in speaking of him Thackeray gave his name the Spanish and not the French pronunciation. He had chaffed Dumas; I remembered, in *The Paris Sketch-Book*, but it was for his dramas, not his novels. I asked him what he thought of the latter, especially *Monte Cristo* and *The Three Guardsmen*. No one ever displayed, he thought, such prodigality of invention as Dumas. His novels were vastly entertaining. For himself, he was never weary of reading *Les Trois Mousquetaires*. The exact language in which Thackeray expressed his admiration for Dumas has passed from my recollection, but the substance of it afterward took this form in print: "Of your heroic heroes, I think our friend Monseigneur Athos, Comte de la Fere, is my favorite. I have read about him from sunrise to sunset, with the utmost contentment of mind. I have passed through many volumes—forty! fifty! I wish from my heart

there were a hundred more, and would never tire of him rescuing prisoners, punishing ruffians, and running scoundrels through the midriff with his most graceful rapier. Ah! Athos, Porthos, and Aramis, you are a magnificent trio!" The feeling with which Thackeray inspired me was extravagant, I suppose, but it was very sincere. I felt toward him as he felt toward Shakspeare: "I should like to have been Shakspeare's shoe-black, just to have lived in his house, just to have worshiped him, just to have run on his errands, and seen that sweet, serene face." Somebody interrupted our chat; we separated, shook hands when the company dispersed, and—I never met Thackeray again.

"Ah, did you once see Shelley plain?
And did he stop and speak to you?
And did you speak to him again?
How strange it seems, and new!"

The closing years of Thackeray's life were as prosperous as they deserved to be, and as crowded with literary work as if he had still his reputation to make. He returned to England in 1856, and after delivering his lectures on the Four Georges in London and Edinburgh, where they were received with some disfavor, on account of their supposed want of loyalty, he sat down to the composition of *The Virginians*. While it was in progress, he, or his publishers, conceived the idea of a new magazine to be edited by him. He matured his plans carefully, and, instead of relying upon his own reputation to sustain the project, as he might well have done, he sought the assistance of two of his younger contemporaries, whose talents he was among the first to detect. These were Mr. Anthony Trollope and Mr. George Augustus Sala. Mr. Trollope had published several novels, which had had a fair degree of success, the best being *Dr. Thorne*; but his was not the name to conjure with then that it is now. Mr. Sala was favorably known by his papers in *Household Words*, but Thackeray believed that he was capable of greater things. With these trusty lieutenants on his staff, one with his novel of "Framley Parsonage," the other with a life of one of Thackeray's favorite worthies, William Hogarth; with his comedy, which, when it was finally declined, he had recast as "Lovel the Widower;" and with the first of a series of half-humorous, half-pathetic, and altogether unique essays, "The Roundabout Papers," he started *The Cornhill Magazine*. Its success was enormous, the first number reaching a sale of one hundred and ten thousand copies.

Thackeray was a good editor, as the first four or five volumes of *The Cornhill* show, but he was too soft-hearted for the position. It was very fine to advertise on the magazine, "Contributions are only to be sent to 65 Cornhill, and not to the editor's private residence;" they found their way to 36 On-

low Square all the same; and with them private notes, stating the distressing situation of these writers, who generally had sick and widowed mothers or motherless children to support; and after they were returned, other private notes of an eleemosynary or insulting character. If he sent a charity check to some poor devil of a scribbler, it was pretty sure to be answered in a month or two by a note roundly abusing him for not inserting that splendid contribution "on which he had paid half the price on account." The annoyances of all sorts to which he was subjected found a good-natured vent in one of the most amusing of his "Roundabout Papers," "Thorns in the Cushion."

Thackeray's contributions to the *Cornhill* while it was under his management consisted of "Lovel the Widower," "The Four Georges," and "The Roundabout Papers;" and after he had quitted it, which he did with an address to contributors and correspondents, dated March 18, 1862, of "The Adventures of Philip," the third novel which may be said to embody his own life and experience, *Pendennis* being the first, and *The Newcomes*—or so much of that story of all stories as relates to the art life of Clive Newcome—the second. The tenacity with which his early characters had laid hold upon him is illustrated in "Philip," Dr. Firmin being the Philip Brandon of "A Shabby-Genteel Story," and the Little Sister the poor girl whom he marries and abandons more than twenty years before.

The materials for a literary biography of Thackeray are abundant, as my readers have doubtless concluded; the materials for a personal biography are scanty enough. He did not live in public, as some writers do, but in the privacy of his own home, as a gentleman should. He had his struggles and his troubles, but the world knew nothing of them; he was as reticent as he was brave, and bore his burdens without a murmur. There were two natures in him, as there were two elements in his books—the one overflowing with animal spirits, the other profoundly serious, and the impression that he made depended upon which was uppermost, and who was by. We are told by Mr. Blanchard Jerrold that he was not loved, and not often liked, by the outer world—by those with whom he came in contact for the first time. His address was as polished as a steel mirror, and as cold. He was beloved by his inferiors, however, and always deeply touched by any kindness or grace shown to him by one beneath him. Mr. George Hodder, who acted as his secretary at one time, intimates that there was a constitutional reserve in his manner, accompanied at times by a cold austerity, which led to some misgivings as to the possibility of his being the pleasant companion that his friends described

him to be. "And yet it is well known to those who saw much of Thackeray in his familiar moments that he could be essentially 'jolly' (a favorite term of his) when the humor suited him, and that he would, on such occasions, open his heart as freely as if the word 'reticence' formed no part of his vocabulary; whereas at other times he would keep himself entirely within himself, and answer a question by a monosyllable, or peradventure by a significant movement of the head. At one moment he would look you full in the face and greet you jauntily; at another he would turn from you with a peculiar waving of the hand, which of course indicated that he had no desire to talk." Mr. Jerrold gives us a characteristic glimpse of Thackeray, whom he and one of his friends met one afternoon in Fleet Street, as he was ambling to Whitefriars on his cob. "He caught sight of us, and my companion was about to grasp his hand, but he just touched his hat with his finger, and, without opening his lips or relaxing the solemn cast of his features, passed on. My companion stamped his foot upon the pavement, and cried, 'Who would think that we were up till four o'clock this morning together, and that he sang his "Reverend Dr. Luther," and was the liveliest of us!'"

Those who knew Thackeray best loved him most, for they knew what a sincere, kind-hearted, generous gentleman he was. To be in need was to find the way to his heart, as many a touching anecdote shows. Here is one which was first related, I believe, by Father Prout: "One morning, on entering Mr. Thackeray's bedroom in Paris, I found him placing some napoleons in a pill-box, on the lid of which was written, 'One to be taken occasionally.' 'What are you doing?' said I. 'Well,' he replied, 'there is an old person here who says she is very ill and in distress, and I strongly suspect that this is the sort of medicine she wants. Dr. Thackeray intends to leave it with her himself. Let us walk out together.'" There may be a little invention in this anecdote, as a similar one is related of Goldsmith; but here is one which is better authenticated, and which is related by Mr. Jerrold. He was one morning at Horace Mayhew's chambers in Regent Street, he says, when Thackeray knocked at the door, and cried from without, "It's no use, Porry Mayhew; open the door." "It's dear old Thackeray," said Mayhew, as he opened the door. "Well, young gentlemen," he said, cheerily, "you'll admit an old foggy." They were glad to admit the old foggy, who was neither old in years nor in feeling. He took up the papers lying about, talked the gossip of the day, and then suddenly said, with his hat in his hand, "I was going away without doing part of the business of my visit. You spoke the other day at the dinner" (the *Punch*

weekly meeting) "of poor George. Somebody—most unaccountably—has returned me a five-pound note I lent him a long time ago. I didn't expect it; so just hand it to George, and tell him, when his pocket will bear it, just to pass it on to some poor fellow of his acquaintance. By-by." A nod, and he was gone.

Thackeray was a constant attendant at the *Punch* dinners, and a weighty member of the council which discussed and decided upon the contents of the forth-coming number, his neighbors at table being Gilbert & Becket and Douglas Jerrold. He and Jerrold, it is hinted, were apt to squabble, but nothing came of it. "There is no use of our quarreling," he would say, "for we must meet again next week." He was understood by the *Punch* people as few men are understood by their contemporaries: he was more to them than the great Genius he was to the world—he was a dear friend whom they loved, and whom they were soon to commemorate in a mourning page. Nor was he less dear to others who saw less of him. "One loved him almost as one loves a woman," says Mr. Anthony Trollope, "tenderly and with thoughtfulness; thinking of him when away from him as a source of joy which can not be analyzed, but is full of comfort. One who loved him loved him thus because his heart was tender as is the heart of a woman."

The figure of Thackeray was as well known in London as that of any public man, especially at the West End, where the clubs are, and the club men congregate. He belonged to several clubs, where he was often to be seen, now sauntering through the hall of the Reform, and now at the Athenæum, making up his mind to find a corner in which to write. He was generally behind-hand with his "copy," which did not come easily, notwithstanding his years of practice. For the most part he had his materials with him, in the shape of certain little sheets of paper, which he covered, when the mood seized him, with his peculiarly neat penmanship. He was rather proud of it, by-the-way, and used to say that if all trades failed, he could earn sixpence by writing the Lord's Prayer and the Creed in the size of one. If he could not write, and was not inclined to talk, he would stare out the club window with a dreamy and often with a sad and weary look. By-and-by, in the afternoon, his tall, commanding form and gray head would be seen in the streets overtopping the passer-by, who turned to look at him as he sailed majestically along, with his hand thrust in his pocket, thinking of the little girls, now women, and one beginning to be famous, who awaited his coming in the house that he had built for himself in Kensington.

It was known that he was writing a story which had been in his mind for years; and

one or two of his friends to whom he had shown a portion of it pronounced it his best story. It was also known that he was quite ill. Indeed, he was often in his doctor's hands now. He would be about, however, and when the anniversary of the death of "good old Thomas Sutton" came round again, on the 12th of December, 1863, he was present, as was his wont, at the Charter-house, in his usual back seat in the quaint old chapel. He attended the oration in the Governor's Room, and as he walked up to the orator with his contribution he was received with hearty applause by his fellow-Carthusians. Four days later he dined at the house of his next neighbor, Baron Marochetti, where he enjoyed himself in a quiet way, and added to the enjoyment of those who were less quiet. In the course of the evening a question arose about a subscription in aid of a distressed artist, and with his usual generosity he offered to increase, if necessary, the sum he had previously promised. We hear of him a few days later at the Athenæum Club, where he met Dickens, to whom he confessed that he had been three days in bed, and that after these attacks of his he was troubled with cold shiverings, "which quite took the power of work out of him." On the 21st of December he attended the funeral of a relative at Kensal Green, and on the following day went to his favorite haunt, the Garrick Club, and asked a seat at the table of two friends, who of course welcomed him. There was a little nook in the dining-room, just off the reading-room, and hanging there was a famous picture of a scene in *The Clandestine Marriage*. He sat opposite this picture—his friends remembered—and took his dinner quietly. Afterward he went into the smoking-room, a place in which he delighted, and in which he imagined Brown the elder when he moralized to his nephew about "Members Deceased." Did he think of it then, I wonder? The next day he was out, though in great suffering, and was seen in Kensington Palace Gardens reading a book. He was no better in the evening, and his servant proposed to sit up with him; but, with the consideration which was a part of his character, he declined, and bade the man "good-night." His mother, who slept overhead, heard him moving about midnight, but was not alarmed, as it was his custom when he was ill. At nine o'clock the next morning the servant entered his chamber as usual, and found him lying on his back, with his arms stretched over the coverlet. As he was accustomed to see him in this position after his attack, he took no further notice of him, but brought a cup of coffee, and set it down beside the bed. It was not until he returned some time afterward, and saw that the cup was untasted, that he discovered he was dead!

The funeral took place on the 30th of De-

cember. The mournful procession started from Kensington at eleven o'clock, and reached Kensal Green Cemetery about noon. The male relatives of the deceased followed in a mourning-coach and in his private carriage, after which came a long line of carriages containing persons of rank and wealth, and numbers of what are considered in England the humble classes—authors, artists, and other intellectual workers. The most distinguished men of letters were there—Dickens, Browning, Anthony Trollope, Tom Taylor, Lewes, Mark Lemon, Shirley Brooks, the whole *Punch* staff, Millais, Doyle, Cruikshank, authors, artists—there were a thousand mourners. The coffin was borne into the little chapel of the burying-ground, which was at once filled. When the solemn service was over, they proceeded to the grave, which was in a quiet spot, beside the grave of one of his children. It was a beautiful day, one of those days in which December revives the remembrance of June, and which makes us forget, if any thing can, the remembrance of Death. "Ashes to ashes, dust to dust, but the spirit to God who gave it." They are solemn words; it was a solemn sight. But the saddest sight of all was the spectacle of his two daughters, who advanced in the deepest mourning, and, taking a last sad look at the coffin, turned suddenly away in unspeakable grief. Strong men wept: there was not a dry eye as the earth closed over all that was earthly of England's greatest novelist—William Makepeace Thackeray.

IN THE ABBESS'S PARLOR.

By FRANK LEE BENEDICT.

"IF wishes were fishes, we'd have some fried; if wishes were horses, beggars might ride," crooned little Jem Walters, in a doleful under-tone, which suited admirably the aggravating hopelessness of the old nursery rhyme. She was uncomfortably perched, knees downward, on a chair in the window-seat, her elbows resting upon the sill, her small fingers beating time to her minor-keyed melody. I am sorry to say that every now and then she breathed on the pane, in utter defiance of a strict law devised by her pastors and masters, and afterward, without any interruption in the sort of dirge or dead-march she was beating, the tiniest finger of her right hand would trace across the glass strange hieroglyphics, which assumed astounding shapes to her too vivid fancy. Once she saw an elephant with a howdah on his back—a how-do-you-do was what Jem called it; but no matter. Then she beheld a sphinx, with "a calm, eternal" smile on its countenance, which so irritated Jem that she cut the mystery in twain with one sweep of her thumb nail. Presently she evoked a group of palm-trees, a camel, and

a lost pilgrim dying in the desert sand, with a fountain, which he had no strength to reach, shining before his weary eyes. Then she perceived a face so grotesque that she giggled; then a rhinoceros; then something which looked so like a dreadful kind of antediluvian beast that Jem was half frightened, and rubbed him into nothingness with her elbow.

Then, to her horror, she perceived that in the engrossing interest of her occupation she had smeared four panes of glass in a hopeless manner. No polishing with the corner of her white apron was of the slightest use; yet cleansed the glass must be before Aunt Julia appeared to inquire if that stony-hearted arithmetical puzzle had been solved. Jem once more quavered out, "If fishes were wishes—" stopped to laugh at her blunder, desperate as she was, and by some unguarded movement toppled herself and her chair over, and lay there on the floor beneath it like a melancholy snail that had hired a house much too large for him. She managed at length to rise, discovered that she had upset Aunt Julia's work-basket, which had been placed on an ottoman near, and had torn the gathers of her apron in front.

Then the devil tempted Jem. She should be as severely punished as possible for the transgressions and mishaps which had already occurred; she might as well exhaust her badness now. She gave the basket a vicious kick, and the torn apron a deliberate rent; then she sat down on the carpet and cried a little, but found herself too miserable for tears to be got at easily; so she attempted the impossible task of restoring Aunt Julia's basket to order, and then tried to mend her apron with some blue silk, partly because the color pleased her, and partly because she found a needle already supplied with it, and ingenious as Jem was in many ways, she never could make a thread hit the eye.

Poor little Jem! she was not yet seven years old, and Aunt Julia obliged her to study French verbs, and had pushed her on into fractions, and when Jem, with a horrible precocity, perpetrated a joke and pronounced them "vulgar," Aunt Julia took it for impertinence, and made her spell the names of twelve unpleasant Hebrew kings as a fitting penance.

Poor little motherless Jem, consigned to the mercies of an Aunt Julia who had theories! She meant to be a good woman, and she loved the child; for that very reason felt it a duty to be strict with her, and acted, as so many people do where children are concerned, by the rule of contraries, that is, whatever Jem liked to do must be forbidden, and whatever Jem liked not must be done: this to teach the mite patience, and subdue the evil tendencies of the "natural Adam," reference to which improper personage was frequently upon Aunt Julia's lips.

Jem had been two days in disgrace, a trouble brought about by those horrible fractions and a mud-pie, the latter having been fabricated when she was sent forth to take the air in the garden, had gone down the high-road instead, and after making her pie, had fallen into it head-foremost. With the closing performances of this morning the door of hope had shut, and Jem, unconsciously become a wicked little fatalist, decided that she could no more amend or atone for all that had happened than she could have prevented its occurrence.

Now in spite of the heinous nature of Jem's offenses and my severe reprobation thereof, I must mention one thing in her defense—an excuse which "grown-ups" are always bringing forward to palliate their own errors and short-comings, but which they quite forget can ever have any thing to do with the misdemeanors of children of a lesser growth—Jem's nerves were out of order. Not only had Aunt Julia entirely overdone the matter of French verbs and simple fractions, pushing the creature forward from sheer pride in her precocity, and afraid (being afflicted with religious sentiments of a gloomy nature) that giving way to outward displays of tenderness would lead to the sin of idolatry on her part, but other causes had been at work to upset Jem's mental equilibrium.

The night but one before this day of crime which I am chronicling Jem had slept in Cousin Fanny's bed, and somewhere among the small hours had been awakened by the sound of bitter weeping. She sat up among the pillows, and by the light of the lamp saw Fanny kneeling beside a table, and crying as if her heart would break. Jem spoke to her, but she did not hear; then the child cowered down in bed and cried too, making so much noise about it that Fanny had to stop her own lachrymatory performances and go and soothe her, and Jem promised to do her best to forget what she had seen—at least to tell no living soul, not even Aunt Julia.

Cousin Fanny was also a niece of that sad-voiced relative, but a grown woman, who did just as she pleased, never had any French verbs to learn, was independent of fractions, simple or compound, and it seemed a marvelous thing that she should find any thing to cry about.

So, taking advantage of the morbid state into which all these combined causes had thrown the child, the devil tempted her, and Jem fell, rushing recklessly on from sin to sin, till she reached the climax—kicked Aunt Julia's work-basket and tore her own apron.

It would be better now to die, Jem thought. She had heard Cousin Fanny on that tumultuous night ask why death did not come. Jem felt that in the pass to which fate had brought her not only was the question applicable, but it would be

wise to resort to stern measures and have done with life. She lay down upon the carpet and stretched out her arms, and was dying comfortably, when a bug that had come in at the window on an exploring expedition crawled across her hand and brought her back to existence and an upright position in great haste. A happy thought struck Jem. She had one of Mrs. Sherwood's tales fresh in her mind. She would go and be a nun. She should have two full hours before her for carrying out this design. Fanny and Aunt Julia had gone to see a friend who was soon to depart from the neighborhood, and would not be back till luncheon, so up to that time Jem would have the freedom of the library and the companionship of her vulgar fractions. It seemed only right to inform her relatives of her intention, and Jem spent a long while composing a letter to the younger of the pair:

"DEAR COUSIN FANNY,—I have gone to be a none. I rather do so than fractions. I've tore my Apron and kic Ant Julia baxet so I shall go a none like Ann. I no her name in Mrs. Serwood. Tell Ant Julia I am verry sory and love her until deth which I think is Neere. so know more from your cousin

"JEM NONE.

"P. s. I shall never tel about the other night even to the Abes or the sisters.

"p. S. too. I take Ant Julia black vail because the Abes might not have one convenyent and I would never like to put the convent to Expenche."

Then she went to Aunt Julia's room, and got out the crape veil which her guardian had worn a few months previous when in mourning for some relation.

Jem departed. Through the garden and orchard she took her way. Then came a grove; then the boundary which she had been forbidden ever to pass, because beyond lay old Mr. Milner's estate, and he and Aunt Julia were not friends. Still on Jem went, climbed through a broken gate, and kept her course, weary but determined. Off in the distance, upon a wooded hill, she saw a summer-house, which, by some reasoning perfectly clear to her own mind, she decided to be a convent, and toward that haven of rest she plodded.

It was very warm and Jem very tired by the time she reached her goal—a pretty spot as weary pilgrim could wish to rest in. She pushed open the door and entered. There was nobody present but a red butterfly, which did not seem in the least glad to see her, and began turning somersaults in the air till Jem grew quite dizzy watching him.

"The abbess has gone out," said Jem to herself; "but I shall take the veil and be all ready when she comes back."

So she wrapped the crape about her head, and sat down on a low rustic couch to meditate, and presently, as people usually do when they make up their minds to meditate, fell fast asleep.

When she woke she saw a very handsome

man sitting opposite her, tranquilly smoking a cigar. Jem was not in the least frightened, though he could not possibly be the abbess, and she was inclined to think she must still be asleep. She rubbed her eyes and looked again, but there the vision still was—such a handsome man, with great brown eyes and a silky mustache, and somehow his face was so familiar to Jem, though she did not know him from Saul of Tarsus, that, without stirring, she called out,

"Did I dream you, please?"

"Halloo!" said he, laughing. "What little brown elf are you?"

"Yes, I'm rather brown," replied Jem, dolefully; "but it's not very polite of you to tell me so."

"I only meant I thought you were a kind of fairy called a brownie," he explained.

"Oh," said Jem, quite mollified. "No, I'm not; I'm a nun."

"A what?" he asked.

"A nun. Don't you know? I've taken the black veil, and this is my convent."

"The deuce it is," said he.

"Yes," said Jem, sitting up, and staring at him with round eyes of astonishment. "You're very handsome, ain't you—I mean aren't you? Ain't isn't correct; you mustn't ever say it."

"I won't, you small syntax," he said, laughing, till Jem laughed from sheer sympathy, though she could not imagine what he meant by his merriment.

"So you're a nun," he observed, presently.

"The blackest kind," said Jem, touching her veil. "Haden't you better stay here and be one too?"

"Upon my word, I think I had! Will I be allowed to smoke?"

"Maybe," replied Jem, doubtfully. "Mrs. Sherwood don't tell, I believe."

"Is that the abbess?"

"Oh no; she wrote the story. The rest of her stories are all about decayed gentlewomen; but I think they would be very nasty; don't you?"

"Uncommonly so, I should say. Now what's your name, brown elf?"

"I'm Sister Ann—Annunciata."

"But before you left the world? When you were at home, you know?"

"Oh, Jemima; but I don't like it; I'm Jem."

"I expect you ran away," said he. "What made you?"

"Fractions," answered Jem, promptly; "but they can't get me back, for I've taken the black veil, you see."

He nodded his head, and sat studying her little pale face, and Jem studied him with great earnestness. Suddenly she clapped her hands and cried,

"Why, you're the picture!"

"The dickens I am! Now what are you at?" he asked.

"That's how I knew you; but I couldn't think," returned Jem, nodding her head many times in a satisfied way.

"She's daft!" he exclaimed, looking about with a bewildered air. "Tell me what you mean, this minute!"

"I know you are the picture," persisted Jem. "I saw you in her box. I opened it, and there you were."

"O Lord!" said he. "Well, whose box?"

"Why, Fanny's, of course. That's my cousin, and her other name is Ames. She's very good, and I love her awfully, and—and—why, what's the matter with you?" For he had turned strangely pale, and was gazing at her with such intentness that she grew troubled.

"I hope you ain't angry—aren't, I mean," she faltered, but, with the influence of Aunt Julia's spirit strong upon her, struggling resolutely to be grammatical to the last. "Please don't be angry, you know."

"Angry! No, child, no," he answered, with such a beautiful smile fitting over his white lips that Jem felt perfectly reassured.

He rose and walked to the door, and stood there for a little with his back toward her. He had motioned Jem to keep still, and she did not stir. Presently he returned, sat down on the seat beside her, and drew her close to him.

"So you love Fanny very much," he said.

"She's so good," sighed Jem. "She comes every night after I'm in bed, and kisses me three times on my forehead—here."

He stooped and pressed his lips thrice upon the spot she had touched with her finger.

"Now, Jem," said he, "we are going to be great friends."

"Yes, indeed; we're both nuns, you know."

"Well, we'll talk about that afterward," he replied; "but first I want you to tell me something."

"But it's not fractions?" questioned Jem, rather disturbed by the grave expression of his face.

"No, no; I hate them as much as you do."

"Good," said Jem. "If it's not fractions, I'll tell you any thing in the world! I know a beautiful story about a white mice."

"We'll have that too by-and-by; but about the picture first."

"That's you," said Jem. "Only it was in the box, and you are here. I really thought I dreamed you."

"It was my portrait," said he.

"Of course," returned Jem, somewhat confused. "I meant that all the time, only I saw you so sudden."

"Exactly. Tell me, Jem, did Fanny know you saw it?"

"Yes, but she didn't scold. I opened the wrong box."

"What did she say?"

"Oh, she wasn't a bit angry. I didn't do

it on purpose. I wouldn't be so mean for any thing."

"Of course not. But what did she say about the picture?"

"It had 'Charles' on it," began Jem.

"That's my name."

"Oh, is it? Why, that night when I woke up and she was crying, she said, 'Charley, Charley.'" Then Jem suddenly remembered her promise, and burst into tears, saying, "Oh, I've told, I've told, and I promised not! Oh! oh! And now she'll think I'm bad—"

Here sobs checked her utterance.

"I do think she'll drive me mad!" muttered the young man; but he restrained himself, gathered Jem in his arms, and soothed her with tender words.

"She'll not be angry," he averred; "you did not mean to tell."

"No, no," sobbed Jem; "indeed, indeed I didn't."

"You know we are nuns, and nuns are obliged to confess," continued he, sinfully taking advantage of the cobwebs in her childish brain to turn her morbid fancies to his own use. "You must have read that in Mrs. Sherwood."

"So I did," said Jem, a good deal relieved. "They had to tell every thing to the abbees and the pro—no, the—the—"

"Confessor. Just so."

"I shouldn't break my word for all the professors—I mean con—that ever lived!" cried Jem, proudly.

"I'd like to shake her!" he groaned. "She's as mad as a March hare, and she'll drive me madder than herself."

Jem did not catch the words, but the tone startled her.

"Oh dear, you *are* angry!" she said, with renewed sobs. "Oh, I don't know what I shall do if you're angry!"

"No, no; not a bit. See, I am smiling. I love you dearly, my little Jem, and we are the best friends possible."

"Ah," said Jem, nestling up to him, and leaning her head on his arm with a long sigh of content. "I think I shall like being a nun along with you. I wish Fanny would come and be one too."

"So she cried and spoke my name?" he asked. "Was that when you opened the box?"

"Oh no; that was in the daytime. And she looked very pale, just as you do now, and—"

"Yes—well?"

"She said she wasn't angry. Then she asked me if I knew what a treasure was."

"And you did?"

"Of course—a heap of gold locked up in a chest. But that wasn't what she meant; and then she said there was another sort—"

"Yes; something very precious—something that belonged to a dead friend, or somebody very dear—"

"Why, that's what she said!" interrupted Jem, in delight.

"And did she say the picture was one?"

"To be sure. What was the word—sacred? Her sacred treasure—too precious to talk about—so I was not to tell I had seen it."

"Then what did she do?"

"Oh, she kissed me ever so many times, and she said, 'Jem, you are too little to understand; but you're a great comfort to me, and I don't mind your knowing.'"

"And then?"

"Then she put you back in the box—I mean the picture—and then—oh, something else—I can't forget!"

"You mean you can't remember?"

"Yes; about—how was it?"

"Try and think."

"About a dead friend," said Jem. "But you aren't dead. Why, what made her think you were?"

"Did she say 'a friend dead to me?'"

"That's it!" cried Jem. "I can't think how you know."

Again the young man rose and walked up and down the summer-house, and Jem sat watching him.

"Have you got the megrims?" she asked, suddenly.

"The what?"

"That's what Nurse Robson says she has when she walks up and down. She says her legs crawl; and once she said she had a nest of ants in her knees; but I didn't believe that, and I told her so, and she said I was a hardened little infidel. I'm not very fond of Nurse Robson. When she's cross she combs my hair the wrong way, and pretends she did it by accident; and if I complain, she says I'm a baby; but I'm sure nobody would like it, now would they?"

"No," he answered, rather absently. He came back and sat down again beside her, and she leaned her head on his arm, and gazed admiringly up at him in happy obliviousness that such troubles as fractions and punishments existed.

"You're such a good little thing," said he. "I'm wonderfully fond of you, my pretty Jem."

This young man named Charles was undoubtedly a very designing person; he meant to make use of every sort of art that could entrap the candid little soul into further confidences.

"I'm so glad you like me," cooed Jem. "I suppose we shall stay here always, sha'n't we?"

"Good gracious, yes! We're nuns, you know."

"Of course," said Jem, clapping her hands in ecstasy.

"So after that, after the day you found the picture, you saw Fanny crying, did you?"

"Yes—that's what I wasn't to tell."

"Of course not, except to me. Fanny meant you to tell me."

"No, I don't think she did, because I didn't know you," replied Jem, after a little reflection. "I only knew your portrait."

"It's all the same," assented this unscrupulous Charles; "and, anyway, you have told me."

"But I didn't mean to. Oh, am I very wicked?" questioned Jem, in great distress.

"No, no. You're the dearest, best child that ever lived. What pretty curls you've got, Jem! So Fanny cried!"

"Oh, so hard! and wanted to die. That's what made me think of dying when it all went so wrong this morning."

"Wanted to die?" he repeated, in an unsteady voice. "Did she say why, Jem?"

"Nothing left—nothing—I remember her saying that," said Jem, with her head on one side, like a wise little robin-redbreast.

"Oh, I was so sorry, and I cried too, and asked her not to die; and then she kissed me. Oh dear, wouldn't it be better for her to come here and be a nun along with us?"

"She's shown me the way," said he, in a low tone. Then, aloud, "See here, Jem, you must write a letter to Fanny."

"Oh, I wrote one to say I was gone to be a nun."

"But you must write another to tell her to come and be one too."

"Do you think she would?"

"I know she would."

"But she won't tell Aunt Julia?"

"Not if you tell her to say nothing. Look, here is paper and ink and every thing," he said, opening a drawer of the table.

"I suppose this is the abbess's parlor," observed Jem.

"No doubt. Now write your letter, like a good child."

"I'll say we both want her to come."

"No, no; not a word about any body but yourself."

"Oh," said Jem, rather puzzled.

"Say you like being a nun very much, and want her to come at once and join you."

"Just so," said Jem.

He arranged the writing materials, and Jem began:

"DEAR COUSIN,—"

She broke off to exclaim, "Oh, there's a blot!"

"Take another sheet. Ah, do be quick, Jem."

She began anew:

DEAR COUSIN,—I'm a none you would better be a none too Come At once the Abes is not at Hoam but I took the Black vale."

Charles read the lines over her shoulder as she wrote, an amused smile breaking across the anxiety and trouble of his face.

"That will do admirably," said he.

VOL. XLIX.—No. 292.—37

"But how shall we get it to the post-office?" asked Jem, struck by a sudden perplexity. "Nuns can't go out."

"I can send it," said Charles. "Now finish. Tell her to be sure and mention your letter to no living soul—to come at once."

So Jem added:

"P. S. Tell no Livin sole Secret to the Grave."

"Add, 'More depends on this than you can think,'" said Charles.

Jem put "p. s. too," and wrote what he dictated.

"Go on," he ordered.

"Oh, isn't it done yet?" she asked, somewhat fatigued by such unusual epistolary efforts.

"Not quite. Say, 'Follow the bearer without delay or question, or it will be too late. Come alone with him, or you will not find me.'"

Jem wrote the whole, and signed her name.

"My good Jem!" pronounced Charles, and kissed her as a reward. "Wait here; don't move till I come back."

He hurried out of the summer-house; whistled sharply; a man cutting underbrush in the grove appeared in answer to his summons. After a brief dialogue between the two, the gardener set off down the hill, and that mysterious Charles returned to the abbess's parlor.

"It's all right, Jem," said he. "Tell me what you would like best in the world; for whatever it is, I mean you to have it."

Jem was so bewildered by the magnitude of the promise that she could frame no wish whatever.

"Never mind; we'll think about that later," he added. "By-the-way, are you hungry, Jem?"

"I do believe I am, but I didn't know it."

Charles produced a little covered basket, opened it, took out some cold chicken, a roll, and a cake of chocolate, and spread them upon the table.

"Why, where did it all come from?" asked Jem.

"Oh, the convent cook must have expected you," he asserted. "Eat, and ask no questions—they're not permitted by the abbess's rules, you may be sure."

"Why, then she's as bad as Nurse Robson," sighed Jem, "and I like to ask questions."

"You small Eve!" laughed Charles.

He urged her to eat, but would have nothing himself, though he smoked vigorously instead. He seemed a very excitable young man. He got up and sat down, muttered to himself, gesticulated, and finally disturbed Jem so much when she had finished her luncheon and found time to watch him that she said,

"You don't think of having brain-fever, do you?"

"Jem, Jem!" he cried, catching her in his arms. "I believe, I hope— Oh, Jem, I believe I am a happy man once more, and I owe it all to you, my precious little lamb!"

"Set me down," said Jem, "and then I'll kiss you. How nice it is to be a nun! Shall we have chicken every day?"

But he had rushed to the door again, and was peering through the trees down to the path which led toward the hill.

Jem nibbled a last bit of chocolate she caught sight of on the table, and meditated upon the bliss of always living in this charmed retreat, with her new friend and Fanny beside her, no fractions to trouble her, and no Nurse Robson to comb her hair the wrong way. Then she suddenly remembered Aunt Julia, who as an aunt out of lessons hours was an entirely different person from the Aunt Julia devoted to French verbs.

"Oh dear!" she cried. "Charles—I'd better call you Charles, hadn't I?"

"Of course," said he, stepping back into the room. "Well, what is it, little pigeon?"

"I've been thinking—there's Aunt Julia. Whatever will she do with Fanny and me both gone?"

"Serves her right," muttered Charles.

"What did you say?" demanded Jem.

"I said you were a darling birdie," replied Charles, and darted out of the door again.

"Aunt Julia might be a nun too," mused Jem, "only she really must get over that dreadful habit of liking fractions, for I don't see how there could be any peace in the convent unless she got rid of it."

Just then in rushed Charles, white as a sheet, his eyes shining like two stars.

"She's coming," gasped he.

"The abbess?" cried Jem.

"The dev—" Then remembered to stop and pretend to sneeze. "You're the maddest child I ever saw."

"I'm not," broke in Jem, indignantly; for Jem was by no means an angel, and had a small temper of her own.

"You're a love," vowed Charles. "She's coming—"

"The abbess?" interrupted Jem again.

"Fanny, of course," said he, impatiently.

"Oh, well," returned Jem, rendered somewhat stolid and matter-of-fact by her copious luncheon; "we knew she was coming. You can see her any day. But where's the abbess? That's what I want to know."

"Jem," said Charles, solemnly, "if you disappoint me now, I'll make an auto-da-fe of you on the spot."

"I know what an autograph is," retorted Jem; "but I'm a nun, and I won't be any thing else for any body."

"Here she is! Get out of the way, Jem!" cried that horrible young man, and with the customary base ingratitude of his sex he thrust Jem into a corner, now that he no longer had any use for her.

Up the hill strode the gardener, and after him came the prettiest vision that one could wish to see on a bright summer morning. A young girl—certainly not more than twenty—with lovely golden hair, glorious blue eyes, and a face such as might have suited one of Raphael's Madonnas. This was Fanny Ames.

Fortunately Aunt Julia had decided to spend the day with her friends. Fanny had driven back alone; had gone at once to the library to release Jem, having begged a commutation of her penance. She found Jem's remarkable epistle, and being a sensible young woman, stood still, wondering what it was best to do, instead of rousing the household by a series of hysterical shrieks, as many of her sisters would have considered the most fitting thing to attempt under the circumstances.

Enter a servant.

"A man wants to see you, Miss Fanny."

"Let him come in," said she, with rare presence of mind, jumping at the conclusion that some sort of relief to her perplexity must appear with this unknown person.

She read the note which the unknown handed her, stopped to ask no questions, but in two minutes was following him across the shrubberies and on over the lands of old Milner, which an hour before she would have believed nothing could induce her to pass. Here she was at the door of the abbess's parlor, calling,

"Oh, Jem! you darling, dreadful little Jem!"

In she rushed, and found herself confronted by a handsome young man, who proceeded to fall on his knees and seize her two hands, and cry:

"They told me you were false—that you wanted to be released from your engagement. So I wrote that wicked letter, and ever since have been wandering like Cain over the face of the earth. Oh, Fanny, it was not true—you did care! It has all come out. I know about the picture and every thing. Fanny, Fanny!"

But the last words were only a moan of pain, for without warning she tottered back, and he caught her just in time; and there she lay senseless in his arms, while he raved like a maniac with a man's usual absurdity; and that sensible little Jem—a true woman in embryo—ran out to the brook near the summer-house, soused Aunt Julia's crape veil thoroughly, rushed back, flung it full in Fanny's face, and greeted the astonished Charles with a thoroughly feminine observation:

"What a big fool you are, to be sure!"

Then she began to yell like a bedlamite as Fanny opened her eyes, and did a spasm of nervous agony which would have done credit to a girl of eighteen.

Heaven knows how long the explanations took, though from the instant the lovers

looked in each other's eyes none whatever was necessary; but they never remembered that time existed; and Jem was equally indifferent, and asked questions, and answered for both, and understood the matter perfectly in her own fashion.

An old, old story. Charles Milner and Fanny had been engaged against the will of Milner *père* and Aunt Julia, who had never been friends since the days when Aunt Julia married his intimate friend instead of himself. Charles was obliged to go to Australia to attend to the affairs of an uncle, who had seen fit to die and leave the young man his heir.

Aunt Julia and old Milner, having fought out all the ancient causes for quarrels, proceeded to get up a new one over a right of way. They decided to settle the matter by arbitration, got into a battle before the umpires, and had led on to worse, till finally, in his wrath—for she had hit him hard at every point—old Milner hinted that Fanny's affection for his son was instigated by a regard for the young man's wealth. Aunt Julia was not to be outdone when her temper was up, and she told the old fellow to his beard that her niece might make a better match tomorrow, and would if she did not consider herself bound by a foolish promise to Charles

—a promise which in reality meant nothing.

Old Milner wrote and told Charles this; and Charles, in a frenzy, wrote a cold letter releasing Fanny from her engagement; and she interpreted his stateliness to mean that he wanted his freedom, and gave it him in an equally tragic epistle; and for twelve months she had been mourning at home, and Charles doing the Wandering Jew in any land which chanced to be convenient. He had reached home, called back by his father's illness, only the night before, and that wicked elopement of Jem's had brought about this happy *dénouement*.

"And we sha'n't be nuns after all," said that small personage; "but I don't mind, for Charles has promised to cure Aunt Julia of her love for fractions."

And Charles kept his word, and Aunt Julia was so content to see Fanny look happy once more, and old Milner—he was only forty-six, after all—so content to get his son back, that four weeks after the two danced a quadrille at the young people's wedding, and were married themselves the next autumn, and to this day Jem, now a grown woman, tells me she knows no more about fractions than I know about the lost Pleiad, and cares as little.

THE NEW SOUTH.*

By EDWIN DE LEON.

III.—COMMERCE AND NAVIGATION.

TODAY the commerce and navigation of the Southern States, as compared to those of the Northern, do not show well, owing to the fact of the virtual monopoly of the carrying trade by our enterprising brethren of the North, who have succeeded in controlling the prices of our great staples, as well as the transmission of them at home and abroad.

Direct trade with Europe, for so many years past the cherished vision and hope of the Southern statesmen and more far-sighted commercial men in the Southern sea-ports, has never yet attained any considerable proportions, while even our internal and coasting trade is in Northern hands to a great extent. New Orleans alone can boast of regular direct lines of steamers to European ports, although the other Southern ports send forth occasional or semi-occasional steamers and sailing ships, Savannah recently having taken the lead in these efforts, and Norfolk now boasting of its Allan line of steamers. Still, these are only sufficient exceptions to prove the rule.

Southern commerce depends on its great staples, their handling, exchange, and trans-

mission to the Northern and foreign markets, paying ever a heavy tax to the Northern middle-men, merchants, and ship-owners for their transmission abroad, and also helping materially to enrich the Northern railway kings, who have stretched out their arms into the far South, and *annexed* the chief Southern railroads as feeders to their great trunk lines, and virtually control all the outlets to the cotton, rice, sugar, tobacco, of the South and Southwest. The grangers of the West, who have risen in rebellion against this giant monopoly, have found co-operators throughout the Southern States, where-in granges are springing up with marvelous rapidity. But whether these organizations can effect a different solution to the transportation problem, and permit the producer to reap more of the profits arising from his products, is a question to be solved within a very short time by the present generation.

Southern commerce, as contradistinguished from mere local trade or small shop-keeping, rests on the great staples, and under the present system it can not be denied that the great producing section annually absorbs the smaller portion of the profits accruing from the culture, while the Northern, by the mere transportation and handling of those prod-

* Continued from the February number, page 422.

ucts, pockets the lion's share, reversing Pharaoh's vision of the fat and lean kine, since it is the former which swallows the latter in this instance. The annual reports of commerce and navigation, issued from the bureau at Washington, may be dry reading, but their facts and figures are very instructive; neither can they be gainsaid, giving as they do the inexorable logic of trade returns and shipping lists.

The great centres of Southern trade are her sea-port cities, New Orleans taking the lead, and Norfolk, Savannah, Charleston, Mobile, and Galveston coming next in succession. The great inland mart of the cotton trade is Memphis, which receives the product of the Mississippi Valley, and taps the Southwest. Though an inland town, Memphis is a great river port, its lines of river steamers carrying 20,000 tons, and making trips longer than many sea-voyages. It also is the centre of a perfect web of railways, extending northward and eastward, with projected lines to tap the mineral regions of Alabama, and the ports of Norfolk, Charleston, and Savannah.

As the first in importance as well as in size, let us take a retrospect of the recent trade of New Orleans, the greatest of the Southern ports, and the only one boasting regular direct steam communication with Europe. Since the revival of her commerce, *post bellum*, New Orleans has had her most rapid recovery in the cotton trade. This might be considered a curious circumstance in view of the fact that she is really out of the cotton-producing region by a full geographical degree, and that little if any cotton is grown within a hundred miles of the city. In this respect Charleston, Savannah, and even Mobile have great natural advantages over the Crescent City. Yet this is neutralized by her position on what Mr. Calhoun so aptly called her "great inland sea," the Mississippi, giving her an outlet to the Gulf and the Atlantic Ocean, and opening to the enterprise of her merchants that vast region watered by the great river and its tributaries. New Orleans, through these facilities, now controls about one-third of the crop grown in the Southern States, and the foreign spinners largely fill their orders there, many having special agents or branches domiciled at New Orleans at least for six months in the year. If she has been able to accomplish so much under the very exceptional and abnormal condition of her government (she never yet having been really reconstructed), what may not her future be, when all barriers and impediments are removed, and capital flows in again from abroad to facilitate and increase her commercial operations? Her *ante bellum* export was very large. In 1860-61 the export of cotton from New Orleans reached near 2,000,000 bales. During the war, of course, her trade was paralyzed, even after

the Federal forces had taken the city and raised the blockade.

With peace came a rapid revival of her cotton trade. In 1865-66 her exports were 768,465 bales; in 1869-70 they rose to 1,185,050 bales, of which about half went to Liverpool, about a quarter to Havre, 115,000 to New York, and the rest to Bremen and other manufacturing centres abroad. The returns for 1870-71 are the largest. They rose to 1,541,359 bales. The last, for 1872-73, were almost up to that figure, viz., 1,406,026 bales, of which 733,007 went to Liverpool, 194,088 went to France, and the balance was distributed between the northern states of Europe, south of Europe, coastwise, and Mexico. This, for a city of about 150,000 white men, who have all the trade in their hands (the 60,000 blacks being chiefly laborers or artisans), is certainly doing very well. The Cotton Exchange Board, recently organized in New Orleans, has already exercised a most beneficial influence on the trade. Already, this year, up to the 1st of February, the rush of cotton to this market was unprecedented, more than a million and a quarter of bales having been received up to March 1, 1874.

The next great staple of produce, and once the leading one of Louisiana, sugar, with its satellite molasses, seems to have suffered more from the shock of the war than any other, while its yield in the Mississippi and Red River plantations has decreased four-fifths since the war, and the receipts from other quarters suffer a similar diminution. It must be borne in mind, however, that the sugar trade of New Orleans (unlike its cotton) was ever more local than general, supplying the Western demand only, while the outside supply for the rest of the Union came from Cuba and the West Indies through the Northern ports. But the shrinkage in the local production is a painful fact, as well as an undeniable one, as the tables will prove. The export of sugar and molasses from New Orleans is thus summarily stated in the report of M. Bouchereau, which is accepted as correct by the trade.

He says that the produce of sugar in 1861-62 was near 390,000 hogsheads under the old process of "pawning," and under the "refining" process about 70,000 hogsheads, making in all about 460,000 hogsheads, or 530,000,000 pounds of sugar. In 1869-70 the whole yield did not reach 100,000,000 pounds. For the year 1872-73 the reported yield has been less than 37,000 hogsheads and 32,000 barrels of sugar, and about 133,000 barrels of molasses—a slight improvement on the two preceding years, but a notable falling off from the *ante bellum* stand-point.

The tobacco trade also of New Orleans, to use the emphatic slang of the dealers, is "very sick." It is gaining ground, however, and the dealers have hopes of a

restoration of the trade to even more than its previous proportions. Just before the war the annual receipts of tobacco at New Orleans rose as high as 81,000 hogsheads; in 1868 but 15,000 hogsheads were received; in 1870 they had risen to 20,000 hogsheads only; in 1871-72 there was a further increase to 22,582 hogsheads; and again a relapse in 1872-73 to 20,000 hogsheads. Louisiana herself does not raise much tobacco. She is very proud of her peculiar kind, termed "perrique," which has an exceptional flavor, and is very strong. But her supplies have been chiefly drawn down the river from the States of Illinois, Missouri, Kentucky, and Tennessee; and the products of these States seem since the war to have been directed into other channels. Competent judges entertain the opinion that Louisiana could readily rival Cuba in the production of tobacco as well as of sugar were attention turned to it, climate and soil being both auspicious. But the people of the State love not new things, and are disheartened at the progressive decrease in the yield of their old staples and former mainstays; so that the halcyon days of the smoker of the native weed must be delayed for some time, even should they ever arrive in our day and generation. In the mean time the tobacco dealers, both for exportation and domestic consumption, are pushing both branches vigorously, the emigration of Cubans aiding greatly the production of the cigar in New Orleans, where factories and fabrics for that purpose now abound, much of the tobacco used therein also coming from Cuban plantations, the proprietors of which have transferred their laborers and workshops into this safer latitude. The production and consumption of cigars made on the spot is now enormous, the figures attainable in returns not giving a tithe of the actual ones. As far as the figures go, derivable from the tax returns, more unreliable now in the Southern country than they are elsewhere, owing to peculiar circumstances, they show that the United States revenue at New Orleans from this source alone amounts annually to \$100,000, and that nearly, if not quite, 2,000,000 cigars are manufactured on the spot out of Cuban and native tobacco.

Although the direct foreign trade of the South, as indicated by the Custom-house returns, affords a most imperfect idea of the actual consumption of foreign goods by that section, owing to the virtual monopoly of foreign trade in Northern hands, yet the table is valuable as marking a decided increase on the small beginnings the South is making in direct trade. A contrast of the imports (foreign) in 1860 and 1870 will prove this increase, especially in the case of New Orleans, which is remarkable when the war shrinkage is taken into consideration:

Customs Districts.	1860.	1870.
Alexandria, Virginia	\$176,002	\$32,692
Albemarle, N. C.	4,797
Appalachicola, Florida ..	7,841	6,538

Wilmington, N. C.	311,344	119,758
Fernandina, Florida	100,973
Total	\$40,476,757	\$42,298,706

The exports from the same ports also show a similar recovery, the total aggregate value of Southern shipments to foreign ports in 1870 amounting to \$208,567,240, against \$207,457,262 in 1860. Add to this the domestic exports of \$500,000,000, and the commercial condition and prospects of the South can by no means be considered discouraging when all the drawbacks are taken into consideration. The wonder is that she makes so good a showing, and has so rapidly recovered lost ground, commercially as well as agriculturally. Did space admit of minute detail in these matters, the rapid development of Southern resources, internal and external, would astonish the "rest of mankind" in and out of the United States.

The position of the Crescent City at the embouchure of the Mississippi River would seem to have given her the keys of the Gulf, and thus made her the great entrepôt and distributing centre for West Indian and South American products. Yet she has lost during and since the war even the small headway she had previously made in this direction; for during the ten years preceding the war she imported three millions and a quarter bags of coffee, equivalent to one-third of all the coffee imported into the United States; and for the four years following the war she received less than one-tenth of that import, and seven-eighths less than her previous receipts. The immense circuit this trade now makes to reach Northern ports shows that immense efforts and extraneous causes alone can effect so unnatural a diversion. Nor is it in her external trade alone that New Orleans has suffered. She re-echoes the complaint of the famous old South Carolina judge of olden time, who declared that he "had been once a great hogshead of law, but that the little lawyers came with their little tin cups, and tapped and drew off a pint at a time, until little was left but the lees." So her active little neighbors, who can not rival her in population, resources, or position individually, have diverted each of them a portion

of her trade—some for export to the North, others, like Columbus, to feed their own factories, while other causes have diminished her dry-goods trade.

Among the many striking changes wrought by the war through the extension of railroad lines, the diversion of trade from old routes is one of the most noticeable throughout the Southern country. The giant young city of St. Louis, and the growing new centres of Kentucky and Tennessee, Louisville and Memphis, have diverted much of the trade of New Orleans by steamboat and railroad lines, tapping the trade of the great river and its tributaries, and competing even for the dry-goods supplies of Texas. Not so severely crippled in credit or cash as the Crescent City, not subjected to the same internal taxation and depreciation of values, these younger rivals have stolen away much of their elder sister's trade, leaving her to depend chiefly on her cotton and other staples. It is believed, however, that when the bar obstructions are removed, or the St. Philip's Canal facilitates the navigation by making a safe and easy outlet to the Gulf, that New Orleans will regain her lost ground, and start on a new career of prosperity.

But the greatest drawbacks on the commerce of New Orleans are the want of capital (or of credit that might command it), and the terrible taxation, Federal and State, under which it staggers. True, she enjoys the benefit of a discriminating tariff in favor of her sugar, which apparently does her no good, while all other articles in which she might trade successfully are heavily weighted. Woolen and cotton goods, the foreign liquor trade, clothing, earthenware, and all articles in common use, thus "protected" against foreign competition, prevent direct trade with Europe for her cheaper fabrics, and restrict the trade, which otherwise would spring up, in exchange for cotton. But the Federal taxation is the lightest of these burdens, and only indirectly felt. Piled up over these are city and State taxation, both indefinite quantities under the existing government, which is making hay while the sun shines. The license duties, the direct taxes on his capital employed in business, on his real estate, on his cash capital unemployed in business, on railway and steamboat stock, together with stamp duties and payment of percentage to the assessors, *who are paid in proportion to the magnitude of the assessment*, leave the trader or the proprietor little if any margin for himself when these exactions have been met. If he does not pay, the process of collection is most summary. On short notice the property is sold at public sale for what it will bring, and inevitably sacrificed in a community where no one has money to invest. The cotton crop, which the world *must have*, is chiefly moved by foreign capital. English, French, German, and New

York banking houses make more money out of exchange at such periods than the planter or his factor can out of his produce. There are in New Orleans but ten or eleven banking houses, whose entire paid-up capital does not reach \$7,500,000, and the total deposits average about double that sum—only a drop in the bucket when the amount necessary to move *one-third* of a cotton crop now averaging 4,000,000 bales annually is considered, not to mention the other staples and articles of internal trade drawn down the river from the vast region above, and by the railroads from the surrounding country made tributary to her trade by the new lines of railway and water communication, executed or in process of execution.

The navigation of New Orleans comprises the ocean steamers and sailing vessels and the river fleet, and cotton is king again over this branch of business. The river trade has fallen off immensely, owing to causes already explained; the ocean trade holds its own, either in direct transit or coastwise to the great Northern ports, where the cotton is transhipped for European ports. From the annual statement of shipping, for the year ending August 3, 1873, it appears that there entered the port of New Orleans during that time:

VESSELS FROM FOREIGN PORTS.

There are now in the regular service the following lines of steam-ships: to Liverpool, three regular and two occasional lines; to Bremen, one regular line; to Hamburg, one regular line; to New York, three weekly lines; to Philadelphia, one semi-monthly line; to Baltimore, one semi-monthly line.

An idea of the work done by the Liverpool lines above named, which are in the hands of American, German, and English owners, a few of whom are resident at New Orleans, may be formed from the following brief statement of the business done by the State Line, furnished by its agent from his books:

"The imports by the State Line Steam-

ship Company to this port consist of Scotch and English beer and ale, hardware, caustic, bicarbonate of soda, ammonia, English cheeses, cotton ticks, dry-goods, and salt. From Bordeaux, sardines, wines and brandies, preserved fruits, linen lawns, and cloths. The average length of voyages is eighteen and a half days. This is preferable to Northern routes on account of general pleasant weather during winter months, having also vessels of the finest construction, with careful and experienced officers. We believe it will eventually be the favorite route for travelers of the West. The exports by the same line were, in sixteen voyages to Liverpool, 3150 hides, 191 hogsheads of tobacco, 43,732 bales of cotton, 37,370 skins of oil-cake, 4040 barrels of cotton-seed oil, 35,620 staves, 562 bales of moss, 5923 barrels of flour, 176,865 bushels of corn, \$1,099,450 in specie from Mexico; with 1400 immigrants inward and 400 passengers outward, which will more than double next year.

The Mississippi Valley Transportation Company, running a line of steamers and barges between New Orleans and St. Louis, owns a fleet of seven steamers and fifty huge barges. Forty-nine trips were made during the year, and nearly two hundred barges towed by their steamers. The Southern planters fail to raise their own corn, in their anxiety to lay down a greater breadth of cotton, and the great artery of the West brings down and puts in circulation annually, *via* New Orleans, seven millions of bushels of corn. Of this about one million and a half are shipped to Great Britain, Cuba, and other foreign ports, about as much sent to neighboring Gulf ports, and the balance used for Southern distribution. It will thus be seen what a large tribute the South annually pays the West for an article it could so readily produce at one-fifth of the cost, in connection with its cotton culture. Flour also is sent down in considerable quantities from the great national granary "out West." The total supply sent to New Orleans averages from a million and a quarter to a million and a half of barrels annually, the great bulk of which is for Southern consumption. Thus it will be seen that the "daily bread" of the South (whether wheaten or corn) is supplied in great part by her energetic and enterprising Western neighbors, who furnish "hog" as well as "hominy." Bacon to the value of one million and a half of dollars was received during the past year at New Orleans from the interior. Horse-feed likewise comes down in great quantities.

For the article of oats alone upward of one million and a quarter of dollars find their way out of Southern into Western pockets; and hay from the same quarter, and from the North, extracts another million of dollars merely through the avenue of New Or-

leans. But New Orleans does not deal in solids alone. Irrespective of molasses of native product, she takes yet more of the Western corn and rye in liquid shape, the annual value of her whisky supply rising to the enormous sum of \$3,166,000 for 1871-72, and \$2,172,000 for 1872-73. Thus for these articles of Western produce, in solid and fluid form, New Orleans and the South pay tribute to the West to the tune of \$6,000,000 annually. The consumption of the great growing and thirsty State of Texas, however, is drawn chiefly from New Orleans, though the other Gulf cities also take their share.

The total value of the produce of the interior finding its outlet at New Orleans amounted in 1871-72 to \$169,653,107, against \$184,624,927 for 1872-73, showing an increase of receipts of nearly \$15,000,000 for the last year over its predecessor.

The custom-house statistics show the following items for the fiscal year ending June 30, 1873:

FOREIGN IMPORTS AND EXPORTS.

Fiscal Years.	Imports.	Exports.
1869-70.....	\$14,998,756	\$106,080,340
1870-71.....	19,497,238	95,243,744
1871-72.....	18,502,528	90,382,975
1872-73.....	19,916,285	101,994,511

This table shows the quantity of cotton exported from New Orleans for the four years ending August 31, 1873, and the total crop raised for each year:

Years.	Exports. New Orleans. Bales.	Total Crops. Bales.
1870.....	1,185,050	3,114,592
1871.....	1,541,369	4,347,206
1872.....	1,087,453	2,974,351
1873.....	1,406,026	3,930,508

The value of cotton exported for the year ending August 31, 1873 (1,406,206 bales), is estimated to be \$118,700,738.

In a previous article in this Magazine the fact of the increased and increasing culture of rice in Louisiana was commented upon, and the particulars given. Subsequent investigation has confirmed and strengthened the predictions and previsions indulged in, and confirmed the belief that at some day not far distant the old rice fields of South Carolina, now rapidly reverting to jungle and reeds, and the great rice fields of the Egyptian Delta at the mouths of the Rosetta and Damietta branches of the Nile, would find their most dangerous rival in the as yet unreclaimed swamps and bayous of Southern Louisiana. Already many of the sugar plantations have been diverted into the cultivation of this cereal with great success and corresponding profit. The growth of this culture may be judged from the exports, which, in the years succeeding the war, 1865-66, amounted to but 20,900 barrels and sacks, rising in 1870-71 to 52,800, and in 1872-73 amounting to nearly four times the

quantity first mentioned, viz., 74,000 barrels and sacks, by the authenticated returns of the prices current for the year. There are many good reasons why this diversion of production and labor into new channels should continue permanent which it would be out of place in this connection to expatiate upon. Suffice it to say that the probabilities are that the rice region of the future in America will be found in this vicinity and in Florida.

It has been justly remarked by a shrewd English observer, who visited New Orleans three years ago, that "the imperial city of New York during the war, by large and free capital and military and naval power, supplanted New Orleans in her trade, and still continues to hold the new relations thus established by force of its superior monetary resources, and by a pressure on canals and railways carried to the last extreme of stringency, in pursuance of purely local interests, against which New Orleans, by straining her utmost means, can with difficulty, and but partially, recover her lost ground." "Wherever," says this acute witness, "they successfully took up the trade of New Orleans during the war, they have continued more or less to prevail, and from the start thus made are the better able, from their conserved capital and profits, to make fresh incursions and conquests." The magnitude of the business here is seen only in the export of domestic products. In the import of foreign commodities, whether for domestic consumption or re-export, it dwindles into marked disproportion. This is confirmed by a glance at the exports and imports to and from foreign countries from this port, the former reaching over a *hundred millions of dollars in value*, the latter modestly keeping but little over the tens of millions. Hence, in view of this state of things, the British observer somewhat sarcastically remarks: "The great bulk of the customs duties is collected in the modest building in Wall Street, New York. The imposing Maine granite Custom-house of New Orleans must have been designed when New Orleans was both presently and prospectively one of the chief sources of this branch of revenue, which, no doubt, under a wise policy, she might still become. As it is, New Orleans can not be supposed to supply direct the extensive countries from which she draws immense quantities of cotton, sugar, molasses, hides, and other raw products with more than a *tithe* of the foreign merchandise they consume, of which she is the proper and most economical port of entry."

Such is the testimony of a shrewd stranger, who had neither prejudices nor prepossessions to warp his judgment. He adds: "The foreign commodities re-exported from New Orleans, amounting in 1870 to less than half a million of dollars in value, exhibit

strongly at once the maimed condition of trade and the great opportunities which, under better conditions, might present themselves."

The United States official returns of taxation will substantiate the extent of these drawbacks on the commerce of New Orleans, and which bear heavily also on the lesser Southern ports. The internal revenue taxation of the Southern States for the fiscal year ending June 30, 1872, footed up \$16,392,000 on the five items of spirits, tobacco, fermented liquors, and banking capital. Of this Louisiana paid into the United States Treasury the sum of \$1,340,000 for her share, Virginia and Maryland alone exceeding, and North Carolina only equaling her in amount. From Virginia the enormous sum of \$7,350,000 was derived; from Maryland, \$3,750,000. Contrasting the relative prosperity and position of the States named, the unparalleled severity of this imposition on prostrate Louisiana will be seen, while it also gives an evidence of the gigantic efforts she is making and has made to revive her commercial prosperity. The giant States of the Eastern division, with their riotous prosperity and boundless wealth, annually accumulating as a snow-ball does as it rolls along, including New York and Massachusetts and Pennsylvania, contribute to the national Treasury only double the amount drawn from the impoverished South.

What New Orleans is to the foreign cotton trade of the South, the young city of Memphis is to the interior commerce in that staple. This new centre is now just half a century old, having obtained her charter in 1824. It reminds one of Sancho Panza's "sea-ports" of Baratania, in as far as proximity to the sea is concerned, yet it has a "direct foreign trade," over sixty per cent. of shipments of cotton thence last year being to foreign countries. Owing to the great scarcity of tonnage at New Orleans last year, and obstructions at the mouth of the river, much of the Memphis cotton was shipped *via* Norfolk and New York, at through rates to Liverpool, Bremen, etc., by rail and steam, doing away with the New York middle-men altogether. The magnitude of these inland operations, and their rapid increase, may be judged by the figures given in their trade report as follows:

	1872-73.	1871-72.	1870-71.	1869-70.
	Bales.	Bales.	Bales.	Bales.

Memphis has a population in all of about 50,000 inhabitants. Situated at the point just between the cotton and corn producing districts of the Mississippi Valley, *en route* to

the great Atlantic sea-ports, to which she is bound with iron bands, this little city, of one-fifth the population of New Orleans, threatens to rival her elder sister even in the export of cotton. She expects to handle this year upward of half a million bales of cotton, and her Chamber of Commerce has solemnly resolved that Port Royal—an embryo port in South Carolina, midway between Savannah and Charleston—is the destined “gateway of Memphis to the sea,” to which both the older sea-ports demur, and are competing for that privilege by newly projected lines of railway supplementing those already existing. This keen competition between the Southern ports for the extension of their lines of supply shows the energy and industry with which the Southern merchants are striving to revive and increase their commercial relations with the interior and with foreign countries. The classification of cotton in Memphis is the same as in New Orleans, their sources of supply being the same, but the prevailing basis of transactions is the Liverpool standard. This export trade is but three years old, and is due to the enterprise of a few of her cotton brokers, who, since the war, having tried the experiment of getting direct orders from Liverpool, developed the present system, by which the merchant or spinner abroad can buy in Memphis from the producer, and have the cotton delivered to him in Liverpool within four weeks of the purchase, through bills of lading, with insurance, being effected at reasonable rates, thus saving the handling of the cotton over and over again, and the commission charges incident thereto. Besides these advantages, there is also the additional one that the foreign buyer can, by cable, control and regulate his orders and shipments.

This system the shrewd English and foreign merchants, and branches of foreign houses, have long since adopted; but to see little Memphis coming into the ring against big New Orleans reminds one of the prize-fight for the belt in which little Tom Sayers faced the Benicia Boy, showing how science and pluck can sometimes make up for inferior size and strength. By act of Congress Memphis has been made a port of entry, paying its own import duties on the spot, instead of at New York or Boston. At the close of the fiscal year, June 30, 1870, Memphis paid \$41,140 in gold import duties on her direct imports from Europe. Yet Memphis is far north of the centre of the great “Southern cotton belt,” which is always considered to lie between the thirty-fifth and thirty-first degrees of latitude; and it is due to her superior management and energy alone that she takes the trade away from the older cities lying in the very heart of that region, two of which, Savannah and Charleston, are awakening to the necessity

of extraordinary efforts at least to share the new departure with her by means of railroad communications, new water lines, and direct steamers—in which latter movement Norfolk is the successful pioneer.

The series of disasters which has visited Memphis during the last year has crippled her river trade and diminished the tonnage of her river fleet for the time. The epizootic, the cholera, the small-pox, successively visited the apparently doomed city; an ice blockade and late thaw crippled navigation; then followed the financial crash at New York in the very height of the business season, owing to the rebuilding of Chicago and payment of the French indemnity in Europe, all of which operated injuriously on trade. Yet in general trade the little city boasts to have “held its own” the past year, and is hopeful of a bright future. From the causes enumerated, and possibly also from extending railway connections, the river fleet has been reduced. A local authority thus admits the facts: “Three years ago the assessed value of steamers engaged in local river trade was, in round numbers, \$1,000,000, and the next year this valuation was reduced to \$650,000, the vessels carrying freight and passengers enrolled here numbering thirty-five. Now the number is reduced to less than twenty, and their aggregate value will not exceed half a million dollars.”

The banking capital of Memphis was estimated in round numbers at about \$2,000,000.

The other interior cotton ports are Augusta, Columbus, and Macon in Georgia, Montgomery and Selma in Alabama, Nashville in Tennessee, and a few smaller ones. From September 1, 1873, up to November 22 about 100,000 bales had passed through these channels, being about 11,000 more bales than during the corresponding period in 1872.

The towns of Columbia and Camden, in South Carolina, once did a large cotton trade, but with the reduction of the cotton crops since the war, and the extension of the railway lines opening direct communication between the planter and the sea-port, the cotton trade of the interior towns in the Southern States has decreased, and is diminishing.

Mobile was fortunate in escaping the immediate effects of the war, although its subsequent effects on her trade have been more disastrous than to any other city except Charleston. The extension of railroad lines in her case, thus far, has proved injurious to her, especially the opening of the line of 140 miles between her and New Orleans; the latter city having derived almost all the benefit, the former much of the loss, through that connection. When, however, Mobile can carry through her two lines, which are to tap the coal region and connect her with Arkansas and the West, she may recover her losses, and start out on a new career of pro-

perity. Her present prospects are not brilliant. Like most of the Southern ports, her chief activity centres in cotton, although she deals also in naval stores, lumber, and dry-goods. Her river trade is still considerable, though not as heavy as it used to be before the railway lines came into competition with the steamers. Modern experience, both in the North and South, has demonstrated how fatal railway competition is to riparian trade, and how fallacious the contrary of that theory, so long entertained, has proved to be. Harbor and bar improvements are urgently needed at Mobile, and it is hoped that the Congressional commission which lately visited and inspected both will lead to practical results in improving the facilities for the trade of the outlet to this giant young State.

The receipts of cotton for the commercial year ending August 31, 1873, were 332,457 bales, against 288,012 the year previous, an increase of 44,445 bales. The floods of 1872 destroyed not less than 35,000 to 40,000 bales that would have found a market here. The direct foreign shipments were 132,130 bales, weighing 64,368,451 pounds; average weight per bale, 487 pounds; value per bale, \$82 95; and average cost per pound, 17.03 cents. Taking the averages above for the whole receipts, we have the sum of \$27,577,408 15 as the value of cotton received last year.

A very large portion of the cotton sold at Mobile for foreign account was sent to New Orleans for shipment, owing to the lack of tonnage there. Such will not be the case this season, as there is there, and to arrive, a much larger supply than last year. The foreign exports since September 1 are in excess of the same period of last year.

The receipts from September 1 to December 1, inclusive, aggregate 81,814 bales, against an aggregate for the same period of the preceding year of 112,877 bales, showing a net falling off of 31,063 bales. By railroads there is a decrease of 31,453 bales, and by rivers an increase of 390 bales.

Up to March 1, 1873, the "through" cotton to New Orleans footed up about 25,000 bales, and this year only 5466 bales, showing that the falling off is largely in "through" cotton, and not in the amount handled at Mobile, as would appear at the first glance.

The value of foreign merchandise imported into the district for the year ending June 30, 1873, is stated at \$1,099,716, and the total duties thereon at \$44,212 71, these figures not including merchandise brought from other districts in bond.

The value of exports of domestic produce from the port of Mobile for the year ending June 30, 1873, is given in the 1873 report of the Board of Trade, as follows:

Total exported in American vessels...	\$3,880,636
Total exported in foreign vessels.....	8,514,479
Grand total.....	\$12,395,115

Lumber is a growing branch of trade, and bids fair to become of great importance. The supply has at all times been ample, but insufficiency of tonnage has greatly restricted business. Total shipments, 2,627,549 feet, against 1,725,574 last year, not including many cargoes not cleared at the custom-house, in vessels having coasting licenses, and shipments to the interior.

The direct importations of coffee have of late years largely increased, and promise to become at no distant day a very important branch of the city's commerce. The superior inducements which she is enabled to offer in the matter of cheap freights and rapid transit to the West have made the city a most desirable distributing point for the Western trade centres, and have diverted a very considerable amount of the coffee business which formerly sought the markets of the Atlantic sea-board. The imports thus far this season are 17,125 bags, against 23,116 last season.

The new and growing coal interests of Alabama challenge attention, since the South bids fair soon to furnish all her own coal from her own fields. The comparative receipts of coal at Mobile for the past three years are as follows:

	1870-71.	1871-72.	1872-73.
	Tons.	Tons.	Tons.
Pennsylvania and England..	6404	8359	8069
Alabama	853	1561	1466

The attention of capitalists in the North and in Europe has at last been turned to Alabama, and the astonishing reports which have been sent forth as to her immense richness in minerals have gained credence. The Mobile Board of Trade has done much in disseminating information on this subject, and is entitled to the credit. Numbers of gentlemen from the North and from Europe have visited the State during the past year to see for themselves. Large investments have been made by Pennsylvanians and Englishmen. There are now in operation in Middle Alabama some fourteen blast-furnaces, and a number building and projected; others will follow soon; then we may look for rolling-mills, nail factories, etc. The hardware merchants are now buying nails, bar, square, and round iron, in adjoining States. The tide of traffic in these things is changing, and money which formerly went to England and the North for such goods is now going into the hands of men who live in the South. Rome, in Georgia, and Birmingham, in Alabama, are the chief centres of this new production, some details of which have already been given in a previous article in this Magazine.

The production of turpentine is thus referred to: "In this branch of trade there is constant improvement. Every year new orchards are being opened, and the production increased. The production in the country adjacent for the past year, ending Septem-

ber 1, reached, in spirits of turpentine, 15,000 to 20,000 barrels; resin, 75,000 to 100,000 barrels; pitch and tar, 1000 barrels; estimated value, notwithstanding a much lower range of prices, \$750,000, an increase of fifty per cent. over the year previous." When it is known that this trade is but of two years' growth the increase will not seem so inconsiderable. The field for its development is almost boundless, the demand for the products equally so. North Carolina may anticipate a sharp rivalry from Alabama in coming years in her hitherto unrivaled specialty in tar, turpentine, and resin. The pitch-pine of Alabama is unsurpassed by any in the country, and the pine orchards will yield rich fruit to the enterprise of their workers.

The entrances and clearances at the port of Mobile for the year ending June 30, 1873, are given as follows:

Entries.	Arrivals.			Clearances.		
	Vessels.	Tons.	Crew.	Vessels.	Tons.	Crew.

Total...	213	88,444	2607	191	78,055	2045

The city of Charleston, which felt the brunt of the war more than any of her sisters, and whose losses were in every way greater than theirs, with the additional burdens of misgovernment and terrible taxation imposed upon her people, is yet recovering and regaining her lost position as one of the chief centres of Southern commerce. A late report gives the following satisfactory statements:

"Before making any remarks upon the facts which these tables present it may be as well to recall to our minds the condition in which the war left us. A large and valuable portion of our city had been laid in ashes. All the railroads in which the city was interested—and the debt of the city is largely due to subscriptions to railroads—were worn out, and in some instances destroyed. The Blue Ridge Railroad, in which the city had one million of stock—one-fifth of its debt—was thrown aside, and no funds were to be had then, or have been obtained since, to complete it. The rich sea-coast of the State, which furnished, with its cotton and rice plantations, so large an amount of valuable produce for export, and required such large supplies of goods, was ruined. The planters who made their residence in Charleston, who formed a leading class among its citizens, and who spent their incomes among us, were compelled by their fallen fortunes to seek elsewhere cheaper residences than a city affords. Merchants found themselves with their long accumulations gone forever from them, and nothing but their old credit and character left; and a banking capital of \$14,000,000 was almost entirely swept away. Taxes, which in for-

mer years had been levied upon incomes derived from the various pursuits of life as well as upon property, were now, by new laws, made to bear entirely upon the latter, and naturally fell chiefly upon what was visible—real estate. Add to this the disruption of all the former political and social organizations, the forming of a new government in which the late slaves became the rulers, and the flood of extravagance and corruption which has naturally followed, and there will be no wonder that for a long time there was small improvement visible in building again the city, and that its desolate places still remained."

The extent and importance of the trade of Charleston in commercial fertilizers, manufactured from the South Carolina phosphates, are not fully appreciated. It has developed itself with singular rapidity, and the business has been attended with encouraging results. The early companies, selling their fertilizers at extreme prices, made handsome dividends, and were able to improve and increase their power, while laying by a reserve fund to meet contingent expenses. The late companies took advantage of the experience of the pioneers, and avoided many of the expensive mistakes into which their predecessors fell. There are now six factories for making commercial fertilizers in or near the city. They are the Wando Company, the Sulphuric Acid and Superphosphate Company, the Pacific Guano Company, the Atlantic Company, the Stono Company, and I. B. Sardy's Wappoo Mills. The five first-mentioned companies have acid chambers of the largest and most approved patterns, and it is claimed for the Sulphuric Acid and Superphosphate Company that it has the largest single acid chamber in the United States. The combined mining and manufacturing interests, which are mainly centred in this city, have diverted from other investments, since 1868, and accumulated here at least \$4,000,000, represented by mills, machinery, dredges, pumps, steamers, wharf property, etc. The first shipment of the crude phosphate was made in 1867, and from that time up to July 1, 1872, no less than 242,415 tons were shipped, and nearly 90,000 tons of manufactured fertilizers. During the past season the demand was unusually active. The companies have been working to their fullest capacity, and the shipments have been larger than ever before. In addition to this, the manufacture of sulphuric acid has grown to be an extensive business, the five companies which have acid chambers having made since they were built 10,614 tons of acid, worth over \$350,200, and instead of importing it, are now able to fill orders for the trade.

The lumber mills of Charleston are on the most extended scale, affording the greatest facilities for the cutting, handling, and ship-

ping of lumber, while the bold river fronts of the city, with ample ponds, securely protected, where the immense rafts await the shipper, are probably unequalled in any Southern market. There are now at work, or in course of construction, some seven saw-mills, of a capacity of about twenty million feet per annum. Most of them are situated on the western side of the city, and are admirably fitted to receive the arrivals from the great store-house of the Edisto, the source from which most of the timber comes for the supply of this market. This branch of commerce shows increased activity, and promises to largely develop in importance and value. The shipments were 8,389,174 feet in 1865-66, and they reached near 20,000,000 feet in 1871-72.

The land and water connections of Charleston are in a satisfactory condition, although the city urgently needs an independent connection by railroad with the West. Charleston has eight steamers running to New York, and two each to Baltimore, Philadelphia, and Boston. There are also steamers to Savannah and Florida, and to various points on the South Carolina coast.

The banking capital of Charleston was nothing when the war closed, and is now (including the capital of private bankers) about \$3,500,000. The total deposits are \$2,745,990, including \$1,590,000 held by the four savings-banks.

The sea-island cotton culture has not prospered since the war, owing chiefly to the ravages of caterpillars and unfavorable seasons. This has led to diminished planting, and a diminished export compared with what it was before that period. For the three years immediately preceding the war the aggregate production of the three States, South Carolina, Georgia, and Florida, was 129,805 bales, of which quantity Charleston exported 80,898 bales, and of which export 54,904 bales were the growth of South Carolina. In 1872 she grew and exported but 23,000 bales.

The receipts of cotton have increased from 111,714 bales in 1865-66, and 165,316 bales in 1866-67, to 282,086 bales in 1871-72, being respectively five per cent., eight per cent., and ten per cent. of the entire crop. The foreign exports of cotton have increased from 54,210 bales in 1865-66, and 80,896 bales in 1866-67, to 111,388 bales in 1871-72.

The receipts of rice, which were only 4019 tierces in 1865-66, and 15,337 tierces in 1866-67, were 42,677 in 1871-72; and the exports have increased from 3120 tierces in 1865-66 to 32,610 tierces in 1871-72.

The lumber business shows a steady improvement, the exports of lumber having increased from 8,389,171 feet in 1865-66 to 18,460,339 in 1871-72.

The naval stores business has developed with surprising rapidity. In 1865-66 the ex-

ports were 32,136 barrels, and in the following year 54,026 barrels. Last year the exports were 147,910 barrels.

The wholesale grocery and jobbing trade is reported to be in a flourishing condition, the business of 1872 being, upon an average, from twenty to twenty-five per cent. greater than in 1871.

The work of rebuilding Charleston has gone on surely, if not as rapidly as could be wished. Last year \$473,800 were spent for new buildings and repairs in the city, and \$177,509 for similar work on Sullivan's Island, making a total expenditure in the year of \$651,309.

Truck farming, a business which has sprung up since the war, now gives active and profitable employment to a capital of \$295,000. On Charleston Neck about three hundred laborers are constantly at work, and last season no less than 216,974 packages of potatoes and other vegetables were shipped to Northern cities.

The greatest obstacle to the use of this port by vessels of heavy draught is the sand bar at the entrance, about five miles, in an air line, below the city. The channels through which vessels pass undergo gradual changes, and those used sixty or seventy years ago have been abandoned, owing to the shallowing of the water. The greatest depth of water on the bar has nearly always been found not immediately opposite to the harbor front, but at a point to the southward, near the end of Morris Island, at which point there is a depth of from sixteen to eighteen feet at high water. The outlet now used by large vessels, known as Pumpkin Hill Channel, has only been serviceable since the sinking of the stone fleet during the war, which obstruction deflected the water from the old ship channel, and threw it across the Pumpkin Hill shoal.

During the war the channel was injured by the sinking of blockade-runners; but the wrecks are now removed, and Major-General Q. A. Gillmore, U.S.A., who has the work in charge, is confident of being able to secure, by changing the jetty and by judicious dredging, a depth of from twenty to twenty-two feet of water. The preliminary work has already begun, and as Congress has made the necessary appropriations, it will be pushed vigorously to its completion.

Charleston, unlike other Southern seaports, is not dependent for her growth and success upon staple productions alone. In addition to her business in cotton, rice, naval stores, and lumber, she has the profitable and well-nigh exclusive trade in commercial fertilizers and phosphates. Beyond these she has a general jobbing business larger in volume than is controlled by any other city on the South Atlantic coast.

With regard to the jobbing trade, definite information can be given. This trade has

steadily increased during the past three years; and the various dealers are now drawing back their old customers in Georgia and Alabama, who, before the war, made all their purchases in Charleston.

The report of the Board of Trade made last year informs us that there are now running between Charleston and New York eight fine steamers, forming a tri-weekly line, capable of carrying 30,000 bales of cotton per month. The steamers have all first-class passenger accommodations, and can carry a large number of passengers. On the Baltimore line there are three steamers, leaving once every five days. These steamers have also passenger accommodations, and a carrying capacity of 4800 bales of cotton per month. To Philadelphia there are two steamers for freight only, carrying 4500 bales per month, and leaving once each week. To Boston there are also two steamers for freight only, capable of carrying 4500 bales of cotton per month.

The management of the steam-ship lines out of this port has, in co-operation with the management of the South Carolina Railroad, been so successful as to attract a large amount of freight to the city, and, as compared with 1860, the increase in steam-ship freight would be perhaps three hundred per cent. Its growth has, however, cut off a large sail tonnage from employment, and the total tonnage named in 1872 is not larger than in 1860.

To Florida, *i. e.*, to Fernandina, Jacksonville, Pilatka, and other points on the St. Johns River, *viz* Savannah, there is a line of two fine steam-ships, making three departures per week. These vessels have first-class passenger accommodations, and ample freight room for the demands of the trade.

Both the coastwise and foreign trade of Charleston has greatly improved in the last two or three years, and the rapid opening of new lines of railroad to the south and west warrants the hope that the day is not far distant when direct lines of steamers between this port and Europe will be paying institutions.

The city of Savannah is one of the few fortunate exceptions to the general rule of ruin and loss wrought by the war on Southern sea-ports. Rather she has gained and thriven by the events which crippled and almost crushed her less fortunate sister and neighbor, Charleston, so sternly visited, and whose loss both of capital and credit for a time diverted her ancient trade into the new channel of the Georgia sea-port. Charleston is rapidly regaining her lost ground, but Savannah still thrives, and her present population and prosperity and trade are greater now than ever before the war. The value of her real estate has also appreciated above the *ante bellum* standard, though below the

inflated valuation it reached a few years after the return of peace. She can boast also of a little direct trade, though the steamers run irregularly between her port and those of England and the Continent. Yet the enterprising houses of Long and Co. and Octavius Cohen and Co. annually send their steamers to Liverpool, and foreign vessels seeking direct trade are not infrequent visitors to her port, whence a considerable portion of her cotton receipts are shipped direct, as well as lumber and other home products. She also has two other regular lines of steamers running weekly to New York, and carrying much freight as well as numerous passengers, especially in the spring and autumn, while her coastwise trade is also considerable.

The rivalry between Savannah and Charleston, which is as old as the two cities, has rather been increased than diminished by their closer connection by railroad, of comparatively recent construction. Nature has certainly done most for Charleston in the matter of her superiority as an open port, and the energy of her merchants is proverbial; but the wounds of the war, and her failure to receive the same contributions of Northern and foreign capital as her rival, have given the latter a temporary advantage and a greater appearance of prosperity. Moreover, Savannah has the control of her affairs in the hands of her own leading citizens. Charleston is still in the hands of a very different class. Mobile has probably suffered more than Charleston by the commercial rivalry of Savannah, whose intersecting lines of railroad now cut off much of the former cotton supply of the Alabama sea-port.

The total exports and imports of Savannah previous to the late war were about \$26,000,000 in value; the tonnage employed previous to the late war, about 500,000 tons.

VALUE OF EXPORTS AND IMPORTS, AND TONNAGE, FROM 1867 TO 1871.

Years.	Value.	Tonnage.
1867.....	\$41,225,488	820,991.00
1868.....	50,256,209
1869.....	49,152,639	1,129,884.84
1870.....	58,850,198	623,028.00
1871.....	64,893,893

The Mayor of Savannah, Hon. Edward C. Anderson, has issued a tabular circular showing the commerce of that city for the year 1873, from which we condense the following:

Total value of imports.....	\$390,664
Total value of exports.....	29,850,375
The latter includes—	
Sea-island cotton, 2945 bales.....	843,533
Uplands, 874,752 bales.....	29,002,733
Total tonnage entered and cleared, 1,180,304 tons	

The number of men employed in manning the vessels engaged in this traffic has averaged about twenty thousand per annum.

Savannah River bar affords one of the

easiest entrances from the sea along the whole Southern coast of the United States. It has a depth of water upon it of nineteen feet at mean low tide, with a rise of seven feet on the flood, making its soundings at high water twenty-six and one-half feet. Vessels of heavy draught can always run for a harbor in stress of weather, and but for the impediments above could proceed without delay to the city. Government aid has been asked and given for the improvement of the channel. The argument for direct trade with Europe is based on the proposition that the tax now paid the North in the shape of additional costs or charges and freights at and from Savannah to New York on each bale of cotton forwarded thence, as compared with the cost of forwarding direct, is at least two dollars per bale. Savannah ships about 500,000 bales per annum to all points.

The city of Galveston, in Texas, is now the fourth cotton centre in the South, and is rapidly growing in importance as well as in the extent of its commercial transactions. Not personally acquainted with Texas as with the rest of the extreme Southern country, the writer is compelled to rely on the meagre details of the trade of Galveston gleaned from its trade report; but even these suffice to show the progress already made, and still increasing in an accelerated ratio. Texas was spared the ravages and the losses of war inflicted on her Southern sisters. In fact, she benefited by the war, and has benefited more since its cessation by the great influx of capital, population, and labor it has given her, while foreign immigration of men with means has poured like a flood tide, and is still pouring in, much of it through Louisiana, by land and sea. The immigrants that come in the German Lloyd's line of steamers to New Orleans are chiefly intended for Texas, wherein large German colonies have already settled, annually reinforced by new recruits from the Vaterland. Good farmers and shrewd traders, this class of immigrants is of immense value to Texas commercially as well as agriculturally, while her railroad communications are stretching out already, like the arms of the devil-fish, in all directions toward the older settled States, especially into their cotton regions.

Galveston has grown very rapidly both in importance and population. A recent census of the city shows about 35,000 inhabitants, an increase of 27,000 since 1866. Few towns, North or South, can show so sudden an expansion. It is claimed that Galveston will receive this year upward of 400,000 bales of cotton. The development of this city and her trade are greatly due to the enterprise of one man—the owner of the Morgan line of steamers, and the railway connecting them with New Orleans.

In the year 1869 Mr. Charles Morgan purchased at the United States marshal's sale the New Orleans, Opelousas, and Great Western Railroad at a cost of \$2,050,000, and has since expended \$2,000,000 in improvements. His plan of cameling cars across the Mississippi River by means of steam ferries and powerful machinery used on both shores is an enterprise that few would have undertaken. Prior to this freights were handled three or four times before loading into cars; the freight is now loaded from drays or floats into cars undisturbed until its destination or the end of the route is reached. Altogether Mr. Morgan owns one hundred miles of railroad, exclusive of switches and side tracks, and is believed to be the only single owner in the country of a railroad of that length. The object of purchase of this road and its improvements at such large cost was for the purpose of facilitating his Texas trade, and it is not amiss to enter here into some of its details. In 1835 Mr. Morgan began his steam-ship business between New Orleans and Galveston, and in the early part lost many vessels on that then unknown coast, and since he began the ship business he has built *one hundred and seven* vessels, sail and steam, exclusive of dredges and tenders. Before his purchase of the railroad his steamers ran down the Mississippi River, making one hundred and seventy-five miles more than the present route from Brashear. To perfect this new line he dredged a steamboat channel six miles long, two hundred feet wide, and ten feet deep. This grand work is now completed, after three years of night-and-day work, at an expense of one and a half millions of dollars, and steamers now ply to and from Texas in fourteen feet of water, where before there were barely two. Fifteen magnificent steamers specially built for that purpose are now engaged in the trade, their whole tonnage 15,150.80, and an average carrying capacity on ten feet of water of 10,000 barrels of freight. The passenger accommodations are first class, and the points they run to are Galveston, Indianola, Lavacca, Rockport, Corpus Christi, Brazos, St. Iago, and Sabine. A Galveston passenger ship carrying the United States mail leaves daily, three ships making two trips each a week, and the other ships once a week each for the ports further west. In the month of January, 1873, 5300 head of cattle were carried on these ships to New Orleans, *via* Brashear. Mr. Charles Morgan was born in 1795 in Clinton, Connecticut, is a resident of New York city, and all his vast business is still under his direction and management.

A few such men would soon make the story of Southern commerce very different from what it now is. And the trade of Texas has received an impulse from this great enterprise impossible to overrate. When the pro-

jected line of railroad in extension of this is carried out, Houston will enter into active rivalry with Galveston. For the present the latter city is the chief entrepôt and outlet for Texas. Her receipts of cotton this year up to February 14, from August 31 of last year, have amounted to near 300,000 bales, putting her fourth on the list—after New Orleans, Savannah, and Charleston, and a little ahead of Mobile.

Wilmington, in North Carolina, very notorious during the war for having been the head-quarters and central focus of the blockade-runners, who woke up the time-honored old resting-place of the Southern Rip Van Winkle, and made it a most busy entrepôt—the starting-point for cotton operations outwardly, and supplies from abroad inwardly—has not been able to retain the supremacy she then enforced, in which Charleston alone rivaled her among Southern ports. But she is a brisk and busy little place even now, and no picture of Southern trade would be complete without a sketch of her present position and prospects.

North Carolina is well known as the tar and turpentine State, she having wisely utilized her immense forests of pitch-pine, both in the shape of lumber and naval supplies, and doing also some cotton business.

Of lumber she sent out in 1872 23,264,000 feet, and in 1873 near 20,000,000 feet (pitch-pine). In 1860 she sent out 250,000 barrels of turpentine, and 150,000 in 1873, with 700,000 barrels of resin, and 100,000 bushels of peanuts—her special product, much loved of American legislators. Her cotton exports do not exceed 48,000 bales. The vicinity of Wilmington to Charleston and Savannah, and the want of a wealthy back country, will doubtless prevent the rapid extension of the commerce of Wilmington, and confine it chiefly to the exportation of her own pine-woods produce.

Situated on the north bank of the Elizabeth River, eight miles from its entrance into Hampton Roads, and twenty miles by water to the mouth of Chesapeake Bay, with water deep enough for vessels drawing thirty feet to lie at its wharves, and a harbor broad enough to contain the navies of the world, while it is so protected that in the roughest weather the smallest sloop may ride at anchor in perfect security, Norfolk has natural advantages that are absolutely unrivaled.

The population of Norfolk is a little over 20,000, while Portsmouth, on the opposite side of the river, and virtually the same city, has 10,000 more. The leading articles of trade are cotton, corn, lumber, early vegetables, pea-nuts, groceries, etc.

The receipts of corn from August 31, 1871, to August 31, 1872, amounted to 700,260 bushels. During the following season, from Sep-

tember 1, 1872, to February 28, 1873, the receipts were 325,000 bushels; and it is estimated that for the whole season they will exceed one million bushels.

Norfolk does a very extensive grocery business, having eleven large wholesale grocery establishments. Other branches of business are represented by large and flourishing wholesale houses, and it is estimated by well-informed men that the entire business of the city has increased fifty per cent. in the past year.

The trucking business of Norfolk has grown to immense proportions, and is increasing rapidly. Beginning in March with kale, spinach, etc., radishes, cabbages, strawberries, pease, cucumbers, corn, tomatoes, Irish potatoes, etc., follow in their season, closing with sweet-potatoes in August and September. Besides supplying the home market and sending large quantities of vegetables to Richmond and other points in Virginia, the truckers load to their utmost capacity a daily steamer to Baltimore, two per week to Philadelphia, three per week to New York, two per week to Boston, and one every week to Providence, Rhode Island; and very frequently the steamers are unable to take half that is brought, and leave the wharves piled up with vegetables that must spoil for want of transportation.

This trucking business gives employment to the steamers at an otherwise dull season, the vicinity being full three weeks earlier than the market gardens near the Northern cities, and when the season is favorable the truckers reap very handsome dividends.

The oyster and fish trade of Norfolk is enormous, and seems capable of almost indefinite expansion. The sales of fresh fish in Norfolk for the season of 1872 amounted to about \$200,000.

The chief inspector of oysters reported that during the year 1869 there were engaged in taking oysters in Virginia waters 5000 small boats and 1000 vessels of over five tons, the total amount taken being 10,530,000 bushels. About one-fourth of these oysters are disposed of in Norfolk.

In regard to the shipping of Norfolk the records of the custom-house show that from November 1, 1871, to October 31, 1872, the foreign tonnage entered was—sailing vessels, 12, with a tonnage of 6776; steamers, 11, with a tonnage of 15,242. Cleared—sailing vessels, 55, with a tonnage of 16,220; steamers, 2, with a tonnage of 3235. This does not include the steamers of the Allan line.

The coastwise tonnage entered was—sailing vessels, 174, with a tonnage of 23,195; steamers, 904, with a tonnage of 1,206,586. Cleared—sailing vessels, 78, with a tonnage of 6540; steamers, 944, with a tonnage of 945,176.

From the official report of the agent of the "Settlers' and Immigrants' Aid Society" of

Norfolk we learn that for the year ending December 31, 1872, there arrived in Norfolk 25 steamers of the Allan line, and that they brought 1368 immigrants, of whom 1170 were English and Scotch, 52 French, 97 German, 11 Swedes, 2 Belgian, 15 Danish, 1 Norwegian, 5 Welsh, 9 Irish, and 6 Canadian. The report states that not one of these immigrants was a pauper, and that only one required medical attention.

The success of this Allan line has been such that since the 1st of January, 1872, the splendid Spanish steamers of Robert M'Andrew and Co.'s London and Havana line have been running in connection with the Allan line, thus giving a steamer from Norfolk to Liverpool every week.

Of the internal trade of the Southern States with each other and with the Northern and Western States it is impossible to obtain fuller statistics than those already given. But it must be obvious how large such trade must be when the Southern habit of producing only great staples and cereals is considered, and the annual exodus of the merchants from South to North to lay in supplies is taken into account. The cattle trade of Texas alone is an immense item, and annually expanding its proportions. Southwestern Texas, it is calculated, ships annually to the East half a million of cattle. These have been heretofore driven North in droves through the Indian Territory and Kansas to some railroad point for shipment to Northern markets. When the Missouri, Kansas, and Texas Railroad reached Dennison, that point became the favorite shipping station for the ranch-men; but the International and Great Northern Railway having now crossed the Brazos, threatens to dispute this monopoly, and to bring St. Louis and Chicago into competition for the countless herds of Texas.

The rapidity of growth of these Texas towns is almost incredible. After Dennison was reached by railway, and became the shipping point for Texas cattle, in six months it got 10,000 population, and other towns on the route are springing up with similar marvelous rapidity.

Of the lumber trade of the South general mention, with some special illustrations, has been already made in this Magazine (February number), and it is a great and increasing interest from the coasts of Georgia down to those of Florida (east and west), and the interior of the great pine-growing States, from North Carolina down to Mississippi. Probably one of the largest elements of the future wealth of the South (outside of her boundless mineral resources) is to be found in those vast virgin forests, as yet untouched by the axe or saw, which must be utilized hereafter to the profit of the Southern people, to whom they now are valueless. The chief difficulty thus far, even in those places

where the experiment has been tried, has been the lack of tonnage; but that want can be readily supplied by the enterprising North as soon as the torpor of the American shipping, induced by the war and its consequences, is succeeded by the former activity in the Northern ship-building yards from Maine to New York. The demand never fails to create a supply in a population so eager and energetic as that of the Northern States, and the complaint, now so common at all the Southern sea-ports, of inadequate tonnage for the transport of its produce and lumber, must soon be succeeded by a sufficient supply to meet the new demand that has sprung up in those localities. If this be not so, then Yankee enterprise must be paralyzed indeed. The future of the South commercially depends chiefly on the possibility of her securing direct trade with Europe on a large scale for one or several of her sea-ports. With the exception of New Orleans, as has been shown, this communication is only spasmodic or intermittent, as in the case of Norfolk, Charleston, and Savannah, all of which have a little communication direct, but not enough to create any rivalry with the Northern sea-ports, especially New York, holding as she does at this time and for a long time past almost a virtual monopoly of the carrying trade with Europe, although since the war chiefly in English or other foreign bottoms.

Several of the Southern States, notably Georgia and Alabama, have moved in this matter, but as yet no progress worthy of record has been made. That there will be within a few years seems most likely; but for the present both confidence and cash are wanting in the South for such enterprises, and her depleted State governments dare not offer the necessary subsidies for such experiments, which would involve additional taxation on a people impatient of that already imposed upon them, and clamoring for its reduction.

HIDE-AND-GO-SEEK.

By ELIZABETH STUART PHELPS.

HAPPINESS has found me out—

Found me out at last!

Oh, she's dogged me round about;

All my hurrying life she's chased me,

Treading hard and hot she's faced me,

Almost touched me, all but faced me—

Here she is at last!

Wary were you, Happiness!

Patient to the last!

From your thankless business

Laggard Time has come to free you.

Always driven by Fate to flee you,

Never did I think to see you

Track me down at last!

THE RHINE FROM THE ODENWALD.

I look out from the Odenwald to France,
Aerial, peopled, sun-lit, throbbing leagues,
Across the nineteen crowded centuries,
From Caesar vexing Rhine with its first bridge,
And yokeless human streams with piers yet strong,
And built upon by earth's new civil arch,
In spite of Cassius' dagger and Time's tooth:
From Tacitus, with weak, soft, leprous Rome
Ever in eye, praising the chastity
Of German clans, as pure as were the dews
The savage forests shook upon their heads;
Unmelted men, and therefore kings, and sires
Of nations now among the nations kings:
To Charlemagne's mailed hand, with arrow's edge,
From Ebro to the Elbe, the human woods,
Fruitless as yet and wild, but plump with sap,
Grafting with slips from out the aged boughs
Of Greece and Rome, beneath that new-risen sun
His banners bore, whence plenteous fruit at last
On Europe's age-long barren orchard slope:
To billowy, hot, crusading myriads,
The Western human sea, mixed still with slime,
Green ridgy monsters in its crawling depths,
And yet a sea responsive to Christ's name,
As ocean with its tides to sun and moon,
And swirling through this Rhine and Danube gate,
Or past the clangorous Venetian wharves,
To meet great Saladin at Ascalon;
The nobles sold their lands, and so the serf
Grew free; the fiefs of nobles slain became
The king's, and so the king grew free; the towns
The deluge filled, grown rich, bought new strange
rights,

Votes, armies, parliaments, self-government,
And so the world grew free; Christ's grave not free
Made Europe free; His pierced right-hand the vote
Placed in the trembling fingers of the poor;
Fair Venice, threescore Rhine towns joining shields,
Yon blood-washed Netherlands, strong Hansa's league,
The burgher's right wrenched from a feudal world;
False John grew faint at Runnymede, and leaped
In Magna Charta's womb America:
To Greeks driven west from off the cultured shore
Of Bosphorus, when fell Rome's eastern arch,
Constantinople, like another Troy;
Now column, frieze, and pediment,
From under Turkish hoofs snatched tenderly,
Are built aloft afar when exiles found
Rich Florence, Paris, this free Rhine; and hence
New tastes in all the West; the huge fair shafts,
With mystic traceries planned by Plato's eye
And Aristotle's brain, bring Europe's morn,
Reflected from their Attic architraves;
The starry temple to the earth's last verge
Yet copied; Athens so by Greeks in white
Immortal marble set on hills once more:
To streams of Eastern caravans dried up;
And streams of gold in Genoa's mountain ports,
And streams of gold in Venice's liquid streets,
The streams between the utmost East and West,
Fabled far Ind and Albion's poor hoarse coast,
The giant, harvest-dropping, human Nile,
Diverted, not made dry, by the New World
Columbus opened in the sunset gold,
And by the new way past the fearful cape
To shores reached once only by camel ships
Through seas of sand henceforth to sift unheard;
And so fat Spain made great, though rotten soon,
And England great, but rotten not as yet;
And all this Pagan West as central made
Upon the earth as once were Rome's seven hills,
The Applan Way hung on Atlantic deeps,
The transferred Tiber turned into the Rhine:
To Chivalry's and Robbery's throned cliffs,
Browbeating all these castellated shores,
A chafing manacle on Europe's wrist,
Burst suddenly when once the arm had strength,

Vol. XLIX.—No. 292.—38

The gaping, ragged halves not welded yet,
Save by the ivy's pitying thick vells:
To Strasburg and Cologne, and skilled saints there
Lifting majestically to peopled heavens
Awe-struck stone anthems, not unheard of God,
Cathedral enics, voice of man's tall hour:
To eagles of the French, and in their beaks
Fire-brands above this doomed Palatinate,
A thousand smokes sent up from yonder plain:
To Rhine waves red with hottest modern blood,
And Rhine hills tremulous yet in all their vines
With blows of him who made the Rhine a stream
Of France, and with the Rhine lost France: and so
To swiftly struck, far-resonant Sedan.

I look against the sun which saw all this,
And through the rustling air across his face
Ride ghosts in number more than winter's flakes.
My land swims far beyond that settling sun,
Which burns the Voeges now and Niederwald;
These ghosts were not my brothers, yet they wrought
For me, as I for those who follow us.
My eyes were cold and dull were they not wet;
Sightless were they here cold and not elate.
This Rhine plain bore its fruit for even me.

God maketh some sods fat with sweat or blood,
But grows in those spots seeds of preciousness,
Which elsewhere could not root, but blown abroad,
When once quite native in the globe, they touch
Its utmost circuits, follow the rough gales
To the remotest isles, and so all sods
From one sod feed, and fill earth's whole deep lap.
Gutenberg there at Mainz with printer's types;
Luther with his "God help me!" there at Worms;
Spire there elate in spite of ghastly wounds;
This Heidelberg rained on by cannon seven times,
Twice gutted by fierce pillage, thrice by flame—
These wrought for England too, and she for me.

And now America in Europe shines;
The light of White, not Red Democracy,
At rising clear as Washington's own eyes,
Mixed horribly too soon with blue-green flame
From out the atheist throat of the French hell,
And smoke and ashes of a feudal world,
Grows white again unvelled above the bars
Made by the vapors its own shining raised.
Albion Republic all but in the name;
Berlin to-day thatches the peasant's roof.
And swift wheels cleave the plains, and swifter words
All seas. And Peace for once upon the Alps,
In God's name in the shadow of Mont Blanc,
Throttling the precedents of butchery,
At fair Geneva yonder lifts aloft
A white flag yet perhaps in cultured hands
Of Saxon-belted, trade-leagued hemispheres,
To chase from off the dolorous, cheated earth
Barbaric black and outworn red of war:
A white flag on which heaven breathes, so high
It reaches to the steady upper winds
That blow about the globe, untouched by jars
Of local zephyr, breeze, or hurricane.

There are no foreign lands. I yield at last.
No great cause can be only local now.
Here on the brink of nineteen centuries,
And looking from the Odenwald to France,
I cease to be only of my own coasts.
One sea laves every shore: I hear its voice,
Which, lifted from the solemn headlands vast,
Or low sweet coves of time, doth sound in storm
And calm; doth ever sound; did sound when man
Was not; and soundeth in all zones one sound.
I will be citizen of the whole earth.

THE ART OF PERFUMERY.

RIMMEL'S FLOWER GARDEN AND PERFUME FACTORY AT NICE.

"Then, were not summer's distillation left,
A liquid prisoner pent in walls of glass,
Beauty's effect with beauty were bereft,
Nor it, nor no remembrance what it was.
But flowers distilled, though they with winter meet,
Leese but their show; their substance still lives
sweet."
SHAKESPEARE.

MAN has an innate love for the aroma of spices and the fragrance of flowers, which has from time immemorial suggested and encouraged the art of the perfumer. The most refined nations have always been distinguished for appreciation of sweet odors, and all civilized peoples have ever sought pleasure in the offerings that Nature makes to the sense of smell.

The earliest records show that perfumes were abundantly employed in religious ceremonies by the nations of antiquity, and mention is made of their private use as luxuries at a time almost equally remote. Indeed, it is difficult to determine which use had priority; the one probably succeeded the other so very soon as to leave no marked distinction in this respect. However this may be, it appears certain that the earliest perfumes were in the form of incense. History makes mention of these first in order, and it is reasonable to infer that in the most primitive times the perfumer's store consisted exclusively of aromatic woods and barks and fragrant balsams and resins, such as the

frankincense and myrrh of the Scriptures, and the sandal and aloes wood of later times. These were obtainable with the least possible exercise of skill or invention, and could be made to yield their odors by burning, which liberated and volatilized the constituents to which their fragrance was due. The more convenient applications of perfumes depended on the discovery of methods by which odors could be separated from the plants and flowers in which they existed.

Perfumes held an important place in the religious festivals of the ancient Egyptians. In the temple of Isis and in those of other divinities sweet incense was constantly burned by the attendant priests, and on extraordinary occasions the king himself performed this ceremony. Perfumed ointment was offered, as well as incense, when the oblation was intended to be complete.

No king could be crowned in ancient Egypt unless he had been anointed by the priests, and in this rite also perfumes came into use, and on special occasions the monarch was entitled to receive offerings of incense as an acknowledgment of his supreme exaltation. Spices filled an important part in the embalming of the dead, and fragrant unguents and scented oils were largely consumed by the living as an almost universal adjunct of the bath.

That the Egyptians were skillful in making these preparations is attested by a specimen of ointment now preserved in Alnwick Castle Museum, England, which, although over 3000 years old, still retains a pleasant odor.

The perfumes known to the Jews were of the same general character as those in use among the Egyptians; and the ancient Asiatic nations, as well as the Greeks and Romans, seem to have made but little advance in the art of perfumery. It is true, the Greeks in the time of their splendor appear to have been acquainted with the making of certain essences similar to those of more modern times. A writer quoted by Athenæus says, in a treatise on perfumes: "The iris is best in Elis and at Cyzicus; the perfume made from roses is most excellent at Phaselis, and that made at Naples and Capua is also very fine. That made from crocus (saffron) is in the highest perfection at Soli in Cilicia, and at Rhodes. The essence of spikenard is best at Tarsus, and the extract of vine leaves is made best at Cyprus and Adramyttium. The best perfume from marjoram and from apples comes from Cos. Egypt bears the palm for its essence of cypripedium, and the next best is the Cyprian and Phœnician, and after them comes the Sidonian. The perfume called panathenaicum is made at Athens, and those called metopian and mendesian are prepared with the greatest skill in Egypt. But the metopian is made from oil which is extracted from bitter almonds."

Nothing is here mentioned, however, that indicates a knowledge of distillation—a process on which the perfumer of modern times is largely dependent for his most useful essences. The invention of this process is ascribed to Avicenna, an Arabian doctor who flourished in the tenth century. Previous to his time resins, spices, and oils or ointments scented by contact with fragrant substances were the chief, if not the only, forms of perfume known. To him, it is said, belongs the honor of first separating the aromas of plants and flowers in such a manner that they could be readily applied where greasy unguents and smoking incense were alike unavailable.

To the invention of Avicenna we are indebted for the most durable elements of modern perfumery; but our most fragrant and delicate odors are produced by another process, of much later discovery, which we will attempt to describe in the paragraphs that follow.

The odors of all vegetable matters reside in a principle or constituent known as essential oil, or, more properly, otto. Each indi-

vidual plant or flower contains a greater or less amount of this principle, the separation of which from the parent substance is the initial movement in all the most important of the perfumer's operations. As it exists in but small proportion, we have in it when isolated a remarkable concentration of odor, and its stability when so separated is so great that many varieties can be kept for years unchanged. In the otto we not only possess the fragrance of the flower long after the season of blooming is past, but by its use can impart a favorite odor to a thousand bodies scentless in themselves.

Ottos are all in the liquid form, are of an oily appearance, vary in color from light straw to dark red or brown, and possess, as before stated, the odor of the substances from which they are derived. The yield of this principle from various materials ranges from six per cent. or more down to very minute quantities. Nutmegs, for instance, are very rich in otto; lemon rinds contain it in such abundance that it can be profitably extracted by expression; while roses yield so little that but three tea-spoonfuls are obtained from a hundred pounds of the petals.

The well-known process of distillation is the method most frequently employed to procure these ottos. This process, as almost every one knows, consists essentially in vaporizing a liquid in a closed vessel, and conducting the vapor to a receiver, in which it is condensed by the application of cold water. When a given plant or flower is placed in the still with a proper proportion of water, and heat applied, its otto, being volatile, rises with the steam, and both being condensed together, they readily separate on cooling. When applied to this purpose the process is often conducted by passing steam through the material to be exhausted instead of boiling it in the usual way.

FRANKINCENSE.

THE STILL.

The heat employed in distillation is necessarily injurious to the product, and to preserve the exquisite freshness and delicacy of the odors of flowers another way of proceeding is necessary, namely, *maceration* or *enfleurage*.

Fatty bodies have a strong affinity for all ottos, and at the same time exert little or no solvent power on the other matters with which they are associated. Flowers, aromatics, or balsams infused in oil impart to it their characteristic odors, and if this infusion be repeated a sufficient number of times, a highly scented preparation is obtained, which exhibits a *naturalness* of fragrance not attainable by distillation. The operation of so impregnating grease with odors is conducted as follows:

The flowers, separated from leaves or other extraneous matter, are placed in a suitable vessel, and covered with oil or liquefied suet or lard. A gentle heat is then applied for a period ranging from twelve to forty-eight hours, at the end of which the fat is strained from them, and again digested with fresh ones, which operation is repeated four or five times, or until sufficient perfume is imparted to the grease. This method of extraction is called *maceration*, or, more properly, *digestion*, it being a warm process.

Where the aroma is very delicate it is necessary to avoid heat entirely, and a variation of the foregoing method is employed, which is known as *enfleurage*. In this way of working, the fatty matter, when of solid body, is spread in thin layers on trays or "frames," and its surface covered with flowers, cup downward, which, after being allowed to remain thus for from twelve to seventy-two hours, are removed, and their place supplied by fresh ones, which are again renewed, as in *maceration*, until sufficient odor is imparted to the grease. When oil is used, coarse cloths saturated with it take the place of the lard or suet. These are treat-

ed precisely as before, and the oil recovered from them by powerful pressure.

The greases used in the foregoing processes must, of course, be as free from odor as possible. Benne and olive oils, when fresh, need no preparation, but lard and suet require thorough and repeated washings with water to render them sufficiently scentless.

The oils and pomades thus produced are in no essential different from those of the ancients, and still another process is needed to render their sweets available for the wants of the modern perfumer. They furnish, it is true, the most elegant hair-dressings, and, by saponification, yield the choicest of toilet soaps, but to make the otto they contain available for other purposes it must be dissolved out by alcohol. This liquid is a ready solvent of ottos, but refuses to combine, to any appreciable extent, with the fats employed in *enfleurage*. So they are robbed in turn of their odor by digestion in alcohol, and dilute essences are thus obtained which represent in great perfection the flowers from which they are derived.

Ottos and alcoholates are the most useful forms of the perfumer's materials; tinctures are next in importance; and, lastly, odorous balsams, herbs, and roots are sometimes employed in substance.

As we have seen, the chief processes of the perfumer's art are distillation and *enfleurage*. The essences thus obtained being at hand, simple dissolvings and compoundings produce the bulk of his wares. Having sufficiently considered the subject of manipulation, we come now to the crude materials themselves, on which the perfumer depends for his essences and ottos.

POMADE FRAME.

The uninitiated may naturally suppose, on looking over the extended catalogue of a manufacturing perfumer of the present day, that quite a large number of flowers and herbs were "distilled" to produce the variety offered, but, on the contrary, the materials actually employed are comparatively limited. The shelves of a well-stocked perfume bazar exhibit "extracts" of almost every flower that possesses a desirable odor, yet the blossoms really used will scarcely reach a dozen in number. The distiller can work profitably with but few materials; it is to the compounder's skill that we are indebted for the majority of our perfumes.

The chief materials used in the manufacture of perfumery are given in the following table:

ty chiefly cultivated for these uses is said to be the "hundred-leaved," *Rosa centifolia*.

The otto of rose is a light yellow or straw-colored liquid, possessing in a high degree of concentration the characteristic odor of the rose bloom, and a diffusiveness and persistency that render it of great service to the perfumer. It is extensively used and almost universally known. As stated elsewhere, the distillation of a hundred pounds of the flowers produces only about three tea-spoonfuls of the otto. This fact necessarily renders it high in price, which is still not so extravagant as the general public supposes. The usual wholesale rate in this country will average about ten dollars per ounce. The first quality is known as Kisanlic, from an Arabian port at which it is

Name.	Source.	Part used.	Preparation employed.
Almond (Bitter)	<i>Amygdalus amara</i>	Kernel of fruit	Otto.
Ambergris	<i>Physeter macrocephalus</i>	Secretion	Tincture.
Benzoin	<i>Styrax benzoin</i>	Inspissated juice	Tincture.
Bergamot	<i>Citrus bergamia</i>	Rind of fruit	Otto.
Cassia	<i>Laurus cassia</i>	Bark	Otto.
Cassia	<i>Acacia farnesiana</i>	Flowers	Alcoholate.
Cedrat	<i>Citrus cedrata</i>	Rind of fruit	Otto.
Cinnamon (True)	<i>Laurus cinnamomum</i>	Bark	Otto.
Citronella	<i>Andropogon citratus</i>	Leaves	Otto.
Civet	<i>Viverra civetta</i>	Secretion	Tincture.
Cloves	<i>Caryophyllus aromaticus</i>	Unopened flower buds	Otto.
Geranium	<i>Pelargonium odoratissimum</i>	Leaves	Otto.
Jasmine	<i>Jasminum odoratissimum</i>	Flowers	Alcoholate.
Lavender	<i>Lavandula vera</i>	Leaves	Otto.
Lemon	<i>Citrus medica</i>	Rind of fruit	Otto.
Lemon-grass	<i>Andropogon schenanthus</i>	Leaves	Otto.
Musk	<i>Moschus moschiferus</i>	Secretion	Tincture.
Neroli	<i>Citrus bigarradia</i>	Flowers	Otto.
Orange flower	<i>Citrus bigarradia</i>	Flowers	Alcoholate.
Orris	<i>Iris florentina</i>	Rhizome	Tincture.
Patchouly	<i>Pogostemon patchouli</i>	Leaves	Otto.
Rose	<i>Rosa centifolia</i>	Flowers	Otto and alcoholate.
Rosemary	<i>Rosmarinus officinalis</i>	Leaves	Otto.
Sandal	<i>Santalum citrinum</i>	Wood	Otto.
Tonka	<i>Dipterix odorata</i>	Beans	Tincture.
Tuberose	<i>Pollanthes tuberosa</i>	Flowers	Alcoholate.
Vanilla	<i>Vanilla planifolia</i>	Beans	Tincture.
Vetiver	<i>Anatherum muricatum</i>	Root	Otto and tincture.
Violet	<i>Viola odorata</i>	Flowers	Alcoholate.
Ylang-ylang	<i>Unona odoratissima</i>	Flowers	Otto.

By including all the material in use by the perfumer the foregoing list might be doubled, but the articles omitted are either without striking characteristics, or furnish odors which are only available in the commoner kinds of toilet soaps, and for similar uses.

We will now briefly describe the articles enumerated above, treating of them in the order of their importance.

The rose (too well known to need description here) is one of the most valuable of the limited series of flowers that are available to the perfumer. When dried it is useful in sachets or scented powders; distilled, it yields rose-water and the well-known otto; and subjected to enfleurage, gives oil, pomade, and alcoholate.

The rose is grown for commercial uses most extensively in Turkey, India, and the south of France. The crop of the East is distilled for the otto; the French flowers are generally applied to the production of "water," "oil," and "pomade." The varie-

supposed to find its exit, and is imported in metal canteens containing about fifty ounces.

The otto of roses, though an excellent representative of their fragrance when exhibited in a properly diluted form, is surpassed by the alcoholate obtained by enfleurage. Both preparations are largely used, both alone and in combination with other scents.

The citrine family, consisting of the two great divisions of lemons and oranges, is also of much importance to the perfumer. Originally a native of India and China, this genus is now introduced into nearly all countries. All its varieties thrive well in the warm latitudes, and in colder climates are readily grown in-doors. Their general form is that of a tree from ten to fifteen feet in height, with smooth shining ovate or oval lanceolate leaves. They bear a white five-petaled flower and an ovoid fruit, the rind of which is more or less fragrant.

The bitter or Seville orange (*Citrus bigarradia*) is the most valuable species to the

JASMINE.

perfumer. Its flowers yield by distillation a highly prized otto, known in commerce as oil of neroli, or néroly, and by enfleurage a pomade and alcoholate of delightful fragrance. The usefulness of this tree does not cease with its flowers. The rind of the ripe fruit contains the "oil of bitter orange peel," and the small unripe berries and leaves give the "oil of petit grain" (literally *little berries*), an essence similar to neroli.

The flowers of the other species of oranges and lemons also yield ottos, but of less desirable character than the foregoing.

From the rind of the common sweet orange (*C. aurantium*) we have an otto possessing the odor and taste of this favorite fruit; from another variety (*C. bergamia*) the well-known "oil of bergamot," which has long done such faithful service in hair oils and "bear's grease." The common lemon (*C. limonum*) gives an essence still more widely known than that of bergamot, and having the double use of perfume and flavor; and from the citron fruit (*C. cedrata*) we obtain the otto of cedrat, a truly delicious essence, resembling that of the ordinary lemon, but much richer, and of peculiar mellowness. These constitute the chief products of this useful family.

The principal plantations of bitter-orange trees are in the south of France, Calabria, and Sicily. Lemons are chiefly supplied by the West Indies, and also by the Mediterranean. France and Italy give us bergamot also, and the delightful cedrat is furnished by the same countries.

The jasmine is largely utilized in the preparation of perfumes. This shrub was introduced from the East, and has been for many years largely cultivated in southern lati-

tudes. Jasmines are rambling or climbing shrubs, bearing white or yellow blossoms, which have an intensely sweet odor. Their otto is extracted by enfleurage alone, it being so delicate and small in quantity that distillation is impracticable. Jasmine flowers grown in very hot climates have been successfully distilled, but the product proved too costly to become an article of commerce. A specimen exhibited at the World's Fair (Tunisian department) held in London in 1851 was valued at nine pounds (forty-five dollars) per ounce.

The most fragrant species of this shrub is the *Jasminum odoratissimum*, a yellow-flowering climber, which in the French flower fields is grafted on the wild jasmine, forming a bush three or four feet high.

The odor of the jasmine is so sweet in its pure state as to be cloying or "sickly" to many persons, but this property gives it great value in

forming compounds with scents of opposite character.

By enfleurage the modest violet yields an odor which is as universally admired for its delicacy and sweetness as is the flower itself for its quiet beauty. Although in great request, the supply is necessarily limited by the difficulty of successful cultivation, a peculiar climate and location being required to bring this floral treasure to perfection.

The chief violet beds are at Nice, France, the variety grown being *Viola odorata*. The plants are bedded in the shade of the orange or acacia groves to secure necessary screening from the noonday sunbeams.

Approximations of the scent of the violet

CASSIA.

TUBEROSE.

are found in the acacia (noticed below), the orris, and in myallwood, a native of Australia.

Cassie flowers are another staple in the perfume trade. They are the product of the *Acacia farnesiana*, a small tree or shrub which

grows only in southern latitudes. Its usual height is from five to six feet; the leaf is fern-like and very graceful; the flowers are of a globular form, about the size of a large pea, of a bright yellow color, and emit an odor similar to that of the violet, but more cloying and jasmine-like in sweetness.

Cassie, like the violet, is treated only by enfleurage. It gives a strong essence, which is used mainly in compounds. Cassie must not be confounded with *cassia*, the common cinnamon, which is of entirely different odor.

The tuberose (*Polianthes tuberosa*) is grown on a large scale for the use of the perfumer, and furnishes a valuable essence. It is a bulbous plant, first noticed by the old writers as the "Indian hyacinth." The stock rises about three feet, bearing flowers at its top, which resemble the hyacinth in form, and have a somewhat similar but more delightful odor. This odor is obtained by enfleurage, and is not only a favorite in the pure state, but enters into the formation of the most *recherché* bouquets.

The tuberose thrives well in France, Italy, and Spain, the first-named country being probably the chief place of production.

Last on this section of our list comes the ylang-ylang, or "flower of flowers," the latest introduced, and consequently least known, of all we have yet described. This blossom is produced by a large tree, native in the islands of the Indian Archipelago. Its native Tagal name is the one we have given (written sometimes *ihlang-ihlang*); the Malays call it *kanonga*, and to botanists it is known as *Unona odoratissima*.

The flowers of the *Unona* are flacculent and drooping, reminding one somewhat of our own familiar locust blossom. Their color is greenish-yellow, and they possess an odor resembling a mixture of jasmine and lilac, yet having a peculiarity that can not be likened to the scent of any other flower. This odor is said to be so powerful that it scents the air for miles around the trees.

The ylang-ylang was first distilled by a chemist at Manilla, who succeeded in drawing its otto, which was exhibited probably for the first time in Europe at the Exposi-

tion of 1867. It is now largely manufactured at Manilla and Singapore.

The otto of ylang-ylang is exceedingly costly, being worth fifty per cent. more than that of roses. Its price at the time of writing may be given in round numbers at fifteen dollars the ounce, or at the rate of two hundred and fifty dollars per pound. It is chiefly used in the manufacture of a handkerchief perfume, either pure or in combination with jasmine.

The odorous herbs furnish many ottos that are valuable for scenting soaps, and some of the more fragrant of these are useful in handkerchief essences and toilet waters. The principal ones of the latter class are lavender, rosemary, and patchouly. The two former are quite well known in this country; the last-named is an Indian plant resembling our garden sage. This herb is known to the natives as *putchapat*, and to botanists as *Pogostemon patchouli*. Both leaves and stems yield an otto of great strength and very peculiar odor, which, although disagreeable to some persons, is generally much admired.

Of the spice series cloves and cinnamon are the only ones that have much use in perfumery, and these are chiefly employed in soaps and the cheaper kinds of pomades.

Cloves are the unexpanded flower buds of the clove-tree (*Caryophyllus aromaticus*), which is largely cultivated in the West Indies, the Malacca Islands, and other similar latitudes.

Cinnamon is the bark of a tree, or trees, rather, for it is of two kinds. The variety generally met with is obtained from the *Laurus cassia*, and is properly known as *cassia* bark. *Laurus cinnamomum* furnishes the true cinnamon, which is in thinner quills of a lighter color, and though closely resembling the former in odor and flavor, is milder or softer, and has a faint touch of muskiness.

YLANG-YLANG.

PATCHOULY.

Cassia comes to us from China; the true cinnamon from Ceylon.

Two odorous grasses, natives of India, furnish ottos of extensive usefulness. One is lemon-grass, having a close resemblance in odor to the leaf of the lemon-verbena. Nearly or quite all our "extract of verbena" and "verbena-water" are made from this otto, which, by

the addition of a little lemon essence, becomes so *au naturel* as to leave little or no room for complaint.

The other otto is citronella, a perfume with which most persons have made acquaintance in the popular so-called "honey soap."

The rose-geranium is largely grown in France and Spain for its leaf, which yields a cheap and useful substitute for the otto of roses.

The wood of the sandal-tree, a native of the East Indies, gives a curious odor, greatly admired in Oriental countries, and much valued by us. It is both used in substance and distilled for its otto. Sandal-wood is very precious in the East. Immense quantities of it are burned before various pagan divinities, and it is worked into a variety of useful and ornamental articles. Most of our

SANDAL-WOOD.

readers have seen ladies' fans the ribs of which were of sandal, and will remember their curious and seemingly inexhaustible odor.

Vetivert, or kus-kus, a thread-like Indian root, furnishes another perfume of the same class as sandal, but sharper and more approaching floral odors. Its virtues are extracted either by tincturation or by the still. Vetivert has a strong and durable odor, which, though seldom liked alone, has in combination given perfumes of great popularity. The famous "mousseline," which, on its first introduction years ago, created quite a *furor*, owes its peculiar character to this substance. The otto of vetivert, like that of ylang-ylang, is very expensive, being much higher in cost than even that of roses.

Bitter almonds, though containing no otto when in their natural state, yield one by the reaction of their constituents in the presence of water. Thus the still furnishes us the

ALMOND.

almond odor, which, while sickening in its pure state, finds a place in minute quantities in many of the finest floral compounds.

As auxiliaries, or odors which are seldom or never used alone, but are valuable as modifiers, and from the property of fixing or giving permanence to the more volatile scents, we may mention orris, tonka, vanilla, and benzoin; and three animal substances, ambergris, civet, and musk.

Orris is the rhizome of the *Iris florentina*, a plant of the flag or lily order. Its scent somewhat resembles that of the violet, to which it is, however, so inferior as scarcely to merit the comparison. It is employed in the form of tincture, and its use is simply to give a body to more ethereal compounds, and lessen their volatility on the handkerchief or elsewhere.

Tonka, the seed of *Dipterix odorata*, a tree of the West Indies and South America, is familiarly known as the "snuff bean," from long use in scenting the "titillating dust." Tonka-beans are ovate, dark brown exter-

nally, very light brown internally, from one to two inches long, and from the shriveling of the dried epidermis have a somewhat bark-like appearance. From a strong resemblance in odor to newly mown hay, they are made the basis of a popular "extract" sold under that name, and also find uses similar to those of orris.

Vanilla is the capsule of *Vanilla planifolia*, a beautiful creeping plant native in Mexico, South America, and other warm countries. It is also derived from several other species of the same genus. The vanilla capsule, or bean, as it is generally termed, is from six to ten inches in length, one-fourth to three-eighths of an inch in diameter, cylindrical in shape, tapering toward either end, and slightly flattened. The color is dark brown. The interior contains a sort of pulp which is filled with little shining black seeds. The flavor of vanilla is well known in confectionery, and universally liked. As a perfume its tincture is valuable in combination both as a modifying ingredient and as a fixing substance.

Benzoin is a gum or gum-resin, the exudation of the benzoin or benjamin tree (*Styrax benzoin*), which is found chiefly in Siam and Java. It has a somewhat vanilla-like odor, and is employed for similar though inferior uses.

Of the animal substances ambergris is perhaps the least used at the present day. Its origin was long a mystery, but it is now known to be a secretion of the spermaceti-whale (*Physeter macrocephalus*), and supposed to form as the result of disease. It is found floating on the surface of the sea in masses which from appearance suggested the name *ambre gris*—gray amber. Its odor is extremely unpleasant when pure or concentrated, but it gives mellowness and permanency to mixtures.

Civet is a dark brown semi-fluid secretion obtained from the civet cat (*Fiverra civetta*), a native of Africa and India. It is found in an external pouch or receptacle peculiar to the animal. Its properties are in general similar to those of ambergris, but its odor

THE MUSK-DEER.

harmonizes more perfectly with floral compounds.

Musk, the last and by far the most important of the animal triad, is also a secretion, and is obtained from the musk-deer (*Moschus moschiferus*), a pretty little animal inhabiting the higher mountain ranges of China, Tonquin, and Thibet. The musk is found in a small pocket or pouch under the belly of the deer. The hunters cut off this pouch, which, becoming dry, preserves its contents, and in this state the best article reaches our markets. Musk, when moderately dry, is an unctuous powder of reddish-brown color. It gives out a powerful odor of a warm, aromatic character and most wonderful persistency. Blending well with almost every other scent, it discovers but little of its own peculiarity in compounds, when used in proper proportion, and yet gives them great permanency. In point of general usefulness to the perfumer it is probably unequalled by any other substance; for, although coarse and undesirable in a pure state, the most popular compounds are those in which it is an ingredient.

Genuine musk is very costly, being worth, when separated from its sac and all extraneous matter, from twenty-five to thirty-five dollars the ounce. Its great strength compensates in a measure for its price. One part of musk, it is said, will scent more than three thousand parts of inodorous powder.

It may seem a little surprising that from the limited list of materials we have given such a variety of perfumes can be made;

but the fact that odors are grouped into a few classes, the individual members of which have a greater or less resemblance to each other, accounts for the accomplishment of this wonder. This general kinship among individual odors suggested the possibility of producing from a few distinct types all those which may be said to belong to the secondary and tertiary classes, as all the colors known as secondary and tertiary are formed from admixtures of the three primaries—red, yellow, and blue; and this hint has been so well acted on that imitative effort often supplies us with scents which, though prepared by nature, are unavailable for the uses of art.

In this department the perfumer's efforts approach those of the artist. The painter reproduces the flower to the eye; the perfumer grasps and preserves its fleeting fragrance. More than this, he even imitates the charms of blossoms which are inaccessible to his hand, or that refuse to yield their sweets to his most careful skill. It is true his efforts are not always successful, but, on the other hand, many artificial essences are wonderfully like the originals they are intended to represent, and if not perfection itself, yet give us perfumes at will which would otherwise be ours for but a few weeks or days of the year.

From intimate connection with this part of our subject we append a few facts concerning the classification of odors. Various attempts have been made in this direction, the most satisfactory of which, as far as our observation goes, is that of Mr. Rimmel, who, in his *Book of Perfumes*, makes the following groupings of those coming within the province of the perfumer:

Classes.	Types.	Odors belonging to same Class.
Rose	Rose	Geranium, Sweet-brier, Rhodium, Rose-wood.
Jasmine	Jasmine	Lily-of-the-valley.
Orange flower... ..	Orange flower... ..	Syringa, Orange leaves.
Tuberose	Tuberose	Lily, Jonquil, Narcissus, Hyacinth.
Violet	Violet	Cassie, Orris root, Mignonette.
Musk	Musk	Civet, Musk seed, Musk plant.
Amber	Ambergris	Oak moss.
Citrine	Lemon	Bergamot, Orange, Cedrat, Limetta.
Balsamic	Vanilla	Balsam of Peru, Tolu, Benzoin, Styrax, Tonka, Heliotrope.
Spice	Cinnamon	Cassia, Nutmeg, Mace, Pimento.
Clove	Clove	Carnation, Clove pink.
Camphor	Camphor	Rosemary, Patchouly.
Sandal	Sandal-wood	Vetiver, Cedar-wood.
Lavender	Lavender	Thyme, Serpolet, Marjoram.
Mint	Peppermint	Spearmint, Balm, Rue, Sage.
Anise	Anise-seed	Badian, Caraway, Dill, Coriander.
Almond	Bitter almonds	Laurel, Peach kernels.

From this table several odors have been omitted which, standing as sole examples of their kind, could not be assigned to any class.

Sweet odors may be classified in a more general way under three headings—the floral, the aromal, and the balsamic. In the first group may be included all those derived from sweet-smelling flowers; in the second, those of all spices, herbs, and roots; and in the third, those of resins, musk, and similar substances.

MUSK-POD.

It may be of interest to show how the study of such classification, and olfactory observations on the peculiarities of odors, have been made practically useful in the manufacture of perfumes.

The delicate heliotrope, for instance, gives a fragrance resembling the aroma of vanilla combined with the sharper scent of bitter almonds. The heliotrope itself is both scarce and unprofitable to the maker of perfumes, while the two latter substances are easily obtainable, and readily yield their odors. Taking advantage of the idea suggested, the manufacturer adds to a tincture of vanilla a small proportion of the otto of bitter almonds, and sufficient rose and orange-flower essences to give sweetness and a floral character to the compound, and thus easily makes what is really an excellent "extract of heliotrope."

The magnolia is too large to be conveniently subjected to maceration, but its odor is desirable, and is furnished by a mixture of orange-flower, rose, tuberose, and violet

essences, which, making a near approach to the body or foundation of the scent, are converted into "extract of magnolia" by a magic touch of cedrat, which adds the peculiar sweetness characteristic of the flower.

The refreshing scent of the scarce lemon-verbena has almost a counterpart in the Indian lemon-grass, which can be had in abundance. From this, in combination with lemon peel, an "extract of verbena" is obtained which leaves little or nothing to be desired.

The perfume of the sweet-brier is so fleeting that no means yet devised can isolate or imprison it. The sweetness of the rose gives the foundation, a few other flowers modify it, and a dash of verbena creates the artificial essence of sweet-brier.

After the same manner the odor of the violet, the pink, the lily, and many other flowers is produced from motives of either economy or convenience.

Inventive art reaches still farther, and creates perfumes by compounding which are unknown in nature. Few persons at all familiar

with perfumery are unacquainted with "Jockey Club," "West End," "Mousseline," "Millefleurs," and a host of others, which have no counterpart in the flower garden or the spice grove. These bouquets are often esteemed as highly as the unmixed natural essences themselves, and some of them have attained a popularity which has perhaps even exceeded that of the simpler odors.

The general reader would scarcely care to pursue further the mysteries of the art of perfumery. We have followed its chief processes from the garden to the tradesman's bazar. Our work is done, and we leave our interesting subject with some brief advice in regard to the artistic use of the essences and extracts whose manufacture we have endeavored to describe. We

MUSK-DEER HUNTING—AFTER A CHINESE PRINT.

quote again from that eminent authority, Mr. Rimmel, who, addressing the sex which shows the greatest appreciation of sweet odors, says: "Above all, avoid coarse, strong perfumes, and remember that, if a woman's temper may be told from her handwriting, her good taste and good-breeding may as easily be ascertained by the perfume she uses. While a *lady* charms us with the delicate ethereal fragrance she sheds around her, aspiring vulgarity will as surely betray itself by a *mouchoir* redolent of common perfumes."

As a rule, floral scents are to be preferred. The pungent exhalations of musk and the sharp aromas of spices all have useful places in the world of odor, but its chief treasures and highest models are the gentle breathings of the fragrant flowers.

DUETS.

"WHAT a desolate day! One might as well live at the north pole. Have you been out, Helena?"

"No; I never go out when the mercury is below twenty."

"You are a hot-house plant, my dear. Now I walked five miles this morning; I love this clear bracing air."

"That is because you are a brunette, Olive. Brunettes both feel and look well in winter. The wind only brightens their eyes and increases their bloom; they laugh, they sparkle, they fairly radiate brilliancy. But blondes in winter look like the ague personified if taken out of their warm rooms; they are exotics, and need a conservatory."

"Nonsense, Helena. I have seen blondes who looked dazzling in winter."

"Only the rare molten-gold type. You never saw an ordinary blonde, with light blue

eyes, flaxen hair, and pale, delicate skin, who did not turn blue and purple, pinched and miserable, in a winter wind."

"But I would change places with blonde Helena in a moment."

"Bones and all? Ah, my hated collar-bones!"

"And ah, my hated apple-cheeks!"

"For my part, I admire flesh in a woman. I don't believe an angel could get into heaven if she were lean and bony."

"Better a lean angel than a fat one! But you are a female Shylock, Helena. Nothing in your eyes can take the place of a pound of flesh."

"I have all the authorities on my side, Olive. Look at the antiques, the paintings of the old masters. What contours! what grand proportions!"

"Yes; each goddess or Madonna weighs

at least two hundred pounds, and number seven or eight would be the proper size for their shoes. I do not admire the antique either in art or literature. What do I care for Agamemnon or pious Æneas? They are associated in my mind with the fearful days when I was learning Latin. For, as Heine says, 'Oh, that Latin! The Romans would never have found time to conquer the world if they had been obliged first to learn Latin.'

"What a heretic! But I can not believe you are really in earnest, Olive. Have you no desire to go to Rome—to Rome, the former mistress of the world, the store-house of all the treasures of the past?"

"No, Helena, I have not. I am weary of this hue and cry about the everlasting old; and, besides, the word is only comparative. What do we certainly know of the age of the world? Nothing. A mastodon is older than Adam, and a megatherium would laugh them both to scorn."

"But Cicero, Olive?"

"I am more in sympathy with Daniel Webster."

"And Dante?"

"I like Bret Harte better. He, at least, is original, and to me that is every thing. Heigh-ho! It really seems as though in literature there was nothing new under the sun. Take Christmas stories, for instance. Dickens began them, and since then we have had a succession of dreams, angels floating in on clouds, and spirits of Christmas Past knocking at the door, until, like the minstrel song, we cry, 'Stop that knocking, stop that knocking! oh, you'd better stop that knocking at the door!'"

"You are not sufficiently poetical, dear Olive. Now I fairly live in poetry. Take away poetry, and my heart and life go with it."

"No one will ever attempt that, Helena, unless it might be a prosaic husband."

"A prosaic husband I shall never have, Olive. It would be simply impossible for a heart devoid of love for poetry to win mine. I must have a soul-companion, to whom poetry, music, and art are as necessary and dear as they are to me."

"And I must have a strong manly heart, too full of the great questions of the day to dally with your poetry, music, and art, Helena. He must care more for the political condition of the country than for all the old marbles of Italy put together. If a man tries to live in the past, he becomes a useless fossil; if he tries to live in the future, he becomes a useless visionary. The present, the present, is all he has. Let him grasp it, then, with all his strength."

"How practical! Now I live in the past."

"With ghosts, I suppose. I never cared much for ghosts. I would rather be live Olive Dean than dead Cleopatra. To give

you another proof of my practical tendencies—I must have money if I marry."

"Mercenary, Olive? Ah, wealth is nothing compared with true love! To those who love, any lot is happiness so that they are together."

"I do not agree with you. Certainly I shall not waste my life in a hard struggle with poverty. It narrows the mind and crushes the heart. No; I must marry a rich man."

"And I feel sure that if I marry, it will be for love alone."

"I hope you don't think that rich men are incapable of true love? On the whole, however, I do not know that I wish to be married at all. Certainly nothing could induce me to give up my freedom for many long years yet."

"And I, too, feel that I shall always remain unmated. Ah, Olive, memories of the past, sweet and sad, rise like a barrier before the very thought! No; I have lived and loved. The rose can not bloom twice."

"Don't, Helena. That is what I call building grave-yards in the air. Lucius Gray was not worth a tear, much less an eternal tombstone in your heart. He was a most wearing companion, worse than a walking encyclopedia. It was like this: 'Miss Dean, do you know what a hydrometer is?' 'Yes,' I would say, rashly, trying to avert the avalanche; 'curious things, are they not?' But my effort was useless. 'Give me your idea of it, Miss Dean. I shall be interested to hear your explanation of its uses.' Of course then I was caught, and obliged to hear the whole, beginning with, 'a hydrometer is an instrument for determining specific gravity,' and so on to the bitter end. And there was no use trying to escape the closest attention either, for in the most unexpected places he would stop and ask me to repeat his last sentence to show that I had comprehended him. And the next call he would have a review of the whole."

"Do not jest, Olive. Lucius's heart was deep and tender. Perhaps he did not unveil it to you. Ah, I can never forget him!"

"I should think you would be glad to forget him, Helena, especially as he forgot you, and married that German Fräulein. I wonder if she knows what a hydrometer is? By-the-way, how well I remember that lovely moonlight night when I saw you in the arbor with Lucius! If ever there was a time for romance, it was then and there, and you told me yourself that he was giving you sums in mental arithmetic."

"He wished to strengthen my mind, dear. It was a laudable kindness."

"Laudable, perhaps, but wearing. He was constantly setting traps for the unwary. 'How far do you suppose you can see in a perpendicular line, looking upward, Miss Dean?' 'A hundred miles,' I would answer at ran-

dom. 'How blue the sky is!' But I might have said it was green for all the attention he paid to the remark. 'I will prove to you that that is impossible,' he would begin, going back to the hundred miles; 'the powers of vision,' and so on, and so on, until I almost wished I was blind. He was the man, too, who would not play cards, not from any moral objection, but because something was left to chance, and he wished every thing reduced to mathematical certainties."

"In that respect my taste was like his, Olive. I detest games; there is no poetry in them, no sentiment, no imagination. Euchre, for instance, is a complete mystery to me. The cards are dealt out, three rounds are played, and I am straining every nerve to play with the proper discrimination, when suddenly all the others throw down their cards, a general laugh follows, and the game is over before I have realized that it is begun. I played a whole evening in that way once, and I assure you that from beginning to end I had not the faintest idea who was winning or who was beaten. I passed the counters over to my partner, saying, as carelessly as I could, 'that I did not care to keep the account;' but the truth was, I couldn't. But I made a secret vow never to play again, and I never have."

"I would not if I were you. You do not shine in games, my dear, any more than I do in tableaux. My nose is not Grecian, you know. Once, and once only, I was asked to take a part. What joy was mine! What a gorgeous costume I ordered! The whole household was at work, the very air was filled with finery, all Shakspeare's heroines together could not have made more stir. 'What is the tableau, daughter?' asked father, at length, after several days of this confusion. 'From the *Winter's Tale*, papa. Hermione as the statue, and Leontes the king kneeling before her. Oh, it will be perfectly beautiful!' 'And what are you to do in all this finery, Olive?' 'I am to—to hold back the curtain,' I said, slowly. There was a burst of laughter from the assembled household. Some way they had never thought of it in that light. Neither had I! 'Daniel Webster once made a tour through New Hampshire,' said father, 'and a young lawyer of my acquaintance managed to attach himself to the party. Thenceforth it was the glory of his life, and we had to hear the story over and over again—how the great man stood, how he looked, how he moved his arm, and what he said at each town and village. At last one day we asked him, "And what did you do, eh?" "I held his hat," answered the proud youth. From that moment he never could tell the story again; as soon as he began, "When I travelled with Daniel Webster," there was always some one to yell out "Hat! hat!" and so nip the story in the bud.'"

"Is not that last phrase an inappropriate one?"

"Not at all. I have an illustrious example behind me. Don't you know that during an eloquent address in the House of Lords an English peer once created the following sublime simile: 'I smell a rat! I see him floating in the air! But I shall yet be able to nip him in the bud!'"

"Mr. Atkins would not believe that story, Olive. You know how English he is."

"But it is true for all that, John Henry to the contrary notwithstanding. Atkins—Atkins—what a name! Have you ever noticed that plural names in *kin* are invariably plebeian—Simpkins, Haskins, Tompkins, Wilkins, and the like? Not that I care in the least for names; good honest John will do for me. But I know you dote upon elegant high-sounding titles, like Reginald and Ferdinand, or Courtenay and Vavasour."

"Yes, I confess I like a euphonious name. For instance, there is our friend Alexis Peyton St. Clair. By-the-way, what do you think of him?"

"Do you suppose, Helena, that the Grand Duke Alexis had Russia-leather trunks?"

"Of course, else what is the use of being a grand duke? But, seriously, Olive, what do you think of Mr. St. Clair?"

"The dainty, white-handed young artist? Oh, he is of the Hellenic type, and I am an out-and-out Pelasgian. We speak different languages, and can not even comprehend each other. He writes poetry about 'the rain dashing upon the window-pane,' and that sort of thing. I have long detested him from the bottom of my heart; we are totally antagonistic. He ought to go and live with 'Aurora Leigh,' the poetess of the lakes. We went up to the islands last summer, and as soon as we arrived, friend number one told her story. She lived on Lamia Island; her father kept the light-house there; she never saw any man excepting her father until she saw her husband; and she wrote the most beautiful poetry about the lakes—which was all true, and truly remarkable. But even the true and remarkable becomes a torment by repetition. When we had taken the story all in, and discoursed upon it at length, friend number two arrives, and begins: 'You see that island over there? It is called Lamia, and there is a most remarkable story connected with it. The light-house keeper had a daughter—' 'Yes,' we say, hastily; 'very remarkable, is it not? She writes poetry, I hear.' But friend number two is not to be defrauded of his narration in this way; he goes back gravely, not to say sternly, and begins again—'The light-house keeper had a daughter,' and so on, through the whole. We go in to dinner. 'Did you see that island off to the right?' remarks friend number three, as the soup appears. 'It is called Lamia, and there is a

very remarkable story connected with it. The light-house keeper had a daughter—'Yes,' I interrupt, boldly; 'a remarkable story, as you say. She never saw any man except her father until she saw her husband, and she writes the most beautiful poetry about the lakes. Truly remarkable!' But it is of no use. 'The light-house keeper had a daughter,' repeats number three, without noticing my attempt, and the tale lasts through fish, meat, and dessert, only ending with the coffee. This narrator was the slowest of all. We have a chance to compare, for we only hear the story five times more before night. The next day the thing continues, and the next. At last, in desperation, I take it up myself, and issue a new edition, enlarged and beautified. This version I tell to all new-comers, gravely: 'You see that island over there? It is called Rattlesnake, and there is a most remarkable story connected with it. The light-house keeper there had six daughters, who never saw any man except their father until they saw their six husbands. They never ate any thing, they never drank any thing, they never slept, they never spoke. Their clothing consisted principally of shells. They lived continuously upon the top of the light-house, and wrote the most beautiful poetry about the lakes, which the loons carried to shore.' By dint of constantly repeating this version, I flatter myself that I mixed the two stories so well together that hereafter the dazed public will refuse to believe either, and consider them part of the Indian mythology of the lakes."

"Just like you! But, seriously, Olive, I really like 'Aurora Leigh's' poetry. I often see it in the *Jupiter Magazine*."

"So do I like it. She can not help herself; it is her friends who pull her before the public. But she has glory enough in the *Jupiter*, surrounded by the well-established Eastern aristocrats. A clergyman once told me that he had known several estimable young men so far led astray as to become quite profane over the difficulty of getting into the exclusive *Jupiter* columns."

"Oh, Olive, there is Mr. Atkins coming up the walk!"

"Of course he is coming to see you, and as I am only a visitor, I will step into the library and amuse myself with your books until he goes."

"Oh, stay, I entreat you, dear. I do not wish to see him alone."

"Don't you like him, Helena?"

"I can not endure him!"

"Well, I'm sorry; but I must go to the library all the same. Bear it as well as you can. Good-by."

"Good-afternoon, Mr. Atkins. Will you come to the fire? It is a bitter day."

"I like it, Miss Marbury; I like it. There

is something in this cold air that invigorates one and enlivens the circulation. A healthy soul and body ought to enjoy a day like this. American ladies are but a puny set, generally speaking; but I know that you, Miss Marbury, are a beautiful exception."

"I do indeed love such weather of all things. So inspiring!"

"Just what I always say. How would you like a walk, now—say as far as the lake? There is a fine bracing wind from the north that will fill your lungs, and give you an appetite for dinner. Do come. I came on purpose to ask you."

"I shall be delighted to accompany you, Mr. Atkins. Fortunately my wraps are in the hall.".....

"Isn't this fine, now? The wind must be about forty miles an hour, I should say."

"Really delicious! It is like battling with Æolus, the king of the blast."

"Æolus, eh? Some poetical person, I suppose. I never cared much for poetry myself; wouldn't waste my time over it. Poets are but a shiftless set; no heads for business, you know. I suspect a poet's wife has but a hard time of it. Money is necessary to make the world go easy, and people in easy circumstances are always more reputable citizens than the Bohemian brotherhood of poets, musicians, and artists. Give me a man with a fixed income—a man not too young, with good health, and a good temper—a man who knows nothing of poetry and such nonsense; and depend upon it, Miss Marbury, you have the best the world affords."

"Such men are the pillars of society, Mr. Atkins."

"You see it, Miss Helena, of course. But, strange as it may appear to a person of your good sense, there are young ladies who prefer mere boys, with their heads full of philosophy, poetry, rationalism, and the like—fellows of no position, no income, and utterly unable to maintain a household in good style. Talk about love! What love is there in five hundred a year, and not always that? I call it selfishness. I would not ask a woman to give up all the luxuries of life for my sake. I have waited until my position and my fortune were certainties; and now it would be my pleasure to give my wife all reasonable comforts. Don't walk so fast, Miss Helena. Do take my arm. The wind is pretty strong."

"If we should step up on to that porch, Mr. Atkins, we should be partially protected."

"Not on my account. I like the wind, and the full view of the lake. But if you are cold—"

"Not in the least, I assure you; and the view is truly arctic. It is rather difficult, however, to keep one's footing on the icy bank; but the freshness of the atmosphere is absolutely inspiring."

"Isn't it? I knew you would think so."

Hold my arm firmly. Wait, let me take your hand; my fur glove will help keep it warm. There, that's comfortable."

"Ahem—hem! I can not imagine what makes me cough. Ahem! In summer the lake always reminds me of pictures of the Bay of Naples. Have you ever visited Italy?"

"No; nor want to. America is good enough for me. I'll wager that New York Harbor is as good as any thing the Italians can show; and as to the race itself, it seems to produce nothing but opera-singers, organ-grinders, and the little boys who scrape their fiddles upside down. Compare an opera-singer, now, with an American merchant!"

"Our merchants are indeed the bulwark of American prosperity. But I fear I am engrossing your valuable time, Mr. Atkins. Shall we return?"

"My time is yours, Miss Marbury—entirely yours. I would cast aside a good investment for the sake of being with you. Can I say more? I am well able to afford it, however. Let us walk on as far as the hospital; the view is very fine from there. That is, if you are not cold?"

"Not in the least. Ahem—hem! This cough is merely in the throat. How is your dear little niece, Mr. Atkins?"

"Well, quite well, thank you. I caught her reading a new Jo Miller, a kind of poet living on the Rocky Mountains, they say, and I went to her room and confiscated every verse-book there. The whole shelf had to go. I told her there was something else to do in the world besides reading rhymes. That is the only way, Miss Marbury."

"Yes, indeed. Young girls are so romantic."

"Some one sent her Dante's *Inferno*, illustrated by Doré; but I sent it to the right about the very same day. The poetry was trash to begin with, and as for the pictures, they were enough to give any one the nightmare. But I gave her a set of Miss Edgeworth to make up."

"Far better. At that age Miss Edgeworth's works were my constant and cherished companions."

"I can readily believe that, Miss Marbury. I have long admired your good sense and sound judgment. Your ideas of life are sure to correspond with my own, for I think I can safely say that you have no nonsense about you. A good house, a good cook, a little company to make the evening pleasant, ending with a social game of cards—whist or euchre. I always play cards in the evening; it is a habit I inherit from my English ancestors. You play, of course?"

"I—I am not a skillful player, Mr. Atkins."

"Oh, you can learn—you can learn! I know you have a head for games. Euchre, now, will just suit you."

"I know something of euchre; it is a deep-

ly interesting game. But all games of cards are fascinating."

"Just what I say. My neighbors sometimes ask, 'Atkins, must you always play cards in the evening?' And I always answer, 'Yes, Sir; John Henry Atkins must have his game in the evening, just as he must have his cheese at dinner.' Corned beef and cabbage, too, I'm fond of, Miss Marbury; and let me tell you, too, it is not every cook that knows how to cook a cabbage. There is a science in the art. You like cabbage, I hope?"

"I have—I have had but few opportunities to taste it, but I could easily learn to like it, I know."

"Some people object to the odor, but I like it just as I do the odor of onions. An onion of the proper age, cooked in cream, is delicious. I always have what I like on my table, no matter what the fashion may be."

"You have a noble independence in all things, Mr. Atkins."

"I flatter myself so, Miss Marbury. John Henry Atkins is proud of his independence, his nation, and his name. Atkins—it is an old Dorsetshire name; and, Miss Marbury, dearest Helena, permit me to offer it to you!"

"Mr. Atkins, this is so sudden. I really do not know—perhaps I mistake—what do you mean?"

"I mean you to be Mrs. J. H. Atkins. I do not speak under impulse, Helena; I have long felt an esteem for you, my dear, and I know you will suit me."

"Oh, Mr. Atkins!"

"Call me John Henry, dearest."

"Oh, John—John Henry—this is so sudden!"

"Not to me, not to me. I assure you I have thought it all over and looked at it on all sides. I have weighed every consideration, and, on the whole, I think we shall get on admirably. I know just the amount of your property. It is not much, to be sure; but I can double it for you in ten years, and in the mean time you shall share in all the comforts of my home."

"Oh, Mr. Atkins—John Henry—I think I ought to confess that there are memories of the past, sweet, though sad—"

"Some old love affair? That is a matter of course at your age. Girls over twenty-five always have something of the kind to talk about. I have had a dozen such affairs myself. I will tell you about them some time. But I am not afraid of an old memory, my dear, if that is my only rival. To tell the truth, I knew the field was clear; I never make one of a crowd. You will not be likely to have any more offers, you know, and certainly none so advantageous as mine. Come, Helena, I am a plain speaker, but none the less honest for that. I could have no motive but affection, could I, now? Say

yes, my dear; be Mrs. Atkins, and you shall see how comfortable we shall be together."

"A little time for reflection."

"No time like the present. See here, now, my love, I know you're going to say yes at the end, so I'll just take it for granted that it's said, and spare you all the trouble. Now, Mrs. Atkins, shall we go back to the house?"

"Oh, John Henry, you are so impetuous! Who could resist you?"

"Miss Olive, Mr. St. Clair is in the parlor waiting to see you."

"How did he know I was here, Martha?"

"He said he had called upon you, and was told you were at Miss Marbury's; so he came here."

"Mr. Atkins and Miss Marbury are there, I suppose?"

"No, ma'am; they went out for a walk a few minutes ago."

"Very well, I will go to the parlor".....

"Good-afternoon, Mr. St. Clair. This room very warm, I fear."

"A delicious atmosphere, Miss Dean. A soft air balmy with flower fragrance is absolutely necessary to me. I feel like an exile on this bleak lake shore, and this fierce north wind sweeping over miles of ice seems to freeze my very soul. I tried to paint, but the cold palsied my hand and chilled the flow of inspiration; so I came to you, Miss Olive, for warmth and strength and life."

"You flatter me, I fear."

"I could not flatter you; it is not in the power of words. As I came shivering through this inhuman wind, I thought of you, beautiful tropical flower that you are, and fancied you sitting in the glow of the fire in all the bloom and light and radiance of your loveliness, and the picture cheered me on through the arctic streets. Miss Olive, I know your nature is exotic, like mine, that you suffer in this brutal climate, and that you long for the glowing South. There is that delicacy in your face that tells me this, for its changing expressions belong not to this cold, prosaic country."

"Life in the tropics must be very beautiful."

"Oh, to fly with you to the land of the orange and palm! Oh, to roam with you under a sky forever blue! Do you not long to go to Rome, and wander among the monuments of past glory, the treasures of antique art, the rich memories of the golden age of this degenerate earth?"

"I have dreamed of such a pilgrimage for years; it is the desire of my heart, Mr. St. Clair; but how can I bring it into the realms of reality?"

"Let me be the magician, Miss Olive. Oh, why should we stay in this land of ice and snow, when Italy holds out her arms to us? There are the immortal works of the old masters; the ruins whose every stone

is worth more to appreciative hearts than whole cities of modern growth; the graves of Dante and Petrarca, which we could bedew with a humble tear. Our souls are alike. We abhor together the sacrilegious new; we adore together the divine old. America is the land of iconoclasts; its politicians are demagogues, its history a history of mere utility. Go with me, Olive, thou angel of my heart, to a warmer clime!"

"Mr. St. Clair, I beg— Perhaps I misapprehend you."

"Let us unite our hearts and lives in one, Olive. I know that I am not worthy of you—who could be?—but I love you with an ardent eternal affection, and without you I can not live. My very life is in your hands. Oh, look down upon me kneeling at your feet, and do not crush me with your scorn!"

"Alexis—in tears! Can you, do you really love me—poor plain me, without genius or fortune?"

"My darling Olive, this is heaven. I ask nothing more of fate."

"Nor I."

"Together we will face the storms of life, together live—"

"Together die."

"I have long felt, my own love, that we were intended for each other; in every taste, in every idea, we sympathize. But you seemed so far above me—you a queen, and I a slave at your feet! In the day I have thought and in the night I have dreamed of you; or, as I expressed it in one of my late sonnets, written at midnight,

'Abroad the night is wildering on high,
Loud the wind's plaint amid the vengeful sky,
While 'ploring, 'ploring, walls the tortured sea;
But though the weary, weary moaning rain
Drives ceaselessly upon my window-pane,
My heart wells out in arrowed dreams of thee!'

I am obliged to call the lake a sea; it is so much more classical."

"Oh, how beautiful! What genius is yours, Alexis! You must let me see all your poetry; I adore it."

"I have five large manuscript volumes, love, and it shall be my pleasure to read them all aloud to you. My poetry is too sacred for the public. But now that my poor heart is satisfied, perhaps I may think of writing for publication."

"It is an absolute duty, Alexis. Such genius as yours should not be secluded; it is ungenerous to the world."

"You are right, Olive. Henceforth I will let the public share. But we must leave this dull land and fly to Italy—to the Eternal City. True, I am what the world calls poor; indeed, I have only what the powers of poetry and painting may bring to me. But in your love I shall find new inspiration, and ere long you will see my name borne aloft on the banners of fame. In the mean time, dearest, you are not afraid of poverty?"

"In your love I have all the riches of life, Alexis."

"My own, I knew you would answer so!"

"But I wish, for your sake, dear, that I had a fortune. You know I have nothing."

"Yes, and I rejoice thereat. We will go forth together like two wandering birds, and our Mother Earth will not begrudge us the few crumbs we require. What is money compared to love? Dross; dust of the earth!"

"How strange it is that most women are so mercenary! Now I never think of money."

"I know you do not; with you love is all in all. We are young; we love. Let us then enjoy our youth and our mutual affec-

tion, and leave to the sordid and narrow-minded the wearying accumulation of gain."

"We will! we will! Oh, there is Helena coming up the walk with Mr. Atkins. How she will envy me my happiness! Take that chair on the opposite side of the table, dear."

"Atkins? That man is my *bête noire*. A dull, purse-proud plebeian!"

"Hush! they are in the hall."

"Martha says Mr. St. Clair is in the parlor, John Henry."

"What, that good-for-nothing painter?"

"Hush, dear! they might hear you. Dear Olive, how she will envy me my happiness! Let us go in."

Editor's Easy Chair.

THE Commencement season this year was notable for some remarkable discourses. There are always good things said at such times, and when Mr. Emerson delivered his college addresses some of the noblest contributions to our literature were made. His Phi Beta Kappa address at Cambridge thirty-seven years ago was one of the most significant and memorable of orations. The lofty and lyrical charm of its style was well fitted to the brave and vigorous thought, and to the inspiring appeal to the American scholar to be himself and not another. The conservative timidity of the traditional college atmosphere was wonderfully startled by this bugle note, and many a vital and ennobling influence in American thought and life can be traced back to the electric words of that summer day at Harvard. Then came the address at the Divinity School in 1838, and the orations at Dartmouth in 1838, and at Waterville in 1841. That at Dartmouth has the famous exhortation to the graduates, which is of a loftier tone than any similar words that we recall—a tone which has been deep and true enough to ring through many a manly and generous life ever since the day it was uttered.

And many other memorable words has Dartmouth heard at her annual festival. There, in 1853, Rufus Choate delivered that eulogy on Webster which, as a work of elaborate and impassioned rhetoric, is as unsurpassed as its estimate of Webster is extravagant. Mr. Choate has left nothing more characteristic or better fitted to justify the fame which in his case, as in that of most renowned lawyers, must be mainly a tradition. The Webster eulogy is the splendid special plea of an advocate, and half of its pathos is derived from the consciousness that it can not affect the judgment of the great tribunal of history to which it is addressed. The greatness of Webster is not a subject of doubt. But his relation to the paramount question of his later years is not truly drawn in the picture of Choate, which was designed as a crushing pendant to that of Theodore Parker. The astute orator summons all his skill, all his professional experience and sagacity, all his daring sophistry and casuistry, for the service of his client, and he dis-

charges at Parker the fires of a long-pent and accumulating wrath; but the reader, full of admiration of the dazzling ingenuity and of the consummate craft of a master advocate, still remembers the remark of the tough old Websterian who heard the fiery discourse in the Music-Hall, and who declared, with an oath, that it was the most outrageous thing he ever heard in his life, and the worst of it was that it was true.

Dartmouth must have recalled the Emerson oration and the Choate eulogy when she seated herself on the loveliest of the late June days to hear Mr. Evarts upon Chief Justice Chase. The oration was not unworthy the day, the place, and all the traditions and associations with which it was surrounded, and it leaves Mr. Chase a very stately and memorable figure in the history of his country. It was his misfortune, however, that while, as Mr. Evarts points out, he was always eminent, always high among the highest, always one of three, there was something which always prevented his being a truly representative figure. Perhaps this was evidence of that wise balance and moderation which marked him especially as a statesman, as a man to be safely trusted, of sure and prompt judgment, of a calmness which should always be the atmosphere of executive political thought. With all his distinction and ability he never touched the popular heart or imagination, and therefore never excited any of that enthusiasm which followed all other eminent Americans of his class. He was doubtless, also, seriously injured in public regard by his too evident passion for the Presidency. It is certainly a worthy ambition for such a man, and his abilities, his training, and his temperament pledged him to a worthy discharge of its great duties. But there seemed to be something excessive in Mr. Chase's desire; probably it suggested a suspicion that he was really overpowered by it, and from the moment of that doubt the prize was lost to him forever.

The sketch which Mr. Evarts drew of Mr. Chase's career was masterly, and it was done with a stately rhetoric which became the theme. But at the very close of the discourse, and with the most generous purpose, the orator spoke of Mr. Webster in a manner which should not pass un-

challenged. He said, in effect, that the judgment of the country was now agreed that Mr. Webster and his friends, who consolidated the Union, did as great a work as those who saved it, and a work not less indispensable. This may be historically correct; certainly we do not here dispute it. But to state it as a vindication of Mr. Webster's later course is to appeal to the argument that whatever is right. Mr. Webster's reply to Hayne was final: as a constitutional argument it was impregnable. But the adverse opinion of his political attitude at the close of his life, and the condemnation under which he fell, are not to be discredited because in the constitutional debate that long preceded the war his arguments upon the principle of nullification were so powerful and conclusive. Mr. Webster was a Whig, but if Mr. Seward and other Whigs had been content to do and say what he did, it is easy to imagine the result. To represent him as entitled equally to admiration with those who, with deeper insight, declined to follow him, is surely to misapprehend history and dangerously to confuse moral distinctions.

But while in listening to Mr. Evarts Dartmouth was delighted to honor a son of Yale, Yale herself was glad to honor another. For on the same day Judge Pierrepont, of New York, a classmate of Mr. Evarts and of Chief Justice Waite, addressed the Law Department of Yale in an oration remarkable for the independence and directness of its opinions. The subject was the relation of morals and politics, and it found in morality the secret of national permanence. "No government can prosperously endure which in the main is not administered by the higher intellect and the higher moral sentiments of the people." The orator then proceeded to show that there was a general forgetfulness of this truth in this country, and that we should fail unless we change, "and sturdy honesty drives out imbecility and corruption." Universal suffrage, he said, is useless without virtue and intelligence. Indeed, the orator thinks that "this voting question" is one which the American people will some day reconsider, and that in all the difficult problems which we must settle the lawyers will be of the greatest prominence. Hence, he urges, the necessity that they be wisely trained. Judge Pierrepont justly appealed to English history for illustrations of the service of lawyers to liberty and progress. Unjust judges there had undoubtedly been—Jeffreys is a by-word—but many of the great leaders of English freedom were lawyers, and in America the names of James Otis and Patrick Henry and John Adams are alone enough to indicate the best fame of the profession.

It is remarkable, also, in connection with this oration of Judge Pierrepont, that an eloquent preacher and moralist, David Swing, of Chicago, in one of the sermons in his remarkable book, *Truths for To-Day*, warmly asserts the religious character of the profession. "The bench and bar of all countries and cities and towns have always been allies of the faith in a God. They have not been sectarians in church always, because their habits of thought and hunger for evidence have been too large to permit them to be narrow in creed or credulous as to a thousand dogmas; but as to the belief in a God of infinite

righteousness, the whole judicial multitude—judge, lawyer, statesman—has been pervaded by the religious element." Judge Pierrepont's address was a forcible sermon upon the text that, as Mr. Sumner used to say, the rule of morality and honor is the same for a state as for an individual; and nothing can be more serviceable to the young men who stand "girt and ready upon the threshold of the college" than to hear from those who are already engaged in the active duties of life those wise counsels which are the result of actual experience.

Still another discourse of the late Commencement season was that of Charles Francis Adams at the opening of the Memorial Hall at Cambridge. It was a temperate and careful address, written apparently with the feeling that a university which hoped to gather pupils from the whole country must choose its words at the dedication of a commons hall erected in memory of those only who took one side in a civil war. The orator naturally looked for some theory of the contest which could properly commend itself to the intelligent approval of the whole country, and he found it in the doctrine that, while the college was consecrated to peace, there was one situation in which the resort to force was justifiable and imperative, and that was when it was necessary to sustain law. Perhaps the fate of the occasion imposed a certain apologetic tone upon the discourse, and we should hesitate to accept the accuracy of the orator's description of the condition of public sentiment just before the war. But no one who knows Cambridge will fear any local or sectional spirit in her shades engendered by the war. Every year she becomes more truly a university, more generous, more comprehensive. It will be interesting to her sons to have a glimpse of their alma mater when she was but about forty years old. In 1680 Jasper Dankers and Peter Sluyter, two Labadists, or followers of Jean de Labadie, a mystic and enthusiast, born in France, and educated as a Jesuit, but who appeared in Holland as a Calvinist religious leader and schismatic during the religious excitements described by Mr. Motley in his *Life of John of Barneveld*, came as missionaries to this country, and went on Tuesday, the 9th of July, 1680, to the seat of the university. In their journal, translated by Henry C. Murphy, there is this interesting record:

"We reached Cambridge about eight o'clock. It is not a large village, and the houses stand very much apart. The college building is the most conspicuous among them. We went to it, expecting to see something curious, as it is the only college or would-be academy of the Protestants in all America, but we found ourselves mistaken. In approaching the house we neither heard or saw any thing mentionable; but going to the other side of the building, we heard noise enough in an upper room to lead my comrade to suppose they were engaged in disputation. We entered, and went up stairs, when a person met us and requested us to walk in, which we did. We found there eight or ten young fellows sitting around smoking tobacco, with the smoke of which the room was so full that you could hardly see; and the whole house smelt so strong of it that when I was going up stairs I said, 'This is certainly a Dutch tavern.' Oh, my prophetic soul, my uncle! What son of Harvard

does not recognize his mother? "We excused ourselves that we could speak English only a little, but understood Dutch or French, which they did not. However, we spoke as well as we could. We inquired how many professors there were, and they replied, not one—that there was no money to support one. We asked how many students there were. They said at first thirty, and then came down to twenty. I afterward understood there are probably not ten. They could hardly speak a word of Latin, so that my comrade could not converse with them. They took us to the library, where there was nothing particular. We looked over it a little. They presented us with a glass of wine. This is all we ascertained there."

Another notable Commencement address was that of Governor Dix at Union University, which was an admirable plea for the study of the Latin language, and for accuracy and exactness in all study. The oration strikingly illustrates its own doctrine. What the Governor said about verifying quotations was especially good. They are seldom made upon reference to the original text, but are repeated and echoed from one writer and speaker to another, so that the possibly slight deflection of the first error expands and increases until the whole citation is awry. Besides the excellence of what the orator said, the occasion was memorable because it was a Governor who said it. It was a pleasant reminiscence of the time when the leaders of the State were men of ample and thorough education as well as of natural ability and sagacity and high character.

THERE has been a great deal of feeling aroused among the American sculptors in Italy and their friends by the letters of Mr. P. W. Healy to a New York paper, which asserted, in substance, that the works of which many American sculptors enjoyed the reputation were really the work of unknown Italian mechanics whom they employed. Mr. Healy, in fact, makes the same observation upon certain noted modern artists that Mr. Motley, in his *Life of John of Barneveld*, makes upon certain modern statesmen: "His was not one of those easy posts, not unknown in the modern administration of great affairs, where the subordinate furnishes the intellect, the industry, the experience, while the bland superior, gratifying the world with his sign-manual, appropriates the applause." Mr. Healy's charges are made in part by name and in part by very comprehensive implication. And they are very serious charges, for they accuse the artists of nothing less than gross and systematic dishonesty. That in certain cases Mr. Healy's assertions are correct we have conclusive evidence in the letter of Mr. Charles Eliot Norton to the *Nation*. Mr. Norton, who is one of the most thoroughly accomplished scholars and critics of art in the country, who has lived long in Italy, who is not blinded by the small arts of speculators in the arts, and who says what he sees and thinks with perfect frankness, describes in the most vivid and amusing manner the "enterprise" of a "sculptor, broker, and banker" in one of the Italian cities, who, with his partners, was resolved to "popularize art in America."

Mr. Norton, calling one day at the consul's office, was accosted by this gentleman—and the whole story is well worth reading:

"'You've been a long time in the city,' said he, 'but you've not favored us with a call. I've been hoping to see you, Sir; for, knowing your interest in matters of art, I thought you'd like to see our gallery of sculpture. We try to make it pleasant for our countrymen.' I was obliged to express my ignorance of the existence of the gallery, and accepted an invitation to walk into it while waiting for the consul. The banker's gallery was worth seeing. It contained perhaps twenty or thirty works, copies of ancient and modern statues, in all the brightness of the freshly worked marble. 'You see, Sir,' said my new acquaintance, the sculptor, broker, and banker, 'we do a large business in statuary. In fact, Sir, we undertake to lay down any statue you choose, ancient or modern, at a lower figure and better quality than you can find it any where else in Italy. We haven't got, you see, the expenses to pay that the artists have; we don't make you pay for what they call 'the artistic education.' We can afford to do the business at a cheaper rate. We keep our workmen at Carrara, where we don't pay such wages as they do here, and we have a foreman who understands his business, and can make any model for us we want. We've engaged in the business of popularizing art in America, and we mean to afford our statues at such a figure as the people demand. You might think the artists wouldn't like it, but they every one say it's the very best thing that ever was undertaken. They say—and they're right about it, Sir—'Popularize art, and it's the way to create a demand for our productions.' Why, we've got at this moment seven statues boxed all ready to go off, and we've got twelve more to be ready next month. The American people, Sir, knows what it wants; it wants the culture of art, and we're going to supply it. If they want a classical statue, why we've got all the photographs of the famous statues, and you just select the one you desire, and we'll obtain the cast, and have an exact facsimile made of it for you. This statue here, you see—you know it; it's the famous statue of the 'Crouching Venus.' Well, Sir, somebody wanted it, and we had it made, and I dare say you remember that in the original the left foot is brought a little too far forward. Well, Sir, we corrected that defect: we undertake to deliver you a perfect work, and when there's any defect in an ancient statue we correct it. We don't let anything go out that ain't perfect. But it isn't every body that wants a classical statue. You've got to understand the taste of the people. Now here's a couple of statues that we got up ourselves, and they're the most popular works in the collection. This one's 'Ruth' and that one's 'Rebecca,' and they're what I call 'Biblical domestic subjects,' just the things for an American home. They are meant for contrasts, types, great moral ideas. We got 'Ruth' up first, and she did very well, but she wasn't as successful as she ought to have been; people wanted a pendant to her. And so, thinking about it, I determined to have a 'Rebecca.' I couldn't see my way to it at first; but you're acquainted, Sir, with the 'Faun' of—oh! Praxiteles, that's it. Here's a photograph of it. Well, I was looking over my photograph-book one day, and it struck me that here was the very thing. So I sent for our foreman, and I showed it to him, and I said to him, 'Now you take this, and you make me a design for 'Rebecca' out of it; it's got to be draped, and it's got to be a woman.' So he took it, and he brought me a sketch, and I didn't like it, and then he made me another, and at last he made me this one; and then we wanted something to show who it was, and so we put in this symbolic well here, and altogether it's just about the most popular work of American art going. You see all our works go into America free of duty—production of American artists.' There was more of the conversation, but at length the consul arrived, and I withdrew to meditate on 'popularizing art in America.'"

It seemed at first that Mr. Healy might have encountered this very gentleman, and, hearing of similar practices elsewhere, that he might have generalized too swiftly and thoughtlessly, and so have made himself responsible for more serious charges than he could sustain against truly eminent men. For he did not spare the most famous and conspicuous of living American sculptors, Mr. Story; and many friends of that gentleman, including James Russell Lowell, his life-long friend, Mr. George P. Marsh, Mr. Bayard Taylor, Mr. Hamilton Wild, and others, have united in a letter asserting that such charges

against Mr. Story are wholly without reason, as, of course, every one who knows him believed when they were made. But Mr. Healy insists upon his charges. He replies to these gentlemen, and asks, what is the value of such testimony as against that of several sculptors who are eye-witnesses to the contrary? What sculptors? We should say that such testimony is worth every thing as against that of any but an equal number of artists who were also of equal character and equally free from the suspicion of any professional or personal object. And when such testimony had been given, we should challenge them to show among Mr. Story's workmen the author of the "African Sibyl," the "Cleopatra," or the "Judge Story." The charge really is that Mr. Story is not the author of his own works. We wish, with a writer in the *Tribune*, that Story's fame had been left undefended except by his character. In attacking him Mr. Healy has destroyed the force of his assault upon the really culpable.

Undoubtedly the truth is, as Mr. Norton says, that painting and sculpture as practiced by many of their American professors in Italy are but a poor adjunct to the work of the upholsterer and decorator, and that there are many "artistic" sharpers who prey upon the easily deluded Yankee public upon its travels. To insist, as Mr. Healy does, upon classing William Story with these people is a gross and unpardonable wrong. Most of our readers are aware that the real work of the sculptor, that which shows his imagination, his idea, his creative power, is the sketch which he models in clay. Having done that, if he died before touching the marble in which it is mechanically and precisely copied, he would justly have all the renown of the work. But of course every great sculptor, after the marble copy of his original model has been exactly made, goes over it with his own informing and inspiring hand. Mr. Healy's accusation virtually is that Mr. Story neither makes the sketch nor touches the marble, and that the fame which he enjoys justly belongs to his workmen. There is not one of the sculptor's intimate friends who is not a conclusive witness against such a charge. Since those who chanced to be in Rome have thought fit to repel it, the Easy Chair, an old and intimate friend, will join them. It has seen Story at his work, and it knows that he is as much the author of his own statues as Kensett was of his own pictures. Just now it hears from Rome: "Story has cast his last work, which we consider his best. It is Alcestis returned from the other world, with its atmosphere still around her—a walking figure, with great deep eyes, a tall, noble form, beautifully draped—a grand, modest, lovely woman..... You will see his 'Semiramis' in New York, for it is soon to be sent to Mr. Blodgett, and you will admire its lofty beauty, its grace, and ease."

Like the late Mr. Powers, Mr. Story has lived so long in Italy, and his chief works were so immediately secured by Englishmen, that he has hardly had his just fame in his native country, where he has been so little known. But there has been no American sculptor of loftier imagination, of more originality and accomplishment. And if the result of this extraordinary attack shall be to introduce so distinguished an artist more widely and favorably to his countrymen,

his friends, after the natural indignation has passed, will not regret it.

THE disposition to believe our own time the worst of all times, and public manners and morals more hopeless than ever before, our contemporaries pigmies and our ancestors giants, and to look to the future as the paradise of hope and the golden age, is as old as civilized man. In this country we are inclined to believe that the epoch that followed the Revolution was one of the utmost purity and simplicity. But it was one of the "fathers" who said to a friend upon the adjournment of the first Congress, "Do you suppose such a set of rascals will ever assemble again?" And in his diary John Adams appeals to the calmer mind and juster judgment of the coming age—meaning that in which we live, and from which we look wistfully back to old John Adams's cocked hat and knee-breeches as the symbols of a nobler time. Then there is Fisher Ames, one of the most famous orators and conspicuous leaders of the beginning of the century, who, studying his country at the time to which we recur as the age of high purpose and lofty men, bewails the sordidness, selfishness, and degradation around him. "Of course," he says, seventy years ago, "the single passion that engrosses us, the only avenue to consideration and importance in our society, is the accumulation of property: our inclinations cling to gold, and are bedded in it as deeply as that precious ore in the mine..... As experience evinces that popularity—in other words, consideration and power—is to be procured by the meanest of mankind, the meanest in spirit and understanding, and in the worst of ways, it is obvious that at present the incitement to genius is next to nothing."

We might suppose that we were listening to a contemporary cynic; and whoever reads the history of the politics of that time will find that "the better days of the republic" were very like the days in which we deplore their disappearance. When Mr. Ames died, Mr. John Quincy Adams wrote a review of his works, in which, with the mild equanimity and sweet moderation of the golden age, he remarks, "It is a melancholy contemplation of human nature to see a mind so highly cultivated and so richly gifted as that of Mr. Ames soured and exasperated into the very ravings of a bedlamite." He then proceeds to speak of those who, without believing Mr. Ames's "absurd and inconsistent political creed," are selfishly eager for its propagation, being "choice spirits, amounting to at most six hundred" (which their name was the Essex Junto!), and who hold that "the porcelain must rule over the earthenware, the blind and sordid multitude must put themselves, bound hand and foot, into the custody of the lynx-eyed, seraphic souls of the six hundred, and then all together must go and *squat* for protection under the hundred hands of the British Briareus." To this gentle strain Mr. John Lowell replied in a similar vein, beginning by speaking of the malignity of Mr. Adams's sarcasm, and of his following Mr. Ames to the grave with crocodile tears, informing him that he had no need to assail Mr. Ames's friends with all the venom of an infuriated partisan, because he had already obtained his reward for "ratting" from the Federalists, and this act of gratitude to his benefactors was unnecessary. Mr. Lowell ends

his reply by saying that in the course of a short political life Mr. Adams had received more than seventy thousand dollars from the public, and that while no man pitied Mr. Ames, "Mr. Adams is an object of sincere commiseration with many a man of high and honorable feelings, while it is to be doubted whether he is the object of envy to any man on earth."

These are glimpses of the golden age, of that "better day" of the republic with which our own is so often and so injuriously contrasted. Indeed, there is no finer cordial for despondency than a glance at the paradise that hovers behind our retreating steps. The mountain traveler turns and sees a lovely vision floating in the sky.

"How faintly flushed, how phantom-fair,
Was Monte Rosa, hanging there—
A thousand shadowy-pencil'd valleys,
And snowy dells in a golden air."

Good luck! he cries, are those the crags and precipices along which I slid and stumbled in terror of my life? The hanging gardens of the past, the halcyon epoch of our history, the lost paradise of our fathers, are all crags and precipices along which the race and our country have stumbled and slid. If any man is disposed to think that he has fallen upon evil times, let him open his history. It is a marvelous tonic. Does he think republics ungrateful? Look at Mr. Motley's vivid portrait of John of Barneveld. When he was seventy-two years old he writes from his prison to his wife and family: "I receive at this moment the very heavy and sorrowful tidings that I, an old man, for all my services done well and faithfully to the fatherland for so many years.....must prepare myself to die to-morrow." Does he think irreligion undermining society? Look into Smiles's *Huguenots in France after the Revocation of the Edict of Nantes*. For attending Huguenot meetings men were captured by soldiers and sentenced to the galleys, mostly for life. They were chained by the neck with murderers and other criminals, and were quartered in Paris in the dungeon of the Château de la Tourneille. Thick iron collars were attached by iron chains to the beams. The collar was closed around the prisoner's neck, and riveted with blows of a hammer upon an anvil. Twenty men in pairs were chained to each beam. They could not sleep lying; they could not sleep sitting or standing up straight, for the beam was too high for the one and too low for the other. This was done in the name of religion. Irreligion, in the true sense, is a curse; but let us not forget that all the great influences of civilization, all that promotes human welfare and happiness, has always been denounced by priestcraft as irreligious. The age of Louis the Fourteenth is thought to be one of the great epochs of the world. It was an age in which the king's mistress persuaded him to slaughter and banish hundreds of thousands of his subjects because of their religious faith, and the great preachers of his church applauded, and the Holy Father approved, and even Madame De Sévigné, whose letters some young ladies at Newport and Saratoga are diligently reading, and sighing for the good old witty times in which she lived, wrote of the most innocent and most devoted men: "Hanging is quite a refreshment to me. They have just taken twenty-four or thirty of these men, and are going to throw them off."

The golden age is not yesterday or to-morrow, but to-day. It is the age in which we live, not that in which somebody else lived. The trouble, vexation, corruption, weakness, selfishness, meanness, which dismay us and tempt us to despair are the old lions that have always beset the path. No man is born out of time; and what man living to-day, who is not pinched with poverty or disease, would have lived a thousand years ago? If our politics seem mean and our men small, how does Alfred's time seem, or the glory of Athens, or the court of Louis the Fourteenth, or Luther's Germany? What did Jefferson think of Hamilton, or the *Aurora* say of Washington? Nearly forty years ago the wisest of Americans said to the young scholars of his time, and may the young Americans of to-day lay his words to heart:

"In the sighing of these woods—in the quiet of these gray fields—in the cool breeze that sings out of these Northern mountains—in the workmen, the boys, the maidens, you meet—in the hopes of the morning, the ennui of noon, and sauntering of the afternoon—in the disquieting comparisons—in the regrets at want of vigor—in the great idea and the puny execution, behold Charles the Fifth's day, another, yet the same; behold Chatham's, Hampden's, Bayard's, Alfred's, Scipio's, Pericles's day—day of all that are born of woman."

FIERCE and consuming war was declared in the early summer upon the dogs, and there were sad stories of suffering and death by hydrophobia. In New York the authorities agreed to pay fifty cents for every friendless cur that was brought in to the public pound, and the street Arabs, stimulated by the reward, instantly vowed that every dog they could lay hold of, foully or fairly, was a friendless cur. The poor animals were then slaughtered in the most cruel manner, as if to show that governments, although they aspire to control telegraphs and to absorb all kinds of power, can not even kill dogs decently. The details of the massacres in New York were another disgrace to the much-disgraced government of that city, and Mr. Bergh, for all whose offenses of whatever kind the recording angel will surely have obliterating tears of pity, promptly sued the offending officer. A few years since the humanity of Mr. Bergh seemed to many persons excessive and eccentric, but if dumb animals could speak, how they would bless him! The suffering that he has prevented, and the crimes against the innocent and defenseless that he has caused to be punished, can be estimated only by reflecting that not an angry driver raises his whip or foot against his faithful brute servant without a restraining fear of the avenging justice of Bergh. Macaulay says that Saracen mothers hushed their refractory infants with the terrible name of the Cœur de Lion, and so the very thought of Bergh keeps the peace toward the domestic animals in New York.

The doctors have been in high debate upon the question of hydrophobia; and one thing at least seems to be settled, that dogs are not more liable to the "madness" in summer than in any other season. Indeed our gross ignorance and the dull and universal acceptance of groundless traditions are strikingly illustrated by the simple facts now made public, and long familiar to sci-

ence, that most of the hapless dogs who have been done to death as mad, and therefore supposed to be frenziedly avoiding water, were consumed with thirst and passionately seeking water; but with their mouths open, panting and perspiring through their tongues, were objects of terror, and, chased by boys and men as mad, were practically made so by the madness and ignorance of their persecutors. The terror which the tradition of hydrophobia may produce was shown in the case of Entwistle, who was, however, according to the account of one of the chief papers, already the victim of shattered nerves, if not of delirium tremens. The poor man seems to have died of the fear that he should die.

The excitement also produced a very various and decided expression of feeling in regard to dogs. One gentleman wrote to the newspaper that the dogs consume every year enough to feed all the poor, and that they should be exterminated. He declared that he wished he owned the last pair in existence, and he would at once take order that their tails should be cut off just behind their ears. He ventured to surmise also that as there is apparently no use for dogs in this world, they must have been created for another sphere, into which all good people will help them to enter as fast as possible. This stirred the heart and wrath of some friend of Tray. It was, he said, a poor and cruel intelligence that could speak in such a strain, and so flippantly discourse of the God who graciously permitted such an enemy of dogs to live. How would he like to have some being as superior to him as he fancies himself to be superior to a dog (!) amputate his physical frame in the manner he suggests for the foul murder of the noble dog? Indeed, the tone of indignant injury in which the friends of the victim and maligned race resented every aspersion and insinuation showed that the street Arabs are not likely to dispose of all the dogs this year.

One timid soul, thinking probably that a letter addressed to the Easy Chair would be a weapon discharged at long and safe range, wrote as follows:

"DEAR EASY CHAIR,—Is there no way of persuading people who keep dogs that it is not pleasant to have your ankles and shins, unprotected by the low summer shoes suitable to the season, gnawed and tasted by those animals? My wife, who has many brothers who use tobacco in the form of cigars and in short pipes, says that they can not believe and do

not believe that any body really dislikes the smoke of the weed. They insist that such an idea is ridiculous; it is mere affectation; for it is well known that it is always spoken of in poetry as the 'fragrant' smoke, and nothing is more unquestionable than that Milton, who sang of Paradise lost, also smoked a pipe. It is mere nonsense, therefore, contend my wife's brothers, to assert that the smoke and smell of tobacco are unpleasant. What can there be unpleasant about it? they ask, in the most conclusive manner.

"It seems to me that our good friends who own dogs indulge in the same strain of reasoning. Near the lodgings where I am passing the summer, and where I read every morning in the paper the ghastly column of hydrophobic intelligence, and the names and residences of the victims of the day before—near my lodgings, I say, dwells my friend Anubis, in his charming rural cottage. My friend has two dogs, and their manners are of different schools. One of them receives me when I go—or, more truly, received me, for I confess that I now confine myself to chats with Anubis over the fence—with a series of rushes at my legs, and a sharp yelping and continuous snapping at my ankles, during which I said, very energetically, 'Poor fellow! poor old doggy!' and Anubis remarked, 'He's a playful fellow, and full of life. You ought to have seen him go for a tramp this morning.' The other dog was not demonstrative. He appeared when I opened the gate, and followed silently, close at my heels. There was something extremely unpleasant in his taciturnity, and when, one day, I asked Anubis if the dog had lost his bark, he said, lightly, 'Oh, he is of the bull species.' Soon afterward I discontinued my visits. Anubis asked me why I never came, and I told him frankly. 'Why, my dear fellow,' he replied, 'those dogs of mine never hurt anybody.' 'Very probably,' I said, 'but they annoy me. It is not agreeable to have a cur yelping and snapping at my shins, nor to have him escorting me in awful silence. Nor does it become agreeable when it is called playfulness and life. You do not permit your child to fret and scream in the room where visitors are calling upon you, and I don't see why your dog should be allowed to bark at them in your grounds. In fact, my dear Anubis, it is an utter and intolerable selfishness. You have no more right to expect me to like your dogs, and their barking and snapping, and leaping and following, than my wife's brothers have to expect her to like their tobacco-smoke.' And thereupon I told him the story. 'They are quite right,' said he; 'what is there unpleasant about tobacco-smoke?' It isn't the dogs that's complained of, dear Mr. Easy Chair, it is their masters, who try to hide their own selfishness by laughing at other people's cowardice.

"Yours respectfully,
"CAVE CANEM."

If any of Mrs. Canem's brothers, or any of the Anubis family, should chance to see these words, may they inwardly digest them! May they also remember what Mrs. Dangle says to Mr. Dangle in Sheridan's *Critic*, "Why can't you ride your hobby-horse without desiring to place me on a pillion behind you, Mr. Dangle?" Mr. Canem will not then have written in vain.

Editor's Literary Record.

HISTORY.

TWO works of value to the student, not only of history, but also of philosophy and human nature, are EDWARD B. TYLOR's *Primitive Culture* (Henry Holt and Co.) and EDWARD FREEMAN's *Comparative Politics* (Macmillan and Co.), the latter taking up the thread of philosophic thought where the former drops it. A book which within three years after its publication is translated into the German and the Russian languages, and is reprinted in America, may safely be assumed to be a work of unusual merit, and one has not to read far in Mr. Tylor's two volumes to come to the conclusion that they merit the honor which has been paid to them. The

origin of things appears now to have a greater interest to the student than almost any other problem; and it must be confessed that he who has succeeded in learning where the cradle of the race was situated, and what was the course of education by which it has attained its present growth, has contributed much toward the solution of the other problem, namely, the necessary conditions of growth in the future. The degradation and the progression theories Mr. Tylor sets in sharp contrast in his second chapter. He recognizes apparently both progression and degradation in the history of the human race, yet regards its starting-point to be savagery. "Progression is primary, and degradation is second-

ary; culture must be gained before it can be lost." And the method of this progress he also indicates in a single sentence: "History within its proper field, and ethnography over a wider range, combine to show that the institutions which can best hold their own in the world generally supersede the less fit ones, and that this incessant conflict determines the general resultant course of culture." We are justified, then, in defining his book as an attempt to apply the evolution theory in tracing the history of culture, using that word in its largest sense, as nearly equivalent to civilization, including, however, the mental and moral course of which civilization is at once the product and the expression. Leaving it to the philosophers to discuss the value of Mr. Tylor's theories, it must suffice for us here to say that alike those that accept and those that reject them will find his book one of unusual interest and value. As a collocation of interesting and often significant facts it has the unusual merit which has rendered the writings of Darwin so effective and so valuable. His reading has been simply omnivorous; and the principal defect of his treatise is this, that he crowds his pages so full of facts that it is impossible for an ordinary mind to remember them, and not easy even to apply them. They possess the greater value that they are not gathered, apparently, in the interest of any particular theory; on the contrary, facts which accord with and facts which militate against the progression theory are given with impartiality. Thus, for example, the believer in an original revelation of God to the human soul at creation will find here a statement of facts which confirms the oft-repeated but sometimes denied declaration that there is no race of men so low as to be absolutely without a religious idea. It is this patient and impartial accumulation of facts which has given the evolutionists their hold upon the thinking world; and they will not be answered, if ever, until they shall find an opponent as studious of life and as unflinching in reporting its testimonies as are Darwin, Lyell, Lubbock, and Tylor.

Essential to the progression theory, in its application to social and political life, is the idea of law, and of the human race as one under law. In direct antagonism to it is the hero-worship doctrine of life, which explains its progress by imputing it to special forces in special men. Possibly the final result of scientific study will be a harmonization of these two now seemingly conflicting conceptions. Mr. Freeman's *Comparative Politics* is based upon the former idea. He claims "for political institutions a right to a scientific treatment of exactly the same kind as that which has been applied to language, to mythology, and to the progress of culture." Exactly the same kind of scientific treatment can not be applied, unless the laws are as exact and undeviating in the one case as in the other—a premise which may be true, but which ought not to be assumed. But without accepting this premise, the student of history will find a real and substantial value in Mr. Freeman's successful attempt "to point out and bring together the many analogies which are to be seen between the political institutions of times and centuries most remote from one another;" and he can hardly doubt, as the result, that there are certain general laws under and in accord-

ance with which the life of nations is worked out, and of which the hero-worshippers, who have been our most popular historians in the past, make little or no account; and to this conclusion he will come, though, with us, he thinks that Mr. Freeman errs in denying the possibility of a division of history into epochs, and in demanding of the student that he "cast away all distinctions of ancient and modern, of dead and living." These distinctions, like those which in time divide the months, are somewhat artificial, and epoch merges into epoch as season into season, but there is a veritable distinction between summer and fall, none the less that no man can say when one ends and the other begins; and for convenience of study there is a real advantage in considering the successive growths of the human race, though one merges into its successor, and each epoch, like each event in life, "is always the son of another, and we must not forget the parentage."

BIOGRAPHY.

JUDGE WARDEN, in his *Life of Salmon P. Chase* (Wiltach, Baldwin, and Co), intimates that the most serious fault of one whom he persistently calls, after the manner of the romancers, "our hero," was his inability to form correct judgments of men. This criticism the critic himself illustrates and exemplifies in a most striking manner, for the Chief Justice made a most unfortunate selection in choosing Judge Warden to be his biographer. He possesses neither moral discrimination nor literary taste. His egotism, his personal piques and political prejudices, his moral incapacity to comprehend the nature of the man whose life he was chosen to write, and his total inability to measure the relative value of the various material intrusted to him, render him singularly unfitted for the work which, unhappily for the reputation of Chief Justice Chase, has fallen into his hands.

But the volume is largely autobiographic; and the material furnished by Chief Justice Chase, though neither wisely selected nor wisely arranged by the editor, affords valuable matter, out of which an assiduous and patient reader can construct for himself what will be of very considerable value, both as a biography and as a contribution to American history. Studying these materials, we arise from their revelations with our previous respect for Chief Justice Chase deepened into reverence. There are very few public men who could with safety to their reputations admit us so unreservedly to their confidential correspondence and their secret thoughts.

Conservative in method but radical in principle, he was throughout his life a worthy representative of that unformed but not impotent party which contends, in the words of Mr. George William Curtis, "for conscience, intelligence, and morality as the supreme power in our politics and the sole salvation of America." This consecration to conscience is the most marked characteristic of his private life; impartial history will declare it manifested in his public services. "I don't know what the effect may be on me personally, but I believe I have done right:" this sentence, though in various forms, appears again and again in diary and in private letters. In 1841, when the temperance movement was without present impetus or future promise, he

openly declared his "resolution to vote for no more licenses to sell intoxicating drinks, whether to taverns or other houses." In 1844, when antislaveryism in the West was as unpopular as it has since become popular throughout the Union, he wrote and publicly signed a paper in which he maintained the right of freedom for all, founded upon "the great cardinal principle of true democracy and of true Christianity, the brotherhood of the human family," and proclaimed war "against slave-holding as the direst form of oppression, and then against every other species of tyranny and injustice." Throughout the administration of which he was a member he appears to have been the foremost in urging a policy of emancipation, and the draft of the final Emancipation Proclamation, with its eloquent invocation at the close, came from his hand. He was not a specialist in reform; he perceived from afar the dangers that have now overtaken the nation. Himself organizing, in time of war, our national currency, he yielded, but reluctantly, to what seemed to be the necessity of the hour, an irredeemable paper money; insisted, from the beginning to the end of his administration of the Treasury Department, that Congress should increase taxation and diminish expenses; and with almost prophetic insight wrote, in 1868, "If any thing will reconcile the American people to repudiation, direct or indirect, it will be perpetuity or apparent perpetuity of debt." Finally, in 1864, he resigned his office of Secretary of the Treasury because his protests against the system of parceling out executive patronage to members of Congress were unavailing, and, despite his endeavors, the appointments were made, or at least appeared to him to be made, upon the principle of reward for party fealty, not upon that of securing for the nation the highest and best attainable service. That his judgment was always correct his best friends will not claim. That his motives were pure and his purposes noble, and his patriotism, if not absolutely unselfish, at least unwarped by selfishness, can hardly be doubted by any one who reads with care the record of his inner life furnished by his letters and diaries, and who puts any faith at all in human nature.

TRAVELS.

Coomassie and Magdala: the Story of Two British Campaigns in Africa, by H. M. STANLEY (Harper and Brothers), is a volume full of the romance of geographical exploration, travel in a wild country, and war with a savage race. Coomassie was the capital of the Ashantees. How Sir Garnet Wolseley conducted a campaign against the Ashantee king, and burned his capital and brought him to surrender, has been so recently told in our daily papers that the outlines of the campaign need not be described here. Yet most readers of the newspaper get from its daily descriptions of current events but a fragmentary and confused idea of such a campaign. Here the story is told in detail, with graphic pictures of the country—the wild ride through the surf at every landing, the frightful fever, the tropical river with its dense and dangerous vegetation, the camp and its singular accoutrements, the battle with the ambuscading savages, and the final and decisive victory—and it is these details which give reality to the story.

Magdala was the final battle-ground in the Abyssinian campaign against King Theodore, of six years ago. It "was a town planted on the top of a mountain about ten thousand feet above the sea-level, amidst gigantic mountains, piled one upon another, grouped together in immense gatherings, profound abysses lying between, two thousand, three thousand, and even four thousand feet deep—a region of indescribable wildness and grandeur. It was an almost impregnable stronghold, situate four hundred miles from the point of embarkation; a strange, weird country, full of peaks and mountains and ruggedness, lay between it and the sea. The scenes which flanked the march bristled with rocks and crags, but they possessed the charm of novelty and picturesqueness, and the country was one of the most healthy countries on the face of the earth. The march was one full of interesting incidents." This passage from the preface we quote, because the description in the volume of the march and battle fully justifies it, and because in its style it indicates the graphic character of the narrative. We know of no better book with which to supplant the boys' story-book of the period, and to feed with healthy diet the appetite for the sensational, than this most romantic story of two African campaigns.

POPULAR SCIENCE.

PROFESSOR JAMES H. DANA's *Manual of Geology* (Iverson, Blakeman, and Phinney) has been before the American public for some twelve years. It now appears in not only a new form, but with such additions and improvements as make it essentially a new book. Its size is greatly increased. Its illustrations are much more numerous. In the present edition they are exceptionally fine; indeed, we do not now recall any scientific text-book which surpasses it in this respect. We observe, too, a very considerable improvement in classification. We notice especially that much matter which in the previous edition was in fine type—the dread and abhorrence of college students—is taken out of the category of notes, and is included in the body of the work, and under the general classification. The treatise is thoroughly American; indeed, if we were to criticise it at all, it would be upon the ground that it is too purely American in its character. But this defect, if indeed it be one, the student can easily correct for himself by comparing with its pages those of Lyell. Since 1862, the date of the first edition, there has been a great increase in geological knowledge in this country. The results of United States surveys in the Rocky Mountain region and in some of the Eastern and Southern States, of paleontological investigations recorded in numerous State reports, and of investigations by individual scientists, are all incorporated in the present work.

By geology Professor Dana means what that word signifies in its etymological sense, viz., the science which treats of the structure, constitution, and physical features of the globe. He therefore begins his treatise with a consideration of physiographic geology, that is, with those subjects which relate to the physical features of the globe, its general contour, its system of bas-reliefs, and the system of oceanic and atmospheric movements which have combined to make it what it is. This division of his subject is briefly

but comprehensively treated. He next takes up lithological geology—the constitution of the materials which compose the earth's surface, and their arrangement or condition. As the former division leads to some consideration of physical geography, so this one requires a brief treatment of mineralogy, the former science being the outcome and the latter the foundation of geology. The third and principal portion of the work treats of historical geology, that is, the true succession or chronological order of the rocks, which itself requires and includes a study of the forms of extinct life found in the rock strata. And it is in illustrating these that the wood-cuts are the most valuable and the most numerous. A fourth book treats of dynamical geology, or the causes of events in the earth's geological progress. The concise style which admirably adapts the volume for the uses of the student renders it less interesting to the reader than the analogous works of Lyell.

Of "Putnam's Advanced Science Series" (G. P. Putnam's Sons) three volumes are before us—*Animal Physiology*, *Inorganic Chemistry*, and *Physical Geography*. They are republications from the English. They are compendiums, will serve the student a useful purpose, and are so compact in expression and arrangement as to be peculiarly useful as books of reference; but they are not written in such a style as to attract the general reader.—Of *The Annual Record of Science and Industry for 1873* (Harper and Brothers) it is hardly necessary to do more than announce the fact of its publication, for its place has already been allotted to it by universal consent. By far the most complete and comprehensive, it is also by far the most trustworthy, work of the kind which has ever issued from the American press, while its copious and admirably arranged table of contents and index render it very easy to find readily any subject which is treated of in the volume.

NOVELS.

Tempest-Tossed (Sheldon and Co.) is the title of Mr. THEODORE TILTON's first venture in the field of romance. Mr. Tilton is nothing if not sensational. As a lecturer, a platform speaker, an editor, he has been making sensations all his life, and we are not surprised to find his novel of the sensational school. We should have been surprised if it were not. But it is a well-wrought specimen of that school. He has studied, and not without advantage, the writings of Victor Hugo, who is, among all the modern sensationalists, without a superior. The fruits of this study are seen not in the style—a defect which Mr. Tilton has not imitated—but in the structure of the story, and still more in the careful study which has evidently preceded and prepared for a part of his work, especially the descriptive portions. His pictures are painted with a painstaking which belongs to the conscientious and true artist. As illustrations of this the reader will note the author's description of a tempest, and his careful narrative of the ship's stores. As an artist he is a pre-Raphaelite. As a painter he is with the pen what Holman Hunt is with the brush. Of the plot we can only say that it is so impossible that no realism of description can make the story seem other than a perfectly wild romance.

The Living Link (Harper and Brothers) is also

a sensational novel, but of a very different type. In the natural history of novels the general class sensational may be divided into various species, somewhat as follows: the metaphysical sensational, in which the author delights to delineate morbid and extraordinary experiences of fear, hope, love, and hate; the melodramatic sensational, which depends for its interest on thrilling adventures and hair-breadth escapes; the scenic sensational, a kind of pantomime in romance, in which the reader is bewildered by the rapidity with which scenic changes and magic transformations succeed each other; and the mysterious sensational, in which the opening chapter propounds a conundrum at which the reader expends his ingenuity till it is solved for him at the end of the volume. *The Living Link* belongs to the latter species, of which Wilkie Collins is pre-eminently the master. The novel in structure and method reminds us of Wilkie Collins, and is not inferior to some of his, though not equal to his best. For the professional critic, accustomed to such romantic mysteries, imagines from the beginning that the mysterious Wiggins is Edith's father; and he will be puzzled to conceive any adequate reason for the long and useless concealment of the fact from his own daughter. If we are not greatly mistaken in English law, Mr. DE MILLE has done it injustice in representing as possible the second arrest of Edith after her first acquittal; and the private madhouse was an accessory which is quite too stale for a story so thoroughly original in its essential features. But, despite these defects, we are inclined to rank *The Living Link* as the best of De Mille's novels, and one among the best of its class. The plot is ingeniously conceived; the situations are certainly possible, and their improbability no more impairs their interest than did the improbability of the one thousand and one tales with which the Princess Scheherezade kept alive the curiosity of her cruel master.

The avidity with which Mr. BAKER's last book, *Mose Evans* (Hurd and Houghton), is devoured is an indication of the appetite for American fiction. For *Mose Evans* is thoroughly American. Only an American could have written it. There is nothing in style or structure or incident to indicate that the author ever so much as read an English novel. The staple of the model novel is all wanting. Indeed, it can hardly be called a novel. It is without plot; almost without incident. It is not a story; it is a picture, a realistic picture of Southwestern life. If we call it a novel, and measure it by critical standards, it is defective. The pivot on which it turns, the marvelous transformation wrought by love on Mose Evans, tasks our credulity to its utmost. That any woman should entertain such a jealousy of her husband's books as to bring her son up in an ignorance so great that he knows not even how to read is not likely. That a man possessing Mose Evans's capacities for culture and his strong determination should reach maturity and never learn to read is improbable. That a man so educated till past the age of twenty-one should, by dint of a few years' travel, even when inspired by the noblest love, become the prince in society which he becomes, is not plausible. The style is faulty. The endeavor on the part of the author to maintain his assumed character of land-agent is

not successful. It even seems at times like an affectation; it may be an unconscious affectation. But nationality, like charity, hides a multitude of sins. And *Mose Evans* is unmistakably an American book. The author has copied every thing from nature, nothing from models. He has written out of his own experience and observation, not from materials furnished by others. So many novels are mere compilations! This is a true original, an indigenous story, and the characters are consequently drawn with rare fidelity to nature, yet with a poetic idealism which prevents them from becoming abhorrent or disgusting. In this respect Mr. Baker is more truly an artist than Mr. Eggleston. We endure the characters of the latter, we are drawn to those of the former. Odd Archer, the drunken lawyer, is none the less true to life that the revolting features of his character are subdued by the kindly spirit of the painter. Over against this type stands another, an ideal, but a true ideal, of the Southern gentleman, General Throop. Even Mose Evans, impossible as we conceive the character and life to be, is real to the imagination, if not to the fact, a veritable hero, not a stage representation of one. The thoughts of the book are noble. Often the author embodies a grand truth in an aphoristic expression that almost deserves to become a proverb. Its ideals are high, sometimes impossibly high, it is true, but always elevating, never degrading. Its love is pure, chaste, inspiring—the love of true, noble, womanly, and manly souls. The piety of the book—for a religious sentiment pervades it—is simple, earnest, heartfelt—free from cant, free from art. It is not put into the book by an artist to give to it warmth and color; it belongs to the book, because it is in the heart of the author. And so, with its superficial artistic defects overborne by its greater moral and intellectual virtues, we welcome *Mose Evans* as a true and valuable addition to American romance.

MISCELLANEOUS.

Prophetic Voices concerning America, by CHARLES SUMNER (Lee and Shepard), is a cabinet filled with rare specimens. The specimens are selected from what numerous men, renowned in widely various departments of literature and life, and speaking from widely intervalled stand-points in history, have left of prophetic utterance touching our country—its discovery, settlement, struggles, independence, glory, and destiny. These museum relics, in themselves the golden utterances of many of the most deservedly famous litterateurs, diplomatists, economists, philosophers, statesmen, bards, and orators, of six tongues and thrice as many centuries, are brought into prominent relief upon a background of biographical sketches, interfused with personal reflections by the author. The book, aside from the melancholy interest which now attaches to every thing that Charles Sumner may have touched in his lifetime, is otherwise well worth possession. In it the author's artistic penchant for the curious and rare is very quaintly apparent. Poets from Seneca to Burns, prose authors from Strabo to De Tocqueville, are here assembled at the great scholar's call. In this merely literary sense the book ranks equally with the well-known work of the elder Dis-

raeli, among "the curiosities of literature." In a moral sense it is more than a curiosity, however—an inspiration. It is a true monograph of its author's life, in whom the Delphic spirit worked prophetic intimations, pointing forever onward to a golden realization of his one idea, "the true grandeur of nations."

The first volume of the "Bric-à-Brac Series" (Scribner, Armstrong, and Co.) makes us wish for more. The purpose of this series is to furnish in successive volumes gossiping reminiscences of famous *litterati* of various classes. The editor, R. H. STODDARD, is a man admirably well adapted to the task. The first volume contains sketchy and anecdotal fragments concerning Chorley, a journalist and critic, Planché, a dramatist, and Young, an actor. These names are, indeed, but little known to American readers; but the journalist and critic carefully keeps himself concealed, since the less his personality is known the better he can do his work; the dramatist is applauded for the moment, but his fame dies with the death of his local comedy; and the actor is forgotten when the curtain falls. These men were of note in their day, and these autobiographical reminiscences introduce us to the London literary and artistic society of the last half century. We are strongly impressed with the intellectual brilliance of that society, and with a conviction that, if this volume gives, as it appears to do, a fair picture of the literary and social life of that epoch and locality, then conversation must be numbered with the lost arts.—No inconsiderable proportion of the matter of this little volume was taken, we suspect, from the *Autobiography and Memoirs of H. F. Chorley*, of which a condensation is published by Henry Holt, entitled *Recent Art and Society*. The title very well describes the volume, which possesses the additional interest of revealing what few understand—the interior life of a journalist and critic.—Mr. CHARLES B. STETSON's little treatise on *Technical Education* (J. R. Osgood and Co.) is itself too technical to serve its purpose. It opens with an earnest and well-written plea for a public-school education that shall be less exclusively literary, and shall, by a larger infusion of natural science, and especially of drawing, make a more adequate provision for the demands which modern life makes on the farmer and the artisan. But this is followed with elaborate extracts from European governmental reports, which, in the present apathetic state of the public mind on this subject, we fear will not be read. If the author had studied and digested these reports, and had embodied the lessons they convey in his own clear and forcible language, he would have made a work which would have done the service which we fear this unreadable compilation from official reports will never do.—Nature has a *life* which the mere scientist who studies it as a mechanism, but ignores its personality, never discovers. It is the acquaintance with this *life* of nature which gives a peculiar charm to *Under the Trees*, by SAMUEL IRENÆUS PRIME—"Irenæus" (Harper and Brothers). These essays are pleasant descriptions of what a careful observer can see "under the trees" on a summer afternoon; they are genial and devout musings upon nature, sometimes with a vein of true poetry in them. But they are more than this. They are revelations of the mysterious life principle

that animates nature, and makes her dear to those that see the soul in the body, the mystical something which led the ancients to personify nature and her various operations, which leads the pantheist to worship nature as the only divinity, the great All, and which leads the Christian to see in nature the presence of a God who is over all and in all, but who is infinitely more than all that eye sees or ear hears. Of these musings, revealing the spiritual side of nature, the greater portion of the book is made. There are some other essays that have not this peculiar flavor, but it is this which gives aroma to the whole book.—Dr. HOVER, in his *Religion and the State* (Estes and Lauriat), argues forcibly and vigorously for a complete separation of church and state, the taxation of churches, the abolition

of governmental chaplains, and the substitution of chaplains voluntarily supported, the enforcement of Sabbath laws only on secular grounds, and within the limits which that principle would allow, and the reading of the Bible in the schools only as a voluntary act, and with the approval of the parents of the scholars.—LANGE's Commentary on the New Testament is completed by the volume on *The Revelation of John* (Scribner, Armstrong, and Co.). The volume is his own personal work. The translator would have served her purpose better by converting German into English idioms: "New Testamentalness" is not English. A Greek index and a topical English index to the entire ten volumes which constitute the New Testament Commentary are appended to this volume.

Editor's Scientific Record.

SUMMARY OF SCIENTIFIC PROGRESS.

MAKING our Summary as complete as possible to the beginning of July, we have, under the head of *Astronomy*, to record that during the month of June the group of asteroids has been increased by the addition of one (No. 138 in the series), discovered at Toulouse on the 19th by Perrotin.

The most interesting feature in the heavens this month has undoubtedly been the rapid growth of the fine comet discovered by Coggia in April. The nucleus of this body will, about the 20th of July, be directly between the earth and sun, and in a day or two thereafter will at its nearest approach to the earth be distant therefrom about one-third of the distance of the sun. At that time throughout the night, although the nucleus will be hidden below the horizon, the tail will be seen extending upward toward the north pole. The earth will undoubtedly approach nearer to this comet's tail than is often the case, but there seems no ground for anticipating that it will come in contact therewith. Spectroscopic observations of this body have been made by Rayet at Paris, and by Lockyer in London. Rayet finds for the nucleus a continuous spectrum, and for the tail the three ordinary cometary bands. Lockyer notices that the continuous spectrum of the nucleus is deficient in blue rays, and that it sparkles as if many short bright lines were superposed upon it.

In reference to the other bodies of the solar system, we note that the reflecting power of Mercury has been investigated by Zöllner by means of his invaluable photometer, an instrument which, if directed to the investigation of Coggia's comet, would probably yield important results.

The question of the possible existence of a satellite to the planet Venus has been considered by Lohse and Klein, who conclude that the question is still an open one, and that considerable weight must be given to the very numerous observations that have been made by eminent astronomers upon the visibility of that side of the planet which is turned away from the sun.

One of the most interesting cases of the appearance of a large meteor occurred a year ago

in Germany, and numerous accurate observations of this body have been collected by Galle, who has deduced therefrom the position of the orbit which was being described by this body at the time it came in contact with the earth's atmosphere. He concludes its path to have been a hyperbola—a result similar to that determined on several previous occasions for other meteors.

The organization of the various parties for the observation of the approaching transit of Venus has been so far completed that most of the gentlemen who are to make the observations have already left their respective homes in America, England, Russia, Germany, and France in order to reach their stations in season. The astronomers of the latter government will occupy five stations, and will make use of the daguerreotype instead of the collodion process. The solar photographs taken by them will be about one inch in diameter, and the subsequent measurements to be made upon them will be performed with the assistance of powerful microscopes.

In connection with astronomical photography Cornu announces a mode of constructing a lens whose focal length shall be the same for both chemical and visual rays; the method adopted by him is but little different from that long ago tried by Rutherford, of New York, to effect this object, and consists simply in separating by the space of an inch, more or less, the two lenses that form the objective of an ordinary achromatic telescope.

While astronomy in America appears to partially languish, if we may judge from the condition of the observatories at Albany, Chicago, Cincinnati, and elsewhere, it is refreshing to be able to refer to the new ones that are being built on the most approved plans in Vienna and Strasbourg, and the magnificent physical laboratory established at Oxford, which will undoubtedly exert a powerful influence on the progress of astronomical spectroscopy.

Meteorological literature has lately received several valuable additions. In the fundamental matter of securing continuous registers of the condition of the atmosphere, Wild, of St. Petersburg, has published the results of some years' observations with his self-recording balance barom-

eter, and he states that its indications are to be relied upon as implicitly as those of any but the most expert observers.

Weilemann has made an interesting study of some questions relating to the temperature of the atmosphere; among other results he announces that the protection afforded by the clouds against the radiation of the heat of the earth into space is three times that afforded by the average quantity of moisture that is present in the atmosphere in ordinary clear weather. The effect of moisture in its invisible state having been well established by the experiments of Tyndall, it would seem that the results obtained by Weilemann must suffice to convince those who have doubted whether Tyndall's results were applicable to the problems of meteorology.

The interesting question of the difference of temperature in the country and the city has been investigated by Fines, and his results will explain many of the discrepancies that exist in meteorological records. Fines concludes, among other things, that the maximum summer temperature of the city is greater than the maximum temperature of the country in the summer; the maximum temperature of the city in the winter-time is, on the other hand, less than the corresponding country temperature; the radiation during clear nights is, according to him, less in the city than in the country. Breitenlohner, in deducing numerous curious relations between the winds and the temperature of fresh-fallen rain-water, concludes that at least in Austria there is no such thing as a warm rain-storm; the coldest rains, according to him, come with northerly winds.

The progress eastward in Europe of the areas of extreme cold weather in winter-time has been studied by Dove with his customary care, and the examination by him of the mean temperatures of a large number of places shows that about two days' time is required to complete the transit eastward over the whole of Europe of extensive areas of low temperature.

In the development of the mathematical theory of the movements of the winds in accordance with the laws of mechanics, Ferrel has supplied an important formula by which he connects together the barometric gradient on the one hand and the force and direction of the wind on the other.

A balloon voyage of very considerable interest is reported as having been made by Brunelle at Charkow, in Russia. This voyage lasted for eight hours, during which time the aeronaut was carried several hundred miles. The most remarkable feature of the voyage consisted in the fact that the lower strata of air were colder than those above; and even at night-time the former were found to be rushing along the earth's surface with great rapidity, while the upper currents of the atmosphere were in comparative quiet. These atmospheric conditions appear to have been precisely the reverse of those that obtained during most of Glaisher's voyages. It is greatly to be hoped that the aeronauts of America will favor meteorological students with some details, published in a commodious form, of their own wide experiences in this important field of research. The science of meteorology will certainly profit greatly by the execution of the programme that Mr. Barnum has announced for the present season.

The intimate connection between meteorology and forestry justifies our mentioning in this place the experiments made by Baranetzky on the periodical flow of sap in trees. He finds that the ascent of sap is only quite indirectly dependent on the changes of temperature.

In *Practical Geodesy* much interest will attach to the work of Mr. Gardner, geographer to the survey of the Western Territories, who has just concluded a most laborious study of the bewildering mass of contradictory figures relating to the altitudes of points in the interior of America. Mr. Gardner finds that the published profiles of our railroads are quite unreliable for any exact purpose, and has only brought his studies to a successful conclusion after discovering numerous errors in the computations relative to what have hitherto been considered the best-established lines of leveling; fortunately he is able to show that the original observations are generally quite good, and that the errors are mostly of a clerical nature. In connection with this subject, and of very fundamental importance in reference to geodetical works, we notice the investigation, just published by Balyer, of Berlin, into the effect of so-called local attractions on the results of all leveling operations. The examples calculated by General Balyer in illustration of his formulæ show that in the Hartz Mountains a line of leveling running to the summit of the Brocken, and less than three miles long, is in error to the extent of six inches from this cause alone. To what extent similar errors may affect leveling operations that extend from our Atlantic sea-coast westward to Denver we can only surmise.

In *Electrical Science* Boltzmann has published an investigation into dielectric absorption. His experiments confirm most of Faraday's well-known ideas, and have shown that in all probability the molecules of electrized bodies are themselves polarized, that is to say, are arranged with positive and negative poles respectively in the same directions. In pursuance of a similar train of thought, Streintz, in studying the effect of electricity on its conducting wire, concludes that the latter expands lengthwise more than is due to its heat, and attributes the surplus to the polarization of the particles composing the wire; the elasticity of the wire is, he finds, unchanged; the effect of the electricity on the length of the wire is manifested gradually, like that of heat.

In reference to the effect of heat on the strength of materials, Professor Thurston, of Hoboken, and Commander L. A. Beardslee, U.S.N., have continued their valuable observations on the exaltation of the limit of strength; and Neissen has shown that the elastic reaction of torsion also increases with the duration of the experiment. The two independent series of observations are thus seen to be remarkably confirmatory of each other.

To the *Chemist* the month has been rather a dull one. Dr. H. Beins in the *Chemical News* has a somewhat curious paper upon "The Successor of Steam." He claims that upon heating in a closed space either the bicarbonate of sodium or of potassium, carbonic acid gas is given off, which readily condenses to the liquid form in another portion of that space. Thus, he says, large quantities of liquefied carbonic acid, which he names "carbolem," can be obtained at tem-

peratures ranging from 300° to 400° C. The expansive force of this liquid he proposes to use, instead of steam, as a motive power.

Mallet has reinvestigated the alleged fact that cast iron and lead, like water, expand in solidification from the fused state. He admits that through some peculiar force the solid metal will float upon the melted metal, but shows that in reality the latter has far the lower specific gravity. He therefore concludes that these metals do not expand when they solidify, nor contract when they fuse.

Amorphous phosphorus still continues to be an object of study. Schrötter has recently shown that it can be obtained from ordinary phosphorus by the action of electricity upon the latter, and has proved that the transformation is due entirely to the electricity, and not to the heat or light accompanying it.

In the organic kingdom the most interesting achievement is perhaps that of Tiemann and Haarman, who have artificially produced the flavoring substance of vanilla. These chemists, examining the sap of the cambium layer of various pines, fir, and larches, obtained a white crystalline body containing carbon, hydrogen, and oxygen, to which they gave the name of coniferine. From this substance, by a peculiar process, vanillin was obtained, identical in its properties with that made from the natural vanilla.

As bearing upon the progress of *Ethnology* since our last report, we may refer to a communication by Rev. Mr. Swayne from Formosa, giving an account of a mode of sepulture which connects itself with the hut burials described by Nilsson and Lubbock. When a man dies the hearth-stones are removed from the centre of the hut, and a pit is dug about four feet deep. The body is placed therein, together with food and his dress and implements. The hole is then filled up, the earth is packed down, the hearth-stones are replaced, and every thing goes on as formerly.

Referring to Mr. Charles Ran's article in the last Smithsonian Report upon "Ancient Aboriginal Trade in North America," we have from Mr. Schlagintweit an account of a probable European prehistoric traffic. It has long been known that the jade and other minerals of which the axes, chisels, scrapers, etc., of the drift and cave periods were made do not exist in sufficient quantity and purity in Europe to justify the opinion that these implements were manufactured by the men who used them, and with whose bones they lie buried. Mr. Schlagintweit has discovered in the Caucasus and in Northern Armenia, near the great highways of trade from the earliest times, abundant deposits of jade, etc., a fact which goes to confirm the opinion that in early times caravan commerce existed between Western Europe and Asia.

Professor Busk figures and describes a new chorometer in Vol. III. of the Journal of the Anthropological Institute. A discussion upon the best material for testing the cubical contents of skulls accompanies the report.

In the same journal Lieutenant Swinton C. Holland, R.N., gives an exceedingly interesting paper upon the Ainos, or the supposed aborigines of Yesso, Saghalien, Kunashir, and the most of the Kurile Islands. Although in utter subju-

gation to the Japanese, they are a distinct race in form, language, clothing, building, navigation, feasts, and superstitions. The men are of middle stature; they carefully cultivate the beard and mustache, never using knife or scissors upon them. Their bodies are also covered with coarse hair, growing profusely on the breast, arms, and legs, and in some cases even over the backbone.

Their only method of computing time is by great events, as, for example, the time of the great snow-storm, the catching of the big fish, etc. They preserve a rough record of their ancient history in songs and tales. The mode of saluting among the men is to rub the hands together, raise them to the forehead, palms up, and then to stroke the beard. Among the women the custom is to draw the first finger of the right hand between the first finger and the thumb of the left; then to raise both hands to the forehead, palms up; then to rub the upper lip under the nose with the first finger of the right hand. When a man has been traveling and returns home, he and his friend lay their heads on each other's shoulders; the elder of the two then places his hands upon the head of the younger, and strokes it down, gradually drawing his hands over the shoulders, down the arms, and to the very tips of the fingers of the younger; until this is done neither speaks a word.

When a person dies all mention of him ceases; his house is either burned or deserted, and his utensils, however coveted or desired by his surviving neighbors, are left untouched.

They worship the spirits of their ancestors, of the elements, and of natural objects. The most sacred animal seems to be the bear, the young of which are caught and suckled by women. When weaned they are kept in sacred cages, and fed for two or three years. They are then killed and eaten with great ceremony, while their skulls go to adorn the tops of the posts of the sacred stockade.

Since our last summary the most important work on ethnology announced is the *Völkerkunde*, by Oscar Peschel. (Leipsic: Duncker and Humblot, 1874.)

Under the head of *Zoology* we have to report the discovery by Dr. E. Bessel, of the *Polaris* expedition, of a new *Moner*, belonging to the lowest division of *Protozoa*, being even simpler than the *Amœba*, as it has no nucleus. It is closely allied to the *Bathybius* discovered by the English deep-sea expedition. It has been named *Protobathybius robesonii*. *Bathybius* has been regarded by some as not being a true organism, but only a sort of slime made up of decomposing animals; but Bessel's discovery puts the matter beyond all doubt. Ascending to the sponges, of which some rare and new forms have been discovered by the United States Fish Commission, under Professor Baird's direction, we note the discovery on Cashe's Ledge, by Messrs. Packard and Cooke, of a remarkable sponge, described by Professor Verrill in the *American Journal of Science and Arts* under the name of *Dorvillia echinata*. It is four inches in diameter, and supported on a broad, stout, but short peduncle, forming one-half of the total height. Other species discovered at great depths in the North Atlantic by the British exploring expeditions have been found in 70 to 100 fathoms off the coast of Maine.

M. Alfred Giard finds a curious assemblage of parasites on the compound ascidians of the coast of France. He observed that a shell (*Lamellaria perspicua*) imitates the appearance of certain *Didemna*, *Leptochina*, etc. "The more," he says, "the eye is trained to discover these singular disguises, the more are we astonished at their frequency and their admirable perfection." He then asks, "What is the result of this disguising on the part of the *Lamellaria*? Evidently to protect them against their enemies." A naked mollusk (*Goniadoris*) also imitates the ascidians on which it feeds. A flat worm (*Planaria schlosseri*) affords a remarkable example of mimicry. It so closely resembles an individual *Botryllus* as to require much close observation to distinguish it, the illusion is so perfect; and the resemblance even extends to the internal anatomy of the worm, which is analogous to that of the individual *Botryllus*. A sponge (*Halisarca mimosa*) extends itself, like *Botrylloides rubrum*, in quite thin layers over a plane surface of brick-red varied with yellow-orange. The oscules are of the same diameter as the common cloacal openings of the *Botryllus*, and around the oscules we see series of orange lines arranged like the radial lines of the ascidians. Giard also finds that certain compound ascidians mimic simple ones. The account in full, with plates, may be found in Lacaze-Duthiers's *Archives de Zoologie expérimentale et générale*.

A fossil *Cicada* has been found in the miocene-tertiary formation of Europe by M. Laporta. It is the first fossil *Cicada* which has been found, and belongs to a genus now confined to Southern Africa. It is to be remembered that miocene Europe supported also the African type of rhinoceros, giraffes, and antelopes, thus affording ground for the hypothesis of a union between Southern Europe and Africa during the miocene period.

Some interesting remarks on hybridism among ducks have been made by Dr. Brewer at a late meeting of the Boston Society of Natural History. In a large proportion of remarkable cases, where the evidences of the parentage on both sides are well marked, the common mallard duck figures as one of the parents. The specimens described by Audubon as *Anas breweri*, the like of which has never since been obtained, is presumed to have been a cross between the wild mallard and the gadwall or gray duck. A cross between a male canvas-back and a female tame mallard existed for several generations, preserving with a remarkable degree of uniformity the markings of their origin. The so-called Cayuga Lake duck had the characteristic peculiarities of the male mallard and the female Muscovy. The race of hybrids between the canvas-back and the mallard was nearly twice the size of either parent; and this is equally true of the Cayuga hybrid.

The squirrels of North America have been undergoing revision by Mr. J. A. Allen. Professor Baird, in a monograph of the group published in 1857, reduced the number of species of the genus *Sciurus* alone from twenty-four—the number recognized by Audubon and Bachman in 1854—to ten well-established species and two doubtful ones. Now Mr. Allen finds so much variation in the group as to be obliged to reduce the specific forms to five, "recognizing, however, seven

geographical varieties in addition, making the whole number of recognized forms twelve." He enumerates twenty-five species of *Sciuridae* in all. It seems that Southern squirrels are more highly colored than Northern ones; Western specimens from the dry plains are paler, more faded out, than Eastern examples; Southern specimens are also smaller than the Northern, darker forms. He then divides the continent into five more or less well marked areas, characterized by certain peculiarities of color variations in birds and mammals.

Among the *Agricultural* investigations of which our foreign journals bring us accounts are some experiments performed at the station at Hohenheim, in Germany, under the direction of Dr. Von Wolff, on the digestibility of bean hay and aftermath when fed alone and when mixed with turnips. Sheep were fed during a certain period with bean hay or aftermath alone, and during another period with these mixed with turnips or beets, and in each case the amounts of the food ingredients were determined.

It was found that the woody fibre of the young succulent bean hay was more digestible than that of the aftermath, and that the digestibility of each decreased while it was kept stored during the winter, the proportions of organic substance of the bean hay digested in November being 64.9 per cent., and in the following April 62.3. The amounts of the aftermath digested at the same times were 67.1 and 62.7 per cent. When mixed with turnips, from 2.5 to 5.5 per cent. less of the organic substance of the bean hay and aftermath was digested than when the latter were fed alone. The decrease in digestion of the albuminoids under the influence of the turnips was less with the bean hay than with the aftermath. The results of these experiments, like those of others made at Hohenheim and elsewhere, indicate that when materials poor in nitrogen (albuminoids) are added to rations of hay and like materials, the digestion of the albuminoids of the latter is decreased, and that this decrease is greater in materials containing little than in those containing much nitrogen.

In the department of *Engineering* a number of items of interest are worthy of record. At home we note the fact that the tunnel which forms part of the western approaches of the Illinois and St. Louis Bridge is advancing rapidly to completion. The bridge was opened for the passage of wagons June 4, and the formal opening for railway traffic took place with much ceremony on July 4. Upon the great suspension-bridge across the East River, between Brooklyn and New York, the work which was for a time suspended is now resumed. The Brooklyn tower has reached an elevation of 222 feet, and the New York tower 123 feet above high-water mark. The anchorage on the Brooklyn side is six feet high, and contains 8334 cubic feet of masonry. No work on the New York anchorage, or on the approaches, has yet been begun. The immediate cause of the resumption of this important work is doubtless the recent signing by the Governor of a bill providing for the raising of the money needed for its completion.

The massive and elegant iron bridge over the Schuylkill, at Girard Avenue, was formally transferred to the authorities of the city of Philadelphia on the 4th of July by the contractors,

Clarke, Reeves, and Co. It has five spans, four piers, and two abutments, and is 1000 feet long by 100 feet wide.

Of projected enterprises perhaps the most important is the Fort St. Philip Canal, a scheme which provides for a canal 200 feet wide at bottom and twenty-five feet deep, to form a permanent highway from the Mississippi to the Gulf of Mexico. The work, it is proposed, shall be constructed by the United States, and when completed is to be free to all nations, and to cost about eight millions of dollars. Three years are required for its construction. The proposed canal is to extend a distance of six and a half miles, from the left bank of the Mississippi below Fort St. Philip to a point four miles south of Breton Island. Its advocates claim that the construction of such a canal would realize the great desideratum of keeping open the channels of the great river. In this connection it is of interest to note that the plan presented to Congress by Colonel Eads for the same purpose has been rejected. This proposes the building of jetties upon each side of the stream, and thus, by narrowing the channel, to cause a swifter current, by which the stream would be compelled to carry its silt farther out to sea, as well as to remove some of that already deposited, and thus deepen itself.

Of foreign news the following official statistics concerning the Suez Canal will be found of interest. It is now four and a half years since the canal was opened, and during that time the traffic has been as follows: In 1870, 486 vessels, 435,000 tons; in 1871, 765 ships, 761,000 tons; in 1872, 1082 ships, 1,060,000 tons; in 1873, 1173 ships, 1,380,000 tons. During the first three months of this year the number of ships was somewhat lower than for the corresponding period of last year, but the tonnage was increased by twelve per cent.

Of foreign projected enterprises none are of more interest to the engineer than the announcement that General Chanzy, the Governor of Algeria, has ordered preliminary surveys of a work which proposes the creation of an artificial sea on the plains of Northern Africa, in the Desert of Sahara. The length of the projected sea would be about two hundred and fifty miles, by forty-five in width. Much interest attaches to the scheme, which, it is claimed by its advocates, will have an incalculably favorable influence on the climate, commerce, and productions of the neighboring portions of Africa, and even upon the more remote countries of Italy and Spain.

The steam-ship *Faraday*, whose departure from Gravesend with the new Atlantic cable we chronicled in our last monthly summary, has successfully accomplished a portion of her mission. The work, however, will not be completed before September next. A new cable between Newfoundland and Ireland is shortly to be laid by the Anglo-American Company. The cable itself is completed. The *Great Eastern*, it is reported, will commence the work on the 27th of July.

Since our last summary the annual sessions of several important bodies have taken place. The American Society of Civil Engineers held its sixth annual convention in New York about the middle of June. On the first day a number of papers were read, and the second was given to a recep-

tion by the Stevens Institute, including a visit to the famous Stevens Battery, the Brooklyn tower of the East River Bridge, the Hell Gate improvements, and the track-sinking in Fourth Avenue. The latter work, report says, is progressing favorably, in spite of the rebuff which the railroad company has lately received from the city government in the threatened refusal to pay one-half the costs of the improvement. From the Harlem River to One Hundred and Fifteenth Street the track will be sunk, with iron bridges at the street crossings. From One Hundred and Fifteenth to One Hundredth Street is the stone viaduct, which, it is believed, will be finished within two months. From One Hundredth to Eighty-sixth Street are the three tunnels, two of them new and nearly ready. The engineer, Mr. Buckhout, thinks the work can be completed by January next.

Among the papers of most interest we note that by Colonel Eads on upright arched bridges—a defense of the famous structure built under his direction across the Mississippi at St. Louis. The report of the committee to investigate the Mill River disaster was made by James B. Francis, and condemns the specifications for the work and its character in strong terms. Mr. Coryell described the fires in the Wilkesbarre coal mine, and the measures that had been tried to stop them. Steam and water thus far had proven unsuccessful.

The American Institute of Mining Engineers likewise held an interesting session at St. Louis, from the published reports of which it appears that some twenty papers were presented and read, and numerous places of interest visited. The excursions of the institute included a visit to the famous mine La Motte, an inspection of the deposits of Iron Mountain and Pilot Knob, the zinc and iron works at Carondelet, and a visit to the block coal fields of Indiana, which was marked by an inspection of the operation of the Monitor coal-cutting machine at the mines of the Messrs. Niblack, Zimmerman, and Alexander.

The passage of the bill providing for a geological survey of the State of Pennsylvania was noted in our last month's summary. We can supplement that announcement now with the agreeable information that its direction has been confided by the commissioners to Professor J. P. Lesley, the veteran geologist, whose eminent fitness for the position is acknowledged by all. The work may now be looked upon as fairly begun, and great results may be expected to accrue from it.

The United States Commission appointed to investigate the causes of steam-boiler explosions, and of whose operations during the past fall we gave an account, is preparing to resume its work. It is reported that the commission will continue for two years to come, and will make no report until its labors are ended. The experimental trials will be resumed about the beginning of August.

The following railroad statistics, just published, are worthy of recording. The aggregate of railways in the various countries of Europe in 1873 was as follows: Germany, 12,207 miles; Austria, 5865; France, 10,833; Russia, 7044; Great Britain, 15,814; Belgium, 1801; Netherlands, 886; Switzerland, 820; Italy, 3667;

Denmark, 420; Spain, 8401; Portugal, 458; Sweden and Norway, 1049; Greece, 100.

	Miles.	Population.
Railroads in Europe in 1873.....	65,360..	282,456,742
Railroads in United States in 1873..	70,650..	40,281,000

In *Technology* we note the process of Hirzel for manufacturing illuminating gas. His invention consists in passing hydrogen gas heated to redness into a retort likewise heated to redness, and causing it there to act upon the vapors and gases obtained from tarry products and certain oils, by which it is claimed a permanent gas of great illuminating power is obtained.

In nickel plating Messrs. Martin and Delamotte have patented the use of organic acids with the salts of nickel instead of the mineral acids heretofore employed. They instance citric acid. In this connection it may be well to note that Mr. G. W. Beardslee has devised a process of electroplating with cobalt, which, it is said, forms a thick and useful covering, which will very thoroughly protect the plated surface from the action of the elements, and will form likewise a plating exceedingly white and hard, very durable, tenaciously adherent, and not liable to tarnish.

In our *Mechanical* department we record the fact that the fireless locomotive, before described in these pages, is meeting with considerable success. Eighteen of these engines are now running. Its latest introduction is in Brooklyn, New York, where it is now employed on the East New York and Canarsie Railroad.

The proposition to establish a mechanical laboratory, which was broached lately by Professor Thurston, is likely to be realized, inasmuch as the trustees of the Stevens Institute have, with much wisdom, given the requisite authorization for the foundation of such an adjunct to that progressive institution, and seconded this action by a liberal donation of apparatus to furnish it.

A power-supplying company, which carries on no manufactures, but rents its buildings to others, supplying them with power, is one of the novelties of Rochester. The company has 1500 horsepower to dispose of, obtained from several immense water-wheels.

THE CONSTITUTION OF COMETS.

Dr. Vogel has reviewed the results of the spectrum analysis of the light of the comets that have appeared since 1864. None of these have been remarkable for their brilliancy, and in most of them the difficulty of attaining exact measurements has been almost insurmountable, because of the faintness of the objects. The spectrum of the second comet of 1868 seemed to Huggins to give with some certainty a coincidence of the three bright bands with the three bands of olefiant gas, and it has been somewhat rashly inferred that the hydrocarbons were generally present in the cometary substance. This opinion, however, Vogel combats with considerable force, showing that of nine comets examined within ten years there is as yet only one for which two reliable observers agreed in asserting a probability of coincidence of the lines in its spectrum with those of hydrocarbons, and Vogel thinks we should content ourselves with the deduction that a portion of the light is emitted by the comet itself, very probably from glowing gas, and is

in addition to that portion which is reflected from the comet's surface. In regard to the various statements that nitrogen, aqueous vapor, and other bodies have been identified in these comets, they can not be accepted as firmly established. These are merely hypotheses that should have a stimulating influence on the progress of scientific research.

LIFE IN DEATH.

At the meeting of the Swiss Scientific Association, in August, 1873, Professor Karsten stated that the development and increase of embryonic cells contained in the cell fluid continues for a longer or shorter time after the death of the organism, unless suppressed by great dryness, extremes of temperature, want of oxygen, or chronic agents that interfere with assimilation. He considered the bacteria, vibriones, etc., present in closed cells of the tissues of diseased or dead organs, and regarded as the carriers of contagion, to be in reality pathological cell forms, as of pus, yeast, etc. These, in consequence, do not represent distinct organic varieties, and should not be looked upon as complete organic species, since no act of reproduction, eggs, nor seeds can be recognized, while the active movements of the vibriones are no indication of an independent nature. There is nothing left but to regard these objects, long since named pseudophytes by Müller, as pathological products, since careful observation will satisfy any one that they originate within the cells of plants and animals, and are not introduced into them like parasites. Again, the bacteria, vibriones, etc., developing within the diseased organ, and contributing to its rapid disorganization, may become free, and induce to some extent the same disease in healthy individuals, as is known with certainty of the cells of different kinds of lymph, pus, bacteria, and micrococci.

ROTATION OF THE PLANETS.

Professor Peirce has attempted to deduce from the nebular hypothesis an explanation of the actual rotation of the planets on their axes, and reasoning especially with regard to Jupiter and Saturn, he shows that the inner portion of the ring thrown off from the rotating central body must have a less velocity than the outer portion, and consequently there must be a breaking up of the ring, and the formation of planetary bodies. He demonstrates by a mathematical analysis of the movements of the particles constituting the liquid ring that the velocity of the resulting rotation must be such as is actually observed.

CAUSE OF PHOSPHORESCENCE OF DECAYING WOOD.

It is stated that the attempt to account for the phosphorescence of decaying wood by the assumption of a peculiar process of combustion accompanying decay has lately been rendered unnecessary by the discovery of the presence on such wood of a fungus which emits light, as a result of vital processes, and which, without destruction of this power, can be scraped off and transferred to other wood; even animal matter may be rendered phosphorescent by it. High temperature or gases that destroy life, as well as the withdrawal of the requisite degree of moisture, cause instant cessation of the light.

Editor's Historical Record.

OUR Record is closed on the 21st of July.—The Democratic State Convention of Vermont, at Montpelier, June 25, nominated the Hon. W. H. Bingham for Governor.

The regular appropriation bills passed during the recent session of Congress and the sums appropriated were as follows:

Military Academy Bill	\$883,115 00
Navy Bill.....	16,723,274 30
Fortifications Bill.....	624,000 00
Consular and Diplomatic Bill.....	3,962,404 00
River and Harbor Bill.....	5,906,000 00
Pension Bill.....	29,500,000 00
The Indian Bill.....	4,908,487 18
The Deficiency Bill.....	2,983,762 76
Extraordinary expenses of the naval service.....	4,000,000 00
The Army Bill.....	27,788,500 00
Legislative, Executive, and Judicial Bill.....	20,496,234 80
Sundry Civil Expenses Bill.....	26,895,645 31
The Post-office Bill.....	41,253,933 00
Total.....	\$184,784,346 25

The Democratic State Convention of Indiana met at Indianapolis June 15. Governor Hendricks presided. Its platform of resolutions arraigns the administration for usurpation and corruption; favors the redemption of five-twenties in greenbacks, the repeal of the National Banking law, the substitution of greenbacks for national bank currency, and the return to specie payments "as soon as the business interests of the country will permit;" advocates such legislation from time to time as will adjust the volume of the currency to the commercial and industrial wants of the country; recommends a liberal system of education for colored as well as white children, but opposes the "mixture of the white and black races" in our public schools or educational institutions; demands that the issue involved in the Civil Rights Bill shall be decided at the ballot-box; and closes with the usual tribute to the Union soldiers. The Convention nominated J. E. Neff for Secretary of State.

The Republican State Convention of Iowa, at Des Moines, July 1, renominated Josiah L. Young for Secretary of State, and William Christy for Treasurer.

Postmaster-General John A. J. Creswell tendered his resignation June 24. The Hon. Marshall Jewell has been appointed in his place.

The last South Carolina Legislature, after making appropriations largely in excess of the amount realized by taxation, passed an act authorizing the issue of certificates of indebtedness to the amount of \$340,000. The State Treasurer has refused to pay these, and the case has been brought before the Supreme Court of the State.

On the 8th of July Governor Davis, of Minnesota, sent the following message to the Secretary of War:

"A terrible calamity has befallen the people of the several counties in the northwestern part of this State. The locusts have devoured every kind of crop, and left the country for miles perfectly bare. They did the same thing last year in the same area. Many thousands are now suffering for food, and I am using every public and private source that I can lawfully command to send immediate supplies of food. This State is entitled to two years' quota of arms, estimated at \$8160. I respectfully request that the Subsistence Department be ordered to turn over to me in lieu of these arms a quantity equivalent in value of rations, or such

parts of a ration as I may require. I should not make this request but for the gravest reasons, and to prevent immediate starvation I have used every resource which the State has given."

On June 25 there was an exchange of congratulatory messages between our President and the Emperor Dom Pedro on account of the telegraphic connection of the United States with Brazil.

Michel Domingue has been elected by the National Assembly of Hayti President of that republic.

The French government has prohibited the distribution in France of photographs of the Prince Imperial.

The Count of Montalivet, who was minister under Louis Philippe, has written to M. Casimir-Perier declaring that the salvation of France imperatively requires the loyal acceptance of the republic.

The Comte de Chambord early in July issued a manifesto to the French people, proclaiming that France has need of royalty, and that birth has made him their king. He advocates limited monarchy, which admits of the existence of two Chambers, one nominated by the king, and the other elected by the nation. *L'Union*, which first published the manifesto, was suspended from publication for two weeks.

The Legitimists in the Assembly threatened an interpellation in regard to the suspension of *L'Union*. On the 8th a motion of regret for this suspension was rejected by a vote of 80 yeas to 379 nays—the Left not voting. Then M. Paris, of the Right Centre, moved that the Assembly, resolving to uphold the septennial powers conferred upon Marshal M'Mahon, President of the Republic, and reserving the questions submitted to the constitutional committee, "passes to the order of the day." The government identified itself with this motion, which was defeated by a vote of 331 yeas to 368 nays. The motion of the order of the day pure and simple was then adopted, 339 to 315. Thus the situation for the ministry remained uncertain. They tendered their resignations, but President M'Mahon peremptorily refused to accept them.

On the 9th President M'Mahon sent a message to the Assembly declaring that the powers conferred upon him by the law of November 20, 1873, devolved upon him duties which he could not evade. He said: "Your confidence rendered my powers irrevocable for a fixed term in forestalling votes on constitutional bills. In according them you yourselves enchain your sovereignty. I shall employ the means with which I am armed by the laws to defend my power." He then proceeded to urge the Assembly to complete the law of November 20, and fulfill its engagements. "The country demands the organization of the public powers, and questions which are reserved must be settled. Further delays will depress trade and hamper the prosperity of the country."

A motion for the dissolution of the Assembly after having voted upon the financial bills, the bill on military organization, and the bill providing for a general election on October 23, followed the reading of the message. The demand

for "urgency," however, was not supported, and the motion was referred to the Committee on Parliamentary Initiative, in which the Left predominates.

The report of the Committee of Thirty was read in the Assembly July 15. The committee recognizes the irrevocability of President M'Mahon's powers, and substitutes for M. Casimir-Perier's bill one of its own, with six clauses. The first maintains the title of President of the Republic. The second establishes ministerial responsibility. The third confers the legislative power upon two Chambers, the appointment of members of the Upper House, or Senate, to be the subject of a future bill. The fourth provides that the President alone is authorized to dissolve the Lower House, or Chamber of Deputies. The fifth prescribes that a congress of both Chambers shall provide for the continuance of the government in case Marshal M'Mahon dies, resigns, or reaches the end of his term of office. The sixth declares no modification of the constitutional laws is to be allowed unless first proposed to the President.

M. De Fourtrev, Minister of the Interior, resigned July 17. This was followed by a ministerial crisis, and the Duc de Broglie proceeded to constitute a cabinet based on the old majority in the Assembly. The crisis was terminated July 20, when General De Cissey, Minister of War and Vice-President of the Council, announced in the Assembly that Baron de Chabaud-Latour had been made Minister of the Interior, and M. Mathieu Bodet Minister of Finance. The cabinet as re-organized has no Bonapartist member. The debate on the bill presented by the Committee of Thirty was postponed till the 23d.

The Spanish troops under General Concha surprised three of the positions occupied by the Carlists defending Estella, June 27. The next day General Concha was killed in an attack on the Carlist position at Muro, near Estella. General Zaballa, President of the Council and Minister of War, succeeded to the command. Thereupon Señor Cotoner became Minister of War, and Señor Sagasta President of the Council. Estella is defended by a Carlist army of 25,000 men. The attacking army numbers 30,000 men. The entire strength of the Spanish army in the field is estimated at 150,000. The entire Carlist force is probably between 50,000 and 60,000. Decrees have been issued by the Spanish government declaring all Spain in a state of siege, sequestrating the property of Carlists, and creating a special reserve of 125,000 men.

In an address at the banquet given by the Merchant Tailors' Company, June 24, Mr. Disraeli claimed for English Conservatism that it had solved the three great political problems. "We have," he said, "combined religious equality with a national Church; we have maintained the authority of monarchical and aristocratical institutions with a large distribution of political power among the people; and we have made a free exchange of commodities consistent with the existence of a prosperous, because untaxed, native industry."

In the British House of Commons, June 24, Mr. Plimsoll's bill requiring an official survey of merchant ships before sailing was rejected by a vote of 170 yeas to 173 nays.—On the 30th Dr. Butt, in the House, moved his resolve in favor

of home rule in Ireland. On July 3 the vote was taken—61 yeas to 458 nays.

While Prince Bismarck was driving in the country near Kissingen, July 13, he was fired at by a young man named Kullmann, who calls himself a good Catholic. The prince was wounded in the wrist.

MISCELLANEOUS.

The college regatta on Saratoga Lake, July 18, resulted in the victory of the Columbia crew. Time, 16.42¼. The Wesleyan crew came second, Harvard third, and Williams fourth.

On the 1st of June there were in the United States 19,492 subordinate granges. This would make the number of patrons who are voters about one million.

The official reports relating to the Bengal famine at the close of May were very encouraging, and indicated that the Indian government had put forth masterly and efficient efforts to such an extent that relief had prevailed over famine. The official system of relief resembles the complex operations of an army. About three millions of people were being fed by the government. The number of deaths was estimated at 2000. In 1866 Orissa lost by famine one-tenth of her population before the end of May.

DISASTERS.

July 4.—Destructive fire in Alleghany City, Pennsylvania. Over one hundred houses burned.

July 6.—At Stony Creek, eleven miles from New Haven, Connecticut, a train of six cars on the Shore Line road was, owing to the neglect of a switchman, thrown from the track. Superintendent Wilcox was killed, and a large number of passengers were injured.

July 10.—Off Atlantic City, New Jersey, a pleasure yacht was capsized, and five persons drowned.—Great fire at the Weehawken Docks, New Jersey. An electric spark ignited an oil tank. Oil to the value of \$250,000 consumed.

July 14.—Another great fire in Chicago. The burned area covers fifteen squares. Loss to insurance companies two and one-half millions of dollars. Three hundred and forty-six buildings destroyed. Entire loss over \$4,000,000.

July 18.—Collision of two express trains on the Erie Railroad near Canasara. One man killed and ten injured.

OBITUARY.

June 20.—At South Manchester, Connecticut, Charles Cheney, of the firm of Cheney Brothers, extensive silk manufacturers, aged seventy-seven years.

June 30.—In New York city, Henry Grinnell, the well-known patron of arctic exploration, aged seventy-five years.

July 3.—In Branford, Connecticut, Theodore N. Parmelee, a prominent journalist of the last generation, and author of "Recollections of an Old Stager," which have appeared from time to time in this magazine, aged seventy years.

June 26.—In England, Howard Staunton, a celebrated chess-player, aged sixty-four years.

July 4.—In France, M. De Goulard, an eminent French statesman, and member of the present Assembly, aged sixty-two years.

July 15.—In England, Agnes Strickland, the well-known authoress, aged sixty-eight years.

Editor's Drawer.

WILL CARLETON, whose fine poems have had so large a reading in this country in the exquisitely illustrated volume published by Harper and Brothers, was recently invited to deliver a second lecture in Hudson, Ohio, and duly arrived in that classic bailiwick in good order. The first thing that met his eye on entering "the Athens of the Western Reserve" was a small body of men making excavations in an antique pile of ruins, in which the reading must be delivered unless a large percentage of the door money was pledged to the missionary cause, in which case it could be given in the college chapel. Mr. Carleton was disposed to do his share for "Greenland's icy mountains" and "towns' round," but when it came to asking a Christian audience to the shabbiest, filthiest house in town because the heathen had not been first provided for, he relucted, paid the committee their advertising bills, and withdrew from the presence without giving any lecture at all. "If I had read in Hudson," he says, "I should have expected, as a display of the leading industries of the place, 'a pyramid,' not 'of solid cheese,' but of the heads of that estimable vegetable of which the Germans make sourkrout. And my peroration would have been:

"I've walked where eastern sunbeams glow
New England's rock across,
And seen the peasant twist the hoe
Around his garden sauce;

"I've cashed the loud mosquitoes' bills,
Ere they had time to draw,
Upon the sandy green-clad hills
Of far-famed Saginaw;

"I've sat, ere dinner half was done,
With napkin on my knees,
And smiled to see the last-born son
Make havoc with the pease;

"I've lounged in prairie Illinois,
Where Sucker babes be born,
And watched the stocky farmer-boy
Trip lightly through the corn;

"But for a pure and cheerful green,
When all is done and said,
Give me, for all I've ever seen,
A Hudson cabbage-head."

In the Rev. Dr. Samuel Ireneus Prime's charming book, *Under the Trees*, recently published by Harper and Brothers, is a chapter on "Dogs," that is one of the pleasantest in the book. Dr. Prime himself, as every one knows who knows him, is one of the cleverest and most delightful men the country has produced. This is from his chapter on "Dogs:"

"The Rev. Dr. Wickham, of Manchester, Vermont, has told me of a dog which belonged to a good deacon of that place.

"At the stroke of the bell each Sabbath morning, unless forcibly restrained, this dog would hasten with all speed to the church, and take his position on the broad step of the stairs ascending to the pulpit, and there recline at his ease, remaining quiet during the public service. By the kind sufferance of the minister who then occupied the pulpit, he was never disturbed. But on the accession of another to the pastorate, to whom the proximity of this animal was unwelcome, he was once and again dislodged by a kick from his

position as the minister ascended the pulpit stairs. Upon the repetition of this indignity he came no more, but regularly as the Sabbath returned passed by the door of the church he had attended to another of a different denomination, nearly two miles distant from the former. He continued to do this for the space of nearly three years. At the end of that time, on the accession of a new minister, he was seen in his old position on the pulpit stairs. Being undisturbed, though his church-going habit remained, he went no more to the distant church, but for the residue of his short life punctually attended where he had done before, and where his owner and family were stated worshippers."

A GENTLEMAN who thinks it high time that the "little Johnny" poetry should give place to something neater and more fully charged with sentiment sends us the following as largely combining both:

Oh, bury Bartholomew out in the woods,
In a beautiful hole in the ground,
Where the bumble-bees buzz and the woodpeckers
sing
And the straddle-bugs tumble around;
So that, in winter, when the snow and the slush
Have covered his last little bed,
His brother Artemus can go out with Jane
And visit the place with his sled.

WE are indebted to the author of *Old Times in West Tennessee* for reminiscences of pioneer life and sketches of the early emigrant settlers in the Big Hatchie country—a volume that must have decided interest for the people of that region, and which has much of interest and anecdote for the general reader.

Among the men who were notable in the early times was the Rev. Arthur Davis, one of the pioneer preachers of the Methodist Episcopal Church. "Few men knew better how to take the 'bull by the horns,' or win to the Master's kingdom a sinner's soul." He gloried in being called to preach in the wilderness. At one of the places where he had made an appointment lived a band of outlaws, who, seeing the notice sticking up in the neighborhood, gave out that "no ——— Methodist preacher should preach in that house," and if Mr. D. attempted to fill the appointment they would give him a sound drubbing. He paid no attention to the threat, but opened service and preached, and announced that on a certain day he would preach there again. He then invited the congregation to attend him out in the grove. Passing out and stopping at a stump, he took off his hat and coat, and, turning to those present, asked if any of them belonged to any church. A gentleman stepped forward and replied that he had been a Presbyterian. "That will do, Sir; thank you," said Mr. Davis. "I have a wife and one child. Her name is Drusilla. I want you to promise, by the vow you took when you joined the church, that if any thing should happen to Arthur Davis to-day by which he should never see her again, you will tell her all about it, and how it happened. Now, Mr. Regulators," turning to a party of men who were standing apart from the crowd, "I am ready for you. Come one at a

time, and I'll show you who Art Davis is." They looked at one another, and then at the preacher. "Don't keep me waiting," said he. "You have made your threats that no Methodist preacher should preach in that house. I am a Methodist preacher, and have preached in it according to appointment. I am now ready to meet you according to *your* appointment, one at a time, and you will make the acquaintance of Art Davis." The leader of the band threw down his club, walked up to the brave-hearted man, and said, "Mr. Davis, you are my sort of man; I like you, Sir. You shall preach here whenever it may please you to do so, and I will see that you do it in peace. You are the preacher for me." With that the neighborhood gathered around him, introducing one another, until he made the personal acquaintance of every one present. He was ever after that a welcome preacher in the neighborhood.

The boldness with which Mr. Davis asserted his right to talk to sinners was illustrated at a camp-meeting held near Brownsville. The good work was going on swimmingly; the mourners' bench was filled, and gave promise of the conversion of many. Mr. Davis, in passing along, administering to their troubled souls, came to an old and hardened sinner, a gentleman of his acquaintance. He saw that he was "under conviction." Laying his heavy hand upon his shoulder, he said, in a loud and strong voice, "Pray! Pray hard! Pray with all your mind, might, and soul! You are a moving, breathing mass of putrefaction. Pray with all your mind and strength, for you are the very butt-cut of sin!" The power and force of his language struck the old sinner with such terror as to his situation that he slid from the bench into the straw, and wrestled with the devil until he triumphed.

CHILDREN are very observing, and sometimes have (for others) inconveniently good memories.

It is said that a mother was talking to her children on subjects connected with the catechism, and among other questions asked, "Can either of you mention some act of returning good for evil?"

One of the younger children said, "Maybe I do not remember that, but I know of once when, I think, somebody returned *evil for good*."

"When was that, dear?" said her mother.

"Why, when papa kissed Mary" (the waiter girl), "she slapped his face—but not very hard, mamma!"

The happy family gathering was just then somewhat disturbed.

ONE morning not long since we were standing in the railroad station at Morristown, New Jersey, waiting for the train, when we had evidence once more of the utter ignorance of a certain class who travel in Europe. On the platform, also waiting for the train, was a young couple, apparently not long married. They had with them a large Saratoga trunk, plastered nearly all over with Continental railroad marks, showing that some one had made an extended tour in Europe. In order that I might understand how they came there, and with the vanity of a young wife to show off her husband, the following took place, solely for my benefit. The bride,

walking up to the trunk and looking intently at it, her eye was attracted by a particularly large card printed in large letters, "Via chemin de fer," and nothing else on it. Spelling this out in full, and giving it a free English pronunciation, she looked up into her husband's face and said, very sweetly, "Darling, were you there?"

To which he replied, confidently, "Oh yes; that is one of those German towns where I staid overnight."

Those who are familiar with French will perceive the point and appreciate it.

JUSTICE MORGAN, one of the new police justices of this city, had before him a witness the other day, of whom he asked, "What do you know of the character of this man?"

"What do I know of his character? I know it to be perfectly unbleachable, your honor," he replied, with emphasis.

THE *Chicago Tribune* has detailed one of its staff to illuminate the people on the virgin topic of "Man as a Processionist." The task has been accomplished with much fidelity and some fun. Truly doth the writer say: "The effect of the procession upon the individual hardly has a parallel among natural phenomena. Your butcher or your shoe-maker may be, and probably is, a very ordinary man; not blessed with wealth or beauty; having no soul-cravings or yearning desires for the good, the true, and the beautiful; the owner of a brood of rather dirty and promiscuous children; with an intellect capable of the scientific carving of a sheep or skillful cobbling of a boot. There is nothing majestic or awful about him. You would not invite him to your soirée as a paragon. Indeed, in his morning call at your house your servant receives him, and they gossip together in a friendly way. But once array your butcher in a plug hat and white apron, throw an emblazoned crimson scarf about his muscular shoulders, put a boiled shirt on him and stick a rose in his button-hole, hang two or three tinsel crosses and other ornaments on his manly breast, and, if he be a large butcher, let him carry a banner stuck in a pouch, looking as if it were rooted in his ample corpus, and he becomes metamorphosed into another creature. As he marches along in his stately manner, keeping time, time, time, in a sort of Runic rhyme, to the tintinnabulation of the band, he is an awful and majestic being, who towers above you as you stand upon the curbstone, and looks down upon you as one of the *sans culottes*. Yesterday he would have taken off his hat to you; to-day, if he sees you at all, he only sees you as an atom: one of a thousand, admiring him as a magnificent being, only equalled by a royal potentate, and possibly surpassed by a Sultan, in the grandeur of his bearing and the gorgeousness of his apparel. As you retire to your chamber at night with the confused pictures of flags, banners, crosses, swords, aprons, horse-collars, trombones, and guns fitting before you, the vision of this majestic creature appears, looming up like Mont Blanc among lesser hills. You regret now that only yesterday you vexed his great soul with complaints about tough beef; that you had threatened to discharge this awe-inspiring creature and employ another. You regret your dullness in not recognizing the

possibilities lying dormant in him, and you mentally resolve to make your respects to him, the Thrice Illustrious Prince, or Most Eminent Grand Seigneur, or High and Top-Lofty Baron, commanding the Most Stunning Knights of Pythagoras, and request the pleasure of eating tough steak hereafter."

All of which is true and deftly said.

The Drawer remembers to have witnessed in a country village some years ago a procession which had its humorous side. The undertaker of the place had been requested to send to the house of a respectable mechanic a small coffin, suitable for a child two days old. On the morning of the interment, desiring that every thing should be done decently and in order, the undertaker directed an employé, a colored boy of twelve, to put on proper apparel, put the little coffin under his arm—it was but little larger than a cigar-box—and take it to the house designated. The boy of color, in discharging his duty, passed by a group of little white boys, one of whom said, with the levity of his class: "Oh, look at that darky! I say, Pomp, what's under your wing?"

The boy of color strode onward, maintaining the gravity of the mission on which he was bent, and exclaiming with a disdainful tone, "Go 'way, white boys! go 'way! *I's a funeral!*"

We have from Paris an anecdote of a reporter on one of the well-known journals of that city, who is famed for his dislike of the traditional note-book of his order, and has hit upon a method of taking notes unobserved by those around him. He wears large white linen cuffs to his shirt, and nonchalantly jots his impressions on these with the most microscopic of pencils. At first his laundress was greatly puzzled with the hieroglyphics, but afterward learned to make them out, and thus gathered the news of the week while pursuing her avocation. One day she astonished the man by saying,

"Your last washing was very interesting, only you don't give us enough political news."

A MISSIONARY of the American Sunday-school Union in Kentucky was canvassing a certain neighborhood for a Sunday-school, when a man said: "Mister, thar ain't a feller in this beat fiten fur foreman of this thing; they're all gourd-heads abouten here; thar ain't but three men in this beat that can write their names; they needs it bad; but I don't see how you can skeer it up."

The missionary asked, "Can I get up a Sunday-school at Dry Crane's?"

"Wa'al, maybe, and maybe not; but you needn't go any lower down, fur Sunday never comes below the mouth of Crane Creek. They pitch quakes, and fish, and run horse-races all day of Sundays."

But the missionary went and organized the first school planted in all that region, supplying all destitute families with Bibles, and thence on to another very destitute settlement, where he gathered a hundred children into a school; and so on to a third very rough and needy place, forming still another; thus in one day establishing three schools. At one place he asked a young man, "Who was the first man?"

After studying over it a while he replied, "I think his name was Sam."

Few people are aware of the magnitude of

the work that has been accomplished by the American Sunday-school Union. During the fifty years of its existence—1824 to 1874—it has organized 61,299 schools, containing 404,242 teachers, and 2,650,317 scholars. The amount it has expended in missionary operations is \$2,133,264 13, of which \$517,000 were for books, papers, etc., granted to Sunday-schools, while the value of books, papers, etc., circulated by sale and grants is over \$6,000,000. There is nothing very funny in that, but what a vast amount of good!

THE hydrophobic season has nearly closed, and, curiously enough, the only dog-gerel it has produced has been one epic by "Jean Paul," and the following from the pen of that pungent gentleman, Donn Piatt:

Mr. William Goepfel bought a dog at great expense,
And tied him with an iron chain to Henry Meyer's fence.

This dog he was a playful pup, and led a canine choir,
Which his singing of these moonlight nights disturbed the same H. Meyer.

And while his sleepless evenings thinned him to a skeleton,
The dog kept up his concert, and rather liked the fun.

When M. had used his boot-jacks up and flung his final brick,
He said, "I'll dose that poodle with a pound of arsenic."
Which he did, and then the canine grew very deadly sick.

When Mrs. Goepfel saw the state of her dear Newfoundland,
She started off a-hopping and she called for her husband,
Who says, "That dog is poisoned, or if not, may I be hanged!"

So he got a pail of water and began at once to soak it,
But the canine scorned the temperance draught and coldly kicked the bucket!

Then Mr. G. walked down the street to the court of Justice Shea's,
And filed a bill of trespass, hundred dollars damages,
Which occasioned the same Meyer for to rise right up and sneeze.

The honest justice weighed the case and pondered for a while,
And then dismissed the parties with a calm, luxurious smile;

Both of which affected Mr. G. and aci-fied his bile!

And when he saw proceedings for the present time were busted,
He got up with a sickly smile, which showed he was disgusted,
And without a why or wherefore he turned right round and dusted.

A FRIEND in Oskya, Mississippi, sends us the following:

Half a century or so past polemical divinity was rampant in this section of the moral vineyard, the Baptists backing Calvinism, the Methodists *contra*. Hardly a sermon was preached on either side that was not of a belligerent cast. They called it doctrinal preaching, and so antagonistic was the attitude of the above-named sects toward each other that each seemed to think its existence depended on the overthrow of its adversary. Prominent among the Methodist itinerants was Miles Harper, one of the pioneers, a man of wit, sagacity, and force, combative as a Modoc, and, figuratively speaking, always on the war-path. He was never so

much in his glory as when taking scalps in a foray on the tents of the reformer of Geneva. Nathan Morris was the Baptist champion, who, though inferior to Harper in education and capacity, was equally warlike, and excelled him in bigotry and sectarian exclusiveness. Of course two such "braves" could not occupy the same field without frequent conflicts, any more than two stars could keep their motion in one sphere, or one England brook a double reign, etc. One day they met by previous appointment to discuss the question, "Can a regenerate soul fall from grace?" Large numbers of partisans on both sides were in attendance, and Harper opened with a bold splurge on the affirmative. Morris, rising to reply, proposed to sing a hymn, and taking up Harper's "Methodist hymns," opened at random, and selecting a hymn, without looking into its "doctrinal" features, read:

Ab, Lord, with trembling I confess,
A gracious soul may fall from grace.

Harper, who, Napoleon-like, was always ready to take advantage of a blunder in the tactics of his enemy, as quick as thought sprang to his feet, slapped his hands, and bellowed out with the voice of a stentor, "Thank God, Brother Morris, for that confession!" at the same time offering him the right hand of fellowship. To say that "Brother" Morris was thunderstruck would be to put it mildly. For some seconds all his faculties seemed paralyzed; but recovering himself at last he threw down the book in high dudgeon, denounced it as the work of the devil, and solemnly avowed that he confessed no such thing. The gravity of the audience being completely upset by the ludicrous aspect of the thing, and Harper putting on the grandiloquent air of a conqueror, Morris saw the day was lost, so threw up the metaphorical sponge and quitted the field.

Harper was as bald as Mont Blanc, and when giving the details of what he called his bloodless Waterloo, he would laugh to the back of his neck. Nor could he ever induce Morris to meet him in debate any more, to such an extent was he demoralized by his overwhelming defeat.

FROM Galesburg, Illinois, comes this:

One of our deacons last Christmas, I believe, brought home to his youngest son a new pair of skates. After the young folks had retired, leaving their stockings prepared to receive the gifts of Santa Claus, the skates and a new comforter were put in and near I——'s stockings. Of course next morning he was in a great hurry to try his skates. After breakfast, as usual, the good deacon read the Scriptures, and explained as he read, somewhat lengthily, at least I—— thought so, while looking wistfully at his skates and comforter on the next chair. When prayers were over, and the father had just uttered Amen, what was his astonishment to hear that young hopeful, as he burst out of the room with skates and comforter in one hand and cap in the other, sing out, as only a boy can, "Bully for the Amen!"

"THE Dream of Pilate's Wife," Doré's last picture, is said to be the most brilliant of all his works. Why he came to select that subject it is difficult to imagine, for of all the disreputable fellows mentioned in the New Testament Pilate was one of the meanest. In fact, he was a first-class

fraud. He was some such man as in our day struts in the Southern States or in some of the Territories as Governor—a cunning, ignorant, selfish, dissipated fellow, given to cheap "feeds," probably, a frequenter of the saloon or corner grocery of the period, and a "big Indian" among the strikers and pot-house politicians of that day. In Abbott's *Dictionary of Religious Knowledge*, now in press by Harper and Brothers, the character and career of the fellow are sketched as follows:

"Pilate (Pontius) was the Roman procurator, or resident governor, of Judea during the period of Christ's public ministry and death. Of his life before he became procurator nothing is known, except that his name indicates a probability that he was a freedman, or the descendant of a freedman, connected with the Pontian house. He succeeded Valerius Gratus as procurator of Judea and Samaria about the year 26 A.D., and he held the appointment for a period of ten years. Secular history shows him to have been unscrupulous in the exercise of his authority, and instances are recorded by Josephus of his contempt of the Jews. His behavior was equally tyrannical toward the Samaritans, and on their complaint to Vitellius, president or prefect of Syria, Pilate was ordered to go to Rome to answer for his conduct before the emperor. His deposition must have occurred in A.D. 36, most probably prior to the Passover. Before he arrived in Rome, however, Tiberius was dead. Pilate is said to have been banished by Caligula to Vienne, in Gaul; according to Eusebius, he put an end to his own existence. Our chief knowledge of Pilate, however, is derived from the gospels, and it is only his connection with the trial, condemnation, and execution of Jesus of Nazareth that has given him an unhappy fame. From this account it is evident that he was a tool in the hands of stronger men. He had no inclination to yield to the Jewish priesthood, but he had still less to occasion a mob in the Holy City, and to bring upon himself the charge of not being Cæsar's friend. He tried to save the innocent life before him, but resorted for this purpose to a series of compromises and subterfuges. He had no moral courage. His crime was the crime of cowardice."

GOOD.—A Detroit paper, noticing the fact that a man fell down dead while combing his hair, says, "And yet there are people who will persist in that dangerous habit!"

WE had been without a pastor for some months (writes a friend in Massachusetts), and had the pulpit supplied by such ministers as we could get, especially those who, we thought, might satisfy our people, and finally succeeded in procuring one.

While visiting the Sunday-school, a few Sabbaths since, he stopped to talk with a class of elderly ladies. After the usual salutations, one of the ladies said,

"Well, I am glad we've got somebody; we've been having every body."

"Yes," said the pastor, "I suppose you have had the cream of the ministers among your supplies."

"Well," said the lady, "I am farmer's wife enough to know, if you want good cream, you

must let the milk set still, and not keep a-stirring it up all the time."

YOUR anecdote of Platt Evans (writes our correspondent C. C. H.) will doubtless remind those who knew the stuttering joker of others. Here is a good one. Platt lived in Cincinnati as long ago as the time when it was considered a capital joke to send a countryman from store to store inquiring for things he would be certain *not* to find at the places to which he was sent. One day a country fellow came, as he had been directed, to Platt's store to *buy a Jew's-harp*. Platt was a merchant tailor, and kept men's furnishing goods. He was busy with a customer as the man appeared, but observing that several of the "boys" had dropped in at the door, just to see what Platt would do, he "took" at once, and responded to the inquiry for the musical instrument, "W-w-wait a minute!" Having served his customer, he picked up a pair of glove-stretchers and approached the rural melodist with, "L-l-let me m-m-measure your m-m-mouth," and introducing the stretchers, gave them such a grip as transformed the astonished aperture into a horizontal yawn awful to see, and capacious enough to hold half a peck of Jew's-harps. Removing the apparatus, he examined it carefully and deliberately as one might scrutinize a thermometer or pocket-compass, and then dismissed the unsuccessful searcher for Jew's-harps, as he said, in a tone of well-feigned disappointment, "W-w-we hain't g-g-got any your s-s-size!"

THE following epitaph, copied from a gravestone in Pembroke, Massachusetts, is almost a century old, and is now for the first time in print:

Here rests a poor woman
Who always was tired,
For she lived in a house
Where Help was not hired.
Her last words were, Friends,
Fare ye well; I am going
To a place where there's nothing
Of washing or sewing.
Then weep not, my friends,
When death shall us sever;
For I'll have a nice time
In doing nothing forever,
For every thing there
Is exact to my wishes,
Since where they don't eat
There's no washing of dishes.
The courts with sweet music
Are constantly ringing;
But having no voice,
I shall get clear of singing.
She folded her hands
With her latest endeavor,
And whispered sweet nothing,
Oh, nothing, forever.

WE estimate that any one would have laughed at the scene described in the following as having occurred in Eddyville, Kentucky, and communicated to us by an old reader of the Drawer in that place:

A few weeks ago our Circuit Court met, presided over by our dignified Judge G—. The weather was very warm, the very flies had a lazy hum as they flew around the court-house, and every thing and every body seemed wilted. As it happened, an election for town officers was going on at the same time in the clerk's office adjoining the court-house. Suddenly a negro man walked in, with a business look on his face,

and never stopped till he stood right in front of Judge G—, hauled out a greasy dilapidated pocket-book, and extracting an election ticket therefrom, handed it over to him. The judge had been sitting, with a perplexed countenance, observing the action of the negro, but on glancing at the ticket a grin slowly relaxed his features as he called on the sheriff to show the colored individual the proper voting place. In the mean time the audience had taken in the situation at a glance, and poor Sambo left the court-house with a mortified look, amidst the laughter of the audience.

MRS. H.

BY E. ALMA GUNDEL

An ancient dame was Mistress H.,
Whose life showed many a streak:
When age of charms despoiled her face,
She fell back on her cheek.

So huge a shock of hair made up
Her capillary stock,
Kind-hearted Mother Nature, sure,
Ne'er gave her such a shock.

Their faults long since had doomed her teeth
To rot in dentists' vaults;
And yet, as soon as they were out,
She filled her mouth with false.

At last she died—consumption's prey,
The doctors did aver;
She fell to coughing, died, and then
A coffin fell to her.

But those who saw her fearful end
Forbore to jeer or scoff,
And took to taking on as soon
As she was taken off.

COLONEL CONGREVE, the celebrated inventor of the destructive Congreve rocket, was a musical amateur, and one day accompanied Madame Vestris, the great singer, to view a monument that had been erected to the memory of Purcell, the composer. The colonel read aloud the epitaph with good emphasis and modulation: "He is gone to *that* place where alone his *harmony* can be exceeded."

Vestris immediately cried out, "La, colonel, the same epitaph will serve for you by merely altering *one word*, thus, 'He is gone to *that* place where alone his *fire-works* can be exceeded.'"

OUR esteemed friend, the editor of the New York Observer, has so fine an appreciation of humor that we were not surprised to see in a recent number of his paper the following neat bit by a brother clergyman, under the head of "Christian Work in the South:"

"The other day a lame man accosted me in the street with, 'Won't you give me a Bible, Sir? I am not able to buy one; I have none, and am poor, and a cripple at that.'"

"How came you a cripple?" I inquired.

"In the war, Sir," he answered. "I fought against you as hard as I could."

"You fought against me, and now you ask me to give you a Bible!"

"I was forced into it," he replied.

"Well, take this Bible," placing one in his hand, "and may it prove to you a source of blessing and joy."

"Not without emotion he received it, and thanked me for the precious gift."

"Time has already softened down the asperi-

ties of the past. I find some who look back upon their past sufferings and deprivations complacently and even good-humoredly. Said a veteran Confederate, placing his hand behind his ear, and leaning forward, 'Speak a little louder, Sir; I can not hear very well.'

"Have you been long deaf?"

"Only a few years, Sir. I will tell you how it happened. During the little unpleasantness that occurred between the North and South I enlisted as a private. One day, when on guard, I saw a Yankee picket stalking along, and I knew his gun was unloaded, because I saw him fire it off. I reckoned I'd do a smart thing; so I ran up behind him, and yelled out, 'Surrender!' But I think he must have misunderstood me, for he turned round and hit me such a thundering whack on the side of my head with the butt-end of his musket that I did not know any thing for about ten hours, and have not been able to hear very well since."

A FRIEND sends us the following. It reminds one of Casabianca, but two points of difference may be noticed: Casabianca would not take water, but the Washington youngster did; Casabianca got "blowed up," this one did not.

There is nowadays a good deal of complaint about the want of obedience to parental authority on the part of the rising generation, especially on the part of the boys. We heard of a case the other day which proves that there are noble exceptions to the average "boy of the period." A young son of one of the principal examiners in the Patent-office at Washington went to pass his school vacation at an uncle's in Kentucky, near the Ohio River. There was but one restriction on the scope of the boy's amusements. Horses, dogs, rifles, shot-guns, etc., etc., were freely allowed as companions of his amusements; but as his cousins were as fond of the water as so many ducks, he was requested to shun the boat which the cousins were wont to use in their aquatic excursions. He promised faithfully, like the dutiful lad he is, and departed rejoicing. A recent letter to his father graphically describes various excursions and the "good times" he had enjoyed, among the very last one in which the cousins had desired to visit the Ohio shore. "They went over in the boat," writes the boy, "but I remembered your wishes in that respect, and so swam the river!" It is understood that the next mail announced to the youngster that the embargo upon the boat had been removed.

At a caucus held recently in one of the lower wards of Troy one John O'Brien was nominated for some minor position on the ward ticket to be voted for at the charter election. A gentleman present asked another O'Brien who John O'Brien was; he had lived some time in the neighborhood, but could call no such name to mind.

"He's me brother," said Pat; "he's not arrived in the country yet, but he tuk ship Winsday, an' 'll be here in time for 'laction."

At a similar meeting held in another ward a gentleman arose and said, "Mr. Prisdint, I nominates Jerry Maloney for one o' thim."

"One of what?" asked the prisdint.

"One o' thim ye're makin'."

Jerry was 'lacted, and Johnny too. Such is the vivacity of the American character!

THE following from the St. Louis *Globe* is so suggestive, embodying in its way a volume of criticism, that we give it a place:

MOLL 'N' HER LAMB.

(Boston, 1874.)

AFTER BRET HARTE.

	I.	Hyar, ye darned skunk, Hev ye hearn tell All about Moll 'N' her fo'-legged doll? Ye haven't? Hi—ll!
Mary	II.	Why, the yarn's hank.
had a little lamb, with fleece as white as snow, and	III.	'Twas a pup ram— Wa'al, call it lamb— I don't care a—bit. Its fleece were—white? Sonny, ye're right, White was just it.
ev'ry where that Mary went the lamb was sure to go.	IV.	This animlle So juvinille, So help me! whar- Ever Moll war, In-door or out, He war just thar Or tharabout.
It followed her to school one day,	V.	Wa'al, Mary once She went to school; She wan't no dunce, And that lamb—shoo! Went to school too, Like a durn fool.
which was against the rule; it made the children laugh and play to see a lamb at school; and so the mis- tress turned it out,	VI.	Now sheep in thar Wan't 'cordin' to Hoyle, No way you fix it; So the kids star, And the schoolma'am roila And out she kicked it.
but still it lingered near, and	VII.	Did the lamb get? Scarcely, you bet, Thar he did keep, Bold as a sheep, Firm as an anchor Or Caseyblanker.
waited patiently about till	VIII.	He loafed around; He felt in clover; He keeled a hive over And pawed up the ground, And the schoolma'am's green yerbs He sorter disturbs, And caves in the fence Of her residence.
Mary did appear, and then he ran to her	IX.	But when he see Moll re-appear, He got up on his ear And scooted to she.
and	X.	Wasn't he cute? Cute ain't no word. He had inferred (For the schoolma'am she knew it, And, in short, see him do it) He'd get bust in the snoot.
laid his head upon her arm, as if to say, I'm not afraid; she'll shield me from all harm.	XI.	So under Moll's arm His bowsprit he runs (As they say on the seas); And beneath Mary's guns, Feeling safe from all harm, He observed, "B-a, ba!" As much as to say, Mary'll settle for these.
"What makes the lamb love Mary so?" the little chil- dren cry. "Be- cause Mary loves the lamb, you know?" the teach- er did reply.	XII.	"Why is he so blamed sweet Upon Moll?" said young Pete. "Because the young limb," Replied the schoolma'am, "The son of a ram, Knows Moll's sweet upon him."

HARPER'S NEW MONTHLY MAGAZINE.

No. CCXCIII.—OCTOBER, 1874.—Vol. XLIX.

THE EMIGRANT'S STORY.

FRIEND, have a pipe, and a seat on the log
here under the pine-tree:
Here in the cool of the day we'll smoke, and
I'll tell you the story.

First—do you notice the girl? the slim one
helping her mother—
Tough little tow-head, spry as a catamount,
freckled as birch-bark!
Nannie her name is: it happened the sum-
mer when she was a baby.

Times were hard in the States. We lived
on the farm with the old folks:
There all our dear little tots had been born,
and their mother before them.
But the old hive wouldn't grow with the
fresh young life that was buzzing
In and out of its doors; and, after much
tribulation—

Many a sleepless night I talked it over with Molly—
We had concluded to swarm—go West, and find us a new hive.

Well, it was settled at last; and, packing our pots and our kettles,
Clothing and bedding, and bags of Indian meal and potatoes,
Hen-coop, cradle—the few indispensable things to a poor man—
Into a regular broad-beamed ark-on-wheels of a wagon,
Canvas-covered, drawn by two yoke of oxen, we started—
Crowing cockerel, dog and cat, and chickens and children.

Father and mother and grandmother stood and watched from the door-yard—
Two generations that staid saw two generations departing.
Molly just smothered her babies, and sobbed, and never looked back once—
Woman all over! but I (though I broke down trying to cheer her)
Turned at the top of the hill, and gave a good stare at the old house,
Well-sweep, orchard, barn, the smoke from the chimney, and still one
Handkerchief feebly fluttering, with the great sunrise behind all.
That is the picture I saw, and see again at this minute
Plain as if this were the hill, and down by the creek there the homestead.
Then it dropped into the past, with the life we had lived, and a new world
Lay before us. I tell you, 'twas hard on the woman! But, stranger,
Look at her now, with her grown and half-grown daughters about her,
Smart as the best of them, setting the table and getting our supper,
Hopeful, resolute, light of heart and of hand—and, believe me,
That's just the way she has been ever since: after having her cry out
Over her young ones that morning, she turned a face like the sunrise
Westward—never a tear from that time, nor a word of repining!

Novelty tickles the young; and the children, seeing the world move
Slowly and leisurely past, through the rolled-up sides of the canvas,
Shouted and laughed, and thought there was nothing but fun in a journey.

Entered according to Act of Congress, in the year 1874, by Harper and Brothers, in the Office of the Librarian of Congress, at Washington.

Vol. XLIX.—No. 293.—41

"THOUGHT THERE WAS NOTHING BUT FUN IN A JOURNEY."

Tired of that, they walked, or romped with the dog by the road-side,
 Racing, gathering flowers, and picking and stringing the berries;
 Tired of that, sometimes they rode on the backs of the oxen;
 Tired of every thing else, they fell asleep in the wagon,
 Spite of the jolts: what wouldn't we give to sleep as a boy sleeps?
 Then they had something to do when we camped at noon or at night-fall,
 Fetching sticks for the fire, while I looked after the oxen.

So we journeyed day after day, and night after night slept
 Under our canvas, or lay on the ground rolled up in our blankets;
 Leaving the cities behind us, pushing on into the backwoods,
 Past the scattered settlements, fording the streams; then the timber
 Dwindled and disappeared; and on the great prairies the sun rose
 Over the stern of our wagon and set on the horns of the oxen,
 Morning and night; then forests once more; and the trail that we followed
 Brought us into these woods. We meant to have gone on and settled
 Over on Big Buck Branch, where one of our neighbors, John Osmond,
 Going before, had fenced his claim and rigged up a saw-mill.
 Here we camped at night, and here what Molly calls God's hand
 Interfered with our plans in the way I am going to tell you.
 After a close and sultry day in September, the night came
 Breathless and hot. We had halted here in the gathering twilight,
 Choosing our camping ground where fuel and water were plenty;
 Woods, great woods all about us, only on one side the creek there
 Flowed through the grassy bottom much as you see it at present.
 I had unyoked and watered the poor lolling cattle, and left them

Deep in the wild grass, tethered, feeding, and fighting mosquitoes.
 Then in the woods rang the sound of an axe, and I was the chopper,
 Slashing away at the tops of a whitewood fallen in the forest,
 Throwing off sticks and chips which the two boys caught up and ran with.
 Molly, intent on her housekeeping, minding the baby, arranging
 Every thing for our comfort, was in and out of the wagon;
 Robbie already had run with a pail and brought water to cook with;
 Then in the darkening woods shot up the blaze of our camp-fire,
 Cheerful and bright; and soon the savory smell of our cooking
 Made us deliciously hungry—steaming coffee and stewing
 Prairie chickens: I shot them that afternoon from our wagon.

After supper the little ones said their prayers to their mother,
 Kneeling under the great gaunt trees, in the gleam of the fire-light.
 Molly then (she is one of the pious sort, did I tell you?)
 Prayed for us all—a short prayer that we might be kept until morning.
 Little the poor girl knew where the morning would find us! It makes me—
 Well, yes, soft is the word, when I think of that prayer and what followed.

This is the very spot. Here (fill your pipe again, stranger),
 After making our bed—that is, just spreading our blankets
 On the dry ground—we stood, the mother and I, for a long while
 Hand in hand, that night, and looked at our six little shavers,
 All asleep in their nests, either in or under the wagon—
 Robbie, and Johnny, and Jane, and Tommy, and Bess, and the baby—
 None of your puny sort—cheeks brown and handsome as russets:
 Here in the great still woods we watched them, with curious feelings,
 Asking ourselves again and again if we had done wisely
 Making this journey, and wasn't it all a fool-hardy adventure?
 Each knew well enough what the other was thinking: then Molly—
 "God will take care of them and of us," says she, "if we trust Him."
 'Twasn't for me to dispute her; but somehow I have a notion,
 Praying our best is doing our best for ourselves and each other;
 Trust in God is believing that, after we have done our part,
 He will look out for the rest; anyhow, it is useless to worry,

"AFTER SUPPER THE LITTLE ONES SAID THEIR PRAYERS TO THEIR MOTHER."

Whether He does or He doesn't; and so I reasoned and acted.
 Though, after all's been said, there's certainly something or other,
 Call it the finger of God, Fate, Providence, what you've a mind to—
 Something that packs the cards in this game of life we are playing,
 So that, shuffle and cut and deal as we may, things do turn out—
 Well, to say the least, curiously. That's my sentiment, stranger.
 After what happened that night, I'm not the man to deny it.

I had been maybe three hours asleep, when the crow of our cooped-up
 Rooster, along about midnight, awoke me; and well I remember
 What a strange night it was—how quiet and ghostly and lonesome!
 Dark as Egypt all round our little traveling household,
 In the small, shadowy space half lit by our flickering night-fire.
 Not a leaf rustled; no breath, no sound, except the incessant,
 Teasing noise of the vixenish katydids contradicting.
 Then there was all at once a commotion: the branches above us
 Swayed and clashed, and all the woods seemed to rock for a moment.
 Then it passed off in a roar like the sea, and again there was silence;
 Even the katydids had stopped their scolding to listen.
 Nature seemed to be holding her breath and waiting for something.

"Can't you sleep, Thomas?" says Molly. "Are you awake too?" I said. "Yes, dear.
 I haven't slept for an hour; my mind is full of forebodings.
 What can it mean? I feel there's something dreadful impending!
 Twice to-night I have dreamed that a limb from one of the trees fell
 Right where we are! Each time I woke with a scream—did you hear me?—
 Just as 'twas falling on you. Sleep again I can not and dare not,
 For if I do I am sure I shall dream the same dream for a third time.
 Hark!" said she; "what is that?"

A singular noise in the southwest;
 Not like the roar we had heard when the wind died away in the distance—
 Sharper and stronger than that; and, instead of dying, increasing,
 Coming toward us—a terrible rushing and howling and crashing;
 Louder and louder, as if all the trees in the forest were falling;
 Nearer and nearer, a deafening, thundering roar! Then I started;
 "Molly!" I shrieked, "the tornado!" and made a dash at the children,
 Snatched them out of their beds, all dazed and frightened and stupid,
 Half in the dark, in the awfulest din and confusion.

Poor Molly
 Didn't know which way to turn, but flung herself on them, to shield them.
 "Run!" I yelled; "to the creek!" In a moment the crash would be on us.
 "Run! for your lives! Oh Heavens! not that way!" Nobody heard me.
 Catching my arms full—one by the wrist—the mother beside me
 Bearing her part—Heaven only knows how, we carried, we dragged them
 Down the dark slope, in the roar of a hundred Niagaras plunging,
 Blackness ahead, and the big trees screeching and breaking and crashing
 Close at our heels, all about us—the tops of one whipped us in falling!
 Then the wind took us, and—

Well, the next minute I found myself lying
 Down in the grass there, clinging, and holding on to the small fry,
 In a mad storm of leaves and broken branches and hail-stones—
 Howling darkness, and jaws of lightning that showed us the world all
 Rushing and streaming one way. I can't say how long it lasted,
 Maybe ten minutes, not more; then all of a sudden the lull came.

Counting heads, I found that three of the children were with me,
 Cuddled close; but where all the while were the rest, and their mother?
 Never a one to be seen, as I looked by the quivering flashes—
 Only the grass blown flat, ironed down, all along by the creek shore.
 Soon as the wind would permit, I rose to my feet, braced against it,
 Shouted, and listened; when out of the dire confusion of noises
 Came a long, dismal bellow from one of my poor frightened oxen.
 Then a child cried near by. Then her voice, "Are you all safe there?"

"BLACKNESS AHEAD, AND THE BIG TREES SCREECHING AND BREAKING AND CRASHING."

"Yes. Where are you?" I cried. "Here! under the bank, by the water, Tommy and Jennie—nobody hurt—just where the wind dropped us. Oh, what a merciful Providence! Did you say—did you say *all* safe? Baby and all?"

"The baby!" I said. "Haven't you got the baby?" That brought her up from the creek with a shriek—shall I ever forget it? That, or the look she gave, as she rushed out before me, her long black hair flying wild in the wind, face white, in a sheet of white lightning! "Oh, my baby!" she said; "you had it—I felt its bed empty!" "Yes, I remember—I took it, I gave it to some one—to Jennie! Then I put both in your arms."

"Oh, father!" says Jennie, "you gave me something wrapped up in a blanket. I hugged it tight, but it squirmed so—I was so frightened—it scratched and jumped from my arms—and, oh, father! 'Twasn't the baby, I know!" And that was the way of it: I had thrust my hand into the wagon, and caught up something I found there under the blanket. Consider the horrible uproar and hubbub, darkness and fright, and then maybe you'll understand how a man can make such a blunder: the baby had rolled from its place, and the blanket dropped on the cat, I suppose, when I took up the last of the children.

Well, there we were, and it's easy to think of pleasanter places one might prefer to be in, if he had his choice in the matter: young ones shivering, crying, mother almost distracted, none of us more than half dressed, just the clothes on which we had slept in; dark as Egypt again, not even the lightning to guide us into the terrible windfall in search of our camp and the baby; weather grown suddenly cold, and five hours yet until daylight!

All was quiet again, very much as if nothing had happened—only occasional flurries of wind and spatters of cold rain; then I looked up, and, behold! the stars were shining; I saw them glance through flying clouds, and the twisted and intricate branches, where I was struggling so fiercely to find a way back to the wagon.

I had paused for the twentieth time to hear if a child cried,
 Hoping still against fate, when they shone out, oh, so serenely!
 Over my head, those stars, looking down on my rage and impatience.
 Something entered my soul with their beams—I could never explain it;
 'Twasn't just what you might call a pious notion that took me—
 But from that time I was calm, under all my outward excitement;
 Calm deep down in my heart, and prepared for whatever might happen.

Still it was frightful business—tearing my way through the tree-tops,
 Climbing about on the huge crossed trunks and limbs, till a glimmer
 Caught my eye through the brush—a blinking brand of our camp-fire,
 Scattered, but not quite extinguished, for all the rain and the whirlwind.
 All this time I had kept up a frequent hallooing to Molly,
 Brooding her half-naked young ones just outside of the windfall,
 Waiting in terror and cold to hear the worst. Only Robbie,
 Stout little fellow, was with me; wherever I clambered, he followed.
 "Father!" he cried, "see the light!" and forward we scrambled to reach it—
 Scraped together what sticks and leaves we could feel with our fingers.
 Every thing, though, was so damp that, with all our puffing and blowing,
 Never a blaze would start (our matches were left in the wagon)—
 Till, all at once, a flash! I looked, and there was the rogue, Sir,
 Tearing his shirt into strips of cotton to kindle the fire with!
 "Mother won't care," says he. "What's a shirt, if we only find baby?"

On went branches and bark. There, in the still light, all around us
 Lay the tremendous tangle—timber scattered like jack-straws;
 Shaggy and shadowy masses starting out of the darkness;
 Upright roots, with their cart-loads of earth—all the work of a minute!
 Still no sign of a wagon; no cry in the terrible silence—
 Only the hiss of the flames, and the hiss and crackle of green stuff
 Where they streamed into the hair of a giant pine-tree, and lit up
 All that part of the windfall. Near by, on a bough, a small bird sat,
 Dazed: you might almost have caught it. Just then I saw something white gleam,
 Rushed for it, tore through the brush; and there, Sir, if you'll believe me,
 In a rough pen of trees slung about in the carelessst fashion,

"TEARING HIS SHIRT INTO STRIPS OF COTTON TO KINDLE THE FIRE WITH."

"AND THERE, AS I LIVE, WAS THE BABY."

Safe in the midst of 'em, only the tongue smashed up and the canvas
 Damaged a trifle— Excuse me, I never could get through the story,
 Just along here, without being a little mite womanish!—Well, Sir,
 There, as I said, was the wagon, and there, as I live, was the baby,
 Keeled over into a basket, sleeping, peaceful as could be!
 That was the wonder—to think how she had refused to be quiet
 Many a night, to sleep at last through a tearing tornado!
 Strange, too, the moment I saw her she woke, and, as if she was bound to
 Make up for time she had lost, set up such a musical screeching
 In the wild woods as I guess never went to the heart of a gladder
 Mother than Molly. No need for Robbie to yell, "We have found her!"

Soon, by the help of the light, I had brought the whole tribe through the windfall.
 But, after all, the thing did look mighty bad to me, stranger!
 There was our poor dog killed by a tree that had crashed on our camp-fire;
 Dinner-pot smashed; likewise the hen-coop beside it demolished;
 Wagon disabled; and that and all our earthly possessions
 Fast in a snarl of big logs which I never expected to cut through:
 Fifteen miles to Buck Branch, and not a hand nearer to help us!

Well, I was blue! The woman of course went into hysterics,
 Hugging her baby, at first; then came to me with her comfort.
 "Don't be down-hearted!" she said. "Oh dear! do look at that hen-coop!
 Pull off the branch, why don't ye? maybe the poor things are alive yet."
 So I took off the rubbish; three pullets quite stiff; but the rooster
 Fluttered a little, got up, looked about him, and shook out his feathers,
 Saw his three wives lying dead at his feet, his house all in ruins,
 Hopped to a stump, where he flapped his red wings full in the fire-light,
 Stretched up his neck, and crowed! superb, courageous, defiant,
 Flinging his note of cheer out into the night, till the echoes
 Crowed in the distance. The frightened, huddling, and shivering children
 Heard it, laughed, and took heart; and I said, "If that cockerel, after
 All that has happened to him, has pluck enough left him to crow with,
 What am I, to despair, with my wife and children around me,
 Safe, and with hands to shape our future out of this chaos?"

"STRETCHED UP HIS NECK, AND CROWED!"

Daylight came, and showed the work that was laid out before me.
There was the windfall—a gap in the woods far off in the southwest,
Skipping the creek, and then stretching as far away in the northeast—
Just a big swath through the timber, as if a giant had mowed it!
What did I do? Went out and looked up my cattle, the first thing;
Then set to work with my axe, getting poles and bark for a cabin;
Drove to Buck Branch with a drag, sold one yoke of oxen, and brought back
Things that we needed the most; cut grass for the cattle, come winter—
Settled, in short, where we were, because we couldn't well help it.

Watching my chance, by degrees I burned off and logged off the windfall,

Turning it into a wheat lot that hasn't its beat in the country.
Taken together, the woodland, and bottom, and prairie beyond there
Make the best kind of a farm. And soon we began to have neighbors.
Table and chairs took the place of blocks and slabs in our cabin;
Cabin itself gave way in a couple of years to a log-house;
Log-house at last to a framed house—this is the article, stranger;
Not the most elegant mansion—snug, though, and much at your service.
School-house and meeting-house followed. And then came the row with the redskins.
Fearful times! We escaped—and that's a strange part of my story.
Over on Big Buck Branch, where we had intended to settle,
Every man, woman, and child—except our old neighbor, John Osmond,
He was with us at the time—was murdered, or driven for refuge
Into the woods (it was winter), and all their houses and barns burned—
Grist-mill, saw-mill, store, there wasn't a building left standing.
We on the creek took in the poor wretches, and often that winter,
Not for ourselves alone, had reason to bless the tornado—
Yes, and Him who sent it, and with a twirl of His finger
Tied us up here in the woods, in the mighty hard knot of a windfall.

That's the story. Beg pardon! your pipe is out. But there's Nannie—
Baby worth saving, you think?—just coming to call us to supper.

J. T. TROWBRIDGE.

"BABY WORTH SAVING, YOU THINK?"

DECORATIVE ART AND ARCHITECTURE IN ENGLAND.

BY M. D. CONWAY.

[First Paper.]

MICHAEL ANGELO was once commissioned to lead in the destruction of the beautiful villas around Florence. He of all men! The expelled Medici, now of papal dignity, were menacing the city. The first thought of the great artist was to save the Campanile, and he covered that noble work of Giotto with protecting wool-sacks. But the suburban villas must not stand to give aid to the enemy, and at word of command he started out, and for once the track of the great artist was indicated in the destruction instead of in the creation of beautiful things. But he came upon one house whose wall was covered with a beautiful fresco, and he had not the heart to destroy it; the soul of the artist held back the hand of the patriot, and in the field of desolation one mansion remained standing alone—saved by the protecting genius of Beauty.

It is but one incident in the long history of the career of Use and Beauty through the world, hand in hand, undivorceable. All our science is engaged in spelling out their story. Every spot of color on bird or insect it finds to be the trace of a utility. What weary struggles carried on through ages to mimic blossom and leaf, and so hide from pursuing foes! The same force works on when the art of man enters the arena for new creation. The thin and feeble blossom of the brier passes through all the phases of culture until it becomes the full rose of the horticulturist, like unto some little maiden's face for size and lustre, all by merest mercenary influence. Our fairest flowers have migrated from East to West, cherished and preserved for highest use as oracles and symbols of successive goddesses and saints, transplanted from temple courts to flourish under the holier chrisom of convent gardens. Despite his proverb, man has painted the lily and adorned the rose, until we may almost say with the Persian Nizâmi, "Every flower growing in the many-colored garden of the earth is a drop of blood from the heart of a man." Out of a dry and hard necessity comes still the beauty of the world. Behind

our tinted Salviati glass, our painted Sèvres china and Minton majolica and shining silver plate, are the long rows of pallid faces inhaling poison in stifling rooms, breathing death that they may live. Sad experience is the prelude to each charming symphony. The noblest statues and paintings which the world cherishes were wrought in a "sad sincerity;" in the divine depths of sorrow were found the quarries from which emerged the Apollo Belvidere and the Laocoön; the blood of great hearts supplied the chief pigment of the Dresden Madonna and the Transfiguration; and the magnificent frescoes of Italian churches were born of the hopes and fears of millions, for whom they meant not picturesque beauty, but a world's redemption. Man in his best epochs of art has thus carried on the ancient creative power of Nature, giving her potential germs and forms a new blossoming under the heat of his never-ending battle of life. And where it is not thus impelled by nor surrendered to this utilitarian, this most real, force, what does Art amount to? Mere copying of works which denote that force in the past; mere Art Ritualism, crying to other ages, Give us of your oil, for our lamps are gone out!

If Michael Angelo could to-day be set on a work of general demolition in London, one may fear it would hardly require patriotism to encourage his zeal. Would he, in what the London *Times* once called "this our ugly but not altogether uncomfortable metropolis," have reached a single building which would have made him pause? Here and there he might meet one of those ancient mansions whose bricks have hardened into one solid stone that will stand, as Carlyle once said, "till Gabriel's trump blows it down;" but of the miles of modern houses in which—to remember the Chelsea sage again—"every brick is a lie," one may fancy that but few would be saved by any genius of Beauty.

And yet this is, after all, not so certain. That an artist filled with iconoclastic rage might quickly dispatch most of the man-

sious and many of the churches of English suburbs, erected specially for beauty and effect, is quite probable; but there are a number of buildings built without reference to beauty which might perhaps have made Michael Angelo pause with a feeling not unrelated to admiration. If any one will stand beside the Thames River near Charing Cross and gaze for a while on the tremendous sections of the railway bridge there, at its huge iron supports and girders—if he will then go up on it and realize its vast breadth, see four trains passing each other, with room enough between, and room enough for the men and women moving to and fro on their own side-path—he will surely bear away an impression of grandeur. Nay, there will blend with it an impression of beauty also: there is no arch, no slightest foliation or other prettiness, not even a relief to the iron hue save the gilded heads of certain enormous rivets and the gilded monograms of the railway company fixed on the supports of the triple gas-lamps; the bridge is not even straight; and yet beauty there is, and it arises from two sources. The first is the beauty of adequacy for a purpose, involving at once strength and proportion, suggesting what the Greeks may have meant when, in their myth, they wedded Aphrodite to Vulcan. The second is a moral beauty, almost indescribable in physical terms, but resembling the simplicity which expresses character—the subtle charm playing unconsciously through eye and voice of even a homely man, who in word and act is content with the simple truth. In fact, the beauty of this Charing Cross bridge, which has least aimed at architectural effect among those spanning the Thames, is closely related to its ugliness. If any one find this assertion paradoxical, he shall at least find it not doubtful if he can and will do three things—read Oersted's chapter on "Ugliness in Nature," observe carefully Turner's "Rain, Wind, and Speed" (a railway train thundering over a viaduct through English rain and fog), and finally give twenty minutes to the bridge in question, especially taking care to pass beneath it on one of the small iron steamers (water omnibuses) that ply the river. When afterward he shall see the many ornaments of the present copied from the utilities of the past—the towers, steeples, cupolas, crenelles—and remember that they were constructed originally for landmarks, cross-bows, and the watches of war, he will acquire an imaginative respect for this unpretending product of the Iron Age. To my own mind it appears by no means inconceivable (except that the structure looks as if built for eternity) that when Macaulay's artistic New Zealander comes he may sit upon a broken column of St. Paul's to sketch the ruins of Charing Cross bridge!

He who explores the cities of England to

discover that kind of beauty in architecture which is familiar in other lands will not find it. In a late satire on the royal family published in London, *The Silliad*, the Queen is represented as reproaching her eldest son with not taking more after his father, and interesting himself in the industrial affairs of the country. The poor Prince of Wales can only reply, "I've not a model-farming soul." And a somewhat similar answer is all that England can return to the immeasurable scoldings poured out upon her because she can not do the work of the old Italian and Dutch masters. But the time was when England had a reputation such as no other country possessed for just one thing—genuineness of work. It was almost proverbial in Europe to say that you could get pretty things in every capital on the Continent, but if you wanted a thing which would do what it professed to do—the knife that would cut, the carriage that would bear and wear—you must go to England for it. Nay, I remember in my boyhood in Virginia that the belief in the solid character of every thing English was such that even articles which could by no possible means have come from England were yet called "English" to enhance their value; not merely watches made in New England, but I have known American fanciers commend a bird unknown to England by calling it the "English mocking-bird!" All this was a droll re-appearance of the reputation which Eastern gold once had in England, the word "sterling" being a relic of "Easterling," as applied to the British pound of silver when represented in gold. But the most enthusiastic Briton must admit that the virtue of the "English" label has followed that of the "Easterling," and is now a mere survival. The absence of prettiness remains, but the old compensation of genuineness can no longer be claimed, or certainly not in the same general way. The genuine and thorough thing is now exceptional enough to strike one as almost ornamental. But still the word "solidity" has a meaning in this country, and whenever Englishmen undertake to have any thing done, their first effort is to have it substantial and useful. They may not get it, but that is what they pay for, and a real demand is likely in the long-run to overtake its real supply. It has already to some extent overtaken it, and that not alone in the great viaducts and railway bridges which the age of steam has called about it. An age of municipal and civic development has found for the buildings it requires a representative architect in Mr. Waterhouse, who has erected most of the magnificent town-halls and court-houses of the great provincial cities. These vast, and in a certain sense beautiful, buildings are the only ones that can compare with the old cathedrals and castles of England, built with

ASSIZE COURT, MANCHESTER.

as serious a purpose as theirs, and with as physiognomical a relation to the age that produced them. Mr. Waterhouse takes the Gothic style for his basis, just as a pomologist might take a russet as the basis of the apple he means to produce, and, like him, modifies only in obedience to the fundamental law of the style he has selected. His Gothic building has in it nothing capricious or eccentric. So genuinely as, under change of conditions and needs, the bent and bound boughs were copied in the first pointed stone arch, even so, by lawful adaptation, may the window point become more obtuse or the lancets more luminous; but the lesson of this style, which, above all others, has no part or trait not traceable to a use, is never lost, and the Gothic of Mr. Waterhouse is the natural evolution of that found in Westminster Abbey. In one of his buildings, and one of the best structures in the world, the Manchester Assize Court, I could discover but two things which appeared to me without special use or meaning. These were two small figures, a snail and a frog, carved in granite, sitting in the angles of a wall on each side of the main doorway. Of course these may not be mere *jeux*; they may have some connection with a previous bit of eccentricity in an older building (such as it is often desirable to copy and preserve for archaeological reasons; but these two forms, each about as large as one's two fists, were the only things in the vast building which appeared "not to the point." In going over this building I speedily found that

it would not do to pass any thing, as the most casual-seeming bit of ornament was apt to possess a root in history. Thus the superstructure of the great portico at the entrance is supported by detached shafts of solid granite two feet in diameter, which stretch out into foliage as they meet the low roof; but on examination it is discovered that framed in this foliage are finely carved and most appropriate representations of ancient modes of punishment—persons undergoing the pillory or some ordeal, broken on the wheel, wearing the mask, or bridle for scolds, and the rest. On the outside wall the decoration of the upper edge of a large corbel is twined about the words, "He shall judge thy people with righteousness, and thy poor with judgment." Over a gate leading to the judges' residence the tympanum of the gable is adorned with a fine mezzorilievo of the judgment of Solomon. On each side of the grand entrance are carved two chained dogs, imposing enough to be mythologically descended from Cerberus and Orthros themselves. There are but two figures on the outer walls, one of "Justice," another of "Mercy." The building is a parallelogram in form, with a frontage of 335 feet. Within is a grand hall 100 feet long, 50 feet wide, 75 feet high, with an open timber roof of eight carved bays, the principals having moulded brackets and ribs forming pointed arches, and the spandrels filled in with elegant tracery. Carved figures hold the chandeliers. Around this hall, which is for state receptions and banquets, run in ancient let-

MINTON TILE.

ters the words of the Great Charter: "Nullus liber homo capiatur vel imprisonetur aut disseisiatur de aliquo libero tenemento suo vel libertatibus vel liberis consuetudinibus suis, aut utlagetur aut exulet aut aliquo modo destruat, nec super eum ibimus nec super eum mittimus, nisi per legale iudicium parium suorum vel per legem terræ. Nulli vendemus nulli negabimus aut differemus rectum vel iudiciam." This makes about as beautiful a cornice edging as can well be imagined. The last sentence is repeated on a stained window at the end of the hall:

To none will we sell
 To none will we deny
 To none will we delay
 Right or Justice.

The subject of the window illustrates the history of the Great Charter—King John in the centre, and Archbishop Langton and Chief Baron Robert Fitzwalter on either side. There are three miles of corridors, all with a dado of tiles more than a yard deep, of a rich brown tint, and capped with a scroll made of lighter colors. On the whole, I can hardly express adequately my admiration of this superb building, the total cost of which was £130,000. In the centre of Manchester the same architect has nearly completed the outer structure of a larger building, a town-hall, which will cost £1,000,000. Rich and admirable as it is, it can never, on account of the crowding of houses around it, and the irregularity of the ground upon which it is built, be so effective in appearance as the Assize Court. When I went through it there was as yet no decoration, but instead, the rather sombre sight of its workmen on strike, holding a meeting in one of the rooms; but I was impressed by the beautiful variety of color secured by a careful mingling of English, Scotch, and Irish granites grouped as double stems in the balustrade of a spiral stairway. The Irish granite is a bluish-gray, the Scotch has a faint red tint, and the English Shapfels has salmon-colored spars, which are large as raisins. They all take a beautiful polish, and I could not help thinking that for a large public building the effect was better than if they had been marble.

One other of the immense buildings which have become so characteristic of the populous centres of England I must mention, namely, the new Midland Railway Station at St. Pancras, in London. This is unquestionably the finest railway station in the world, and it is the chief work of Sir Gilbert Scott. It is a vast pile, of which every outward detail is graceful and substantial, its turrets and clock-tower superb. The great tower included in its plan has stopped only a little way above the roof, but whether its reasons for ascending no further just now are financial or architectural I can not say. I must say, however, that this immense building conveys an unpleasant impression of being out of place. It implies a park, or at least a larger and more picturesque space than the irregular and ugly one at King's Cross, to secure the perspective needed for any sight of it as a whole. Entering, we find ourselves beneath a vast span of iron and glass, which is almost like a sky; but the comparatively little work that as yet goes on beneath, and the paucity of trains, make this enormous space appear desolate. The front part of the building is a hotel. It has been decorated by Robert Sang, and furnished by Gillow, in the most expensive style, and certainly presents some rich interiors. The reading-room has green cloth-paper, and a ceiling gay with huge leaf frescoes; it is divided by a double arch with gilded architraves. The mantel-pieces are of dark marble, with two small pillars of yellow marble set

KIDDERMINSTER CARPET—FERN DESIGN.

on either side. The coffee-room has a general tone of drab, with touches of gold in the paper, and a sort of sarcophagus chimney-piece surmounted by an antique mirror of beveled glass. The sitting-room has red floral paper, and an imitation mosaic ceiling. One of the bedrooms which I visited had deep green paper (somewhat too suggestive of prussic acid), with gold lines and spots, and bed-curtains somewhat similar. The furniture was of heavy oak, tastefully carved. The halls and corridors have a dado of fine dark brown tiles, and bright fleur-de-lis paper above. All of which was rich, costly, and, with slight exceptions, by no means gaudy. Yet I could not altogether like it, or think the decorations entirely appropriate for a hotel. It looked as if there had been more exercise of ingenuity to find things costly than to find things beautiful. The salon, the reading-room, may naturally be made gorgeous, but the bedroom ought to be more quiet. One does not desire to sleep amidst purple and gold. The traveler who needs rest may well spare these things, which, however, he knows will not spare him; for if there is gold paper on the wall, there will be gold paper in the bill.

For its purpose it would be difficult to fancy, impossible to find, a more complete structure than "The Criterion," which the great

London caterers, Messrs. Spiers and Pond, have erected at Piccadilly Circus. This building includes social and private dining-rooms, room for *table d'hôte*, hall for public banquets and balls, restaurant, and buffet; and beneath all these a theatre large enough to entertain a thousand people. The architect, Mr. Thomas Verity, plainly had it in his mind to raise a great gastronomic temple, and when one enters the door what he sees on every side is the apotheosis of eating. Through an archway we enter, and find ourselves amidst the French Renaissance. The façade outside, and the doorway, with its glazed framing and superb bronze columns, make one feel that he is about to dine superbly. Whether he does so I know not. I fear that the French Renaissance hardly extends to the culinary art of the establishment, for that would imply a revolution in the Briton's constitution. Mr. Wyon has placed some fair sculptures, the Seasons, etc., in the niches and on spandrels of the wall outside, but the inside decorations of Mr. Simpson are truly, in the words of Messrs. Spiers and Pond, "upon a scale which has hitherto never been attempted." The grand hall rises squarely through three stories to a light Mansard-roof, from which sun-burners blaze down at night, and outside of which is a promenade commanding a fine view of

• MINTON TILES FOR MANTEL

London. All of the sides of this grand and lofty hall are of tiles made for this establishment, and combining to form large pictures, the subjects of which were designed and painted by A. W. Coke. Over the right-hand door, leading to the restaurant, is a semi-classical scene of youth and maid by the sea-side gathering in fish; on the opposite side, over the door opening into the buffet, is a picture of two girls in a wheat field, where there is an apple-tree, the one attending to the sheaves, the other to the apples; around the lower hall are—still in tile mosaic—large figures of Euterpe and Terpsichore (for there will be music and dancing above), Pomona, Flora, Bacchus, and, of course, Diana, goddess of venison. The floor of the hall is as fine as any mosaic in London, and is adorned at the edges with the monograms of the firm. In the restaurant there are all manner of allegorical figures on the walls, the Seasons, and the genii which dig and delve and hunt, all with the object that humanity shall be fed. In the buffet there are charming tile pictures representing chubby boys and girls; one party up the tree gathering fruits, the other beneath

catching the same and putting them into baskets; in each picture a different tree and fruit. On one side of the main stairway is the figure of a boy stealing up to a bird's nest, over which a bird hovers; opposite, the boy has the nest, the bird flies away. This device is not immoral; it means that plovers' eggs are on the bill of fare. One of the finest things in this staircase is an ebony hand-railing, three inches in diameter, with plated silver mountings. Also a very fine effect has been produced by framing the doorways in white majolica, although greater simplicity in the designs than human faces festooned with flowers would, I suspect, have been better. I must not omit to mention that the cornice inside the grand hall, at the top of the first and here floorless story, has the unique ornament of sentences from Shakspeare running all around the walls with picturesque lettering:

"None here, he hopes,
In all this noble bevy, has brought with her
One care abroad: he would have all as merry
As first-good company, good wine, good welcome,
Can make good people."

"A good digestion to you all: and, once more,
I shower a welcome on you;—Welcome all."

ALBERT MEMORIAL, HYDE PARK.

ALBERT MEMORIAL—EUROPE.

So it is that money enough enables common folk now to dine in palaces and enjoy banquets quite as royally served and surrounded as Bluff Harry offered to Cardinal Wolsey and the lords and ladies at the Presence Chamber in York Place. But even that monarch could not have entertained his guests so luxuriously in one particular as Messrs. Spiers and Pond theirs; for these, having dined, may pass through a door and descend by a stairway adorned with Muses and mirrors, and rich with floral clusters, to a theatre all glorious in blue and gold, cushioned chairs, boxes with curtains of yellow satin and lace, and a good drab background to set them off, and pass the rest of the evening in enjoyment of such real entertainments as are pretty sure to be secured where Artemus Ward's old friend Hingston is the dramatic caterer.

So far as most of the hotels and restaurants of London are concerned, one may with satisfaction follow the advice of the Duke of Gloster to Anne in the first act of *Richard III.*:

"Leave these sad designs
To him that hath more cause to be a mourner,
And presently repair to Crosby Place."

For the old Gothic palace in the city, which Sir John Crosby built on a piece of land with

one hundred and ten feet frontage, for which he paid a little over eleven pounds, which his widow sold to the duke who afterward became Richard III., and which in Shakspeare's time had fallen to the richest of Lord Mayors (Sir John Spencer), has now followed the course of so many royal buildings, and become the banqueting hall of the public. Crosby Hall is haunted by memories of the great. It gives flavor to every thing one eats in it to know that it has been celebrated by Shakspeare, that from the year in which it was built (1466) it was associated with whatever has been most romantic in the history of London. Here Sir John Rest was installed as Lord Mayor in the days (1516) when the Lord Mayor's show meant something. The civic procession which accompanied him contained four giants, one unicorn, one dromedary, one camel, one ass, one dragon, six hobby-horses, and sixteen naked boys. Here resided Sir Thomas More, Under-Treasurer and Lord High Chancellor of England. Here he wrote his best works, and received the visits of Henry VIII. Here Erasmus visited the author of *Utopia*, whose domestic life he described: "With him you might imagine yourself in the academy of Plato; but I should do injustice to his house by comparing it to the academy of Plato,

where numbers and geometrical figures, and sometimes moral virtues, were the subjects of discussion; it would be more just to call it a school and an exercise of the Christian religion. All its inhabitants, male and female, applied their leisure to liberal studies and profitable reading, although piety was their first care. No wrangling, no idle word, was heard in it; every one did his duty with alacrity, and not without a temperate cheerfulness." In 1672 the hall was arranged for Non-conformist meetings. For ninety-seven years it was devoted to this purpose, and among those who preached here was Thomas Watson, who wrote the famous tract (*Heaven taken by Storm*) which converted Colonel Gardiner. It is not wonderful that its old splendors then began to depart. The *Mercury* of May 23, 1678, advertises a sale at Crosby Hall, where would be disposed of, among other things, "tapestry hangings, a good chariot, and a black girl about fifteen years of age." Then it became the office of the old East India Company; next a literary and scientific institute; next a wholesale wine warehouse; and at length came into the hands of its present proprietors, who have restored it to its original purpose by making it a banqueting-hall. They have preserved it, and stained its windows with portraits and pictures representing all its history. The decorations are in perfect keeping with the beautiful Gothic style of the building, and the colors seem to have expanded on it as a flower on its stem. One seems to be dining here in an older Guild-hall and at a daily Lord Mayor's banquet, with ancient Shakspearean characters for company. It is particularly entertaining to observe what a rich frieze can be secured for a hall in England by a skillful arrangement of the historic shields and coats of arms which belong to the country; while if some beautiful central figure on wall or glass is desired, it may be obtained in any one of the suggestive and mystical devices which are associated with the olden time—the boar, the lamb with its flag, and so on.

But neither the Criterion nor Crosby Hall furnishes, as I think, the same degree of beauty appropriate to dining-halls as may be found at the South Kensington Museum. Here one of the rooms was intrusted for decoration to the distinguished Professor of Fine Art at University College, Mr. Poynter. He has made exquisite designs for the tiles of which the walls are altogether composed. The simple blue and white colors, and the purely decorative character of the figures thus made, make one almost regret that these figures are not Chinese instead of classic or allegorical, in which case one might eat with a feeling of comfortable seclusion in a china dish. The regular dining-room

VOL. XLIX.—No. 293.—42

ALBERT MEMORIAL—CONTINUATION OF EAST FRONT—PAINTERS.

in the Museum was intrusted to Morris and Co., who have placed on the upper part of the walls a rich floral decoration of embossed plaster, colored (gray-green) by hand. The lower part of the wall, extending over two yards from the floor, consists of panels, on each of which is painted, on a gold ground, some allegorical figure. These figures represent the sun, the moon, and signs of the zodiac; they were designed by the famous pre-Raphaelist Burn Jones, and bear too much of that mystical light and expression which invest all forms and faces which come from his pencil to be gastronomically suggestive. In this respect neither Burn Jones nor the young artist (Murray) who painted his designs could rival the decorator of the Criterion; but one may dine at South Kensington amidst one of the pleasantest little picture-galleries in existence. When Ralph Waldo Emerson was last in London, a poet who wished to give him a dinner conceived the

happy thought of bringing him here, and the sage of Concord no doubt approximated his friend Alcott's ideal of "dining magnificently;" even the "bowls of sunshine" with which A. would replace wine were supplied by the rich stained windows of Morris, and by the brilliant white and gold of the restaurant which separates the two rooms that have been so exquisitely decorated.

There is no doubt that the barbaric element in English taste received a fresh accession of vigor with the advent of the Georges to England. What it was capable of, and what it found pleasing to the aristocratic butterflies who flitted around him whom they adored as "the first gentleman in Europe," may be discovered in the Pavilion at Brighton. That building may be regarded as the physiognomical monument of George IV. It is his interior projected into stone and decoration. The secret stairways and passages leading up to fictitious wardrobes,

really doorways to rooms which his majesty desired to visit, represent the prince who sent horsemen to trample down laborers at Peterloo whose only guilt was to discuss their wrongs; the bizarre carvings, which make fine stone look like terra cotta, illustrate the fop who had come to prefer figment to fact. The interior decorations do not represent so well the monarch whom Thackeray analyzed, and found in his hands only a heap of pad, paint, gold-lace, but no man at all. Those frescoes were made during the first furor which occurred in England about Chinese and Japanese art; and, though ludicrously gorgeous, they are not without a certain interest, arising from the boundless freedom of their design and colors. How this can be it will be difficult for my reader to imagine, when he is told that the walls are covered with large dragons (life size, one might say, if dragons existed), serpents, wild cormorant-like birds, all having a grand field-day amidst ladies and pleasure-grounds. The pillars are like barbers' poles, with the archæological serpent twined around each instead of the red stripe. The Pavilion is said to have found in Mr. P. T. Barnum its only admirer. English critics have been rather hard upon it. Sydney Smith said that the structure looked "as if the dome of St. Paul's had come down to Brighton and pupped." William Cobbett thought that "a good idea of the building might be formed by placing the pointed half of a large turnip upon the middle of a board, with four smaller ones at the corners." The main intent of the building is to imitate a Chinese pagoda, and it was with that aim that the Prince of Wales (for he seems to have been mainly his own architect) committed this enormity. Two years ago the British Association for the Advancement of Science gathered for its charming summer séances at Brighton, and the rooms of the Royal Pavilion were placed at their service. Never were the sessions of the association so well housed, but it was amusing to witness the difficulty which even eminent savants had in the rivalry between the attractions on the walls and those of their papers. On the whole, it is to be feared that the grotesque ornaments left by the Regent carried the day. On one occasion when a discussion occurred in the anthropological section on serpent-worshippers, the dragons and serpents on the wall were so appropriate that the room had the appearance of being frescoed for the archæological purposes of the society. But the ordinary contrast between the severe disquisitions of the scientific men and the luxuriant and barbaric colors and forms of the place was not so great as I witnessed recently in the same place. In the room which above all the rest might be regarded as the temple of vanity, a hundred ritualistic gentlemen and

ALBERT MEMORIAL—SOUTH FRONT—FIGURES AND METEOROL.

ALBERT MEMORIAL—CONTINUATION OF SOUTH FRONT—MUSICIANS.

ladies had gathered to hold a prayer-meeting! In the evening there was a ball in the same room, and then it appeared plainly what had been the final cause of the Brighton Pavilion. I may add that the large building which George IV. erected for his stable, and whose roof is a vast dome, is now the chief concert-room of Brighton, and that another outlying building of the place is occupied by a fair picture-gallery, a good museum, and a capital library. Huish, in his *Memoirs of George IV.*, says "Nothing could exceed the indignation of the people when the civil list came before Parliament, in May, 1816, and £50,000 were found to have been expended in furniture at Brighton, immediately after £534,000 had been voted for covering the excess of the civil list, occasioned entirely by the reckless extravagance of the Prince Regent, whose morning levees were not attended by men of science and of genius, who could have in-

stilled into his mind wholesome notions of practical economy; but the tailor, the upholsterer, the jeweler, and the shoe-maker were the regular attendants of his morning recreations." These mechanics were no doubt the worthiest folk who frequented the building they had made so fine, and probably most of them had to take their pay in royal smiles; but it would have relieved the indignant minds of the middle classes who chiefly had to supply the exorbitant civil list if they could have foreseen that their money was destined in the end to supply their favorite watering-place with its most agreeable, instructive, and useful institution.

When the English people look now upon the Royal Albert Hall they are quite warranted in drawing pleasant conclusions as to the change which has come over the spirit of royalty since the Pavilion was erected. Here we have the real monument of the late Prince

Consort, who, however he may be overrated, certainly did have the ambition to be associated with the progress of science and art in England. Since the erection of the Coliseum in Rome no building so stupendous and noble has been built as this. It is a pile worthy of Rome in its palmiest days; and, with its superb oval form, and external frieze and cornice moulded after the Elgin marbles, devoted to international industrial and art exhibitions and to music, it stands as grandly amidst the European civilization of to-day as the Parthenon stood in Greece. This palace of art, and the Albert monument in the park opposite, make the beauty-spot of London. The latter is beyond question the finest monumental structure in the world. This afternoon, while the golden sunset of a balmy spring day was glorifying the sky, I walked to it, passing by the old Kensington Palace, where the little girl was informed that she was Queen of England who has since had her name associated with her country's longest period of peace and prosperity, passing beneath the ancient patriarchal trees and through the gardens beautified by flowers and plants from every region of the world, until at length I saw the spire of the monument shining like flame through the boughs. There against the clear orange-tinted sky the monument stood forth, with its grand marbles at the four corners—Asia, with its genius mounted on a camel, America on her buffalo, Europe on her bull, Africa on her elephant, and each the centre of a representative group—and its noble reliefs and frescoes rising up to the winged angels at the top; and it appeared to me that every one of the 169 life-size portrait figures—the painters from Cimabue to Turner, the architects from Cheops to Gilbert Scott, who designed this monument, the sculptors from Chares to Thorwaldsen, nay, the very composers and poets from St. Ambrose to Rossini, from Homer to Goethe—had done something to raise this triumphal pile, about which their forms seem to move in stately procession. The architects and sculptors are the work of Philip; the poets, composers, and painters by Armstead; and while both have done admirably, it must be said that the reliefs by the latter can not be surpassed by any modern sculpture. The group of Michael Angelo, Raphael, and Leonardo da Vinci, the kneeling form of Fra Angelico, are works such as can only be ascribed to that fine degree where intellect passes beyond ordinary analysis, and is called genius.

I have already intimated one deduction that must be made from this monument. It only awaits now its central figure, that of Prince Albert; and when that form is placed under the grand canopy, it must stand as a type of the England of to-day that its highest and costliest homage is paid not to any great Englishman—not to Shakspeare, not

to Turner—but to a German, of whom it is certain that had he not been a prince, he could never have excited so much attention as a thousand others of his countrymen. But there is another side to this. The inscription runs: "Queen Victoria and her people to the memory of Albert, Prince Consort, as a tribute of their gratitude for a life devoted to the public good." Mediocre though he was, he will sit there surrounded by the allegorical representations of art, commerce, and the various types of peaceful civilization, to which he did unquestionably devote himself. And it will remain that the noblest monument in Europe has been raised not to any brilliant, devastator of human homes, not to any royal oppressor or scheming diplomatist, but to an ordinary man who used the position and means intrusted to him for the refinement and moral well-being of the country that adopted him. While the legend of one section of Europe is Napoleonic, there is some significance in the fact that Albert should have transmitted that of another section; and the essential—the moral—beauty of every admirable monument is thus not wanting to that which graces the largest and wealthiest city of the civilized world.

There is some reason why the English artists should have done their best work upon the monument of Prince Albert. He may be regarded as the first man to teach this country that money might well be largely expended for the encouragement of fine art, and that it had artists capable of the best work, if the means were adequately supplied to them. He was the means of employing scores of fine brains that had otherwise been unable to make their mark on the country, and he extorted from a grumbling shop-keeping public the splendors which now render the South Kensington Museum and its surrounding institutions an art university for the world. Very different have been the resources and rewards of the artists who have built and adorned the structures I have been mentioning from those which were alone available when the frescoes were placed in the corridors of the Houses of Parliament. Nevertheless, the Prince Consort himself had to be taught by a German artist to look around him for the ability which was needed for English work. When he was appointed the commissioner for the decoration of the Houses of Parliament (1841) he made overtures to Cornelius to come over and do the work. The German artist replied, "Why should you come to me when you have the man by your side—Dyce?" Dyce, who had studied at Rome with Cornelius and Overbeck, was then professor in the School of Design at Somerset House; but he was little known as an artist, and had not competed when designs for the decoration of Westminster Hall had been invited. The Prince Consort at once suggested to

him that he should send in a design, and having too little notice to make a new one he sent in a study he had made for a fresco for the archbishop's palace at Lambeth. It was severely criticised as too German, too papistical, etc.; but it was selected; and the result is the beautiful frescoes of the Baptism of Ethelbert in the House of Lords, and of the Mort d'Arthur in the Queen's robing-room. How slowly the ability of Dyce was recognized in England may be estimated by the fact that one of his most admired works—"Paul preaching to the Gentiles"—now in the South Kensington Museum, was employed at an art exhibition in Manchester as background to an umbrella stand!

But Prince Albert does not appear to have required a hint from Germany to appreciate the Scotch artist—son of a shoe-maker—whose superior genius overshadowed that of his wealthy Irish brother. Already, while Dyce was as yet undiscovered, Maclise had been appointed to set about those grand works which adorn the passage to the House of Commons. But the poor sums which were paid to both of these artists, and the grudging way in which they were dealt with, are now remembered only as a scandal. Dyce was sharply censured because he would not promise exact dates for the completion of his seven frescoes whose payment had been fixed by the Treasury at stated periods. Being rich, he offered to refund, but the Treasury, knowing that this would arouse some indignation, found it convenient to reply that "no precedent" could be found justifying its acceptance of his offer! Any one who looks upon Maclise's two pictures—"Trafalgar" and "Waterloo," the latter with three hundred figures, each perfect in line and expression—can only feel scandalized that Parliament proposed to pay him only £2000. Goaded by the outcry among the artists, it at length raised the sum to £10,000, but then grew sulky and cut off many of the commissions. Mr. Madox Brown, the eminent artist, recently declared in a lecture at Birmingham that Maclise paid £30,000 for the honor of making those pictures. He gave the whole of four years to them at a time when his regular work never brought him less than £10,000 a year. When Cornelius passed through a South German town the ovation was such as no prince could command. When Maclise had completed his frescoes the artists of London presented him with a gold chalk-holder. The Prince Consort did all he could to raise an enthusiasm for decorative art in this country, and to raise the wages and the position of the artist and of the artisan, and he succeeded measurably; but time has sadly shown that he must have imported the climate of Italy rather than its schools to make this a country of beautiful frescoes. Al-

though Cornelius magnanimously declined the overtures made to him, as above stated, in favor of Dyce, he consented to come to London and give advice concerning the proposed works. It was owing to him that frescoes were determined upon. He had seen the glory of the great frescoes of Munich; he could not see that in a few years they would be peeling off (as they are now) even there. Fortunately Maclise resolved to put on his frescoes in silica, and they are yet fairly preserved; but all the pictures in the Houses of Parliament have had to be retouched from time to time, and the silica has such an attraction for the atmospheric moisture that the effect of the colors is frequently diminished. While it is thus manifest that the corroding damp of the English climate is hostile to mural ornamentation, and fatal to external frescoes, there is a steady increase of the desire for such things. This has been especially manifested among the English nobility, who have every thing in the wide world that their hearts can desire excepting only the climate that might comport with luxury and beauty.

That barbaric element in the English aristocracy, of which I have before spoken, which Mr. Matthew Arnold half likes while he impales its eccentricities, is constantly revealed in the contrasts between the baronial halls of England and the majority of the homes of the wealthy middle class. One may take as a specimen of the taste of the latter any one of the fine club buildings on or near Pall Mall. Here one feels that he is stepping on floors which the Pompeians would have thought somewhat sombre, but still enjoyed, and amidst walls and arches which they would have recognized as familiar, though strangely gloomy. The halls are large and spacious, rather costly than rich, built of purest granites and marbles of various hue; the reading, dining, and smoking rooms are comparatively quiet, and built with a view to comfort alone. The clubs represent the desire of gentlemen of means to pass their hours of leisure in palaces, and these are secured at an expenditure of less than a hundred pounds each per annum, even in the best of such institutions. But when one visits the castles of the nobility, such as are still inhabited, the fondness for color and romance is at once manifest. They love their rooms now blue, now green, and again rose-colored. They love classical frescoes—nude Muses, Graces, and Cupids chiefly—on the ceilings, and gay tints on the walls even of sleeping-rooms. In a word, my lords were sensational, and in some cases descended to the most vulgar tricks, as in the case which Wordsworth rebuked so sternly. On the occasion of a visit to Dunkeld the poet was taken into a room lined with mirrors, and where an artificial water-fall was set going by a spring being touched. The

water-fall was reflected one way in the mirrors, but another way in the poet's face, and soon after in his rebuke of such mimicry of nature:

"Ever averse to pantomime,
Thee neither do they know, nor us
Thy servants, who can trifle so."

But what could come of a generation trained by the royal standard which thought it beautiful to tie oranges bought in Covent Garden Market on the twigs of trees at Hampton Court for a garden party? The mansions of the nobility are still really the most tawdry and inartistic in their decorations of any class that have attempted decorations—mere blazings of white and gold; but there is an increasing number of exceptions, represented especially by some ancient families which have manifested a laudable desire to have their halls painted with pictures of legends or historical events connected with their neighborhood or their ancestors. Mr. William B. Scott, artist and poet, who has done the best mural work of this character, has, I believe, fairly persuaded both the aristocracy and the artists of England that they can not have Italian frescoes in this country, and must depend upon mural painting. In exhibiting specimens of his own excellent mural painting before the Institute of British Architects, Mr. Scott made some interesting remarks on fresco. "In Italy," he said, "the reign of fresco was a little more than a century in length. All the earlier works remaining are in tempera. Not many years ago it was not unusual to hear people talk of all early Italian wall paintings as fresco, but it is quite certain no such thing exists; the earlier frescoes, such as Mantegna's works in the Eremitani Chapel, in Milan, are miserable ruins, while the tempera pictures of Giotto, a century and a half older, in the Arena Chapel, in Padua, for example, are perfect. How, then, did it come about that fresco, which died out in Italy very shortly after Michael Angelo finished the Capella Sistina, had a revival in this nineteenth century in Munich and London? A very short narrative of the circumstances attending this revival will, I think, be enough. The associated body of young German students assembled in Rome in the beginning of this century aspired to better things than they found existing in the lifeless art about them. They reverted to the study of earlier art, to the actual reproduction of former art. They were also pietists,

SPANDREL PICTURE.

at least the two leaders, Overbeck and Cornelius; they found that their patron saint, Fra Angelico, painted in fresco; they found also that all the mythological anti-religious pictures of the Bolognese school and later period were in oil: they determined on the revival of fresco. King Ludwig seconded them, and furnished an ample field for their success. The misfortune was, they did not go back far enough; they were self-denying men, and even the hardships and

difficulties of fresco had attractions for them. It was like a revival of Tudor in mistake for a revival of the best period of pointed architecture. Several English artists living in Rome, after the great success of the first very able works of these revivalists, my brother, David Scott, of Edinburgh, and William Dyce, for example, were smitten with the same feeling."

Some eight years ago I had the pleasure of seeing the mural paintings with which Mr. W. B. Scott has decorated Sir Walter Trevelyan's house at Wallington, in Northumberland. No person could have been more appropriately selected for the work than Mr. Scott, who passed much of his early life in that region, and has written such beautiful poems upon its ancient legends. The first (ground-floor) series of paintings is on panels inclosed between pilasters supporting arches, and a second is on the spandrels above the arches in a corridor leading to the bedrooms on the upper floor. The mansion is near the ancient Scottish Border, so haunted by romance, and near it may be still seen the remains of the ancient Roman wall. In four of the panels the subjects are (1) the building of the Roman wall; (2) King Egfrid offering the bishopric of Hexham to Cuthbert, hermit on Farne Island; (3) a descent of the Danes on the coast; (4) death of the Venerable Bede. On the opposite side are later subjects, but equally related to the same region of country: (1) "The Spur in the Dish"—the sign to the moss-trooper that the larder is empty; (2) Bernard Gilpin taking down the gage of battle in Rothbury Church; (3) Grace Darling and her father saving the shipwrecked crew; (4) "Iron and Coal"—the industry of the Tyne. The pilasters and the arcaded ends are also slightly decorated with foliage. The pictures on the spandrels are a series of eighteen on the old Border ballad of *Chevy Chase*. They are full

of spirit, and their rich colors are like bursts of sunset along the ancient corridor. So much, indeed, depends on this color that it is impossible to illustrate the artist's idea of mural painting in a magazine. Nevertheless I must confide to the imagination of my reader (page 631) one characteristic design, "Women looking out for their Husbands and Brothers after the Battle of Chevy Chase."

For his decoration of Penkill Castle, Ayrshire, Mr. Scott appropriately selected the old Scottish poem of *The King's Quair* or book (*cahier*, or quire of paper), said to have been written by James of Scotland when a prisoner at Windsor, in 1420, on his love for Jane, granddaughter of John of Gaunt. The first picture shows the king in prison, turning from his reading for his pen. According to the canto in which the king describes his rising with the matin bell, there is pictured the bell, the warder, the night-watch going home, etc. In the second picture he looks from his window and sees the fairest of womankind listening to the birds in the terraced garden. She has with her two maids and a little dog. Cupid—the Cupid of early art, who is a pretty youth—shoots the king from behind a hedge. The third picture represents the royal poet's dream, in which Master Cupid descends from the starry sphere to carry him away to the court of Venus to obtain her assistance. These three pictures run along a flight of stairs, and the series is taken up with the next flight. In the fourth picture the poet finds all the lovers of history at the shrine of Venus. James prays on his knees to her, but she sends him to Dame Minerva's court of wisdom for advice. Then we have the poet at the court of Minerva; next Lady Jane sending off the carrier-pigeon; and finally the royal poet receiving it. It requires but little reflection for any one to realize that to an ancient baronial castle such a series of paintings as this would be as the breathing of a soul beneath its gray ribs of rock. It must be mainly for the want of such pictures in them that servant-maids and children so often find ghosts rustling along old corridors and haunting antique stairways.

The castle of the Earl of Durham is graced by a fine stained window, illustrating the legend belonging to it of the slaying of the great worm or dragon by the Knight of Lambton; and the similar legend of Moore Hall is finely told in that mansion by the art of Mr. Poynter. The last, however, is simply on canvas, and appeared as a large framed painting at the Royal Academy. It is, of course, necessary that a house should be very large and stately to stand mural paintings. The painting of panels is, indeed, becoming common in old houses which are well wainscoted, but as a general thing it is confined to the doors of more modern dwellings. However, a very fine effect has been

produced in the dining-room of Mr. Birkett Foster, at Witley, in Surrey, by inserting in the wall around the room a pre-Raphaelite work representing the legend of St. George and the Dragon. The stained glass which Morris and Co. have placed in the landing of the staircase in the same beautiful residence shows also that even a cottage-mansion of moderate size admits of a great deal more decorative color than is ordinarily supposed.

AN OLD TOWN BY THE SEA.

By T. B. ALDRICH.

I. CALL it an old town, but it is only comparatively old. When one reflects on the countless centuries that have gone to the formation of this crust of earth on which we live, the most ancient of cities on its surface seem merely things of the week before last. It was only the other day, then—that is to say, in the month of June, 1603—that one Martin Pring, in the ship *Speedwell*, an enormous ship of nearly fifty tons burden, from Bristol, England, sailed up the Piscataqua River. The *Speedwell*, numbering thirtymen, officers and crew, had for consort the *Discoverer*, of twenty-six tons and thirteen men. After following the windings of "the brave river" for twelve miles or more, the two vessels turned back and put to sea again, having failed in the chief object of the expedition, which was to obtain the medicinal Sasfras-tree, from the bark of which, as was well known to our ancestors, could be distilled the Elixir of Life.

It was at some point on the left bank of the Piscataqua, three or four miles from the mouth of the river, that worthy Master Pring probably effected one of his several landings. The beautiful stream widens suddenly at this place, and the then green banks, covered with a net-work of strawberry-vines, and sloping invitingly to the lip of the water, must have won the tired mariners. The

PORTSMOUTH, NEW HAMPSHIRE.

explorers found themselves on the edge of a vast forest of oak, hemlock, maple, and pine; but they saw no sassafras-trees to speak of, nor did they encounter—what would have been infinitely less to their taste—any red men. Here and there were discoverable the scattered ashes of fires where the Indians had encamped earlier in the spring; they were absent now, at the falls, higher up the streams, where fish abounded at that season. The balmy June breeze, laden with the delicate breath of wild flowers and the pungent odors of spruce and pine, ruffled the blue sky reflected in the water; the new leaves lisped pleasantly in the tree-tops, and the birds were singing “in full-throated ease.” No ruder sound or movement of life disturbed the solitude. Master Pring would scarcely recognize the spot if he were to land there to-day.

Nine years afterward a much cleverer man than the commander of the *Speedwell* dropped anchor in the Piscataqua—Captain John Smith of famous memory. After slaying Turks in hand-to-hand combats, and doing all sorts of doughty deeds in various parts of the globe, he had come with two vessels to the fisheries on the coast of Maine, when curiosity, or perhaps a deeper motive, led him to examine the neighboring shore lines.* With eight of his men in a small boat, a ship's yawl, he skirted the coast

from Penobscot Bay to Cape Cod, keeping his eye open. This keeping his eye open was a peculiarity of the little captain's. It was Smith who really discovered the Isles of Shoals, exploring in person those masses of bleached rock—those “*isles asses hautes*,” of which the French navigator Pierre de Guast, Sieur de Monts, had caught a vague glimpse through the twilight in 1605. Captain Smith christened the group “Smith Isles,” a title which posterity, with singular persistence of ingratitude, has ignored. It was a tardy sense of justice that expressed itself a few years ago in erecting on Star Island a simple marble shaft to the memory of John Smith, the greatest, though by no means the only one, of the name.

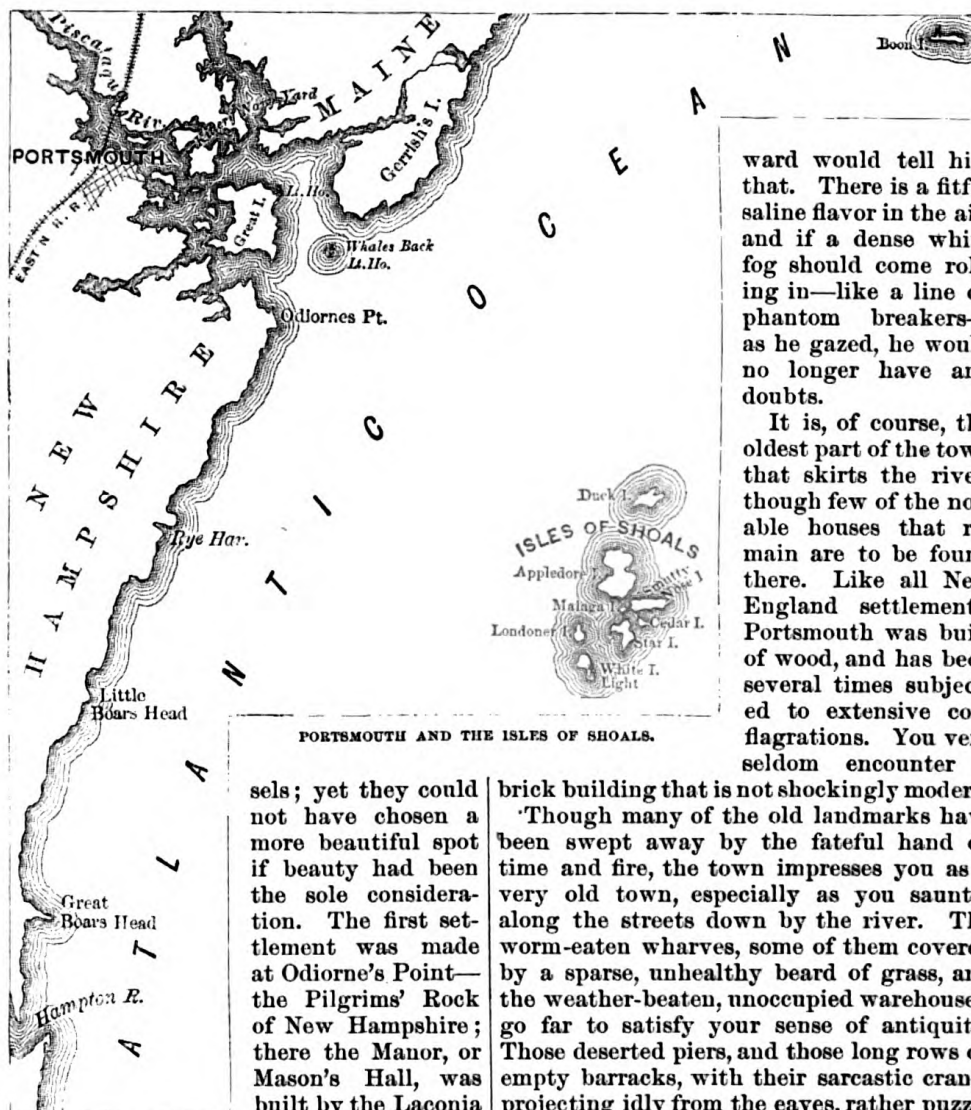

It was doubtless owing to Captain John Smith's representations, on his return to England, that the Laconia Company selected the banks of the Piscataqua for their plantation. Smith was an intimate friend of Sir Ferdinand Gorges, who, five years subsequently, made a tour of inspection along the New England coast, in company with John Mason, then Governor of Newfoundland. One of the results of this summer cruise is the town of Portsmouth, among whose leafy streets, and into some of whose old-fashioned houses, I propose to take the reader, if he has an idle hour on his hands.

II.

It is not supposable that the early settlers selected the site of their plantation on account of its picturesqueness. They were influenced entirely by the lay of the land, its nearness and easy access to the sea, and the secure harbor it offered to their fishing ves-

* “Smith drew the first map of our coast, and on presenting it to Prince Charles, with a request that he would give the country a name, it was for the first time by him called New England.”—*Brewster's Rambles about Portsmouth*, First Series, p. 11.

In Smith's map the locality of Portsmouth is called *Hull*; to Kittery and York he gave the name of *Boston*.

PORTSMOUTH AND THE ISLES OF SHOALS.

sels; yet they could not have chosen a more beautiful spot if beauty had been the sole consideration. The first settlement was made at Odiorne's Point—the Pilgrims' Rock of New Hampshire; there the Manor, or Mason's Hall, was built by the Laconia Company in 1623. It

was not until 1631 that the "Great House" was erected by Humphrey Chadborn on Strawberry Bank. Mr. Chadborn, consciously or unconsciously, sowed a seed from which a city has sprung.

The town of Portsmouth stretches along the south bank of the Piscataqua, about two miles from the sea, as the crow flies—three miles, following the serpentine course of the river. The stream, as has been stated, broadens suddenly at this point, and, at flood tide, lying without a ripple in a basin formed by the interlocked islands and the main-land, it looks more like an inland lake than a river. To the unaccustomed eye there is no outlet visible. Standing on one of the wharves at the foot of State or Court street, a stranger would scarcely suspect the contiguity of the ocean. A little observation, however, would show him that he was in a sea-port. The rich red rust on the gables and roofs of ancient buildings looking sea-

ward would tell him that. There is a fitful saline flavor in the air, and if a dense white fog should come rolling in—like a line of phantom breakers—as he gazed, he would no longer have any doubts.

It is, of course, the oldest part of the town that skirts the river, though few of the notable houses that remain are to be found there. Like all New England settlements, Portsmouth was built of wood, and has been several times subjected to extensive conflagrations. You very seldom encounter a

brick building that is not shockingly modern.

Though many of the old landmarks have been swept away by the fateful hand of time and fire, the town impresses you as a very old town, especially as you saunter along the streets down by the river. The worm-eaten wharves, some of them covered by a sparse, unhealthy beard of grass, and the weather-beaten, unoccupied warehouses, go far to satisfy your sense of antiquity. Those deserted piers, and those long rows of empty barracks, with their sarcastic cranes projecting idly from the eaves, rather puzzle the stranger. Why this great preparation for a commercial activity that does not exist, and evidently has not existed for years? There are no ships lying at the pier heads; there are no gangs of men staggering under heavy cases of merchandise; here and there is a barge laden down to the bulwarks with coal, and here and there a square-rigged schooner from Maine smothered with planks and clapboards; an imported citizen is fishing at the end of a wharf, a ruminative, freckled son of Cork, and own brother to the lazy sunshine that seems to be sole proprietor of these crumbling piers and ridiculous store-houses, from which even the ghost of commerce has fled.

Once upon a time, however, Portsmouth carried on an extensive trade with the West Indies, threatening as a maritime port to eclipse both Boston and New York. At the windows of those old counting-rooms which overlook the river near Spring Market used to stand portly merchants, in knee-breeches

and silver shoe-buckles and plum-colored coats with ruffles at the wrist, waiting for their ships to come in; the cries of stevedores and the chants of sailors at the windlass used to echo along the shore where all is silence now. For reasons not worth setting forth, the trade with the Indies suddenly ceased, having ruined as well as enriched many a Portsmouth merchant. This explains the empty warehouses and the unused wharves. I fancy that few fortunes are either made or lost in Portsmouth nowadays. Formerly it turned out the best ships, as it still does the ablest ship captains, in the world; but the building of ships has declined there. Portsmouth has one or two large cotton factories, and several thriving breweries; it is a wealthy old town, with a liking for first mortgages; but its warmest lover will not claim for Portsmouth the distinction of being a great mercantile centre. The majority of her young men are forced to seek other fields* of enterprise, and almost every city in the Union, and many a city across the sea, can point to some prominent merchant, or lawyer, or what not, as "a Portsmouth boy." Portsmouth even furnished a late King of the Sandwich Islands, Kekuanaoa, with his Prime Minister. He may not, to be sure, according to Mark Twain,† have been a Richelieu; but then the nankeen monarch himself was not of a first-class line of goods.

To come back to the wharves. I do not know of any spot with such a fascinating air of dreams and idleness about it as the old wharf at the end of Court Street. The very fact that it was once a noisy, busy place, crowded with sailors and soldiers—in the war of 1812—gives an enchanting emphasis to the quiet that broods over it to-day.‡ The loungee who sits of a summer afternoon on a rusty anchor fluke in the shadow of one of the silent warehouses, and looks on the lonely river as it goes murmuring past the town, can not be too grateful to the India trade for having taken itself off elsewhere.

What a slumberous, delightful, lazy place

* The affection which the exiles cherish for their native place is worthy of remark. On two occasions—in 1852 and in 1873, the two hundred and fiftieth anniversary of the settlement of Strawberry Bank—the sons of Portsmouth abroad were seized with an impulse to return home. Simultaneously, and almost without concert, the lines of pilgrims took up their march from every quarter of the globe, and swept down with music and banners on the motherly old town.

† Vide *Roughing It*, by Mark Twain (Samuel L. Clemens), p. 487.

‡ Portsmouth did a very neat little business in the privateering way in the war of 1812, sending out a large fleet of the saniciest small craft on record. Some of them came to grief, among others the *Harlequin*, Captain Brown. The *Harlequin* gave chase one day to a noble-looking ship, and got it into close quarters, when suddenly the shy stranger threw open her ports, and proved to be H.M.S. *Bulwark*—seventy-four guns!

it is! The sunshine seems to lie a foot deep on the planks of the dusty wharf, which yields up to the warmth a vague perfume of the cargoes of rum, molasses, and spice that used to be piled upon it. The river is as blue as the inside of a harebell. The opposite shore, in the strangely shifting magic lights of sky and water, stretches along like the silvery coast of fairy-land. Directly opposite you is the Navy-yard, with its neat officers' quarters and workshops and arsenals, and its vast ship-houses, in which the keel of many a famous frigate has been laid. Those monster buildings on the water's edge, with their roofs pierced with innumerable little windows, which blink like eyes in the sunlight, are the ship-houses. On your right lies a cluster of small islands—there are a dozen or more in the harbor—on the most prominent of which you see the fading-away remains of some earth-works thrown up in 1812. Between this—Trepethren's Island—and Peirce's Island lie the Narrows. Perhaps a bark or a sloop of war is making up to town; the hulk is hidden among the islands, and the topmasts have the effect of sweeping across the dry land. On your left is a long bridge, more than a quarter of a mile in length, set upon piles where the water is twenty or thirty feet deep, leading to the Navy-yard and Kittery—the Kittery so often mentioned in Whittier's verse.

This is a mere outline of the landscape that spreads before you. Its protean beauty of form and color, with the summer clouds floating over it, is not to be painted in words. I know of many a place where the scenery is more varied and striking; but there is a mandragora quality in the atmosphere here that holds you to the spot, and makes the half hours seem like minutes. Except for family ties—which include breakfast, dinner, and tea—I could fancy a man sitting on the end of that old wharf very contentedly for two or three years, provided it could be always June.

Perhaps, too, one would desire it to be always high water. The tide falls from eight to twelve feet, and when the water makes out between the wharves some of the picturesqueness makes out also. A corroded section of stove-pipe mailed in barnacles, or the pathetic skeleton of a hoop-skirt protruding from the tide mud like the remains of some old-time wreck, is apt to break the enchantment.

I fear I have given the reader an exaggerated idea of the solitude that reigns along the river-side. Sometimes there is society here of an unconventional kind, if you care to seek it. Aside from the foreign gentleman before mentioned, you are likely to encounter, farther down the shore toward the Point of Graves (a burial-place of the colonial period), a battered and aged native fisherman boiling lobsters on a little gravel-

NAVY-YARD, KITTERY, MAINE.

ly beach, where the river whispers and lisps among the pebbles as the tide creeps in. It is a weather-beaten ex-skipper or ex-pilot, with strands of coarse hair, like sea-weed, falling about a face that has the expression of a half-open clam. He is always ready to talk with you, this amphibious person; and if he is not the most entertaining of gossips—as weather-wise as Old Probabilities, and as full of incident as one of the best of Captain Marryat's naval novels—then he is not the ancient mariner I used to see a few months ago on the strip of beach just beyond Liberty Bridge, building his drift-wood fire under a great tin boiler, and making it rather lively for a lot of reluctant lobsters.

I imagine that very little change has taken place in this immediate locality, known prosaically as "Puddle Dock," during the past fifty or sixty years. The accompanying view, looking across Liberty Bridge, Water Street, is probably the same in every respect that presented itself to the eyes of the rambler a century ago. The flag-staff on the right is the representative of the old "standard of liberty" which the Sons planted on this spot in January, 1766, signaling their opposition to the enforcement of the Stamp Act. On the same occasion the patriots called at the house of Mr. George Meserve, the agent for distributing the stamps in New Hampshire, and relieved him of his stamp-master's commission, which document they carried on the point of a sword through the town to Liberty Bridge (then Swing Bridge), where they erected the staff, with the motto, "Liberty, Property, and no Stamp!"

Turning down a lane on your left, a few rods beyond the bridge, you reach a spot known as the Point of Graves, chiefly interesting as showing what a grave-yard may come to if it last long enough. In 1671 one Captain John Pickering ceded to the town a

piece of ground on this neck for burial purposes. It is an odd-shaped lot, comprising about half an acre, inclosed by a crumbling red brick wall two or three feet high, with wood capping. The place is overgrown with thistles, rank grass, and fungi; the black slate head-stones have mostly fallen over; those that still make a pretense of standing slant to every point of the compass, and look as if they were being blown this way and that by a mysterious gale which leaves every thing else untouched; the mounds have sunk to the common level, and the old underground tombs have collapsed. Here and there among the moss and weeds you can pick out some name that shines in the history of the early settlement; hundreds of the flower of the colony lie here, but the known and the unknown, gentle and simple, mingle their dust on a perfect equality now. The marble that once bore a haughty coat of arms is as smooth as the humblest slate stone guiltless of heraldry. The lion and the unicorn, wherever they appear on some cracked slab, are very much tamed by time. The once fat-faced cherubs, with wing at either cheek, are the merest skeletons now. Pride, pomp, grief, and remembrance are all at an end. No reverent feet come here, no tears fall here; the old grave-yard itself is dead! A more dismal, uncanny spot than this at twilight would be hard to find. It is noticed that when the boys pass it after night-fall, they always go by whistling with a gayety that is perfectly hollow.

Let us get into some cheerfuler neighborhood!

III.

As you leave the river behind you, and pass "up town," the streets grow wider, and the architecture more imposing—streets fringed with beautiful old trees and lined with commodious private dwellings, mostly

LIBERTY BRIDGE, WATER STREET.

square white houses, with spacious halls running through the centre. Many of the

residences stand back from the brick or flag-stone sidewalk, and have pretty gardens at the side or in the rear. If you chance to live in a city where the City Fathers can not rest in their beds until they have hacked down every precious tree within their blighting reach, you will be especially charmed by the beauty of the streets of Portsmouth. In some parts of the town, when the chestnuts are in blossom, you would fancy yourself in the midst of a garden in fairy-land. In spring, summer, and autumn the foliage is the glory of the fair town—her luxuriant green and golden tresses! Nothing could seem more like the work of enchantment than the spectacle which certain streets in Portsmouth present in midwinter after a heavy snow-storm. You may walk for miles under wonderful silvery arches formed by the overhanging and interlaced boughs of the trees, festooned with a drapery even more graceful and dazzling

than spring-time gives them. The numerous elms and maples which shade the principal thoroughfares are not the result of chance, but the ample reward of the loving care that is taken to preserve the trees. There is a society in Portsmouth devoted to this work. It is not unusual there for people to leave legacies to be expended in setting out shade and ornamental trees along some favorite walk. Richards Avenue, a long, unbuilt street leading from Middle Street to the South Burying-ground, perpetuates the name of a public-spirited citizen who gave the labor of his own hands to the beautifying of that wind-swept and barren road to the cemetery.

In the business section of the town trees are necessarily few. The chief business streets are Congress and Market. Market Street is the stronghold of the dry-goods shops. There are seasons, I suppose, when these shops are crowded, but I have never happened to be in Portsmouth at the time. I never pass through the narrow cobb-

POINT OF GRAVES.

BOW STREET.

paved street without wondering where the customers are that must keep all these flourishing little establishments going. Congress Street—a more elegant thoroughfare than Market—is the Tremont Street, the Broadway, the Boulevard des Italiens, of Portsmouth. Among the noticeable buildings is the Athenæum, containing a reading-room and library. From the high roof of this building the stroller will do well to take a glimpse of the surrounding country. He will naturally turn seaward for the more picturesque aspects. If the day is clear, he will see the famous Isles of Shoals, lying nine miles away—Appledore, Smutty-Nose, Star Island, White Island, etc.; there are nine of them in all. On Appledore is Loughton's Hotel, and near it the summer cottage of Celia Thaxter, the poet laureate of the Isles. On the northern end of Star Island is the quaint little town of Gosport, with a tiny stone church perched like a sea-gull on its highest rock. A mile

southwest from Star Island lies White Island, on which is a light-house. Mrs. Thaxter calls this the most picturesque of the group. Perilous neighbors, O mariner! in any but the serenest weather, these wrinkled, scarred, and storm-smitten old rocks, flanked by wicked supken ledges that grow white at the lip with rage when the great winds blow!

How peaceful it all looks off there, on the smooth emerald sea! and how softly the waves seem to break on yonder point where the unfinished fort is! That is the ancient town of Newcastle, to reach which from Portsmouth you have to cross three bridges, with the loveliest scenery in New Hampshire lying on

either hand. Opposite Newcastle is Kittery Point, a romantic spot, where Sir William Pepperell (the first and only American baronet) once lived, and where his tomb now is, in his orchard, across the road, a few hundred yards from the "goodly mansion" he built. The knight's tomb, and the old Pep-

MARKET STREET, FROM MARKET SQUARE.

OLD TOWER, NEWCASTLE.

perell House, which has been somewhat curtailed of its fair proportions, are the objects of frequent pilgrimages to Kittery Point, where there is, I believe, an excellent summer boarding-house.

From this elevation (the roof of the Athenæum) the Navy-yard, the river with its bridges and islands, the clustered gables of Kittery and Newcastle, and the illimitable ocean beyond make a picture worth climbing four or five flights of stairs to gaze upon. Glancing down on the town nestled in the foliage, it seems like a town dropped by chance in the midst of a forest. Among the prominent objects which lift themselves above the tree-tops are the belfries of the various churches, the white façade of the Custom-house, and the Mansard and chimneys of the Rockingham, the leading hotel. The pilgrim will be surprised to find in Portsmouth one of the most elegantly appointed hotels in the United States. The antiquarian may lament the demolition of the old Bell Tavern, and think regretfully of the good cheer once furnished the wayfarer by Master Stavers "at the sign of the Earl of Halifax," but the ordinary traveler will thank his stars, and confess that his lines have fallen in pleasant places, when he finds himself among the frescoes of the Rockingham.

Speaking of public buildings, you will observe looming up on your left, among the green fields one or two miles away, a large structure of red brick. That is the almshouse, on the town farm. I call attention to it, not to compare its accommodations with those of the Rockingham, but in order to say that in Portsmouth was built probably the first pauper work-house ever erected in this or any other country. The building was occupied in 1716, though completed several years previous to that date. It was not until seven years later (1723) that an act was passed in England authorizing the establishment of parish work-houses.

Obliquely opposite the door-step of the Athenæum—we are supposed to be on terra firma again—stands the Old North Church (orthodox), a substantial wooden building, handsomely set on what is called "The Parade," a large open space formed by the junction of Congress, Market, Daniel, and Pleasant streets. Here in happier days, innocent of water-works, stood the town pump.

The churches of Portsmouth are more remarkable for their number than their architecture. With the exception of the Stone Church (Unitarian) they are constructed of wood or plain brick in the simplest style. St. John's Church is the only one likely to attract the eye of a stranger. It is magnificently situated on the crest of Church Hill, overlooking the ever-beautiful river. The present edifice was built in 1808 on the site of what was known as Queen's Chapel, erect-

PEPPERELL HOUSE, KITTERY POINT.

OLD NORTH CHURCH.

ed in 1732, and destroyed by fire December 24, 1806. The chapel was named in honor of Queen Caroline, who furnished the books for the altar and pulpit, the plate, and two elegant mahogany chairs, which are still in use in St. John's. Within the chancel rail is a curious marble font, taken by Colonel John Tufton Mason at the capture of Senegal from the French in 1758, and presented to the Episcopal Society in 1761. The peculiarly sweet-toned bell which calls the parishioners of St. John's together every Sabbath is, I believe, the same that formerly hung in the belfry of the old Queen's Chapel. If so, the bell has a history of its own. It was brought from Louisburg at the time of the reduction of that place in 1745, and given to the church by the officers of the New Hampshire troops.

Portsmouth is rich in grave-yards—they seem to be a New England specialty—ancient and modern. Among the old burial-places the one attached to St. John's Church is perhaps the most interesting. It has

not been permitted to fall into ruin, like the old cemetery at the Point of Graves. When a head-stone here topples over it is kindly lifted up and set on its feet again, and encouraged to do its duty. If it utterly refuses, and isn't shamming decrepitude, it has its face sponged, and is allowed to rest and sun itself against the wall of the church with a row of other exempts. The trees are kept pruned, the grass trimmed, and here and there is a rose-bush drooping with a weight of modest pale roses, as becomes a rose-bush in a church-yard.

The place has about it an indescribable soothing atmosphere of respectability and comfort. Here rest the remains of the principal

and loftiest in rank in their generation of the citizens of Portsmouth prior to the Revolution—stanch, royalty-loving governors, counselors, and secretaries of the Province of New Hampshire, all snugly gathered under the motherly wing of the Church of England. It is almost impossible to walk any where without stepping on a governor.

ST. JOHN'S CHURCH.

You grow haughty in spirit after a while, and scorn to tread on any thing less than one of his majesty's colonels or a secretary under the crown. Here are the tombs of the Atkinsons, the Jaffreys, the Sherburnes, the Sheafes, the Marshes, the Mannings, the Gardners, and others of the quality. All around you underfoot are tumbled-in coffins, with here and there a rusty sword atop, and faded escutcheons, and crumbling armorial devices. You are moving in the very best society.

This, however, is not the earliest cemetery in Portsmouth. An hour's walk from the Episcopal yard will bring you to the spot, already mentioned, where the first house was built and the first grave made, at Odiorne's Point. The exact site of the Manor is not known, but it is supposed to be a few rods north of an old well of flowing water, at which the Tomsons and the Hiltons and their comrades slaked their thirst two hundred and fifty years ago. Odiorne's Point is owned by Mr. Eben L. Odiorne, a lineal descendant of the worthy who held the property in 1657. Not far from the old spring is the resting-place of the earliest pioneers.

"This first cemetery of the white man in New Hampshire occupies a space of perhaps one hundred feet by ninety, and is well walled in. The western side is now used as a burial-place for the family, but two-thirds of it is filled with perhaps forty graves, indicated by rough head and foot stones. Who there rest no one now living knows. But the same care is taken of their quiet beds as if they were of the proprietor's own family. In 1631 Mason sent over about eighty emigrants, many of whom died in a few years, and here they were probably buried. Here too, doubtless, rest the remains of several of those whose names stand conspicuous in our early State records.

"History numbers here
Some names and scenes to long remembrance dear,
And summer verdure clothes the lowly breast
Of the small hillock where our fathers rest.
There was the dauntless heart, the hand, the voice,
That bade the desert blossom and rejoice."

VOL. XLIX.—No. 293.—43

BAPTIST CHURCH, STATE STREET.

"Were there a locality of similar historic interest north of the White Mountains, many an annual pilgrimage it would receive; its locality would be designated by some enduring monument, and a pebble from the first cemetery would be treasured as a mantel curiosity. But now, within a pleasant foot ramble, it is rarely visited, and seems to be almost unknown."

IV.

"Sir," said Dr. Johnson, "let us take a walk down Fleet Street." Gentle reader, let us take a walk down Pleasant Street.

When Washington visited Portsmouth in 1789 he was not deeply impressed by the architecture of the little town that had stood by him so nobly in the struggle for independence. "There are some good houses," he writes,[†] "among which Colonel Lang-

* *Rambles about Portsmouth*, Second Series, p. 37.

† In an unpublished diary which Washington kept during his tour through Connecticut, Massachusetts, and New Hampshire in October, 1789. The portions relating to Portsmouth were quoted by Edward Everett in an address delivered in that city in 1859.

FIRST PRINTING-OFFICE.

don's may be esteemed the first; but in general they are indifferent, and almost entirely of wood. On wondering at this, as the country is full of stone and good clay for bricks, I was told that on account of the fogs and damp they deemed them wholesomer, and for that reason preferred wood buildings."

The house of Colonel Langdon, on Pleasant Street, is still an excellent specimen of the solid and dignified abodes which our great-grandfathers had the sense to build. The art of their construction seems to have been a lost art these fifty years. Here Governor John Langdon resided from 1782 until the time of his death in 1819—a period during which many an illustrious man passed between those two white pillars that support the little balcony over the front-door; among the rest Louis Philippe and his brothers, and the Marquis de Chastellux, a major-general in the French army, serving under the Count de Rochambeau, whom he accompanied from France to the States in 1780. The journal of the marquis contains this reference to his host: "After dinner we went to drink tea with Mr. Langdon. He is a handsome man, and of noble carriage; he has been a member of Congress, and is now one of the first people of the country; his house is elegant and well furnished, and the apartments admirably well wainscoted" (this

reads like Mr. Samuel Pepys): "and he has a good manuscript chart of the harbor of Portsmouth. Mrs. Langdon, his wife, is young, fair, and tolerably handsome, but I conversed less with her than with her husband, in whose favor I was prejudiced from knowing that he had displayed great courage and patriotism at the time of Burgoyne's expedition."

It was at the height of the French Revolution that the three sons of the Duc d'Orleans were entertained at the Langdon Mansion. Years afterward,

when Louis Philippe was on the throne of France, he inquired of a Portsmouth lady presented at his court if the old mansion of Governor Langdon was still in existence.

The house stands back a decorous distance from the street, under the shadows of some gigantic oaks or elms, and presents an imposing appearance as you approach it over the tessellated marble walk. A hundred or two feet on either side of the gate, and abutting on the street, is a small square building of brick, one story in height—probably the porter's lodge and tool-house of former days. There is a large fruit garden attached to the house, which is in excellent condition, taking life comfortably, and having the complacent

GOVERNOR LANGDON'S MANSION.

air of a well-preserved beau of the *ancien régime*. The Langdon Mansion was owned and long occupied by the late Rev. Dr. Burroughs, for a period of forty-seven years the esteemed rector of St. John's Church.

At the other end of Pleasant Street is another notable house, to which we shall come by-and-by. Though President Washington found Portsmouth but moderately attractive from an architectural point of view, the visitor of to-day, if he have an antiquarian taste, will find himself embarrassed by the number of localities and buildings that appeal to his interest. Many of these buildings were new and undoubtedly commonplace enough at the date of Washington's visit; time and association have given them a quaintness and a significance which now make their architecture a question of secondary importance. One might spend a fortnight in Portsmouth exploring the nooks and corners over which history has thrown a glamour, and by no means exhaust the list. The writer, confined by the limits assigned to a magazine article, can not do more than attempt to describe—and that very briefly—a few of the typical old houses. There are several on this same Pleasant Street which we must leave unnoted, with their spacious halls and carven staircases, their antiquated furniture and old silver tankards and choice Copleys. Numerous examples of this artist's best manner are to be found here. To live in Portsmouth without possessing a family portrait done by Copley is like living in Boston without having an ancestor in the Old Granary Burying-ground. You can exist, but you can not be said to flourish. To make this statement smooth, I will remark that every one in Portsmouth *has* a Copley, or would have if a fair division were made.

In the better sections of the town the houses are kept in so excellent repair, and have such a smart appearance with their bright green blinds and freshly painted wood-work, that you are likely to pass many an old landmark without suspecting it. Whenever you see a house with a gambrel roof you may be almost positive that the house is at least eighty or a hundred years old, for the gambrel roof went out of fashion after the Revolution.

THE WARNER HOUSE.

On the corner of Daniel and Chapel streets stands the oldest brick building in Portsmouth—the Warner House. It was built in 1718 by Captain Archibald Macphedris, a Scotchman, as his name indicates, a wealthy merchant, and a member of the King's Council. He was the chief projector of the first iron-works established in America. Captain Macphedris married Sarah Wentworth, one of the sixteen children of Governor John Wentworth, and died in 1729, leaving a daughter, Mary, whose portrait, with that of her mother, painted by the ubiquitous Copley, still hangs in one of the parlors of this house, which, oddly enough, is not known by the name of Captain Macphedris, but by that of his son-in-law, Hon. Jonathan Warner, a member of the King's Council until the revolt of the colonies. "We well recollect Mr. Warner," says Mr. Brewster,* "as one of the last of the cocked hats. As in a vision of early childhood he is still before us, in all the dignity of the aristocratic crown officers. That broad-backed, long-skirted brown coat, those small-clothes and silk stockings, those silver buckles, and that cane—we see them still, although the life that filled and moved them ceased half a century ago."

The Warner House, a three-story building with gambrel roof and luthern win-

* Mr. Charles W. Brewster, for nearly fifty years the editor of the *Portsmouth Journal*, and the author of two volumes of local sketches to which the writer of the present paper acknowledges his indebtedness, died in 1868.

dows, is as fine and substantial a sample of the architecture of the period as you are likely to meet with any where in New England. The eighteen-inch walls are of brick brought from Holland, as were also many of the materials used in the building—the hearth-stones, tiles, etc. Hewn stone underpinnings were seldom adopted in those days; the brick-work rests directly upon the solid walls of the cellar. The interior is rich in paneling and wood carvings about the mantel-shelves, the deep-set windows, and along the cornices. The halls are wide and deep, after a gone-by fashion, with handsome staircases, set at an easy angle, and not standing nearly upright, like those ladders by which one reaches the upper chambers of a modern house. The principal rooms are paneled to the ceiling, and have large open chimney-places, adorned with the quaintest of Dutch tiles. In one of the parlors of the Warner House there is a choice store of family relics—china, silver plate, costumes, old clocks, and the like. There are some interesting paintings too—not by Copley this time. On a broad space each side of the hall windows, at the head of the staircase, are pictures of two Indians, life size. They are probably portraits of some of the numerous chiefs with whom Captain Macphedris had dealings, for the captain was engaged in the fur as well as in the iron business. Some enormous elk antlers, presented to Macphedris by his red friends, are hanging in the lower hall.

By mere chance, fifteen or twenty years

ago, some long-hidden paintings on the walls of this lower hall were brought to light. In repairing the front entry it became necessary to remove the paper, of which four or five layers had accumulated. At one place, where the several coats had peeled off cleanly, a horse's hoof was observed by a little girl of the family. The workman then began removing the paper carefully; first the legs, then the body of a horse with a rider were revealed, and the astonished paper-hanger presently stood before a life-size representation of Governor Phipps on his charger. The workman called other persons to his assistance, and the remaining portions of the wall were speedily stripped, laying bare four or five hundred square feet covered with sketches in color, landscapes, views of distant cities, figure-pieces, Biblical scenes—Abraham offering up Isaac—a lady at a spinning-wheel, etc. Until then no person in the land of the living had had any knowledge of those hidden pictures. An old dame of eighty, who had visited at the house intimately ever since her childhood, all but refused to believe her spectacles when brought face to face with the frescoes.

The place is full of odds and ends calculated to craze a *bric-à-brac* hunter, but there is nothing more curious than these incongruous paintings, evidently the work of a clever hand. Even the outside of the old edifice is not without its attractions for an antiquarian. The lightning-rod which protects the Warner House to-day was put up

HALL OF THE WARNER HOUSE.

under the personal supervision of Benjamin Franklin in 1762, and is supposed to be the first rod put up in New Hampshire. The Warner House has another strong claim on the good-will of the visitor—it is not known positively that George Washington ever slept there.

The same assertion can not be made safely in connection with the old yellow barracks situated on the southwest corner of Court and Atkinson streets. Famous old houses seem to have an intuitive perception of the value of corner lots. If it is a possible thing, they always set themselves down on the most desirable spots. It is beyond a doubt that Washington slept not only one night, but several nights under this roof; for this was a celebrated tavern previous and subsequent to the War of Independence, and Washington made it his head-quarters, I believe, during his visit to Portsmouth in 1797. When I was a boy I knew an old lady—not one of the old ladies in the newspapers, who are always taking preposterous walks before breakfast, and have all their faculties unimpaired, but a real old lady, whose ninety-nine years were beginning to tell on her—who had known Washington very well. She was a girl in her teens when he came to Portsmouth. The President was the staple of her conversation during the last ten years of her life, which she passed in the Stavers House, bedridden; and I think those ten years were rendered short and pleasant to the old gentlewoman by the memory of a compliment to her complexion which Washington probably never paid to her.

The old hotel—now a very unsavory tenement-house—was built by John Stavers, innkeeper, in 1770, who planted in front of the door a tall post, from which swung the sign of "The Earl of Halifax." Stavers had previously kept an inn of the same name on Queen, now State, Street.

It is a square three-story building, shabby and dejected, giving no hint of the really important historical associations that cluster about it. At the time of its erection it was no doubt considered a rather grand structure, for buildings of three stories were rare in Portsmouth. Even in 1798, of the six hundred and twenty-six dwelling-houses of which the town boasted, eighty-six were of one story, five hundred and twenty-four were of two stories, and only sixteen of three stories.* It has the regulation gambrel roof, but is lacking in those wood ornaments which are usually seen over the doors and windows of the more prominent houses of that epoch. It was, however, the hotel of the period.

That same worn door-step upon which Mr. O'Shaughnessy now stretches himself of a

SIDE AND REAR OF THE STAVERS HOUSE.

summer afternoon, with a short clay pipe stuck between his lips, and his hat crushed down on his brows, revolving the sad vicissitude of things (made very much sadder by drink)—that same door-step has been pressed by the feet of generals and marquises and grave dignitaries upon whom depended the destiny of the States—officers in gold-lace and scarlet cloth, and high-heeled belles in patch and powder. At this door the "Flying Stage-Coach," from Boston, once a week set down its load of passengers—and distinguished passengers they often were. Most of the chief celebrities of the land, before and after the secession of the colonies, have been guests of Master Stavers, at the sign of the Earl of Halifax.

While the storm was brewing between the colonies and the mother country it was in a back-room in the old tavern that the adherents of the crown met to discuss matters. The landlord himself was a loyalist, and when the full cloud was on the eve of breaking he had an early intimation of the coming tornado. The Sons of Liberty had long watched with sullen eyes the secret sessions of the Tories in Master Stavers's tavern, and one morning the patriots quietly began cutting down the post which supported the obnoxious emblem. Mr. Stavers, who seems not to have been belligerent himself, but the cause of belligerence in others, sent out his black slave with orders to stop proceedings. The negro, who was armed with an axe, struck but a single blow, and disappeared. This blow fell upon the head of Mark Noble; it did not kill him, but left him an insane man till the day of his death, forty years afterward. A furious mob at once collected, and made an attack on the tavern, bursting in the doors and shattering every pane of glass in the windows. It was only through the intervention of Captain

* *Rambles about Portsmouth*, First Series, p. 190.

WENTWORTH HOUSE, LITTLE HARBOR.

John Langdon, a warm and popular patriot, that the hotel was saved from destruction.

Master Stavers in the mean while had escaped through the stables in the rear. He fled to Stratham, where he was given refuge by his friend William Pottle, who had supplied the hotel with ale. The excitement blew over after a time, and Stavers was induced to return to Portsmouth. He was seized by the Committee of Safety, and lodged in Exeter jail,* when his loyalty, which had really never been very high, went down below zero; he took the oath of allegiance, and shortly after his release re-opened the hotel. The honest face of William Pitt appeared on the repentant sign, *vice* the Earl of Halifax, ignominiously discharged, and Stavers was himself again.

From that period until I do not know what year the Stavers House prospered. It was at the sign of the William Pitt that the officers of the French fleet boarded in 1782, and hither came the Marquis Lafayette, all the way from Providence, to visit them. John Hancock, Elbridge Gerry, Rutledge, and other signers of the Declaration sojourned here at various times. It was here General Knox—"that stalwart man, two officers in size and three in lungs"—was wont to order his dinner, and in a stentorian voice compliment

Master Stavers on the excellence of his larder. One day—it was at the time of the French Revolution—Louis Philippe and his two brothers applied at the door of the William Pitt for lodgings; but the tavern was full, and the future king, with his companions, found comfortable quarters under the hospitable roof of Governor Langdon in Pleasant Street.

A record of the scenes, tragic and humorous, that have been enacted within this old yellow house on the corner would fill a volume. A vivid picture of the social and public life of the old time might be painted by a skillful hand, using the two Earl of Halifax inns for a background. The painter would find gay and sombre colors ready mixed for his palette, and a hundred romantic incidents waiting for his canvas. One of these romantic episodes has been turned to very pretty account by Longfellow in the last series of *The Tales of a Wayside Inn*—the marriage of Governor Benning Wentworth with Martha Hilton, a sort of second edition of King Cophetua and the Beggar Maid.

Martha Hilton was a poor girl, whose bare feet and ankles and scant drapery when she was a child, and even after she was well in the bloom of her teens, used to scandalize good Dame Stavers, the innkeeper's wife. Standing one afternoon in the doorway of the Earl of Halifax,* Dame Stavers took occasion to remonstrate with the sleek-limbed

* In the State records is the following letter from poor Noble—who was not inappropriately named—begging for the discharge of John Stavers:

PORTSMOUTH, February 3, 1777.

"To the Committee of Safety the Town of Exeter:

"GENTLEMEN,—As I am informed that Mr. Stivers is in confinement in goal upon my account contrary to my desire, for when I was at Mr. Stivers a fast day I had no ill nor ment none against the Gentleman but by bad luck or misfortune I have received a bad Blow but it is so well that I hope to go out in a day or two. So by this gentlemen of the Committee I hope you will release the gentleman upon my account. I am yours to serve.

MARK NOBLE,

"A friend to my country."

* The first of the two hotels bearing that title. Mr. Brewster commits a slight anachronism in locating the scene of this incident in Jaffrey Street, now Court. The Stavers House was not built until the year of Governor Benning Wentworth's death. Mr. Longfellow, in the poem, does not fall into the same error.

"One hundred years ago, and something more,
In Queen Street, Portsmouth, at her tavern door,
Neat as a pin, and blooming as a rose,
Stood Mistress Stavers in her furbelows."

and lightly draped Martha, who chanced to be passing the tavern, carrying a pail of water, in which, as the poet neatly says, "the shifting sun-beam danced."

"Yon Pat! you Pat!" cried Mrs. Stavers, severely; "why do you go looking so? You should be ashamed to be seen in the street."

"Never mind how I look," says Miss Martha, with a merry laugh, letting slip a saucy brown shoulder out of her dress; "I shall ride in my chariot yet, ma'am."

Fortunate prophecy! Martha went to live as servant with Governor Wentworth at his mansion at Little Harbor, looking out to sea. Seven years passed, and the "thin slip of a girl," who promised to be no great beauty, had flowered into the loveliest of women, with a lip like a cherry and a cheek like a rose—a lady by instinct, one of Nature's own ladies. The governor, a lonely widower, and not too young, fell in love with his fair handmaid. Without stating his purpose to any one, Governor Wentworth invited a number of friends (among others the Rev. Arthur Brown) to dine with him at Little Harbor on his birthday. After the dinner, which was a very elaborate one, was at an end, and the guests were discussing their tobacco-pipes, Martha Hilton glided into the room, and stood blushing in front of the chimney-place. She was exquisitely dressed, as you may conceive, and wore her hair three stories high. The guests stared at each other, and particularly at her, and wondered. Then the governor, rising from his seat,

"Played slightly with his ruffles, then looked down, And said unto the Reverend Arthur Brown:
"This is my birthday; it shall likewise be
My wedding-day; and you shall marry me!"

The rector was dumfounded, knowing the humble footing Martha had held in the house, and could think of nothing cleverer to say than, "To whom, your excellency?"

"To this lady," replied the governor, taking Martha Hilton by the hand. The Rev. Arthur Brown hesitated. "As the Chief Magistrate of New Hampshire I command you to marry me!" cried the firm old governor.

GOVERNOR BENNING WENTWORTH.

And so it was done; and so the pretty kitchen-maid became Lady Wentworth, and did ride in her own chariot, after all. She wasn't a woman if she didn't drive by Stavers's hotel!

Lady Wentworth had a keen appreciation of the dignity of her new station, and became a grand lady at once. A few days after her marriage, dropping her ring on the floor, she languidly ordered her servant to pick it up. The servant, who appears to have had a fair sense of humor, grew suddenly near-sighted, and was unable to find the ring until Lady Wentworth stooped and placed her ladyship's finger upon it. She turned out a faultless wife, however; and Governor Wentworth at his death, which occurred in 1770, signified his approval of her by leaving her his entire estate. She married again without changing name, accepting the hand, and what there was of the heart, of Michael Wentworth, a retired colonel of the British army, who came to this country in 1767. Colonel Wentworth (not connected, I believe, with the Portsmouth branch of Wentworths) seems to have been

A BIT IN THE WENTWORTH HOUSE, LITTLE HARBOR.

of a convivial turn of mind. He shortly dissipated his wife's fortune in high living, and died abruptly in New York—it is supposed by his own hand. His last words—quite a unique contribution to the literature of last words—were, "I have had my cake, and ate it," which show that the colonel, in his own peculiar line, was a finished philosopher.

The seat of Governor Wentworth at Little Harbor—a pleasant walk from Market Square—is well worth a visit. Time and

change have laid their hands more lightly on this rambling old pile than on any other of the old homes in Portsmouth. When you cross the threshold of the door you step into the colonial period. Here the Past seems to have halted courteously, waiting for you to catch up with it. Inside and outside the Wentworth Mansion remains nearly as the old governor left it; and though it is no longer in the possession of the family, the present owners, in their willingness to gratify the decent curiosity of strangers, show a hospitality which has always characterized the place.

The house is an architectural freak. The main building—if it is the main building—is generally two stories in height, with irregular wings forming three sides of a square which opens on the water. It is, in brief, a cluster of whimsical extensions that look as if they had been built at different periods, which I believe was not the case. The mansion was completed in 1750. It originally contained fifty-two rooms; a portion of the structure was removed twenty or twenty-five years since, leaving at present forty-five apartments. The chambers were connected in the oddest

manner, by unexpected steps leading up or down, and capricious little passages that seem to have been the unhappy afterthoughts of the architect. But it is a mansion on a grand scale, and with a grand air. The cellar was arranged for the stabling of a troop of thirty horse in times of danger. The council-chamber, where for many years all questions of vital importance to the State were discussed, is a spacious, high-studded room, finished in the richest style of the last century. It is said that the ornamentation

of the huge mantel, carved with knife and chisel, cost the workman a year's constant labor. At the entrance to the council-chamber are still the racks for the twelve muskets of the governor's guard—so long ago dismissed!

Some very notable family portraits adorn the walls here, among which is a fine painting—yes, by our friend Copley—of the lovely Dorothy Quincy, who married John Hancock, and afterward became Madam Scott. I have an impression that this is the "Dorothy Q." of Holmes's poem; if so, triply famous lady! Opening on the council-chamber is a large billiard-room; the billiard-table is gone, but an ancient spinnet, with the prim air of an ancient maiden lady, and of a wheezy voice, is there; and in one corner

LADY HANCOCK, PORTRAIT BY COPLEY, IN THE WENTWORTH HOUSE, LITTLE HARBOR.

SIR THOMAS WENTWORTH,* WENTWORTH HOUSE, LITTLE HARBOR.

* "Sir Thomas Wentworth, Earl of Strafford, dictating to his secretary in the Tower, the day before his execution, A.D. 1641." Such is the traditional explanation of the picture, which is after Vandyck. Sir Thomas was the old governor's ancestor.

stands an old *buffet*, near which the imaginative nostril may still detect a faint and tantalizing odor of colonial punch. Opening also on the council-chamber are several tiny apartments, empty and silent now, in which many a close rubber has been played by illustrious hands. The stillness and loneliness of the old house seem saddest here. The jeweled fingers are dust, the merry laughs have turned themselves into silent, sorrowful phantoms, stealing from chamber to chamber. It is easy to believe in the traditional ghost that haunts the place—

"A jolly place in times of old,
But something ails it now!"

The mansion at Little Harbor is not the only notable house that bears the name of Wentworth. On Pleasant Street, at the head of Washington Street, stands the former residence of another colonial worthy, Governor John Wentworth, who went into office in 1767, and went out at the time of the Revolution. He was a royalist of the most decided stripe. In 1775 a man named Fenton, who had become offensive to the patriots, was given shelter in this house by the governor, who refused to deliver the fugitive to the people. The mob planted a field-piece (unloaded) in front of the door-step, and threatened to fire if Fenton were not forth-coming. The family vacated the premises, and the mob entered, doing considerable damage. The broken marble chimney-piece is preserved in its place, mutely protesting against the outrage. Shortly after this event Governor Wentworth retired to England. He was Governor of Nova Scotia from 1792 to 1800, and died in Halifax in 1820. This is one of the handsomest old dwellings in town, and promises to outlast many of its newest neighbors. The parlor presents the same aspect it wore when the populace rushed into it nearly a century ago; the

plush on the walls has not faded, and all the furniture and decorations have been kept in their original positions, and preserved with scrupulous care. In the hall—deep enough for the duel that is always fought in halls in baronial novels—are full-length portraits of the governor and others of the family.

There is still a third Wentworth House, also once occupied by a colonial governor—there were three Governors Wentworth—but that, and a hundred other relics of the past, must remain unmentioned.

The points of interest in and about Portsmouth are innumerable. I have accomplished my end if I have succeeded in intimating this to the reader. The beaches at Rye and Hampton, and the summer resorts inland, annually draw thousands of persons to the neighborhood; for the most part they regard Portsmouth as the place where they purchase their ticket to Boston, or take passage on the little steamer for the Shoals. Yet many of them have crossed the Atlantic, and suffered the hardships and fatigue of foreign land travel, in order to visit localities that can not possibly possess for an American one-half the interest of this Old Town by the Sea.

HUNTSMEN OF THE SEA.

A NIMROD OF THE SEA.

WITHIN the memory of most of us there was a time when we sought some quiet spot at home to read, undisturbed, a romance of the American whale-fisheries. The subject has charms that commend it to all young readers, since it comprehends at the same time both hunting adventures and the wonders of the deep. We are not surprised, then, at the great number of writers for boys who have chosen this field for the scene of their books. But we are surprised and re-

gretful that none of them ever trusted in the riches it contains, and that they preferred to follow their own imaginations into the wildest impossibilities rather than to gather truths infinitely more interesting. More scientific writers have scarcely done better. Perhaps we should say they have done worse, for they have stated as facts things as flimsy as the flimsiest yarns of the story-tellers. Heretofore there have been no trustworthy authorities on the subject, and for the first time a writer appears with credentials that entitle him to the widest consideration.*

He is not a romancer who fabricates his thrilling stories of the sea on dry land, nor a learned Dryasdust, who comes with fresh and sprightly theories from the dissecting-room, but a man from before the mast, who saw and heard with his own eyes and ears all the things that he has written about. His narrative is the unvarnished story of a fore-castle hand, and its chief merits are its veracity and its picturesque simplicity. In some chapters it is rollicking and brimful of adventure; in others it is sad, and weighted down with the miseries of fore-castle life. The descriptions of scenery and the phenomena of the ocean are often so very naïve that if we were not told of their author's busi-

* *Nimrod of the Sea; or, the American Whaleman.* By W. MORRIS DAVIS. New York: Harper and Brothers.

ness, we could easily guess it. The work is eminently one for popular entertainment and instruction; and in one of its most absorbing chapters it shows the brilliant development of the American whale trade. Furthermore we have nothing to, add, save to reiterate that the whole subject is one of intense interest to old and young, as, we think, the material gathered in the succeeding pages will prove. The historical part properly comes first. Some of the adventures will be told later on.

In the reign of King Alfred, it is said, there appeared in England a gallant old Northman, who told his majesty wondrous stories about the whales captured by the Finns off the coast of Lapland. Alfred was so impressed with the advantages of the enterprise that he caused the information to be spread through his kingdom, hoping that his people would engage in it. But they did not, and until 1598 there is no further record on the subject. In that year, according to Hakluyt's *Voyages and Discoveries*, an honest London merchant wrote to a friend of his, requesting "to be advised and directed in the course of killing a whale." The answer conveyed the information that competent whalers and tools were to be obtained in Biscay, where the people had been engaged in the hazardous business since 1390. The correspondence resulted in the equipment of a whaling fleet, which met with great success, and was increased until the English were unrivaled in the Greenland fisheries. Things might have gone happily, but the Dutch intruded on English ground, and met with a hearty English welcome. Their tackle and oil were seized, and they were told to depart, under the penalty of losing

"THERE SHE BLOWS!"

their vessels also. They submitted, but only until some war vessels arrived to protect them, when they resumed the business, and continued it unmolested.

Soon afterward the English relinquished the fishery, and did not again occupy it until the time of Charles the Second. In 1618 it is recorded that the whale-fisheries of Holland employed 12,000 men. This is considered an exaggeration; but in a work called *Discourses upon Trade*, published in 1670, the statement occurs that "the Greenland whale-fisheries of the Dutch and Hamburgers have annually 400 or 500 ships, while the English have only one." It is also said that in forty-six years, ending with 1721, the Dutch made 5886 voyages, and captured 32,906 whales, valued at £16,000,000.

Emulous of so prosperous a traffic, the English again made determined efforts to recover what they had lost, the government granting bounties to whalers, and allow-

ing them exemption from the press-gang. But for some hidden reason the capitalists and tars alike avoided the service, and refused the bait held out to them. The amount of the bounty offered was again increased, and Protestant foreigners were invited to immigrate and avail themselves of all the privileges extended to natural-born subjects; but England, though so grand a naval power, was still unable to muster a whaling fleet or find the stalwart men to man it.

The service required strength, pluck, and enterprise. In these things Americans would suit it, and in 1672 the fruit of their toil in the whale-fisheries first appeared in the markets. We believe there is yet extant the first agreement ever made in America on the subject. In it "James Loper doth engage to carry on a design of whale catching on the island of Nantucket. That is to say, James engages to be a third in all respects, and some of the town engages on the other two-thirds in a like manner."

This little spark, Captain Davis observes, kindled a great flame that burned around the world.

Work was begun on the smallest scale in boats from the shore by thrifty, industrious, and courageous men. It attracted the Americans almost as much as it repelled the English, and in 1761 the small island of Nantucket employed ten vessels of 100 tons each. In the year following the number had increased to fifteen vessels, and within twelve months more a magnificent fleet of eighty vessels, all hailing from Nantucket, were afloat in search of whales on the nearest and most distant waters.

The whalebone exported from America to Great Britain reduced the price of that material one-third. The British government had thus far expended the extraordinary sum of £1,687,902 in bounties, and were content a while to watch the progress of their colonial subjects in the whale-fisheries; but after the Declaration of Independence they were no longer interested in them, and renewed and added to their offers of bounties. They offered a premium of £600 to the vessel proceeding to the Pacific, continuing four months on the ground, and, after being sixteen months out, having the greatest quantity of sperm-oil on board. Five hundred pounds more were promised to any of the seven vessels having the next greatest quantity. A second invitation was also issued to foreigners, who were allowed to import their goods free of duty and to compete for all the premiums. The pertinacity of the government appears as strange as the aversion of the sailors to an exciting service in which they might be expected to glory.

The Americans were never assisted by their government, and depended on their own resources alone. Their success elicited a brilliant eulogy from Burke in the English

Parliament; and on the Arctic and Antarctic, the Pacific and the Atlantic, they were unrivaled as hunters of the grandest game in the world. In 1840 the whaling fleet numbered 675 vessels, most of them measuring over 400 tons each, and their total capacity was 200,000 tons. They were manned by 1700 of the hardiest, pluckiest, and most indomitable seamen. Their value was \$25,000,000, and they carried on an annual business of \$5,000,000.

The secret of the success of the Nantucket whalers is strikingly stated in *Nimrod of the Sea*. They practiced co-operation to perfection. "From the first," says Captain Davis, "the people clubbed their means to build or buy a vessel, and many branches of the labor were conducted by those immediately interested in the voyage. The cooper while employed in making casks took good care that they were of sound and seasoned wood, lest they might leak his oil in the long voyage; the blacksmith forged the choicest iron in the shank of the harpoon, which he knew, perhaps from actual experience, would be put to the severest test in wrenching and twisting as the whale, in which he had a one-hundredth interest, was secured; the rope-maker faithfully tested each yarn of the tow-line to make certain that it would carry 200 pounds of strain, for he well knew that one weak inch in his work might cause the loss of a fighting monster; the very women and girls who made the clothing remembered in their toil that father, brother, or one dearer yet might wear the garment, and extra stitches were lovingly thrown in to save the loss of a button or the ripping of a seam." Thus it was that the profits of the labor were directly enjoyed by those engaged in it, and the workman's interest was the master's, and the master's the workman's.

The English capitalists could not compete with such a hive of co-operationists, although their government aided them with a premium of ten dollars per ton burden of the vessels, protected them by excessive duties on American oil, and granted unprecedented immunities to their seamen. They were compelled to relinquish the honor and the glory and the profit, and to simply watch how others could excel them. For many years to come the commoners of Nantucket, New Bedford, and New London were destined to be masters of the whale-fisheries.

No doubt those of you who are young are impatient for a glimpse of life on board a whaling ship, and now that we have shown you how the Americans came to be renowned in the profession, this desire shall be gratified. The excitement, the adventures, the perils, and the prizes of the service very naturally allure many boys of a roving disposition away from home. If you happen to stroll along the docks to-morrow,

STRUCK ON A BREACH.

you will see outside some of the shipping-offices such unflattering advertisements as, "Greenhorns wanted for whaling voyages." And not far off there will likely be an uncouth lad contemplating it with a wistful eye, ready to obey the first beck of the agent within, and to sign articles for a long three years' cruise. The lad is fearful that the agent will reject him; but usually the agent is as anxious to ship him as he is to be shipped. Captain Davis had the charms of a whaling voyage most eloquently described to him as he stood, fresh from a Pennsylvania farm-house, in a New London shipping-office: "There's fresh beef in plenty; the porpoise is to be had for the catching, and there's muscle in porpoise—it'll stiffen you up, porpoise will. Then there's albatross as big as geese—a little oily, but you'll get used to that, and it makes a man waterproof to eat albatross." And so the lad, who needs no cajolery, willingly writes his name in a sprawling hand to the articles, and with a pat on the back is sent to the outfitter's store, where he is rigged in kerseys, canvas, and tarpaulin.

The whale-fishery is considered one of the best schools for seamen that we have. But the relations between officers and men were as brutal on the vessel in which Captain Davis sailed his first voyage as on most ships in other services. The captain and officers were tyrannical masters, and the men vindictive slaves. The rope's-end and, on

one occasion, the revolver were the arguments used to bring refractory sinners to their senses. The officers swore at the men aloud, and cheated them to their faces. The men swore at the officers in an under-breath, and were treacherous in dark corners. Once there was a revolt, the men protecting a lad from the captain's cat-o'-nine-tails. The mutineers were imprisoned without a trial by an ignorant consul of the United States in one of the Hawaiian ports, and were released after many months by a war vessel. Quarrels, threats, blows, and desertions were of frequent occurrence, and out of the large crew that sailed from New London only four or five returned home in the same ship.

The good days of co-operation were waning, we should think, when Captain Davis went to sea. But there was never a time when the crew refused to work, or allowed a whale to pass without lowering the boats and cheerfully risking their lives in its capture; and a can of grog was never sent to the forecabin nor a kind word said that did not awaken manifest gratitude in these poor sons of the sea. Considering all things, we think that the sailors were to be blamed least. A pathetic incident is related of the illness of a boy named Beers. He was left alone and unattended, without nourishment or medicines, on a narrow shelf in a foul-smelling, vermin-infested pantry. When one of the forecabin hands found him he was delirious, murmuring the words over

and over again, "Oh, how lonely to die so far away from home and friends!—how lonely! how lonely!" And when he recovered consciousness he stroked the hand of his comrade and continued in the same strain, "I should not mind dying near the shore in the track of other vessels; but here, so far at sea, how lonely! how lonely!" His spirit was not released until after many hours of suffering, and he died "babbling of green fields."

All ills on shipboard were treated by one formula. A powerful dose of Epsom salts was first administered to the patient, and if that effected no improvement, a still more powerful dose of jalap followed, with the object of neutralizing the salts. But if neither medicine produced a favorable change, they were supplemented by a potion of calomel that either killed or cured.

In the long voyage around Cape Horn to the sperm-whale ground there are few incidents that have not been often described before. The vessel is followed by the flying-fish, the pilot-fish, and the albatross, and in smooth weather the crews are drilled in capturing a dummy whale. A spar is towed astern, and the greenhorns in the boats manoeuvre around it with a great deal of earnestness, and are taught some of the tricks of the trade. But as soon as they reach the Banks of Brazil actual service is due, and each man is alert for the stirring cry from the mast-head, "There she blows!" The ship is under sail during the day only, and in the night she stands by under close-reefed canvas, an arrangement which allows the crew long watches below, and prepares them for hard toil during the day. The captain and mates strain their eyes across the waters, and the humble deck hand is not less zealous and anxious. When at last the word is heard from aloft, and is repeated quick and oft, the boats are manned with such alacrity and precision as are seldom seen elsewhere.

The American whale-boats, by-the-way, are unexcelled in beauty, speed, and durability. They are twenty-eight feet long, swelling amid-ships to six feet in breadth. The gunwale is twenty-two inches above the keel amid-ships, and rises with an accelerated curve to thirty-seven inches at each end. The elevation of bow and stern, and a clipper-like upper form, give them a duck-like capacity to ride advancing waves that would fill and sink ordinary boats. The gunwale and keel are of the very best timber, and are the heaviest parts, giving a firmness to the rest of the structure. The planking is of half-inch white cedar. We scarcely hope that these specifications will interest the landsman, but by them the quality of the boats shall be known to watermen. Let us add that one of these boats can be lifted by two men, and that it will make ten miles an hour in a dead chase by oars alone.

The equipment of each consists of a line tub, in which are coiled 300 fathoms of the best hempen cord; a mast and sprit-sail; oars, harpoons, and lances; a small apparatus to extinguish the fires that might be ignited by the friction of the cord drawn from the reel; a water keg, lantern, candles, compass, waif flags on poles, and bandages for wounds. The harpoon is a barbed triangular iron, very sharp on the edges, and the lance is a somewhat similar instrument. There is a modern invention, called a bomb-lance, which is not often found in American boats. It is an iron tube about eighteen inches long, sharp at one end, and provided with elastic wings at the other, which serve as the feathers of an arrow. The tube contains six ounces of powder and a fuse, and is aimed at the whale's vital parts. Sometimes it kills instantly, but it is considered uncertain in fastening, and, as we have said, American whalers generally avoid it.

In boats of such lightness as we have described the royal game of the seas is chased and attacked. His moods are variable, his courage is always the same. Sometimes he is killed by the first dart of the harpoon, and dies a quiet death; at other times he fights for hours at a time, destroys boat after boat, mangles the men, and even charges at the ship itself. Such a vicious customer was one of the first Captain Davis had to encounter.

As soon as the harpoon had struck him he swiftly ran a short distance under water, carrying a line with him. Then turning in his course, he rose to the surface, and rushed at full speed, with his head out of water, for one of the boats, which he stove in and rolled over. The captain's boat, in which Davis was bow-oar, came to the rescue; but as the captain saw that the men were not in immediate danger, and that a third boat was approaching, he left them swimming, and attempted to coax the whale away from the wreck, which the enraged monster was threshing with his terrible jaw. Just then the whale noticed the swimmers, however, and rushed toward them, with his jaw at right angles with his body. But before he could reach them a second harpoon was hurled into him, and with that to accelerate his speed, he ran away to the windward, towing the captain's boat in the wake.

It was then the duty of the bow oarsman to grasp the fastening line and haul the boat alongside the enemy, so that the lance might be used upon the huge body. But it was impossible, owing to the increasing speed of the whale, and the savage manner in which he tossed his flukes. The captain used an implement called a spade, with the hope of severing the tendons of his tail, and so bringing him to; but the operation was unsuccessful, and he ran with undiminished speed, often rolling as he went, so as to give the flukes

IN THE WHALE'S JAWS.

a side-cutting power, with the intention of crushing his little antagonist. Under similar circumstances the ordinary manœuvre of the hunters is to sheer the boat to one side of the whale by taking a bight of the line over one side of the boat.

"In this instance," Davis tells us, "the bow oarsman had been tugging at the line for an hour, but was utterly unable to get the boat in advance of the flukes of the whale. A little line might be gained for a short time, but it would soon be torn through the clinging hands, almost taking the flesh with it. This was certainly very aggravating to the excited captain, who was a religious man, and under his own vine and fig-tree, with none to rile him, I guess he would average well in the patience line. But with all our troubles on this day, I believe he wished there had been no sin in a ripping oath.

"He was a little hard on his bow oarsman, and rather more than hinted at somebody's cowardice. This was too much for my hot Welsh blood, and with the aid of two others I brought the boat right up to the iron in the whale's body, and coolly passed a bight around the thwart and made all fast. The captain was delighted to be held up to his work so well, and plied his lance thrust after thrust; but the brute seemed to bear a charmed life. He would not spout blood, and the little jets that came from the lance holes would not bleed a whale to death

in a month. Our boat buried her nose in the waves, and the bloody spray leaped over her sides as we swept right royally onward. Now our majestic race-horse grew impatient of the captain's prodding. He *milled* [turned] across our course, and we ran plump against his head. 'Slack line!' roared the captain. 'Starn all! slack line, and starn!' He turned in his tracks to step aft of the bow oarsman, fearing the upward cut of the whale's jaw, when he saw that the line was fast to the thwart. 'For God's sake cut that line!' he shouted, as he sprang forward for the hatchet; but the loosened bight went over the side, as the whale came up under the forward part of the boat, and carried the bow clear out of the water as he rounded slowly forward.

"At this moment the captain and old Ben [the harpooner] occupied the stern of the boat, and in the perilous moment I was just mad enough to enjoy the expectant look with which the two old whalemens awaited the arrival of the on-coming flukes. Fortunately for all of us, the blow was delayed a moment, and when the thundering concussion came it cleared our boat by a few feet. The other boats were out of sight, and the ship's hull could be dimly seen to the leeward. For two hours more the whale ran and fought with redoubled energy. The captain got long darts with the lance, but with no good effect. The iron drew, and the victorious whale passed from us."

It was night-fall when the worn-out crew reached the vessel, and found that their comrades, whose boat had been wrecked, were all safe on board. On the next day the green but plucky bow oarsman was told that in fastening the line to the boat he had placed six men within an inch of death. If the whale had gone down, the frail craft and her crew would have been a quarter of a mile under water in less than a minute.

More pages than one number of this magazine contains could easily be filled with instances of the heroic daring of whalers, and the prowess of the game which they seek. An infuriated whale is a vastly more terrible antagonist than the wildest and mightiest of land animals. His courage is equal to his power, and instances are on record in which a sperm-whale, after defeating the men in the boats, has actually rushed upon the ship, stove in her bow, and sunk her. A boat or two lost is usually the smallest cost of an encounter, and often the crew are tossed high in the air by his monstrous flukes, with a bristling shower of harpoons, lances, and splinters following after. Coming to the water bruised and lacerated, the men are still pursued by the enemy, and have to avoid his jaws by diving under or crawling over him, until one of the other boats has an opportunity to dispatch him. Whale ships do not carry surgeons, and the most horrible wounds are dressed unskillfully by the captain, who, in all probability, knows less

of surgery than of Latin or Greek. Amputations are performed with carpenter's saws and butcher's knives, and wounds bandaged with canvas. If you should ever meet an old whaler you may read in his patches and scars the evidence of the manifold perils of his profession.

In the pretty cemetery at Sag Harbor, Long Island, there is a marble monument bearing a touching record. It is in the form of a broken ship's mast, with an unstranded hawser twisted around the foot, and engraved upon it are the names of six captains of whale ships belonging to the town, all of them under thirty years of age, who died, within ten years of each other, in actual encounter with the monsters of the deep. An old whaler who had escaped death several times used to declare that he only lived "on borrowed time, a monument of God's infinite mercy." We may also mention here the case of Captain James Huntling as an example of a whaler's endurance. His boat was upset and rolled over him by a large sperm-whale. When he rose to the surface he was entangled in the line, and struggled hard to free himself, but before he could succeed he was jerked out of the sight of his horrified shipmates. A bight of line yet attached to the whale was around his ankle. Drawing himself nearer the retreating animal, he drew a sheath-knife and managed to cut the cord. When he again came to the surface a boat rescued him and con-

"CUTTING IN."

veyed him to the ship. His ankle was broken, and in the presence of his men he set it himself, and then resumed his usual duties.

Captain Davis mentions a sperm-whale which first wrecked two boats and afterward charged at the ship, tearing away the cut-water and the copper sheathing around the bow. Several harpoons, lances, and bomb-lances were fired into him without effect. During the night he remained on the surface in the vicinity of the wrecked boats, and was frequently heard fighting the fragments.

On the following day thirty-one bomb-lances more, each containing half a pound of gunpowder, were exploded in him before he yielded. The monster produced 115 barrels of oil, half of it head-matter, the value of which will be explained anon. Finback whales are even more dangerous than sperm. They are occasionally 120 feet long, and extremely swift and powerful in their motions. But their blubber is thin and the whalebone scant, and they are considered less valuable than others of the species.

When the whale has been killed and is hauled alongside the vessel, the "cutting in" process is begun. This is surgery on the largest scale known. The immense carcass is brought underneath some elaborate tackle rigged on board. From the head of the mast two great sheave blocks depend, a rope about eight inches in circumference running through them. The rope also passes through a corresponding traveling block, to which, in the beginning of the operation, a heavy iron hook is attached by a clevis and bolt. The fall leads to the windlass, near which a number of men stand ready to lend a hand. The rail and side planks above the deck of the vessel are all removed, and two platforms, or gangways, are erected over the side in front of the opening thus formed. The whale is next brought directly underneath the hoisting tackle, which swings above the platforms. On these, secured by ropes around the waist, the officers are sta-

CARCASS ADRIFT.

tioned, and provided with broad-edged tools called spades, which are mounted on sixteen-foot poles. A circular flap is cut from around the whale's eye. One of the boat-steerers now appears, dressed in a rough woolen suit. Secured by a rope fastened around his waist, he is lowered on to the whale's back, and inserts the hook of the tackle in the eye. This is a dangerous duty in a heavy sea, the smooth skin of the whale affording but a poor footing, while a score of sharks are nibbling around, and the ponderous hook and block are swaying with the roll of the ship.

When the hook is inserted the order is given to "haul taut" and "heave away," and the flap, technically the blanket, or blubber, slowly ascends beyond the deck until it reaches three-fourths of the height of the mainmast. A second boat-steerer then cuts an oval plug from it, which is secured by other tackle, both parts being afterward lowered into the blubber-room. The first cut is extended to other parts of the body, the head excepted, which is reserved for the last, and the windlass is constantly working until five hundred or more feet of the blanket have been brought on board. When every bit of the carcass has been stripped of blubber, it is turned adrift and floats away, coloring the water by its oozing blood, and attracting a shoal of sharks and a flock of albatrosses, which hold carnival in the sea and air over the fallen majesty.

The head is one-third the entire length of a sperm-whale, and in obtaining the valuable spermaceti which it contains the whalers divide it into three parts—the “case,” the “junk,” and the bone. The “junk” is first hauled on board and stowed away, and then the “case” is bailed. You will find an illustration of this operation below. The “case” is a massive part of the head, cellular in the interior, the walls of the cells running vertically and transversely. It is filled with an oily substance of a faint yellow tint, translucent when warm. The oil-bearing flesh forms about one-third of the mass, and in a large whale it has yielded three and a half tons. The case also contains the respiratory canal, and a cavity of extraordinary depth filled with oil. An opening is made at one end for the purposes of bailing, and it is next hauled to a vertical position beyond the reach of the water. A deep and narrow bucket attached to a line and pulley is then lowered, and brought up full of transparent spermaceti, mixed with silky integuments having the odor of freshly drawn

milk. The sore hands of the crew, bathed in this rich substance, are relieved and healed, and the greenhorns dabble in it with the ineffable satisfaction displayed by city youngsters in a mud puddle.

As soon as the case has been emptied it is abandoned, and the “try-works” are brought into use. The “try-works” are one of the disfigurements that cause merchantmen and man-of-war’s men to laugh at whaling vessels. They are boilers set in a foundation of brick on the deck, and are used for reducing the blubber to oil. The mainyard is taken aback, the mainsail and top-sails are furled, and, while the vessel drifts in her course, the fires are lighted. “Trying out,” as the work is called, is one of the most wearisome and offensive of the whaler’s toils. Captain Davis states that he never experienced six hours of greater wretchedness than those during which this operation was performed on his first whale. The scene on board is weird in the extreme. Red flame and smoke issue from the flues and shoot into the black night, bringing the outlines of

the masts and rigging into strange relief. The feet of the men slide over the wet and slippery deck at every roll of the ship, and their clothes are wet, sooty, and greasy. If the greenhorn has not yet repented, the words of penitence will surely come to his lips in the “trying out.” The orders of the officers are harsher than ever, and the men swear sullenly in rejoinder. In fact, the ship becomes for the time “a little hell on earth,” and we can scarcely wonder that English sailors avoided so unpleasant an occupation. With every whale caught the drudgery is repeated, and sometimes the decks have been no sooner holy-stoned and the brass-work polished than the furnaces are again lighted. The chase is magnificent

BAILING THE “CASE.”

sport, but the "cutting in" and the "trying out" have an opposite equivalent in horrors.

The cruise after sperm and right whales in the Pacific is a long and dreary one. It generally lasts for three or four years, and there are few incidents to vary its monotony except the excitement of the chase. Calls are made occasionally at South American ports, where the sailors find dirt and debauchery in abundance, and frequently manage to get into conflict with the petty authorities; at the volcanic Galapagos, where delicious terrapin are more plentiful than clams on Long Island, and afford a welcome change in the vessel's dietary, which ordinarily consists of salt pork and mouldy biscuit; at the evergreen Cocos Island, a land of leaf and flowers, where the purest water is found; and at Sandwich Island ports, where the smooth-tempered Hawaiians exchange innocent hospitalities with the sailors, and even extend them so far as to also exchange names and clothing during the vessel's stay in port.

But it is time that we said something about the form and habits of the whale itself. A great diversity of opinion exists on the subject, and an old tar once averred the number of tails a whale carries depends altogether on the quantity of grog the looker-on has drunk. Such authorities as we have had differ most widely, but Captain Davis's observations were submitted to an assemblage of old whalers at New London, who unanimously indorsed their accuracy in all except two or three minor points. One of the most interesting peculiarities of the whale is its immense loss of blood in death. It is presumed to have a large supply arterialized in a reservoir, which is brought into use when that in general circulation becomes vitiated during a prolonged submergence. This reservoir is what whalers term the "life" of the whale, and is

"TRYING OUT."

the spot sought by the harpoon and lance. When touched, Captain Davis states, the bloody torrent surcharges the lungs, and is expelled through the spout-hole. Suffocation and death follow, but when the wound is only slight the agonies of the dying beast are considerably prolonged. The poor creature will lie on the surface feebly propelling itself onward, and, with quick-repeated sobs, will pour out its life by slow degrees, coloring the surface of the ocean with a deep crimson. From this stupor it is aroused to its last struggle. The head rises and falls, and the flukes thrash the water rapidly. With great speed it will swim in a large circle two or three times, and then fall on its side dead, with "fin out."

The length of time a whale can remain below the surface is probably much greater than has hitherto been allowed. Sometimes, notably during the full of the moon, the whales abound over the feeding ground, and many are taken. But the busy season is followed by a period of two weeks or more during which none will be visible. Vessels will be spoken from all points of the compass, and to the question, "Have you seen whales?" the answer will be, "Not for a week or ten days." The busy and dull seasons

alternate uniformly over an area of six hundred miles north and south by nine hundred miles east and west. Bull whales often appear as though they have been reposing on a muddy bottom, and off the coast of New Zealand they have been seen with such barnacles on their lower jaws as are found on a ship's bottom.

In the same connection Captain Davis states an ingenious theory, which we will quote in his own words as nearly as we can remember them. "The 'case' and 'junk' of the largest spermaceti may attain a length of twenty-five feet, a depth of eleven feet, and a breadth of nine feet, with a total weight of sixty thousand pounds. There is nothing to break the alabaster color of the interior, nor any tubular structure, save the breathing pipe. Yet the animal heat of this part is as great as though the circulation was perfect. Now blood is generally regarded as the common carrier of animal economy; but in this case the building and wasting processes are conducted twenty-five feet from the presence of blood, with which the other parts of the whale's body are proportionately more highly charged than land animals. What are the uses of this immense mass? Most writers believe that it acts as a buoy to lift the nostril above water. But, in truth, the head is much less buoyant than the body, owing to the heavy casing of 'white horse'; and when the whale dies the head turns spout-hole down and bony jaw upward, showing the part containing the fatty matter is the heaviest." With these facts as a basis, Captain Davis believes that the sack of oil has a use in the whale's submergence.

It is commonly conceded that whales have a mysterious power of communicating with each other, and instances are mentioned which, if trustworthy, afford the strongest proof possible. Stationed at the mast-heads of their vessels, captains have observed that when their boats were attacking a whale to the leeward, a school several miles to the windward, and out of sight of the combatants, would show signs of alarm, and retreat the moment the first blow of the harpoon was struck. Sound was not the means of communication, as the distance was too great, and furthermore it is a well-ascertained fact that whales only signal by sound in the practice of "lob-tailing." In "lob-tailing" the whale rises perpendicularly in the water, with its head downward. Thus poised, it will swing from side to side, sweeping a radius of thirty feet with awful violence. The concussions of its body with the water may be heard for many miles, while the sea is a mass of foam and the air is filled with spray. The practice is supposed to be intended for amusement, but it is also a tocsin.

"Breaching" is another strange habit common in all varieties of the whale. It consists in the whale's elevating three-

fourths of its body out of water, and then falling heavily on its side. In "sounding" the whale raises its head a few feet out of the water, gives a long spout, rounds its back, and revolves as on an axis. Rounding higher by degrees, it gently lifts its massive flukes without the least spray to a surprising height, and the next moment it smoothly disappears beneath the surface in a perpendicular descent. Considering the size and the apparently unwieldy proportions of the monster, the liteness with which it executes these movements is extraordinary. The sea is not disturbed, and not the least sound is heard. "Sounding" is a certain indication of sperm-whale on a cruising ground, as the right-whale is never found in water so deep that the act is possible, and as the humpback and sulphur-bottom whales do not intrude on sperm-whale ground. Unless it is disturbed by the hunters, the sperm-whale always descends in this manner.

Another manœuvre is "settling," which is often a means of safety to the whale when diving or running will not avail. From a position of inaction the whale can suddenly sink without a stroke of the tail or fins, and without any apparent effort. It is as a mass of lead, and sinks from the head of a pursuing boat so rapidly that the harpoon may be darted but not delivered. Many whales thus escape.

The speed of the sperm-whale and the regularity of its movements are scarcely less wonderful. A vessel once gave chase to a whale, and ran after it at the rate of ten knots, with yards squared and every stitch of canvas stretched. But during twelve hours of daylight she did not gain one knot on the whale, which passed from sight. In other instances captains of vessels have carefully ascertained the course of a fleeing whale in an afternoon's chase, and have followed it during the night. At the return of daylight the same whale has still been in sight ahead or astern, having stood through the dark on the course in which it started. On one other occasion a whale began a chase to the windward as soon as he was struck, towing the boat after him. The ship followed with a full top-sail breeze, but in four hours the whale and the boat in tow were lost to sight.

A large sperm-whale will produce about one hundred and seven barrels of oil. Its length is about seventy-nine feet, its height at the forehead eleven feet, and its width nine or ten feet. It has about fifty teeth, the heaviest of them weighing about one pound and a half.

According to Captain Davis the skin is not naked. Beneath what is called "the black skin" a curdy deposit is found, which is easily scraped away after the death of the animal, and reveals a close fur one-eighth of an inch in thickness. This fur envelops the

entire surface, and has root in the true skin or blubber. The flesh is a dark red, very firm, and of the texture of rope-yarn. It is fit for food in an emergency, but is not sought by epicures. The average temperature of the blood is 104° Fahrenheit.

The whales are gregarious in their habits, but the old males are often found alone. Their ordinary rate of travel is about five miles an hour, although they far exceed that when urged by the hunters. The young are said to measure fourteen feet in length at their birth. How long they remain with their mother is unknown, but the herd watches them until they attain a considerable size. The milk is white and fatty. They are supposed to live to a great age; and, apropos, a story is told of a sailor whose boat was wrecked, while he and his messmates were tossed high into the air, by a mad whale's flukes. As he came down, after half an hour had elapsed, the whale awaited him with open mouth, and instead of sinking as deeply into the sea as he had been high in the air, he slid smoothly into the whale's interior. As soon as he recovered breath he drew out his tobacco-box and helped himself to a liberal "quid," which he rolled over and over in his mouth as he laughed at his adventure. Presently he arose from the soft but moist conch on which he had been thrown, and surveyed the apartment, which contained many wonders, you may be sure. Some writing on one of the walls attracted his attention, and on examination it proved to be the words, "Jonah, B.C. 862." This amused him so much that the "quid" fell out of his mouth, and the whale at once began to writhe and show a violent dislike to the nicotine. A happy idea occurred to him, and he cut his plug of tobacco into small pieces, which he distributed over the floor. The whale then heaved more violently than ever, and while Jack was holding his sides at the joke, he was shot into the water and almost on board one of the ship's boats. Some of his comrades doubted his wondrous story, but, for the benefit of unbelievers, he had brought back with him a pocket-knife with a buck-horn handle on which were stamped Jonah's initials and an American eagle.

The whale's mouth is out of proportion to its other parts, and is so narrow, comparatively speaking, that one might suppose the animal would have difficulty in entrapping its prey. But its food is the voracious cuttle-fish, or "squid," which is found at great depths, and is allured by a white and shining object. The jaw and tongue of the sperm-whale are of silvery whiteness, and thus nature enables the creature to overcome the defect. The sperm-whale only frequents deep water; the male is much larger than the female; the upper jaw, the "case," and the "junk" form the greater

portion of the head; and the under jaw is supplied with ivory teeth. The right-whale is found only in soundings off the coast; the female is larger than the male; the lower jaw, with its lips and tongue, is much larger than the upper jaw; neither the upper nor the lower jaw is supplied with teeth, the upper jaw having great slabs of whalebone instead. The sperm-whale is the more combative of the two, and no large bull whale of its species is taken that has not been scarred by the teeth of its rivals. The sperm-whale is dangerous to the huntsmen at each end. The motions of its flukes are limited; but, to compensate for this, it is possessed of admirable skill in fencing with the jaw. The right-whale's jaw is not dangerous; but it is more active and powerful with its flukes than the sperm-whale; and there is a spot on the upper jaw which is seemingly as sensitive as the antennæ of an insect. However swiftly a right-whale may be advancing on a boat, a slight prick on this point will suddenly arrest his movements, and he will not advance a yard farther, but will either descend, back, or turn to the right or left.

A large-sized right-whale will afford three hundred barrels of inferior oil and three thousand pounds of bone.

The golden days of American whaling are over. In the Revolutionary war Nantucket alone lost by capture 134 vessels, and the war of 1812 was also disastrous. But from both of these calamities the whalers recovered, and, as we have already shown, the whaling fleet of the United States consisted, in 1840, of over 670 vessels, with a capacity of 220,000 tons. The introduction of petroleum materially reduced the demand for and the consumption of whale-oil, however, and the trade received a serious blow when the rebel cruiser *Shenandoah* destroyed thirty-four United States vessels on the arctic ground.

At present the fleet numbers 203 vessels, showing a decrease of fifteen per cent. per annum for the past two years. Our entire import of sperm and whale oil in 1872 was about three-fourths of our import of sperm alone in 1853, and one-fourth of our import of whale-oil alone in 1851. Our import of whalebone in 1872 was only one-twenty-eighth of the import of 1853. No whaling grounds have been abandoned, and every sea and ocean are still explored by American whalers. But it is believed that the arctic fishery will be discontinued soon, as the perils that attend vessels visiting it have caused the demand of an increased rate of insurance. Nevertheless the arctic fleet in 1873 numbered about thirty-two vessels, although the disasters of the previous year were numerous. The profits of whaling are exceedingly small, and the wealthiest capitalists engaged in it are seeking other employments for their ships.

THE TWO ANCHORS.

By R. H. STODDARD.

It was a gallant sailor man
 Had just come home from sea,
 And as I passed him in the town
 He sang "Ahoy!" to me.
 I stopped, and saw I knew the man—
 Had known him from a boy;
 And so I answered, sailor-like,
 "Avast!" to his "Ahoy!"
 I made a song for him one day—
 His ship was then in sight—
 "The little anchor on the left,
 The great one on the right."
 I gave his hand a hearty grip.
 "So you are back again?
 They say you have been pirating
 Upon the Spanish Main;
 Or was it some rich Indianman
 You robbed of all her pearls?
 Of course you have been breaking hearts
 Of poor Kanaka girls!"
 "Wherever I have been," he said,
 "I kept my ship in sight—
 'The little anchor on the left,
 The great one on the right.'"
 "I heard last night that you were in;
 I walked the wharves to-day,
 But saw no ship that looked like yours.
 Where does the good ship lay?
 I want to go on board of her."
 "And so you shall," said he;

"But there are many things to do
 When one comes home from sea.
 You know the song you made for me?
 I sing it morn and night—
 'The little anchor on the left,
 The great one on the right!'"

"But how's your wife and little one?"
 "Come home with me," he said.
 "Go on, go on; I follow you."
 I followed where he led.
 He had a pleasant little house;
 The door was open wide,
 And at the door the dearest face—
 A dearer one inside!
 He hugged his wife and child: he sang—
 His spirits were so light—
 "The little anchor on the left,
 The great one on the right."

'Twas supper-time, and we sat down—
 The sailor's wife and child,
 And he and I: he looked at them,
 And looked at me, and smiled.
 "I think of this when I am tossed
 Upon the stormy foam,
 And though a thousand leagues away,
 Am anchored here at home."
 Then, giving each a kiss, he said,
 "I see in dreams at night
 This little anchor on my left,
 This great one on my right!"

THE ISLES OF SHOALS.

WHALE'S-BACK LIGHT.

MY first visit to the Isles of Shoals was made in mid-August. The grass had every where the emerald brightness of the first June days, before the sun has parched it or the dust has dimmed its glory. But the emerald of the grass was outrivaled by the sapphire of the sea. The fact that it was Sunday made the natural stillness of the day more evident. I had driven down from Portsmouth, along the lovely banks of the Piscataqua, through the pretty village of Newcastle, past many a field already sumptuous with golden-rod, to a point of land at the extreme mouth of the river, and directly facing the Shoals. Here lived a "scholar gypsy," in a house nearly two centuries old, with one spacious room nearly twice as high as the others, and all over the exterior a woodbine's beautiful entanglement. The hush of recent sorrow brooded over all. The little heroine of Celia Thaxter's *Foot-Prints on the Sand* quietly reveled in the per-

fect air and light. I strolled down to the last extremity of the land, and looked out over the flashing sea to the group of islands two or three leagues away. But for the great houses upon Star and Appledore, they would have made a very little break on the horizon. I had been reading Celia Thaxter's little book about them. How strange it seemed, so looking at them, that they should have inspired so much enthusiasm, so much poetry—that they should have been the scene of so much comedy and tragedy and eventful life!

The next day I took the handsome little boat that plies between Portsmouth and Appledore, and past pleasant Kittery-side, where the stately mansion of Sir William Pepperell, hero of Louisburg, was pointed out to me—past the scene of my visit of the day before—we glided on until we reached the open sea, and struck out for the slowly lifting bulk of Appledore. Whale's-back

Light lifted upon the left its mass of fresh new granite side by side with the weather-stained old light-house in which a light no longer shines. Drawing near Appledore the boat's shrill whistle announced the number of our passengers, and soon after we landed on the pretty floating wharf which the Loughton brothers have provided for the safety and comfort of their guests. Of course there was a pleasant gathering upon the wharf of curious or expectant people, and there were many greetings, and there was much kissing. The house at Appledore stretches its long veranda across the head of a little cove. A little to the left of the "lordly pleasure-house" is the cottage where Mrs. Celia Thaxter, the princess of this Thule, holds her court, she being the sister of the brothers Cedric and Oscar Loughton, whose pleasant faces and simple, breezy manners are not the least attractive features of their hospitality. In front of Mrs. Thaxter's cottage is the flower garden which she has celebrated in her book, and this August day it was a splendid rage of color, the flame of the nasturtiums leaping every where among the poppies and sweet-peas, the corn-flowers and the marigolds. The sun that shines upon these barren ledges and the winds that visit them seem not only to

"Touch the human countenance
With a color of romance,"

and to make blanched cheeks ruddy once again, but to bestow on every flower that blooms upon the Isles a color that its kindred on the main can seldom boast.

So far as weather was concerned, my first visit to the Shoals was a good deal of a failure. I had but a few hours of pleasant weather. All of the second day a chilly storm prevailed, and the third day was dubiously fair. Still I walked pretty thor-

oughly around and over Appledore and Star, and saw enough to make me long for more, and then took the *Major*, the Star boat, for Portsmouth, and went home, resolved to come again as soon as possible. My next visit was early in June.

At Portsmouth I found the little schooner *Molly* at the wharf ready to take me to the Shoals as soon as the tide should slack—for the tide in the Piscataqua is not to be ignored. It runs with a tremendous energy. There is one point in the river which is felicitously called "Pull-and-be-damned Point," so hard is it to row against the tide. Meantime the rain came down right merrily, and I took shelter in a carpenter's loft upon the wharf, and tried to get prodigiously interested in a chart of Daniel's prophecies, which proved conclusively that the millennium would come in 1843. It came for me when at length we loosed our hawser and swung out into the stream. This was at two o'clock. It was after seven when the *Molly* dropped her anchor at the Shoals; but I had left her in a whaling-boat an hour before, with her sails idly flapping, near Duck Island, that lay like some grim monster roaring for its food. We went so near that we could see the sandpipers playing in its jaws, as the famed Egyptian birds play in the crocodile's, picking his teeth for him. Duck Island's teeth are terrible incisors, terrible grinders too. Alas for the poor vessel that is driven upon them! This island is less bold than any of the others, and has reefs running far out in all directions. It is the farthest north of all the islands, about a mile from Appledore, and has no inhabitants, nor now any sign of former occupation.

The other islands of the group are Appledore, which is next further south; then Malaga; then Haley's or Smutty-Nose; then Cedar; then Star; then, half a mile to the south,

DUCK ISLAND, FROM APPLIEDORE.

White Island, with Seavey's semi-detached from it by a bar dry at low water; then Londoner, half a mile to the west. The four last named are in New Hampshire, the rest belong to Maine.* The total area of the whole group does not exceed six hundred acres.

Appledore, once called Hog Island, and sometimes even now insulted by that epithet, is the largest of the group, and, all things considered, by far the most attractive, though Star and White have their peculiar charms. It is about a mile in length from east to west, and five-eighths of a mile across its widest part. A valley divides it into two unequal portions. The great house of entertainment stretches across this valley, with pleasant lawns in front of it, not combed too carefully, and in the rear the huge kitchens and laundries which so vast an establishment requires. On rising ground a few rods north from the house stands a broad-based, substantial monument to the "Hon. Henry B. Loughton. Died May 18, 1865. Aged 61." His right to be called honorable, I judge, had other basis than his having held some office in the State government of New Hampshire. He is reputed to have been a man of stalwart form and remarkable endurance, with great intelligence and force of character, entirely original, not without prejudices, and withal "a good hater," such as Dr. Johnson would have loved. Conceiving very naturally a disgust for politics, he accepted the keepership of White Island Light, which he tended faithfully for six years. The prose of those six years has long since vanished; their poetry has been preserved for us in Mrs. Thaxter's verse, and still more perfectly in that prose poem which records her experiences of child life upon White Island. Mr. Loughton never set foot on the main-land again after he had once left it. For five-and-twenty years he regarded its dim outline with unmixed aversion, only regretting that it was not further off. Leaving White Island, he came to Appledore with his family, and built himself a cottage, not with any idea of giving public entertainment. But the keen-scented found him on his mimic continent, and almost before he knew it he was "a host in himself." The fact that this great establishment came from such a small beginning is evidently one reason why it never loses its attraction.

The things that grow are always much more interesting than the things that are made. With five hundred guests crowding its tables, overflowing its beds, and swarming up and down its long piazzas, the Appledore is still home-like to a degree that has no parallel. The genius that directed its beginning still presides over its comforts and conveniences. It is no wonder that

* For map of the Isles of Shoals see page 634 of this number.

LAUGHTON'S GRAVE.

year after year the guests of former years return to revel in this pure and silent world.

The air of Appledore is full of spicy scents of shrubs and tiny plants—scents more delicious than home-coming ships from Spain ever brought with them to these Isles. When the sweet-bay distills its wholesome fragrance in July or August weather, that is the grand climacteric. There is but one tree growing upon Appledore—an elm, covered with yellow lichen, which pierces the piazza of the hotel midway of its enormous length; but the low blueberries grow every where, and the spiked tendrils of the blackberry and raspberry make many a forbidding interlacement. And think not flowers are lacking.

"So bleak these shores, wind-swept, and all the year
Washed by the wild Atlantic's restless tide,
You would not dream that flowers the woods hold
dear
Amid such desolation dare abide."

This is the poet's challenge. Then she sings a sweet anthology of the flowers that blossom, from

"The first wind-flower trembling on its stem"
to those that shiver in October's nipping

WHITE ISLAND LIGHT.

air. As I wandered over Appledore the 1st of June, there were places where I hardly dared to tread for fear of crushing out a colony of the delicate *houstonia*, and the more delicate *trientalis* was growing all about, and the pretty stone-crop, and I knew the pimpernel was not far off, and already the ground was pricked with promises of golden-rod—autumn foreboded when the spring had hardly gone. From Londoner I brought home the first blossoms of wild pea, and upon White Island the wild morning-glories were tumid to the verge of opening.

The different islands have much more likeness than unlikeness, but they have their individual traits. Appledore is wealthiest in shrubs and flowers, and in the variety of its conformation; Haley's boasts the largest plot of arable land; Star is the barrenest of all, except White Island, but not even Appledore can quite compete with its majestic cliffs and crags, and nowhere else do the rocks bear the marks of such convulsions. Duck Island, with its fierce Shag and Mingo reefs, is unlike any of the others. This island would seem to have named the group the Isles of Shoals—not the Isle of Shoals, as is so often said and written. But there are those who say that the group was so called because of the "shoals" of fish which were their first attraction, and it is worthy of mention that "The Shoal of Isles" is an appellation not unknown to old geographers. There were so many of them that there seemed to be a "shoal," a "school," of them.

There is something almost pathetic in the way in which the grass and herbage nestle among the rocks, as if they fain would clothe their jagged forms with many-tinted drapery. The mosses and the lichens emulate their zeal. Appledore is almost as rich in them as any mountain-side. And still the glory of these islands is not in any thing that clothes the rocks, but in the rocks themselves. If they could be stripped bare of every scrap of green they nourish with

precarious food, they would be just as grand as they are now, though far less beautiful; for their soft grays and browns wed very happily with the scanty grass and foliage, and bring forth exquisite effects of color. But who shall fitly say or sing the wonder of these cliffs and crags, these precipices that repel the ever-fresh invasions of the sea, these seams and scars, these dikes and battlements, these veins of different sorts so curiously twisted, so fantastically braided, by the fiery hands that moulded all this fearful pageantry? In what a fierce, wild mood the elemental forces must have been when they did so strange a piece of work as this?

"A heap of bare and splintery crags
Tumbled about by lightning and frost,
With rifts and chasms and storm-bleached jags
That wait and growl for a ship to be lost:
No island, but rather the skeleton
Of a wrecked and vengeance-smitten one."

South Gorge, on Appledore, is a wondrous spot, where the trap-rocks, every where softer than the adjoining granite, has been eaten out by the sea. It gives one a tolerable—
one might say intolerable—idea of eternity to think how long the sea must have been gnawing and nibbling here to bring about the present state of things. There are scores of these dikes about the Shoals, but this one is the finest of them all; and near by there is a fearful precipice with a retreating base, and there being a convenient cleft, you can lean over the edge and fancy yourself leaning over the prow of some enormous ship aground upon the half-tide rocks below, or upon Noah's ark atop of Ararat. Here at the edge of evening it is well to come and linger till White Island Light flashes its red and white alternately, and you think of the sad poem which begins,

"I lit the lamps in the light-house tower,
For the sun dropped down and the day was dead;
They shone like a glorious clustered flower—
Ten golden and five red."

You think, too, of that story told by Mrs. Thaxter of the Nottingham galley that was wrecked long, long ago upon Boon Island, and how the men waxed ravenous for each other's flesh, and of that other story she has told in verse of the young couple, newly wed, who went to keep the light, and how

"Death found them; turned his face and passed her by,
But laid a finger on her lover's lips,
And there was silence. Then the storm ran high,
And tossed and troubled sore the distant ships.

"Nay, who shall speak the terrors of the night,
The speechless sorrow, the supreme despair?
Still, like a ghost, she trimmed the waning light,
Dragging her slow weight up the winding stair.

"With more than oil the saving lamp she fed,
While, lashed to madness, the wild sea she heard;
She kept her awful vigil with the dead,
And God's sweet pity still she ministered."

Boon Island is fifteen miles northeast of Appledore, and about as far from the Maine coast. There is something awful in its loneliness. There is no soil upon the island save a little that has been imported from the main-land, but out of this observant eyes once noted morning-glories creeping up against the weather-beaten light-house tower. From Appledore this tower alone is seen, the island is so insignificant.

Appledore has now only one dwelling on it separate from the hotel. But there was a time when all its southern slope looking toward Star was dotted thick with human habitations, and nothing can be more pathetic than the remains of these that now enhance the natural loneliness of the spot. From the time of the first settlements till 1679 the main hamlet was at Appledore, a good spring of water having probably attracted it. But this hamlet went to ruin nearly two hundred years ago, and all that is now left of it is the seventy or eighty garden and cellar walls, all overgrown with shrubs and vines and mosses, and a few graves, dug, where only they could be, in swampy hollows, with the granite slabs of the island placed at head and feet—slabs quarried for the hapless mourners by the lightning and the storm. Sitting among the ruins, imagination builds them up again, and tries to people them with the folk who made this wilderness once blossom with their rose of joy. The names of some of them are known to us. One of them was William Pepperell, the father of famous Sir William, who had a sister Margery who was drowned one day close by the Shoals. Perhaps when afterward Mr. Pepperell made his

home in Kittery, wee Margery's bones were carried thither. There was a church here once, but where no man can say; and what is more wonderful, there was an "academy," to which "even gentlemen from some of the principal towns on the sea-coast sent their sons for literary instruction."

Over against Star, on Appledore, is the cottage of Jörje Edvart Ingebertsen, an old Norse viking, whom a few years ago the Lughton brothers invited to settle here. He it was who first saw poor Marie Hontvet standing like a spectre on the half-tide rocks of Malaga the morning after Louis Wagner's butchery of Karen and Annetta Christianson. He it was who first went to her and back with her to the house where hell had been let loose. Rowing me over the placid waters one day last summer (1873), he told me something of that day of horrors. His children are named Julius and Waldemar and Axel and Gustava and Thora Ingebertsen—names, like his own, that seem the natural blossom of these rugged shores. It fell to Julius on my second visit to the Shoals to be my ferry-man. White Island was so girt with foam after a stormy night that landing there was dangerous, so I gave my day to Star and Londoner. Star Island has been changing very rapidly within the last few years. Now it has entirely lost the quaint and interesting features of its ancient life, which were not long ago its great attraction after its natural scenery. In 1873 a hotel, called the Oceanic, was built here, which cost \$300,000. Though it accommodates nearly if not quite as many guests as the tripartite house at Appledore, it was filled to overflowing. Since the close of the first season there has been a steady march of improvement. The few Star Islanders who were left in 1873 have sold their cottages to the proprietor of the great house. The worst of them have been pulled down, others have been fitted up as cottages for guests. They were not beautiful, they were not sweet or clean, but, seen from a safe distance, they were very picturesque. They clung like limpets to the rocks. Their walls and roofs were covered with that yellow lichen which abounds at

SHAG AND MINGO ROCKS, DUCK ISLAND.

SOUTHEAST END OF APPLEDORE, LOOKING SOUTH.

Star as nowhere else. It makes splendid masses of warm color on the rocks, and when its background is the dark blue trap-rock, it contrasts with it superbly. It is said that the Shoalers do not like to give up their rude homes, though ever so well paid for them. One of them on Haley's, who had migrated from Star, said to me, "We want to keep together, some of us, as long as we can." The proprietor of the Oceanic is building wharves and pavilions, and making paths and lawns, and doing every thing he can in order to deserve success.

Star Island was comparatively unoccupied for a long time after the settlement of Appledore and Smutty-Nose. Toward the close of the seventeenth century, for some reason or other, it attained a sudden popularity, and Appledore declined in importance. The golden age for Star, and for the Shoals generally, was the middle of the eighteenth century. Then there were three or four hundred inhabitants on all the islands, fishing was pursued with steady industry, and besides great quantities of fish sold on the main, every

winter five or six Spanish ships were loaded with dry fish for Bilbao. We can with difficulty conjure up a mental picture of that prosperous time. Earlier all women were outlaws at the Shoals, doubtless because only the worst came for the worst purposes. Now, unquestionably, there were good women and true, faithful and quiet souls, but they had not all this character. There were typical fish-wives among them, and there were no stocks, ducking-stools, or whipping-posts, as in the previous century, to punish the incorrigible. The first inhabitants of the islands have been described as "industrious, prudent, and temperate;" but quite other inferences must be drawn from the legal records of the seventeenth century. There was no

end to scolding and quarreling and drinking and fighting. Joane Ford, "for calling the constable horn-headed rogue and cow-head rogue," was punished by nine stripes given to her in presence of the court. In 1667 ten fishermen were convicted of drinking twelve gallons of wine in one day. John Andrews, who had a scolding wife, was convicted the same year "for swearing that he was above the heavens and the stars, at which time the said Andrews *did seem to have drunk too much*, and did at that time call the witnesses dogs, toads, and foul birds." Entries akin to these are plentiful.

But for the Revolutionary war Star Island might have had a much longer career of prosperity. The town of Gosport was incorporated in 1715, and as late as 1767 it had 284 residents. At the outbreak of the Revolutionary war the Shoalers were held guilty of giving shelter and sustenance to the enemy, and were ordered to quit the islands. The desertion was so general that in 1775 only forty-four persons were remaining. March 11, 1775, Henry Andres received twen-

OLD CHURCH, STAR ISLAND.

ty shillings "for *histing* the flag," and it has been inferred that this flag was the British. At the close of the war a few families straggled back, but there was never any real prosperity again. The morals at the close of the last century were, if possible, worse than in the century previous: marriage without the ring was not uncommon. In 1811 there were at Star eleven families and "two solitaires" — fifty-two souls; in 1824 fourteen families and "one solitaire." Ever since they have been thinning out, and now on all the group only a handful remain who are descended from the old inhabitants.

Just back of the ledges on which once stood the town of Gosport, upon the highest rock at this end of the island, stands the little meeting-house. It is thirty-six by twenty-four feet on the outside, and the stone walls are two feet thick. These stone walls gave great satisfaction to the Rev. Jedediah Morse, who dedicated the meeting-house on the 24th of November, 1800. "The inhabitants *can not burn it for fuel*, and it will be imperishable," said the dedication sermon. In 1859 the steeple was adorned with a vane. The event was signalized by the following entry in the town records: "At a considerable expense the inhabitants of these Isles have put up a *beautiful vane* on our chapel. May their own hearts yield to the breathings of the Divine Spirit as that vane does to the wind!" Doubtless the odor of sanctity was not a stranger to these walls, but the most conspicuous odor must frequently have been that of the fish stored here upon week-days, and sometimes for a continuous period when there was no regular preaching. A church built by the islanders at the beginning of the eighteenth century, mainly with the

timbers of Spanish ships that had been wrecked upon the Shoals, lasted the century nearly through. In 1790 it was wantonly set on fire by a gang of fishermen, who held a wild revel by its light until it had completely vanished. Not far from the new meeting-house stands the deserted school-house, a map of the Eastern Hemisphere blowing eerily through a shattered window; and a little farther on stands the snug parsonage which was built for the Rev. Josiah Stevens in 1802, when he had married the daughter of dear old Samuel Haley, of Smutty-Nose, and settled here for life.

Side by side with Mr. Stevens's cairn there is another of much more significance, bearing the record of a much longer ministry upon the slab that covers it. Under it lies buried Rev. John Tucke, whose ministry began in 1733, and lasted till his death, in 1773. He filled the medical as well as the pastoral office, and it is graven on his sepulchre that he "was a useful physician both to the bodies and souls of his people." Some of the entries in the town records having reference to the payment of his salary might have emanated from the teeming brain of Mrs. Gamp or Truthful James:

"On March 11th 1762, A genarel free voot past amongst the inhabents that every fall of the year when Mr. Rev^d. John Tucke has his wood to Carry home evary men will not com that is abel to com shall pay forty shillings ould tenor."

"March 12th 1769, A genarel free voot past amongst the inhabents to cus [cause] tow men to go to the Rev^d. Mr. John Tucke to hear wether he was willing to take one Quental of fish each man, or to take the price of Quental in ould tenor which he answered this that he thought it was easer to pay the fish than the money which he consented to talk the fish for the year insuing."

"On March ye 25 1771, their was a meating called and it was gurned until the 23d day of apirel."

In the ecclesiastical history of the Shoals there is only one name more venerable than that of Tucke, that of the Rev. John Brock, who was the first Puritan minister at the Shoals. Before his time the Shoalers had been firm adherents of the Episcopal Church, as, with some few exceptions, were all the colonists north of the Merrimac River. Very bitter was the animosity between the Episcopalians and the Puritans, and the Shoalers took a lively interest in the discussions that were going on upon the main. The first ministers at Appledore were all ardent Episcopalians; but when the authority of the Massachusetts Colony was extended over the Shoals, in 1652, the Rev. John Brock was sent thither by the Boston Puritans. His ministry continued until 1662. Cotton Mather said of him: "He dwelt as near heaven as any man upon the earth. I scarce ever knew any man so familiar with the great God as our dear servant Brock." Many stories have been preserved concerning him, one by Cotton Mather, "to Illustrate and Demonstrate the Providence of God our Saviour over the Business of Fishermen." The story is too good in Mather's words to be told in any others:

"When our Mr. Brock lived on the Isles of Shoals he brought the fishermen into an agreement that besides the Lord's Day they would spend one day of every month together in the worship of the Glorious Lord. A certain day which by their Agreement belonged unto the Exercises of Religion being ar-

rived, they came to Mr. Brock and asked him that they might put by their meeting and go a-fishing, because they had Lost many Days by the Foulness of the weather. He, seeing that without and against his consent they resolved upon doing what they asked of him, replied, 'If you will go away, I say unto you, "Catch fish if you can!" But as for you that will tarry, and worship our Lord Jesus Christ this day, I will pray unto Him for you that you may afterward take fish till you are weary!' Thirty men went away from the meeting and Five tarried. The thirty that went away from the meeting with all their Craft could catch but four Fishes. The Five which tarried went forth afterward and they took five Hundred. The fishermen were after this readier to hearken unto the Voice of their Teacher."

Another story, told of Mr. Brock in Mather's *Magnalia Christi*, is to the effect that once a fisherman who had often made himself useful in ferrying the people to church lost his boat in a storm. He reported the fact to Mr. Brock, hinting that, considering his past services, the Almighty was hardly justified in treating him so shabbily. "Go home contented, good Sir," said Mr. Brock. "I'll mention it to the Lord. You may expect to find your boat to-morrow." And sure enough he did. It came up from the bottom on the fluke of a vessel's anchor lying in the roads. There is another story that redounds less to his credit than to the glory of a parishioner whose name, alas!

has perished. "Supposing, my brethren," he was saying, "that any of you should be overtaken in the bay by a northeast storm, your hearts trembling with fear, and naught but death before you, what would you do?" The reply was instantaneous from an unconscious skeptic of the supernatural, "I'd h'ist the fores'l and scud away for Squam." This story is not one of those preserved by Cotton Mather. After Mr. Brock came a Mr. Hall, and then a Mr. Belcher. It was during his pastorate that the exodus from Appledore took place and the settlement of Star Island began.

GORGE, STAR ISLAND.

CAPTAIN JOHN SMITH'S MONUMENT, STAR ISLAND.

The modern grave-yard upon Star is on the western side. Some of its monuments are quite ambitious. In the vicinity of the Tucke and Stevens monuments there are several ancient graves, with the slab of the island at their heads and feet, with the initials of the dead carved upon them so rudely that one surmises a father's or a husband's hand did this poor homage in some interval of painful toil. A strip of swampy verdure runs across the island here, and beyond to the east the cliffs tower up again. Nowhere else are they quite so magnificent as here. As you walk over them, with the sun blazing on them brightly, your eyes are almost blinded by their storm-bleached whiteness, and by the sparkling mica that is one of their most prominent constituents. Upon the summit of this eastern portion of Star Island there is a monument erected by the islanders to Captain "John Smith, the discoverer of these Isles." This monument is "fearfully and wonderfully made." It is a triangular marble prism set upon the landing of a three-cornered flight of steps. The sides of the prism are covered with long and tedious inscriptions. The top was originally surmounted by three Turks' heads, in token of those lopped off by Captain Smith before the town of Regall, in Hungary, when the Christian army was besieging it. So proud was Captain Smith of this exploit that he named the rocks off Cape Ann, now called the Salvages (pronounced by fishermen along the coast Solwages), "The Three Turks' Heads," and the cape itself he named Cape

Tragabigzanda, after the lovely princess who rescued him from slavery at Constantinople. It is painful to imagine what the Marblehead dialect would have made of Tragabigzanda if the name had been retained. One of the three Turks' heads upon the monument is still in good condition; a second much the worse for wear; the third has been destroyed by stress of weather, or been carried off by vandal hordes. The statement of the monument that Captain Smith was the discoverer of these Isles is not corroborated by archaeologists. He saw them in 1614, when he was sailing along the coast with eight men in a pinnace, and when afterward he published a *Description of New England*, he spoke of them as "Smith's Isles, a heape together, none neare them, against Accominticus." That he should have given them his name speaks well for his appreciation of their character. They did not wear it long. Edward Winslow, of Plymouth, in 1623 refers to "Smith's Isles" in mentioning a new plantation on the Piscataqua. No later use of this name has been discovered in English; but in a chart of "Novi Belgii" contained in Montanus's *Nieuweonbekende Weereld*, published at Amsterdam in 1671, the Isles of Shoals are still called "Smit's Eylant." As for the real discoverers of these islands, there can be little doubt that Gosnold sighted them in 1602, and Martin Pring in 1603, but there is no distinct reference to them in the chronicles until 1605, when they were seen by De Monts, with whom sailed the famous Champlain, who acted as the

chronicler of the voyage. Champlain describes them as "three or four rather prominent islands (*isles asses hautes*) on the West Ipswich Bay." Their guide along the coast was an Indian named Panonias, whose newly wedded squaw stood in the prow of the pinnace as she sailed from place to place. She was a stolen bride, and two years later he was murdered by her jealous kindred. But his faithful Onagimon rescued his corpse, and carried it to Port Royal, whence in the spring a solitary canoe stealthily bore it by night to a lone sandy islet near Cape Sable, called the Island of the Dead. The story, much more fully told, can be found in Mr. Jeuners's admirable little *Historical Sketch of the Isles of Shoals*, to which I am indebted for a great many of the historical statements contained in this paper.

Leaving Star Island, my young viking rowed me through a troubled sea to Londoner. This island is the tamest of the group, but it has a pleasant little cove on the north-eastern side, and at the northwestern extremity a jagged mass of the most tusk-like rocks to be found any where upon the Isles. Fortunately they are on the land side of the island, yet even here it is terrible to fancy how they would gore the hull of any vessel that should be cast upon them. There is a deserted house on Londoner, round which a little piece of grass was marvelously green, the clover marvelously sweet. There were doriesful of drift-wood above high-water mark, and we bore away a goodly store, and that night it made a splendid flame for a company of three at Appledore. Early the next morning my young viking brought his dory round with the good news that it was feasible to land upon White Island. White Island is about a mile from Appledore. By itself it is very small, but a bar that is barely covered at high water connects it with Seavey's Island, which is a little larger, if

not nearly so striking in its configuration. Without the light-house White Island would be a fascinating spot. Its eastern end is very high and fearfully abrupt, and so makes a barrier between the light-house and the onslaught of the easterly gales.

But the light-house gives to White Island a significance that, without it, it could never have. Even a commonplace light-house makes poets of us all, and this is no commonplace one. Few light-houses are more picturesque in their shape or situation. The new tower rising eighty feet and more from its base, and thirty feet additional from the low-water mark; the truncated cone of the old tower of Mr. Lughton's time beside it; the long covered walk, well stanchioned to defy the power of wind and wave; the tidy little cottage at its end; the patch of brilliant green about it; the little girl, with cheeks so brown and red, who shyly scanned the first of all the rout of summer visitors—all this, against a background of delicious sea and sky, made such a picture that I shall not soon forget it. The keeper is an old Star Islander. His assistant took me up into the tower and showed me the working of the lamp, its splendid prisms, the machinery for making it revolve. It is a Fresnel light, and the light alone, exclusive of the tower, cost about \$30,000. There is a superb view from the top, and one gets there a sense of airiness and freedom such as must stir in sailors' breasts, only a hundred times stronger, as they stand high up on the foot-ropes of the yards, while their good ships plunge upon their way.

The keeper's assistant pointed out to me the window through which, as Mrs. Thaxter tells, a wave once broke in a tremendous storm and sent a barrel of walnuts, that were drying on the floor of the room, rolling and dancing down the stairs. But then he added, "That story don't go down with some

LONDONER, FROM STAR ISLAND.

COVERED WALK AND LIGHT-HOUSE, WHITE ISLAND.

of us round here: these people that write pieces for the magazines stretch things a good deal sometimes." However, he confirmed the much more striking story of that night when the whole ponderous walk (more than a hundred feet in length) between the cottage and the light was "carried thundering down the gorge and dragged out into the raging sea."

Haley's Island, once called Smutty-Nose, with Malaga, with which a sea-wall connects it, and Cedar Island lie between Star and Appledore, and make with them the harbor of the Shoals. There is a breakwater between Haley's and Cedar, which is much out of repair. Rumor was saying that the government was soon to put it in good order. Haley's Island is next in size to Appledore. Cedar and Malaga are very small. Haley's has more soil than any of the others, and in the early history of the islands the wealthier and more aristocratic islanders lived here, and orchards were planted, and sheep and cattle grazed among the rocks. To-day literally and figuratively it is more

fragrant of the ancient life of the Shoals than any other spot. For it was "a very ancient and fish-like smell" that greeted us as we rowed into the dock near which two or three fish-houses are still standing, with bits of the old "fish-flakes" on which some fish were drying close at hand. Four or five well-tanned fishermen were lying about upon the rocks, dozing and blinking in the sun. A few rods from the wharf is the house in which Annetta and Karen Christianson were murdered by Louis Wagner in March, 1873. It is a great pity that this incongruous element should have intruded upon the life of the Shoals. They had had their tragedies, but they were far away. The tradition of them had grown softer and softer with time. But once here, it is impossible not to feel an interest in Louis Wagner and the victims of his devilish cruelty. When I went to the Shoals for the first time I was shamefully ignorant of the whole affair. I had not read one word about it in the newspapers. Suddenly I found myself deeply interested. The old man Inge-

bertsen was my ferry-man, and I extracted from him every particular of that eventful morning when Marie Houtvet, standing upon the half-tide rocks of Malaga, held out her hands to him imploringly. A year later I found the interest in the murder at the Shoals as fresh as ever, and my own quite unabated. I cross-questioned young Ingebertsen as if I were conducting the case for the people against the prisoner, and against the people for the prisoner. Another family was about moving into the house. I did not envy them. The blood-stained paper had been torn from the walls by relic-hunters. A fellow-passenger from Portsmouth confessed to a piece in his pocket with no questionable blot upon it. I think he would have sold it to me for a certain sum, but I made him no offer. The window-frame of the window through which Marie thrust out the young wife Annetta into the nipping air has been carried away bodily. But there was the stone on which she stood, only half wakened from her innocent sleep, when Wagner clove her fair young head asunder. He dragged her body back into the house, where

Karen was lying dead, and then sat down and ate a hearty meal. He had rowed ten miles in the bright moonlight to do this deed, and now he must row back again. What a fine opportunity to reflect on his night's work, of which the total profit had been sixteen dollars!

But the shade of Louis Wagner is no match for another shade that haunts this island. Once landed there, I found my interest in the former ebbing very fast, my interest in the latter growing very rapidly. This other shade is that of Mr. Samuel Haley, whose name the island bears more properly than Smutty-Nose, though this name was the first, suggested by a long black point of rock that stretches out from it to the south-east. Samuel Haley's house is near the tiny wharf which he constructed, and a little distance in the rear of it I found a broken headstone bearing the inscription:

"In memory of Mr. Samuel Haley who died in the year 1811 Aged 84. He was a man of great Ingenuity Industry Honor and Honesty, true to his Country & A man who did A great Publik good in Building A Dock & Receiving into his Enclosure many a poor Distressed Seaman & Fisherman in distress of weather."

CLIFFS, WHITE ISLAND.

HALEY DOCK AND HOMESTEAD.

(In the third house from the left the Wagner murder was committed.)

I gathered handfuls of great dandelions, and cherry blossoms from the stunted trees he may himself have planted, and scattered them upon his grave. An island is a very fitting monument for such a man. Let it be called Haley's Island as long as it endures! He was a man of character and enterprise, as his epitaph relates. As he turned over a flat stone one day he found three bars of solid silver. With this treasure he built the sea-wall that connects Smutty-Nose with Malaga, not, I should judge, in quite its present shape. Then, too, he built the wharf near by, and he built a rope-walk 270 feet long, and set up windmills to grind his own corn and wheat. I found one of the millstones still in use, but as a step before a warehouse door. His sheep and cattle used to graze over the rougher portions of the island, but he reduced a generous piece to cul-

tivation. It was his custom every night to put a light in the seaward window of his house for the sake of vessels sailing near.

"How far that little candle throws his beams!
So shines a good deed in a naughty world."

May I not find his grave-stone lying flat next time I wander thither!

Not far from his own grave there are fourteen close together, with slabs of granite at each head and foot. These are the graves of the Spanish sailors of the great ship *Sagunto* that was wrecked here one bitter winter night in a driving snow-storm. Some of the sailors got ashore, it seems, and crawled in the direction of old Haley's light, but died before they reached it, and he found their bodies lying across the wall at the back of his house the next morning. Soon others were washed ashore, and he gave them

SMUTTY-NOSE.

LEDGE OF ROCKS, SMUTTY-NOSE.

"Christian burial," and placed the nameless granite slabs for them.

"O Spanish women, over the far seas,
Could I but show you where your dead repose—
Could I send tidings on this northern breeze
That strong and steady blows!

"Dear dark-eyed sisters, you remember yet
These you have lost, but you can never know
One stands at their bleak graves whose eyes are wet
With thinking of your woe!"

Besides Samuel Haley's three bars of solid silver not much of treasure has been found so easily, though it is said a little black pot of gold and silver pieces was found upon Star Island, buried by Captain Kidd, of course; and once a fisherman from Star, hunting for drift-wood in the coves at Appledore, found Spanish dollars scattered all about, sole proof of some sad wreck upon its pitiless crags.

Most of the silver coins found hereabouts have been found one at a time in fishes' mouths, like Peter's in the miracle. "And is it not a pretty sport," wrote Captain John Smith, "to pull up twopence, sixpence, and twelpence as fast as one can hale or veare a line? The salvages compare the store in the sea to the hairs upon their heads; and surely there is an incredible abundance of them upon the coast."

It is a pleasant sight to see the little fishing smacks that cater for the guests at Star and Appledore go forth at morning and return at eve. It is still pleasanter to see the seine fishers in their great boats close to the shore drawing in their seines. No curves can be more graceful than those made by the little floats of the seine upon the surface of the water as it is being drawn.

I have not tried to analyze the fascination of this island wilderness. It might not prove an easy or a profitable task. But some of the elements of it must be apparent to the least observant eye.

After having staid here for a few days the

towns and cities of the continent become a dream, a myth, to you. Going back to Boston, you are surprised to find both the State-Houses still standing. One's experience here begets a feeling that our ordinary world is too large.

It would be worth while to sit down on these cliffs for weeks and wait for a great storm, as the Cape Cod preachers used to sit and watch for the providential whales on which their salary depended. One of these storms has raged in Lowell's verse with mighty clangor ever since he wrote his *Appledore*. Missing the storm, all visitors should read the poem. Whatever be its mood, the sea about these shores has never any lack of "arts and sorceries." To quote Captain Smith again, "What sport doth yield a more pleasing content with less hurt or charge than crossing the sweet Ayre from Ile to Ile over the silent streams of a calm Sea?"

I looked out over such a sea the morning of my last day at Appledore. But in the course of the forenoon a fresh breeze from the south sprang up, and I bade good-by to my gracious hosts and my solitary fellow-guest, and went on board the *Molly*, who very soon spread her white wings, and made straight for Portsmouth Harbor.

"Behind us lay the islands that we loved,
Touched by a wandering gleam,
Melting in distance where the white sails moved
Softly as in a dream.
Drifting past buoy and scarlet beacon slow,
We gained the coast at last,
And up the harbor, where no wind did blow,
We drew, and anchor cast."

Newcastle's one most rare and perfect elm was perceptibly greener than when I had sailed down the river a few days before, and the grass was growing white with falling blossoms under the Hampton apple-trees. And I said in my heart, I have enjoyed so much that I must tell my joy to others, if haply they may enter into it, and perchance follow my example.

RAPE OF THE GAMP.

"HERE HE WOULD SIT AND GAZE WISTFULLY THROUGH HIS SMOKE WREATHS AT THE OLD SEXTON DIGGING A GRAVE ON THE CHURCH-YARD SLOPE."

CHAPTER V.

DUST TO DUST.

PERHAPS Mr. Lane's life, though preserved by his steady work in school and his habit of much reading, was not altogether a healthy one at this period of his career. In his bedroom, which was itself a vault-like apartment, he had on a *priedieu* two white skulls grinning at each other in a small glass case. This was by way of

cheerfully illustrating the sequel of a sexual passion. In another small glass receptacle was preserved a human stomach—certainly a most unworthy object to live for. In a third was exhibited the brain of a man who had mastered many sciences, and ultimately died of congestion of the brain. The cerebrum and cerebellum were carefully adjusted as in the living head; and this was the organ with which man undertook to criticise the Divine will!

Immediately over this hung one of the most ghastly crucifixes ever produced by a horrible manipulation of form and color. Happily the *priedieu* was a shelf which depended from the bottom of the triptych containing this crucifix; and it was so arranged that he closed it all up, and effectually secreted it under a spring-lock, by merely shutting the triptych doors. The pernicious effect of these sights was therefore not extended to his domestics or any chance visitor who might stray into the room.

After his lugubrious devotions at the foot of this pious apparatus, Mr. Lane would repair to the large window of his sitting-room, in which was a broad seat, conducive to the meditative pipe. Here he would sit and gaze wistfully through his smoke wreaths at the old sexton digging a grave on the church-yard slope. Sometimes he felt very weary of his secret burden, and wished that his body too might be left tenantless, and his bones denuded to furnish a *priedieu*, or be ground into flour for poor men's bread. How was it all to end, he asked himself sometimes, all this labor and trouble, this secrecy and apprehension, this abnegation and distrust of self? Could he really do any good in the world, or secure his acceptance out of it? Are deadly sins really forgiven? Or is the load of conscience merely lightened to give the will and passions play? Surely that terrible sacrifice of Calvary would never have been consummated had God been merciful. Fatuous blindness, to reckon on mercy where "the Holy One and Just" found none. "My God! my God! why hast Thou forsaken me?" The career of man seemed to Mr. Lane at these moments like that of the moth, which seems to be a free agent, and yet, attracted by some irresistible impulse, flies into the flame which inflicts upon it an agonizing death. Yet, come what will after death, death itself comes on apace. Of that no doubt can be entertained even by the fatuous, self-deluding creature called man. For how many dead men had that poor old sexton prepared the narrow bed? Some thousands at least! Say only one a week for fifty years, there would be two thousand six hundred provided for; and there *are*, too, at least all that remains of them. And there he is, digging away still. Inch by inch, sometimes three or four inches at a drop, the old man's lean shanks disappear. Then his old bent body sinks out of view. His head bobs up and down a little while, then is gone. Now nothing but spadefuls of damp red mould and rotten wood and brittle bones comes surging up from the world of the dead.

The dead men nearest to Mr. Lane were on a level with his head as he sat in his pleasant oriel. Those farther off were higher and higher. Terraces of dead men, one above another, on the dismal slope. Along

each terrace the corpses lay, closely ranged, head to foot and head to foot. Three coffin deep lay the dead men every where, till the lowest coffin, with its grim remains, rotted and sunk and slunk away, earth to earth, or, oozing out, exhaled in the church-yard mist. Then would come the tottering sexton with his iron probe, and find there was room. Down would sink his old lean shanks and crooked back, and up would come the spadefuls of mould and mortality, clearing the space, making ready for the rest of another weary head.

Above this garden of the dead the church rose gaunt and gray, itself a temple of the dead. There they lay, whole generations of them, huddled under the slabs which paved the transepts, under the aisles, under the chancel tiles. Some had crept to their last refuge under the very walls, so that when the bells rung out a full chime from the central tower the whole sarcophagus rocked and trembled over their crumbling vaults.

Seldom were those bells at rest, though not often did they sound a summons to praise and prayer. But almost daily a "passing bell" told that some tenant's quarter was up, that a wanderer was moving from his house of clay. Almost daily a bell was tolled feebly, as if the dead man had not paid enough for a few lusty strokes. Presently it died away; then began again—toll, toll. And now a pitiful file of black figures creeps through the dismal dripping rain and oozing slime. This sorry group disappears for a while, then is seen crawling about and clustering round a little heap of mud. The querulous tones of the old curate's cracked treble rise and fall; one meagre black form is convulsed with sobbing, or perhaps with cold and ague; and then what? For the living, winter winds and rain and mist, scorching summer suns and drought and thirst; summer and winter, toil upon toil, and sorrow upon sorrow, until the end, the faintly tolling bell, the hole in the damp church-yard, the sound of the curate's voice. And for the dead, what? Is it "a fearful looking for of judgment," or "the peace that passeth understanding?"

One sad November day the bell beat its hollow plaint for a girl who was "found drowned," as the coroner's jury pathetically expressed it, in a tributary brook which flowed into the river just above the abbey. She must have been "mighty weary o' her life," the sexton told Mr. Lane, for the water was scarcely three feet deep. Yet there she lay on her face, with pale hands clenching at the roots of rushes and water forget-me-nots. Perhaps some lover had gathered her a posy of them not many months before. Another day the bell tolled lustily with no uncertain note—and doubtless this time it raised an echoing chime of marriage-bells in many a

waiting breast—for one of the local bankers, a purisy, tyrannous old man, had left his earthly tabernacle, and set out on that moneyless journey from which no traveler returns. Then the poor had their turn again, and made the best of it. That winter they seemed to Mr. Lane to hurry out of this dolorous life more resolutely than before; no man waiting for his turn, but sometimes two or three jostling each other on the road. The sexton had to send for his son from Farfield, and the two old men (for the son was nearly as old as the father) had a merry time of it. Mr. Lane added the filial old man to his household, and supplied him with tobacco on the paternal scale, so that he acquainted Ada, the housekeeper, in confidence, with his ardent desire that the mortality in Pedlington might “never leave off no more.” A cemetery was being laid out in another suburb of the town, and both the churchyards and the old parish grave-diggers were condemned by anticipation; but these ancients were quite unable to comprehend such a revolution actually taking place, nor did the slightest misgiving seem to suggest to them that after stowing away about three thousand fellow-creatures in their narrow beds, their own turn to submit to a similar operation might arrive. Rather they seemed to consider that all mortality, parturition, and matrimony—in short, all the transitions of the human race—would cease if their peculiar functions were to be suspended. And as to the banker, Mr. Lane felt pretty sure, without instituting any inquiry, that he had taken his notice to quit reluctantly, and would fain have carried his purse with him when he went. But for those poor men and women, those careless tenants who left without notice, what change for the better did they anticipate? What were they seeking? Was it rest?

At a very late hour one evening toward the close of the year Mr. Lane heard unusual sounds of a violent ringing at his bell, then of a man's (an old man's) step in the hall, then a murmured colloquy and a closing of the front-door. In another minute Mr. Graves senior stood in the room.

“Well, Graves!” inquired the master, kindly.

“*He* be a-going,” was the partial explanation.

Mr. Lane had no clew to the name of the individual represented by that little pronoun, but it was a rule with him not to gossip nor encourage others to gossip on affairs which did not concern them. If some one of sufficient importance for his servants to ring the sexton up at this hour and send him to toll the passing bell were dying, and he, Mr. Lane, was not even aware of his illness, he evidently was not concerned in the gentleman's decease. Therefore he said nothing. Graves already had the tower key in

his hand; but before quitting the room he came with a half-deprecatory, half-triumphant manner close to his master, and jerking his withered thumb back over his right shoulder in the direction of the church, whispered, hoarsely, “I’ve a-buried four on ’em. This makes FIVE.” His watery old gray eyes lit up with exultation, and the word “five” broke out of the whisper in which he had thought proper to convey the information, and sounded more like a suppressed shriek than a loud whisper. Then pulling the scant gray forelock which adorned his brow, this ally of old Time set off to fulfill his professional engagement. Lane understood now that the rector of Pedlington was summoned to that interview with the Master of the flock which all shepherds, whether faithful or unfaithful, will have to attend sooner or later.

For full two hours, at intervals, the bell warned all evil-disposed spirits to clear the way for the rector's soul, and give him a free passage to the celestial courts. Mr. Lane, still keeping vigil, was regarding them as courts of judicature rather than as mere galaxies of power and splendor. At length the bell ceased. The soul had passed.

“I suppose he will have ‘benefit of clergy,’” the layman murmured to himself. This solitary man, who was fighting his way honestly though blindly through a legion of spiritual foes, and a region beset with perils of many kinds, had often wondered how it was that in a country which supports a costly and magnificent state church, and which boasts of having trampled upon all the enemies of the soul, and especially removed Roman scales from the spiritual eye-sight, a poor wayfarer is left to blunder and stumble in the midst of hostile forces, and no city of refuge is open to receive him, nor any succor reaches him when sore beset. The rector, it is true, had mumbled over a few dry sermons at noon on Sundays. These may have bristled with the panoply of righteousness; but if so, they required a master at arms to select and distribute appropriate weapons to the combatants. At other times the faded curate used to take up his parable and edify those whom he edified, but Mr. Lane was not one of these. As long as the divine adhered closely to his authorities, or merely attempted harmless antitheses, he did very well; but as sure as he was betrayed into analogy or interpretation, so sure was he to collapse ignominiously. Sometimes he would descant on charity and justice, but before he had gone far he would blunder into a slough of bigotry and malice, and flounder there, bespattering his hearers with silly words and unseemly phrases. When faith and works were the theme of his discourse, he would so shuffle his views of the conflicting schools of thought on this subject that one would have thought his doctrine to be that faith

was wholly independent of the human will, and that good works or a holy life were generally the offspring of spiritual pride. Mr. Lane wondered, as well he might, whether the inert rector or the inapt curate had ever helped a single benighted soul along the trackless waste of the spiritual life, and what sort of account would be required of the former now that his stewardship was ended and his soul had traversed the valley of the shadow of death. As for the hapless curate, there were men in Pedlington, middle-aged professional men, who said he could preach good sermons once, and had done so on his arrival among them, but that the rector (who called himself "a *via media* theologian") had complained of the positiveness of his doctrine; and the poor man, who had a wife and five children depending on his pittance, had muddled and blended and pared and modified, till he exhibited the pitiful spectacle of a preacher maintaining with zeal which amounted to rancor a confusion of theology to which you could assign neither a habitation nor a name.

"Now what is it that I don't believe, Bedford?" asked Phelps of his friend later in the afternoon of that day when their previous conversation occurred. He had said nothing in the heat of his indignation at being reckoned an enemy to the faith by one who knew his heart, and could see that his life was in accordance with the faith. The Doctor knew how to "give place to wrath." Besides which, he was always glad to have a light thrown upon his own conduct. As an enthusiastic lover of liberty, he might, in criticising dogma, have passed the moral limits and degenerated into license. If so, by all means let him bear reproof.

"Now what is it that I don't believe?" he repeated. Mr. Lane had well-nigh forgotten that imputation on his chief's orthodoxy. Since making it they had walked several miles over the windy hills, and felt again like brothers, looking over the purple weald country, with all its "farms and towers lessening t'wards the bounding main;" and most devoutly Mr. Lane wished in his heart that his secret, on the one hand, and his faith, on the other, would leave him free to be knit together with Henry Phelps as one soul. Moreover, he was nervously anxious to avoid a theological discussion, partly from a sound conviction that he would be worsted in any such encounter, but partly from a secret knowledge that in his own heart he was applying to Phelps the Scriptural phrase "the natural man," and to his religious opinions "the wisdom of this world," while at the same time he felt it was unjust thus to prejudge the whole case.

"Pray be candid," urged Phelps. "I'm accustomed to having my knuckles rapped by Puritan parents. What don't I believe?"

And Mr. Lane said, "You can not surely challenge me to name *one* thing which you don't believe?"

"I do," replied Phelps. "Name one."

Mr. Lane cast about in his mind for a dogma or person the very name of which should at once silence this bold heretic, and put an end to the controversy.

"The devil," he said, defiantly, but after due consideration.

"I rehearse the creeds," observed Mr. Phelps, doggedly.

"Well?" rejoined Mr. Lane, not quite seeing the drift of the argument.

"They don't mention him," Mr. Phelps added, in explanation.

"Nor they do," Mr. Lane reluctantly admitted, seeing already that he had made a bad beginning. "But surely," he added, "the devil is plainly spoken of in the Bible."

"Yes," said Phelps, quite seriously; "and *subjectively* he exists always. There's a great deal too much of him in all of us for my liking. But believe me, my dear Bedford, the belief in an *objective devil* is only necessary to men in a transitory stage of the spiritual life. You will emerge from that some day, and yet believe in that curse of humanity no less honestly than I do now."

Whereupon the discussion dropped. Phelps would challenge his matter-of-fact friend no more, and Mr. Lane was only too willing to give him credit for a modified orthodoxy; but he felt, and it pained him to feel, that between them a great gulf was widening.

The Doctor, on his part, believed that Lane would soon arrive at his own speculative level. But he was a far-seeing man. "And after that," he said to himself, "there will still be a barrier, I fear insurmountable. That gaunt skeleton in Bedford's cupboard has more reality about it than our friend with the horns and hoofs has about him."

CHAPTER VI.

DISAFFECTION.

Two years and a half have elapsed since the Grammar School at Pedlington was reopened under the auspices of Dr. Phelps. Hubert has made excellent progress with his studies, and reads privately with Mr. Lane twice a week, besides doing his fair share of school-work. Mr. Lane has slowly but surely come to be acknowledged as a friend of the family. The modesty and reluctance with which he met their first overtures at friendly intercourse rather prepossessed Mr. Browne in his favor, that gentleman being himself slow to form new acquaintances, and being accustomed to see young men jump rather too readily at opportunities for establishing an intimacy with a

family so remarkable for the beauty of its young women. Quite a little amicable rivalry exists between Frank and Hubert as to whose friend Mr. Lane should be considered, Hubert having first spoken to him, but Frank having first invited him to the house.

At a quarter before 9 o'clock A.M. Mrs. and Mr. Browne, Joan, Nelly, Frank, and Hubert, sit down to breakfast in the long parlor, with the long mahogany table. It is called "the dining-room," but is used for all meals except tea, which is served in the drawing-room above. Perhaps two chairs which remain vacant at 8.45 A.M. give rise to a momentary feeling of anger in the breast of *paterfamilias*, and a moment's plaintive regret in that of Mrs. Browne; but the gentleman is soon busily occupied with breakfast and the newspaper; and habit is a second nature. They are accustomed to see Albert's chair and Janet's unoccupied. Albert, besides being in bondage to Morpheus, is given to musing over his toilet. Janet will have her forty winks after the first bell rings, and sometimes only jumps out of bed at sound of the second. Whether she thinks that people ought to be glad to see any thing so bright and beautiful as she is at any hour, is not known; but it is shrewdly suspected that but for the Persian manifesto, which requires the table to be cleared at 9.30, she would still further prolong her slumbers. Having once imprudently done so, she lost her breakfast, and was reduced to plead humbly at the kitchen door for a crust of bread; for Janet is blessed with a hearty appetite, and another manifesto forbids any member of the family, except mamma, to pass the culinary threshold.

Eating goes on briskly, while conversation is languid and desultory. Sister Joan, behind the urn, looks like Minerva; Mr. Browne, at the other end of the long table, is invisible behind the *Times*; Nelly is reading a long letter, crossed and recrossed, Hubert doing tremendous execution on the fried bacon, eggs, and water-cresses; Mrs. Browne, sitting next to Joan, hands the cups, which that virgin supplies with tea and coffee.

"I hate talking at breakfast-time," Frank says, in answer to Nelly, who, looking across from her letter, has just mentioned her conviction that the Browne colony at breakfast resembles "a Quakers' meeting." "I hate talking at breakfast-time," he says; "it makes your head ache, and unfits you for work."

"What is that, Frank?" inquires Mr. Browne, looking round the edge of his paper with a seductive smile.

Frank repeats his observation, with repressed rage.

"Work?" echoes his amiable papa, in a mellifluous tone, as if he had imperfectly heard the word.

"Yes, work," replies Frank, with empha-

sis, and regarding his parent with untutored glances.

Mr. Browne calmly lays down his *Times*, and surveys the company all round with a cheerful and inquiring glance, as who should say, "Did I hear Frank mention *work*? If any one present has ever chanced to see him at work, a statement to that effect would cause me an agreeable surprise."

Mrs. Browne, answering that look with a gentle sigh, shakes her head despondently, which action Frank does not fail to observe. But grinding his white teeth together, and saying nothing, he proceeds with his meal, cursing his father and his fate inwardly.

"My mother has a nasty way of condoling with the governor," Frank used often to say to his friend Mr. Lane, "on my assumed idleness, by which pretense they justify each other for ill-using me. Not that my mother is to blame, because, you know, a wife is a wife. But you must see, Lane, that every thing would come to a dead lock without me. I look after all the office-work, you know. Very often I go for the governor, always with him when he does go, to Petty Sessions and Boards of Guardians, and all that sort of thing. And though he prompts every one else, I have to prompt him. His memory is not what it was, though he thinks it is. And then there's that egregious ass, Albert! I declare that fellow doesn't earn his salt; and you'd hardly believe it, but in the deed of partnership I had to bind myself to keep him here and allow him £100 a year, or to let him go and give him £200 a year for life. They want to make a pauper of me, just because I wouldn't marry a most ill-favored young lady who my father had set his heart upon for my wife."

So poor, virtuous, injured Frank used to pour out his grievances into Mr. Lane's sympathetic ear, and the counselor was sorely puzzled to understand the rights of this question. Unless Frank was attending some board or consultation, he was always to be found in his private office, writing letters, or revising the draft of a deed, or paring his nails over "a confounded new act." "There are new acts, you know, always coming down, to be got up," he would say. Even after tea he used often to return to his office, saying he had more work to do; though the girls, who once made a nocturnal descent upon him in that awful seclusion, used to laugh merrily when they maintained that he was discovered "immersed in parchments and begrimed with ink."

The tea-pot being hopelessly deluged with tepid water, and the table-cloth well littered with crumbs, Albert sauntered in, moon-faced, pallid, and bald, with a melancholy mustache of a reddish-yellow, and a violet

silk neck-tie. Making an elaborate bow and smile to the company after shutting the door, he advanced to the vacant chair at Nelly's side,

"Washing his hands with invisible soap
In imperceptible water."

Among certain ruins of breakfast which still graced the festive board, one egg-cup still appeared to contain a *bona fide* egg. Eying this, with his head on one side, Albert touched Nelly's hand lightly with his forefinger, and said, "Ahem! I say, Nelly dear, no sells?"

Nelly, reaching the egg-cup in a very matter-of-fact manner, took the egg out and turned it over to prove its solidity. Then she placed it before Albert, who, having been repeatedly imposed upon by cavernous eggshells inverted, wisely secured an alliance with sharp and punctual Nelly.

Then cutting himself a slice of bread with as much care as if it were to be the foundation-stone of his fortunes, Albert glanced across the table at the butter, but seeing Frank angry and eating, walked round the table and carried the butter-dish to his own place, offering a piece to Nelly before helping himself.

"Thank you, my dear old Pumpkin," said Nelly, smiling, and determined to countenance her brother. "You behave charmingly when you *do* come, at any rate." She had a playful way of giving her friends horticultural names, and selected this one for Albert on account of some fancied resemblance between his head and that vegetable. But she declined to limit herself strictly to resemblances in this nomenclature, having bestowed the name of "The Black Tulip" on Mr. Lane, partly because he had lent her a little French story called *La Tulipe Noire*, and in part because he was in appearance as little like that rare, dark, and slender flower as possible.

Albert also attempted to cover his want of punctuality by a facetious and imperturbable politeness. Seeing that Joan sat rigid and impregnable behind the urn, he cleared his throat again. "Ahem-hem! Joan, may I, although a Cipher, trouble you for a cup of that delicate infusion which still, if I am not mistaken, simmers in the family teapot?"

Mrs. Browne was not proof against this good temper. Perhaps, indeed, she had a peculiar tenderness for her eldest son on account of a certain feebleness in his constitution, which rendered him almost unfit for the stern battle of life. Catching his eye now, she nodded to him with her gentle smile, which atoned for the quality of his tea, for Albert was only more lazy than sensitive.

Presently this ill-starred young man, who had a habit of stiffening one leg over the knee of the other, dropped a slipper off his extended foot, and conscientiously crawled

under the table to recover it, while Frank, with a sly kick, dispatched it to the region of his father's Wellingtons.

Mr. Browne pushed his chair back with an angry gesture, and walked off with his newspaper, Albert presently emerging in the spot vacated by his father. Thus Frank, having made a hearty breakfast and discomfited his enemies, also left the room, smiling affably.

As Mr. Browne passed through the hall toward the door which led to the offices, Janet, all smiles and blushes, with her beautiful hair forming a perfect crown upon her broad white forehead, came bounding down the stairs. He turned from her, but she ran up and tapped him on the shoulder. "Please, pa, it's me," she said. Mr. Browne turned again, trying in vain to look angry. How could he, in the face of such smiling beauty? She was the flower of his flock, the apple of his eye. Giving him a pretty kiss, she added, "Only me."

Who can expect beauty to speak in good grammar, or to come down punctually at 8.45 to breakfast? Mr. Browne went to his dingy office and musty papers quite happy. The little bit of pretty girl grammar and the pretty kiss and the image of his darling cheered him. Who shall say that old age is not romantic? For my part, I quite long to be old, that I may acquire the simple, generous, little-exacting romance of old age. Talk about querulous, selfish old age! What so querulous, so egotistic, so capacious, as youth? Why, half the young men in Pedlington wanted to have Janet Browne and her £12,000 all to themselves, i. e., each one to himself, and then would have broken her sweet fragile spirit, and made a sour prude or a savage virago of her, while her dear old father was delighted with a false concord and a kiss.

But Janet never kissed any one except her father, not even her mother. So you see he had a monopoly after all.

Then "me" bounced into the parlor, with a saucy little courtesy to mamma and the rest of them, and fell to daintily at a large piece of dry bread and the remnant of a pat of butter.

"Where is Berty?" she asked, presently.

"Gone to school ten minutes or a quarter of an hour ago," answered sister Joan, severely.

As Janet sat opposite the three windows of the long room on the ground-floor, her eyes traversed them slowly from left to right, as if she were following Hubert schoolward. She was very fond of Berty, so she said. And as she looked, a dreamy lustre deepened in the sapphire of her eyes.

As the French say of women, "*Il y a des femmes et des femmes*," so we may say of blue eyes. Many women of our Anglo-Saxon descent have blue eyes; and when you look at them, unless you happen to be color-blind,

you see they are blue. But if Janet Browne passed you in a crowded thoroughfare, an image of a face actually illuminated with two wondrous orbs of matchless sapphire would dwell in your memory, and every drop of blood coursing through the veins all over your body would experience a delight. It is impossible to define this power of beauty, and it baffles the mind to consider whether such eyes would have a similar (though, of course, modified) power if the rest of the face were deficient in beauty. Frank used to say that a little blue vein visible in the hollow on each side of the bridge of the nose was the peculiar feature about Janet's eyes. Others attributed their charm to the long black curling lashes; but in this respect Nelly had rather the advantage. Most probably it is the subtle power of *harmony* which nature achieves in some faces, where the beauty of the eye is merely the key-note of the whole composition.

Whatever the day-dream was which now caused that lustre in Janet's eyes, it was rudely broken.

"My dear Janet," Mrs. Browne began, "I must beg that you will come down in time for breakfast. It does vex your papa so not to see you all punctual."

The good lady had not witnessed the "me" episode in the hall.

"I can not see any more difficulty in coming down at a quarter before nine than at ten minutes past," said Joan.

"I fear I set the bad example, and ought to bear the blame," interposed Albert, gallantly. "And, indeed, for some weeks past I have been revolving measures of reform. Only I am so reluctant to innovate. But now I am resolved. Desperate evils require desperate remedies. Janet, what do you say to half an hour's walk *before* breakfast every morning?"

"I should love it," said that young lady, promptly.

"Very good, my dear," continued Albert, formally—"very good! Now this is a contract terminable at three days' notice on either side. It comes into operation tomorrow at a quarter past eight o'clock. And you shall choose your own route."

Janet bounded on her chair, munching her bread, and expressing her satisfaction by smiles and ecstatic movements.

"I don't know what papa will say to such new doings," remarked Mrs. Browne, when her eldest son flashed out this bright suggestion, and her youngest daughter fluttered into it like a moth into a candle flame.

But Joan conceived an abyss of danger to lurk under this seeming innocent proposition. She endeavored to save her sister from it by the suggestion of a material obstacle. "Walking before breakfast, indeed!" she exclaimed. "Nice chilblains you'll have on your feet at this time of the year!"

"You see," pleaded Albert, who always paid attention to any advice or expostulation offered to him—"you see, the real reason why we are late for breakfast is a profound one. It lies in the perversity of human nature, the natural resistance to law. We do *not* breakfast early of our own accord; but if we take a walk every morning at a quarter past eight, which no one orders us to do, we shall rise like the lark."

"I dare say that's true," rejoined the mother, timidly speculating on the superior efficacy of will to law. But the proposition was too metaphysical for Janet, who determined on the walk. "Because I should like it," as she said to herself, and was quite satisfied with that reason, though there may have been another anonymously lurking in a dark corner of her little brain.

After breakfast, when the ladies were sitting at work in the cozy little "morning-room," with a bright fire glowing on the hearth, Mrs. Browne reopened the unpleasant subject by saying, "Do you know, Janet, I think if you loved your papa you would find it easy to obey him in little things. I can not say that I think it becoming or amiable for a girl to insist upon having her own way."

When this damsel was being scolded she used to abstain from speech altogether, unless asked a direct question. Knowing her habits, Mrs. Browne asked, "Do you love him, Janet?"

"Yes, I do," she replied; "more than—" She was about to add "you," but substituted the more general term, "any one."

"I'm sure I am glad to hear you say so, my dear," Mrs. Browne resumed, "because I know you always speak the truth, and I think you will try to see these little matters as I do, and conform to your papa's wishes in every thing. You must admit he is an indulgent parent."

But Janet's affection for her father had been forced in an artificial atmosphere. She had formed a little conspiracy with herself to spoil herself, and not to submit to law, in practice or theory. If it had been her habit to speak out what passed through her mind, when lectured by her mother or sister Joan, some very startling propositions would have been enunciated in the placid region of Mr. Browne's domesticity. At her little conspiracy her father connived, and she knew that he connived at it. If this had been the result of paternal astuteness, if Mr. Browne had seen that Janet's wrists would not bear fetters, and relaxed them in wisdom, the effect would have been good. But it was really the hard man's soft place. Janet was his little sweetheart. He would humgr and encourage her with sly smiles when he would have spoken harshly to another; but when she grew insolent, and thought he was vanquished, he would rise and crush her with

some terrible *ukase* which not even she ventured to contravene. In consequence of this inconsistent treatment the daughter behaved strangely to her father, at one time wheedling him with sweet confidence, at another (and this usually the result of his barren victory) absolutely refusing to speak to him for days together. Then Mrs. Browne would commence with her usual formula, "My dear Janet, your conduct to your papa is not becoming. Do you intend at some future time to treat your husband like this?"

For Mrs. Browne had a shrewd notion that the way in which a young lady behaves to her father foreshadows her conduct to her husband.

Janet, upon this, contemplated the tip of her boot, and answered, thoughtfully, "If ever I *do* have a husband, I hope he'll make me *respect* him."

This was a hand-grenade for mamma. "But, my dear," she urged, "surely you respect your papa?"

Again Janet thought before she spoke, and this time got fairly out of her depth.

"Yes, I do respect papa," she said.

"I hope so, my dear," her mother added. "He is universally respected."

Janet was in deep waters, and unable to think her way out, much less to express her thought in words. She respected her father's character because he was manful and masterful, and perhaps even more because she was sure that he was a man who had only loved once, and that her mother was the one woman. But though she would not have expressed it in so many words, she saw, at first dimly, afterward plainly, that in mind he was an egotist, never listening to reason on any subject where reason conflicted with his prejudice; in consequence of which she neither respected his opinion (when she saw any reason for differing from it) nor valued his judgment, which still was necessarily her law.

And far more than this: how far beyond her power to state or even to settle to her own mind clearly! Janet was a little volcano of pent-up enthusiasm and aspirations. Occult longings, leanings toward high and noble things, found no sympathy in him, no culture in the system of which she found herself a part. They were stifled at the birth. Heaven, which surrounds us all in infancy, though men may have forgotten it, and overlaid it with crusts of earth, was walled and roofed out from her. Now when any thing high or noble chanced to come her way, she had little power to recognize it, not a chord within her so strung as to vibrate to the heavenly finger. Very likely she would join in Frank's sneer at it, catching at the meagre fun for want of higher emotion. If the whole interest of every member of her family was centred in himself or herself, or at best in the others—if they all ha-

bitually traced every result back to a desire for profit or amusement—if they seemed unable even to understand how any thing should originate in higher motives, and if Frank generalized all such phenomena as "humbugs," whose fault was it?

Blindly and very reluctantly Janet laid all this and much more at her father's door. She did not see, nor did she suppose it possible to see, how it was chargeable to him. But she said to herself, "He has ruled in all things." These thoughts naturally only came to her at times; but at these times she used to make a resolution, and register a vow in her own mental tablets: "If ever a man marries 'ME,' he shall be a man very unlike papa, still more unlike my brothers, and unlike all their friends except one."

Then her fancy would run on this exception. "I am sure *HE* is quite different," she thought. "Fancy any of my brothers lecturing to the poor mechanics for nothing, or living contentedly in that gloomy old place alone, and making those antediluvian old things love him as much as Bertie and all the boys do! Fancy Frank sitting all day at the top of the old tower, studying, with all those queer jackdaws sitting round him, and that dear old Graves dozing at his feet! See how different he is in church: kneeling when he prays, and always looking as if he thought it really was the house of God, instead of going through it as a decent ceremony, and not looking at all the girls as if it were a concert or a ball-room! And *how* he looks when Frank makes one of his clever little sarcasms! Like those great curly retrievers when the little dogs bark at them. Yet he is very fond of Bertie. I can see that by the way in which he puts his hand on Bertie's shoulder. And Bertie adores him. He must like Frank too; or why should he come here so often? I'm sure he takes no notice of *me*. One would think *I* was only an ornament on the mantel-piece. But he thinks *me* rather pretty. That *I* *know*." Here the young lady's mind pauses and reflects. "I wonder why he does come here so often now! At first he used to seem annoyed at having to come, and always came late and went early. Now he comes unasked. But he never asks for *me*. I suppose if I went away for a whole week he would never inquire what had become of *me*. And he can go to much nicer houses than this, houses where the people understand him better. The Delavines are never happy unless they have 'poor Mr. Lane,' as they call him, at their horrid parties. They pretend to think he is unhappy and wants sympathy. He *isn't* unhappy. He *doesn't* want sympathy. He never confesses that he is sad to us. But *I* know. Yes, he is unhappy. He *does* want sympathy. Poor Mr. Lane! And he thinks we are really a happy family, and likes the picture of a home, as they say all

lonely men do. I don't. I hate it. It's a prison, home is. I want freedom, liberty from this tyranny that has made me what I am."

Now Janet stamped her tiny foot upon the ground, and fretted and fumed in imaginary bondage. Then words laden with sacred associations came to her, and she repeated them slowly: "Oh that I had wings like a dove! for then would I fly away, and be at rest."

It seems incredible that a young lady so comfortably circumstanced should have felt the sense of weariness implied in that aspiration. For a moment she hesitated, doubting whether it could be so, but soon decided that she, even she, was weary of life and its puzzles. "No wonder," she reflected, "that mamma has that settled look of wonder on her face. She too is puzzled, but is too subservient to papa to breathe a word of what she feels. There is no one to explain any thing to me. No one but mamma sees there is any thing to be explained. Papa pooh-poohs it all. I don't think he sees it. He would laugh at my perplexities. There must be some great difference between him and me. I want some one to understand me, and to lead me somewhere. How weary my poor little head is!"

Then Janet burst out into a wild, shrill laugh, which, if a wise man had loved her, he would have grieved to hear; for it sounded like the voice of young Despair, that worst enemy of heart and mind. She laughed at the recollection of one of Frank's witticisms. To her, condoling with him on the gradual approach of baldness, he had replied, "I have something else to do with my brains; yours run to seed, and spring up in that marvelous crop of hair."

But the feeble joke passed from her memory, and left her more sad, more weary. "Yes," she murmured, "I would 'fly away, and be at rest,' rest, rest." And again the dreamy eyes wandered as if in search of some one, and the sapphire deepened in them.

CHAPTER VII.

THE RAPE OF THE GAMP.

PEOPLE who live on the margin of a river, especially those who devote much of their leisure time to boating, fishing, and bathing, become as warmly attached to their little tributary as dwellers by the sea-shore do to the mighty ocean. The humble river, like the proud sea, has a voice with many tones; and never a mood of him who loves and listens goes without a response in reedy pool or rocky shallow. It is not, then, to be wondered at that Mr. Lane, who dwelt so near the peaceful river Peddle, and passed so much of his time on its glassy surface, or along its flow-

ery meads and richly wooded slopes—that he should also about this time have taken to walking along the terrace which is cut in the side of the Pedlington cliff, and so reaching the Grammar School by way of the Fair Meadow, thus keeping the river in view as he walked. I can not tell why, but his former habit had been to turn sharply up the sunk road which passed under his window, and so reach Knight Templar Street, which soon led him into the heart of the town, from which he diverged by Corn Lane to the school. Certainly his new route was preferable. Crossing the sunk road, he came at once by a flight of steps to the terrace, which is fringed by a row of pollard willows on the river side, while its other side is flanked by the face of the cliff, and, as you go further, by the gable ends of the old episcopal palace.

As Mr. Lane, morning after morning, at half past eight o'clock, strode along this strip of historic ground, thinking of the bishops and Wycliffe (who was cited to appear there for heresy) and Chaucer and John of Gaunt, a pretty couple, walking gayly side by side, and looking as if they thought it quite a joke to be out so early, passed and greeted him with smiles. Sometimes at this particular hour the wintry sun was glimmering above the bridge, in front of Mr. Lane, but in the backs of Albert and Janet. Sometimes a keen northerly wind made ice on the river margin. And, as ill luck would have it, one morning rain was falling heavily. Still they came, smiling as usual, the lady clinging to her brother, and vainly seeking shelter under his slight umbrella. Mr. Lane, having his goodly canopy of green gingham over his head, and the yellow stick in his hand, pressed it on the young lady's acceptance, and took himself off at a round trot.

She turned to look after him as he went. He looked like a giant in the falling rain. She staggered under the huge *umbra*, and nearly lost her balance as the wind swept round an angle of the church-yard wall. Of one thing she was suddenly resolved—she would not give up the *umbra* to Albert or any body but him. Janet left off smiling, and began to look very serious; but her heart was joyful within her. Yet Mr. Lane had never even stopped to shake hands all those other mornings when the sun was shining or the wind blowing; and this morning all he said to her was, "Do have my gamp," and then ran off laughing. "Why did he laugh? Did he think it funny that I should have this dear old gamp, as he called it, a second time? Has he quite forgotten that first time—so long, long ago? Why do I think of it, of him, so much? He is so lonely; and I know he is unhappy, though he won't say so. How I should like to talk to that old woman, that antediluvian old Ada, and to see his 'den,' as he calls it! I

"SHE TURNED TO LOOK AFTER HIM AS HE WENT."

won't give up the gamp. No, I *won't*. He shall come and ask me for it if he wants it; and I will patch these holes in it, and sew an elastic band on."

All this ran through Janet's mind in a few moments. She was very happy, just because she and Mr. Lane had stood together for a moment in the seclusion of that great dome, with the waters falling round them, and cutting off them two from all the world besides.

The old scene which transpired so long ago was revived with twofold vividness. Rain-drops in the river; a wild shower thickening round her; a measured pulse, not of oars, but of unseen feet, coming to her from the unseen

world. Then a shock of the heart, a space of sweet bewilderment; then the gloom of the great *umbra*, the rain beating upon it like rolling drums, and the splash, splash, drip, drip, all around.

The whole of Janet's simple life condensed itself into those two magic scenes, as a little fleecy vapor reaching dew-point twinkles into crystal drops. Being accustomed to allow every small impulse and emotion to come upon her as it would, and have its sweet or bitter way with her, how could she struggle against this mighty influence which came upon her with Herculean force? As a giant might seize a child, it took her in its

arms and whirled her away with blinding speed, she knew not whither. Matter faded from her cognizance. In fancy she was borne aloft, floating in a golden haze through purple depths of ether. In fact she was traipsing through the mud of Knight Templar Street, in the borough of Pedlington, and making a sad mess of her silken skirts, for both hands were occupied with Mr. Lane's gamp.

As they trudged along Albert tried to rally her, for he was by nature affectionate and communicative.

"What a queer fellow Mr. Lane is!" he shouted.

As no answer was vouchsafed to this suggestion, he presumed the noise of the falling rain dulled the sound of his voice, so he repeated the words in a higher key.

Still no answer.

"One hardly likes to call him 'Lane,' without the Mr., he's so stiff," continued Albert.

No answer.

"Rigid, you know, I mean, dear."

As talking very loud under these conditions was attended with much inconvenience, and as Janet took less notice of his observations than of the gusts of wind which met them at the street corners, which only availed to tighten her grasp on the handle of the *umbra* and deepen her seclusion under that canopy, Albert fell into a melancholy and desponding train of thought, and began in his metaphysical way to wonder why a Cipher should have to put up with positive annoyances such as mud and moisture, being either a negative quantity or no quantity at all. He was not quite sure under which of these definitions a Cipher fell, the mathematics having languished during his school-days at Pedlington. There were no Mr. Lanes in those days. Before this abstruse question was set at rest in his mind they arrived at the little green door of the paternal abode, upon the opening of which Janet, turning her back unceremoniously upon Albert, and evading the house-maid, ran boldly up stairs with the *umbra* before her, having the good fortune to reach her own room without being seen.

Her contemplative brother wiped his feet with much deliberation on the door-mat, removing every trace of mud from sides and toes and heels. Then placing his umbrella in the rack, he took off his great-coat and hat, suspended them on suitable pegs, and gave his boots a final rub on the sheep-skin at the foot of the stairs, in doing which he cast his eyes up, as if following Janet with their glance, and gently murmured to himself, "Oho! oho!"

Albert took his usual chair next to Nelly at precisely a quarter before nine, beaming upon the other members of his family with benevolent complacency. Janet coming in presently and taking her seat opposite, he

nodded to her, and placed a forefinger on his lips, as much as to say, "We keep our own counsel about what happens during our walk." But Janet, making a great fuss and commotion in settling herself, vainly tried to look unconscious of Albert's semaphoric communications, for Joan's hawk eye from her ambush behind the urn had seen them plainly enough, and now saw Janet's conscious blush. "Aha! aha!" muttered Joan to herself.

A subject of interest, however, arose which promised to draw attention away from Janet and her dangerous ally. In the first place, a ball was to be given at the Assembly Rooms on the following Monday night, to which Mrs. Browne and family were politely invited. But it happened that on the same day a lady, a very old friend of the family, was to arrive on a visit of some duration. After due discussion, it was therefore settled that Frank should escort his two younger sisters to the entertainment, placing them under the special care of Mrs. Canon Ormsby, the wife of a clergyman who flourished in an adjacent parish, and who (like Mr. Browne) had many olive-branches fresh and fair to look upon. The elders of the family would remain at home to welcome the coming guest.

The second phase of this question was still more important. There was to be a little dinner-party in honor of the guest on Tuesday, and "a few friends" over and above those who could be entertained at dinner were invited to drop in afterward and enjoy a little music. Robert, the adjutant, had been asked to come, but a letter had been received from him this morning regretting that he could not get away till Christmas-eve. The dining-table seated fourteen (with the extra leaf in). Seven ladies were complete, five gentlemen secured, and Frank had undertaken to invite "two fellows" to make up the complement of males. Albert always declined this responsibility with characteristic modesty, "the eldest son being in this case," he observed, "a Cipher."

More than one member of the family group wished that Dr. Phelps's name might figure on the list. He was a widower, young, handsome, and affluent, universally esteemed and beloved, except by a few religious zealots who considered his "views" to be "unsafe." Even these admitted that in all other respects he was a model of excellence; and his buoyant good humor, inexhaustible fund of calm reasoning power, and frequent sallies of genial wit made him no small acquisition to a dinner-table or drawing-room. The difficulty of inducing him to accept invitations during term-time also enhanced the value of his presence; and if a hostess could add to her other invitations "to meet Dr. Phelps and a few friends," she was safe from the risk of those "previous en-

gagements" which so often cause perplexities in festive preparations. But, "charm he never so wisely," Walter Browne, Esq., would hearken no more to the voice of this charmer. Cards, of course, had been exchanged when the Doctor first settled at Pedlington. They were followed up shortly by one of Mrs. Browne's nice little friendly dinners for fourteen. That good lady and most loving spouse had felt a little nervous at first, for her lord and master had reminded her that the new school-master had been (at Harrow) at once the victorious rival and the close friend of a certain nameless young man, the very memory of whom was gall and wormwood to his soul. But the charm of Mr. Phelps's manner and address carried these outworks instantly. He evidently gained ground rapidly in his host's esteem, and when the ladies left the gentlemen to their glass of port-wine, all was *couleur de rose*. When the magnum was finished, and the gentlemen repaired to the drawing-room, that frail porcelain cup of concord had been shattered. The smiles which still struggled to the surface of Mr. Browne's countenance were evidently born of courtesy, and had to do battle with the gloom which shrouded his mind. Dr. Phelps, either beguiled by his host's affability into thinking him more charitable and reasonable than he proved to be, or acting on the principle of "nothing venture, nothing have," had broached the forbidden subject, and requested the lawyer to enter with him into a dispassionate investigation of that old story about Miss Baily and his early friend Lyte, with a view to clearing away misconceptions, and arriving at a true and fair estimate of the conduct of all who were concerned in a certain disastrous event. The overture was made *sotto voce*, as was its abrupt rejection. Neither host nor guest ever related what had then passed between them. But the autocrat issued his interdict, and the loyal friend passed the threshold of Mr. Browne's house that night for the last time.

But to return to the breakfast-table on that rainy November morning: Mrs. Browne asked Frank whether his two gentlemen were coming to dinner on Tuesday.

"Fuller is coming," replied Frank, carelessly; "but I haven't heard from Lane yet."

"Not heard yet?" cried Joan, in a shrill *crescendo*, with elevated eyebrows.

"Perhaps, sister," rejoined Frank, with provoking calmness, "if you were to drop him a line he might relieve our suspense." At which Joan paled with anger; for a legend was current among the younger members of the family to the effect that their mature sister had at first cast a favorable eye upon the gentleman in question, and had failed to discern that his first attentions to her, as duenna or guardian of her younger sisters, were ceremonial and transient.

Hereupon Hubert rose to hasten away to school.

"I say, Hubert," said Frank, languidly, "just ask Mr. Lane whether he got a note from me yesterday, and say an answer will oblige."

"All right," said Hubert, and vanished.

But before he left the room the notion had got into form in Albert's brain that Janet had only taken the large *umbra* up stairs to prevent its being seen in the hall, and that she would like him to fetch it from concealment and tell Hubert quietly to return it.

Accordingly, clearing his throat three or four times in a dark and mysterious manner, and making spectral grimaces, he tried to catch Janet's eye in vain.

She knew what he was blundering about, and only looked down at her plate, beating the ground with an angry foot.

"Old noodle! old noodle!" she was whispering under her breath. And partly at the allusions to Mr. Lane, partly with anger, and partly with fear that Albert would attract attention to her, she blushed deeply, and a tear came unbidden to her eye.

Joan's hawk eye was fixed upon her. Joan's hand glided under a corner of the table, and was laid on mamma's hand. Mamma, following Joan's glance, saw Janet's confusion.

"You see," Frank went on, apparently seeing none of this by-play, every move of which was like an open map under his languishing eye—"you see, it's not altogether Lane's fault, my dear mother. You sent out your invitations on Monday. I had a great many letters to write on that day, and only sent mine on Tuesday evening. Fuller left his answer and a card and a whole string of polite inquiries yesterday; and probably that was the only thing the doughty warrior did worth speaking of the whole day. But Lane is a different sort of fellow. He's always head over ears in work—not in love, Janet—in work, you know; and perhaps hasn't had time to think about it yet."

"To think about it!" echoed Joan.

But no one responded to the echo. Mrs. Browne was still furtively watching Janet; and however father or mother might disparage Frank's energy in business, the whole family esteemed him (as indeed he was) a prudent and accomplished man of the world. If Frank considered another man justified in neglecting to answer an invitation, they bowed to his superior judgment. Joan was inclined to rebel, but her protest died away in silent disapproval. Perhaps Mrs. Browne felt a moment's trepidation on the subject of the fourteenth guest at table, for, like most country hostesses, she dreaded the number thirteen; but Frank's authority set her mind at ease.

Janet's sororal affections underwent a sud-

den revulsion. She adored Frank. She detested that addle-pated, timid old Albert.

Was it by design on her part, or purely by accident? After breakfast, Janet, smarting under her imaginary wrongs, encountered Albert in the hall alone.

He felt disposed to evade this interview, but she cut off his retreat.

What could that have been? A sharp sound, as if you smote the fingers of one hand briskly on the palm of the other. SMACK! resounded through the house. Reverberations simulating the words, "*Old noodle! old noodle!*" confused the startled echoes. And while Janet turned and sped nimbly up stairs, Albert, with his hand to his cheek, retreated through the doorway which led to the offices.

"Whee-ee-ee-ee-u-u-u-u!" he whistled, half dismayed, half amused; and perching himself upon a tall stool in a dark corner of the clerks' office, ruminated upon the peril of Innovation, and the unsatisfactory nature of all Reform.

CHAPTER VIII.

CROSS-PURPOSES.

ON that same morning of which some events are chronicled in Chapter the Seventh Hubert Browne came hurrying into school at the last stroke of the bell, and elbowing his way up to Mr. Lane's desk, was about to deliver himself of his message.

Mr. Lane, seeing that his favorite rascal had something to say, supposed it was that he had brought back the *umbra*; but catching sight of the Doctor's face, already bent over his prayer-book under the great window, he waved Hubert off, saying, "Come to me at twelve."

By that time Hubert, having his mind set upon a furious bout of foot-ball, in which he fully purposed to become a stumbling-block to the great champion of the opposing host, at risk of his own neck, and to bark the shins of one of that hero's chief henchmen then in enmity with him, Hubert, had forgotten all about Frank's unanswered note and the message to Mr. Lane, but remembered that Mr. Lane had summoned him. The latter also remembered his summons, but not that it had been suggested by an evident wish on the part of Hubert to communicate something.

At noon, accordingly, the pupil stood before his master's desk, and both being equally at a loss to know why, Mr. Lane put his hand on Hubert's shoulder and said, "Never mind your battle of Kilkenny just now. Come along with me, and we will walk round by the cliff together, and keep Martin waiting for five minutes. Let me see—you were at school with Martin, I suppose?"

"I came for one quarter, just as he was leaving," replied Hubert. "But that was in old Dr. Oldham's time, and papa wouldn't let me stay. He said the school wanted reform."

"I am surprised to hear that Mr. Browne advocated reform," said Mr. Lane, slyly.

"But he did," replied Hubert. "He said my going to school with Dr. Oldham was like my wearing his old swallow-tail for best. So I put it on one day for fun, and didn't I look a guy! But mamma took care not to let him see me in it."

"Did you like Martin?" asked Mr. Lane, as they walked briskly past the Fair Meadow and crossed the foot of the bridge to the cliff.

"Oh, I like him well enough," was the answer, with a peculiar emphasis on the pronoun.

Martin was at this time an elegant young man preparing for matriculation at Oxford. Superbly dressed, and delicately perfumed, he rode into Pedlington three times a week on a blood-horse for the purpose of reading with Mr. Lane. In other words, Martin, who had long enjoyed a slight acquaintance with the Brownes, had lately exhibited a strange propensity for presenting himself under favorable conditions wherever the presence of that interesting family might be anticipated. In the absence of the young ladies themselves, any person who took an interest in them, or had occasional access to them, was delectable to Martin. Mr. Lane and the classic authors, varied with a peep into the arcana of German literature, afforded Martin an excellent excuse for pervading Pedlington. Mr. Lane was a famous fellow, a great athlete, and "no end of a scholar;" so Martin assured his parents, who were naturally anxious for his progress at this critical period of life. And now that Hubert Browne had been replaced at the Grammar School, and Mr. Lane was in daily contact with that celestial youth, Martin's affection for his tutor knew no bounds. Mounted grooms rode into the untrodden precincts of the old monastic building with hares or partridges for Mr. Lane; and before long that gentleman somewhat reluctantly found himself a guest at Plumstead Manor-house, the seat of William Culliford Martin, Esq., J.P., one of that very sagacious body to which Mr. Browne was clerk.

"We are pleased that Willie takes so kindly to his classics and German," Mr. Martin would say to Mr. Lane after dinner; the latter gentleman twisting his stiff auburn mustache dubiously, and Martin junior regarding him with fatuous complacency.

"He does *not* work as hard as I could wish," says Mr. Lane, doggedly.

"Now, Lane, that's too bad!" cries the pupil.

"He sits at his books very closely at

home," continues the parent; "and I think he comes to you almost every day now."

"Four times a week, for one hour each time," insists Mr. Lane. "But what is that to the training of a public school? And consider the long interval of idleness to be made up for."

"I was not exactly idle after leaving Dr. Oldham," urged Martin; "I used to read a good deal of English literature, and some little French."

"Poetry, I suppose," Mr. Lane suggested.

"Well, yes; of course the English classics, Shakspeare, Spenser, Dryden, Pope, Wordsworth, and Tennyson," the pupil admitted.

"And Byron," added Mr. Lane, cynically. He had long since discovered traces of "the noble poet" in Martin's sentiments.

"Well, I admit to an infusion of Byron," said Martin.

But the elder gentleman hardly liked to think otherwise than that his son and heir was about to become a ripe scholar and a well-read gentleman. And certainly Mr. Lane was delicately situated.

One day in particular he was sorely urged by his native candor to betray this confiding pupil. Mr. Martin, who, despite his complacency, was nervously anxious about his only son, said to the tutor, taking advantage of Willie's absence from the room, "I can hardly express to you, Sir, how pleased his mother and I are at Willie's strong regard for you and preference for your society. The decided taste which he develops for classical literature we consider entirely due to your judicious treatment. At his critical time of life a studious taste is inestimable—inestimable. We were anxious about him before his acquaintance with you. He might have been forming some foolish attachment, or been led into a—a—indeed, I do not like to think of the dangers which might beset a young man situated as he is."

"And so impressionable and impulsive," added Mr. Lane.

"Just so, Sir, as you say. Dangers, indeed! Ah! dear me!"

And while the justice's imagination ran on to revel among the perils from which the heir of Plumstead Manor was being saved, Mr. Lane wondered uneasily whether an attachment to the daughter of a country solicitor (even with a little fortune) would not seem to Mr. Martin the most parlous of perils.

But to return to Mr. Lane and Hubert Browne, walking at noon from school to the Abbey. At the foot of the terrace which skirted the cliff stood the boat-house. As they passed between it and the flotilla of boats moored beneath the willows, the boy said, "Do you remember what a lark it was that day when Nelly and Janet were trying to row, and you came up with your big ga—umbrella?"

"I did not come up in time to witness their efforts," said Mr. Lane. "Indeed, we heard the laughter, and staid back until the shower came on."

"They do squeal terribly when they're amused."

"I thought it pretty enough. You were rowing when we overhauled you."

"Ah, yes," pleaded Hubert; "a pair of long oars against a pair of short skulls. Not fair, you know. Besides, you hadn't taught me to row then. I never understood that dig at the beginning of the stroke which you get right off the stretcher before; and I don't believe a single soul on the Peddle does, at least hereabouts."

"The Doctor," suggested Mr. Lane.

"Ah!" replied this critical youth, "he does row a very pretty oar, and finishes up his stroke neatly; but he can't 'catch it at the beginning,' as you do."

"But you had passengers, you know, on that occasion, and we were flying light."

"I should think so," rejoined Hubert.

"And precious heavy they are, too, though they don't look it. Janet weighs eight stone, and Nelly seven four. But Frank says it's Janet's purse that weighs down the scale against Nellie. She's an heiress, you know. Old Captain Lyte, who used to live at Box-tree Lodge, left her a lot of money, and Blanche too. But you should have heard the chaff at home that evening! Janet wanted to know who you were, and I told her you were the Marquis of Westminster, and Dr. Phelps Baron Rothschild. And she sucked it in. So did Nelly. Only Nelly found it out. She's sharper than Janet is. But I gammoned them at first that I was going to Pool Park with your umbrella, and—"

Here Hubert's recollections were so overpowering that he nearly choked himself with suppressed laughter. After spluttering for a moment he said, with an effort,

"Now you'll be angry with me."

"Not a bit of it," rejoined the master, cheerfully; "I don't think there was much harm in your joke. But don't tell me any more. Domestic confidences, you know."

But Hubert, not having blown off at football the steam generated in three hours of scholastic discipline, was bound to find another vent.

"Oh no, Mr. Lane," he rattled on, "I have no secrets from you. And I must say Janet is a brick, though they all talk so much about her peculiar temper and ways. And she can't bear Captain Fuller, with his spurs and his great clumsy compliments, which make her get so red and so hot, you know. And she only laughs at Martin, though he is such a tremendous swell, with his new clothes and his thorough-bred horse—and a regular brick, I must say, is Martin. He tipped me half a sovereign one day. Very

good of him, but rather funny, was it not, Mr. Lane? Why, he was a fellow at school two years ago. And I suspect the governor would have been angry with me for taking it."

"Then why did you do so?"

"I hadn't time to think of it at that moment. And when I thought of running after him to give it back, I remembered that I owed three-and-sixpence at the pastry-cook's and my subscription to the cricket club. But, as I was saying, I'm sure Janet sneaks after you, Mr. Lane. She's always asking me about you now, and *pretending not to care*; that's what makes me suspect. And mamma says she's so glad Frank has made a friend of you, and that she hopes he will imitate your energy. They think Frank shirks work, but he doesn't; only he has a lazy way of doing it, and never exerts himself when any one can see him. They don't understand Frank a bit. You would be astonished to know what strangers we brothers and sisters, and even parents and children, are to each other. But mamma says she wishes all the young men were like you, and that young men now are not at all what they used to be when she was young."

"You must really shut up, Hubert. Either this is all nonsense, or I ought not to listen to it."

"It is not telling tales," persisted Hubert, coloring warmly at this. "You have been a better friend to me than any one ever was before. They used to call me blockhead, and say I was as obstinate as a mule, before you came. And mamma tells me to confide in you about every thing, and ask your advice—"

"But not about your sisters, Hubert."

"Well, I won't say another word about them, if you'll just let me talk freely to you about other things. But remember, I haven't said anything unkind of them, and you told us it was no harm to speak of people if one could be sure of never speaking unkindly or suspiciously of them."

At this point of the conversation they encountered Willie Martin, in a seal-skin waistcoat and *chasseur de la garde* boots, caressing his leg with a gold-headed riding-whip.

"Ah, Mr. Lane," he sighed, "I was strolling about to meet you. How d'y'e do, Browne? Hope the young ladies are quite well. Will they be at the Assembly Rooms on Monday night?"

"Two of them, I believe," replied Hubert, looking at the Apollo with a sly twinkle in his roguish eye.

Then Mr. Lane, accompanied by Martin, descended the steps, and crossed the sunk road to his solitary domain. No sooner had they seated themselves to work than Hubert's head appears in the doorway. "Oh, Mr. Lane, I quite forgot. Frank wants an answer to his letter," he blurted out, and then swiftly vanished.

Plunging his hand deep into a multitude of receptacles, Mr. Lane at last produced a letter in Frank's handwriting, dated three days previously. It ran as follows:

"Will you come to dinner at six next Tuesday? An old friend of ours, Miss Lyte, is coming to stay with us. She is a rather jolly old bird, and we always ask the *élite* to meet her. I have asked Fuller, who has known her more or less all his life, and who is a favorite of hers. The Rev. Adolphus Key, the new rector, is coming. He is a bachelor, and a mighty man of music; and in consequence, whenever the haize door is left open, strains of Beethoven, Mendelssohn, and Heller come creeping down the stairs, across the hall, along the passage, and into my devoted ears. *Parce, parce!* I cry in vain. Nightmares and tarantulas are abroad; and no wonder that sonata is called *Appassionata*, considering the way in which it is being treated up stairs."

Short, simple, and playful as this note was, it yet fired three shots right into Mr. Lane's defenses. "Miss Lyte, Key, and Fuller," he thought; "and all in one room, too. Phelps was right. I ought to have braved it out at first, and not left myself to be caught masquerading. But then I should never have seen Her; for I could not have come here."

All this is quite enigmatic. I only record it as Mr. Lane related it afterward. He professes himself now never to be surprised at coincidences, so many having occurred in his own experience. That Mr. Phelps should have come to Pedlington, and so formed an irresistible attraction to him, that Captain Fuller should have exchanged into a regiment the *dépôt* of which was quartered at Pedlington, that the Rev. Adolphus Key should have attained to the rectory of that town, and that he, Mr. Lane, should (against his own will in the outset) have been drawn into a delightful intercourse with the family which was now about to receive Miss Lyte in addition to the two latter gentlemen as guests, were a series of coincidences that surpassed the apparent unrealities of fiction.

During Martin's lesson Mr. Lane was unusually preoccupied in mind, and though gravely disturbed and agitated by this note of Frank's, could not abstain from a sly humorous amusement with poor Martin's hopelessly enamored condition. His fair young cheek, innocent of all but the faintest down upon it, had flushed at meeting Hubert Browne, though he strove to bear himself manfully before that youth. Seeing that Mr. Lane had a letter from the house which was sacred to him by Janet's presence, how Martin clung to Mr. Lane! How he strove to master and make his own Lane's render-

ing of that graceful ode the closing declaration of which is

"Dulce ridentem Lalagen amabo,
Dulce loquentem."

"I like that Sapphic metre," he observed, delicately, when the lesson was ended. "It seems to me the true language of—ah—the tender sentiment. Do you know, Mr. Lane, I have tried one or two little odes myself?"

"No!" said Lane, taking up a pen and writing hurriedly. "I am as much surprised as delighted to hear it. You poets are certainly born, not made. Why, you can't write a respectable paragraph of Latin prose, Sir; how dare you break out into Sapphics?"

Martin only smiled and blushed, but Mr. Lane, still writing, added, "As the spring throistle breaks out in song, I suppose." And the pupil, whether he fully saw the completeness of the allegory or not, was gratified with the imputation. Observing his tutor now, he noticed from the expression of his face, which was particularly calm and statuesque at such times, that he had recently come to a resolution of some importance, and Martin felt a gentle misgiving lest in some way it should concern him and oppose his passion. But Mr. Lane, who, as we know, was moved by a different consideration, still found leisure to think of Martin and his love, and whether his father would approve of it.

"Is your family a *very* old one?" he asked, abruptly, closing and sealing his note to Frank.

"Oh dear, no!" replied Martin, laughing and blushing, and turning away to find his gloves and whip. "My ancestors didn't come over with the Conqueror; they were corn factors in Mark Lane."

And Mr. Lane, for some reason best known to himself, gave a great grunt, at which poor Martin, taking it for scorn, and having heard that his tutor was "well connected," writhed in anguish, and loathed his own plebeian descent with quite an aristocratic fervor.

Mr. Lane, on the contrary, was relieved at the dissipation of those imaginary ancestors, who would have unconsciously been the *fons et origo mali*, had an aristocratic descendant of theirs lowered his crest to an attorney's daughter. So he restored Martin to bliss by saying that they would walk round together and leave his note at Frank's door. This was the note:

"I can not dine. Tuesday is my evening at the night school. But I will look in shortly after nine, and beg for a cup of Miss Browne's Young Hyson. Pray pardon my neglect. Your note got into the left-hand pocket and lost itself."

The shining brass knocker on the pretty green door was barely lifted when it was snatched from Mr. Lane's hand by the door flying open, and—

"Impetuosity of the sex!" exclaimed Albert, within, performing deprecatory gestures. For, with his usual gallantry, he had just opened the door, and, with her usual elasticity, Janet was just bounding out, when a russet beard stopped the way, and she started back, accidentally stamping on Joan's toe. For Albert was taking the two ladies out a-shopping.

Mr. Lane, with Martin, drew back a little, so that the ladies came out, Sister writhing and smiling grimly at Mr. Lane as the cause of her agony.

Martin was in raptures. Joan smiled another sort of smile upon him, and bowed elegantly. Janet actually gave him her *bien gantée* little hand, and said what a long time it was since they had met!

Almost too happy to speak, as he allowed her beauty to fill his longing heart, he yet managed to inquire if she would be at the ball. She hoped so. Then might he be so happy? Yes, he might put her down for one waltz and a set, but not close together. She would keep her card open for him. And not that galop—just that little galop at the end? Well, if she staid so long, he might have the galop too. And might he send some flowers from Plumstead? But no. Janet was peremptory. If flowers came, her card should be filled from first to last without him. She was heartily delighted with this modest, well-bred admirer, and though she would not flirt with him, was glad to secure enough of his attention to assist her in dispensing with some which were apt to become irksome to her. To him, of course, the whole ball, with all the delights of anticipation and retrospect, centred in her. The food on which his joy would live being the two little dances, and what glancing of her eyes and glistening of her pearly teeth he might catch in those fleeting moments.

Meanwhile Albert asked Mr. Lane whether it was a favorable answer, and he, speaking more grandiloquently than he was wont to do, as is often the case with men when forming an important resolution, said, "I am obliged to decline. An old engagement holds me." But he forgot to mention that he had spoken to Frank in the note about dropping in after dinner. Janet heard these words, and knew also that he would not be at the ball on Monday. Still she resolved to maintain a bold front.

Joan was rapidly advancing toward that bitter detestation of Mr. Lane which the "*spretæ injuria formæ*," and the cutting innuendoes which she had been subject to on account of her early partiality for him, would naturally engender in the bosom of mature virginity.

"So Mr. Lane has at last condescended to decline the invitation!" she now said to Albert, in a high-pitched, querulous voice, for Janet's special benefit. "What a strange

expression he used! 'An old engagement holds me.' And he is one who measures his words, is that Mr. Lane. Now I should not wonder if that were true in more ways than one."

As Joan uttered the word "one" she closed her lips like a vise, as much as to say, "There, Miss Janet! There's a sting for your vanity! While you think all the men are dying for you, this Mr. Lane, whom you prefer, scorns your preference, and loves another girl."

But Janet carried her little head high, and assumed an elastic, jaunty gait, expressive of a "don't care" state of mind generally, and, in particular, derision for the emanations of Sister's pathetic soul. There was sadness in her gentle heart for all that, and her relentless enemy knew it.

Joan's anger was not the only peril which arose from negligence in opening Frank's letter. The decision at which he so hastily arrived of accepting the tail of the invitation was itself pregnant with danger. Had he perused the document on receipt, as he should have done, and taken time to consider the proposal contained, and all that de-

pended on his action in the matter, he would probably have declined not only the invitation to dinner, for which he had a sufficient excuse, but for the later part of the evening, and would have resolved to abstain from visiting Frank or his relatives during the stay of that "rather jolly old bird, Miss Lyte."

One very prudent step Mr. Lane did take, having an unforeseen phase of his danger in view, and wishing to provide against it. He called upon his old acquaintance Captain Fuller, at the cavalry barracks, and, without mentioning his intention of being present on Tuesday evening, cautioned the gallant captain against any verbal imprudence which might compromise him in a difficult position. He also "took the bull by the horns," as the saying is, and called upon the new rector, who received him very warmly, as a new parishioner of whom he had heard golden opinions, and whose acquaintance he was heartily glad to make. Having adopted these precautions, Mr. Lane awaited the future calmly, but still not altogether without apprehension of impending evil.

SOME TALKS OF AN ASTRONOMER.

I.—A LOOK AT THE HEAVENS.

YOU want to know how the planets are weighed; how their distances are ascertained; how we know that the earth turns on its axis and around the sun, and not the sun around the earth; what sort of instruments are used in measuring the celestial spaces; also something about comets, and something, moreover, about stellar astronomy in general. That is rather too much to tell at one time, but by a series of talks I may be able to make it all plain.

You know that men found out at least some of these things before they had a telescope, and that by observations with the naked eye alone they were enabled to learn the main features of the system of the world. Let us, then, go out and view the heavens, and take our first lesson in astronomy with the naked eye. The first thing we notice is that all the heavenly bodies seem to be spread out on the surface of a sphere, in the centre of which we appear to be placed. One-half of this sphere is above the earth, extending down to the horizon on every side; the other is below the horizon, and is therefore, together with the stars which stud it, invisible. The highest point is over our heads, the lowest one under our feet. This you see at the first glance. Now watch a few hours, and you will see that this whole sphere, with all the heavenly bodies which it contains, turns around from east to west. You know very well that the sun rises and sets daily; but perhaps you have not noticed that most of the stars rise and set in like

manner. Now let us examine more closely how this apparent diurnal motion of the heavens, or of the celestial sphere, takes place. The polar star never rises nor sets, and it changes its place in the heavens so slightly that unless we compare it with some fixed object we could see no movement at all. There is a constellation by which the polar star can always be found. It is commonly called the "Dipper," but astronomers call it Ursa Major, or the Great Bear. If you look out early on an autumn evening you will see it low down in the north, but in the month of May it will be high up, quite near the zenith. Here is a picture of it. Now

CONSTELLATION OF URSA MAJOR.

draw a line through the two stars on the right-hand end and continue it upward, and you see that it meets a tolerably bright star standing north nearly by itself. This is the polar star. Now if you watch this Dipper a few hours, you will see it moving around toward the west; if you should watch it all night, you will see it moving down toward the northwestern side of the horizon, passing toward the east under the pole, and rising upon the northeastern side. In fact, it de-

scribes a complete circle round the polar star, always keeping at the same distance from it. That curved-looking constellation on the opposite side of the polar star, and in the autumn near the zenith, is called Cassiopeia, or "the lady in her chair." You perceive that if we take any star a little further from the pole than the Dipper, it dips below the horizon in its daily revolution, and the further we go from the pole, the greater length of time it will be below the horizon. A star which when it passes above the pole is directly over our heads will, in this country, be from one to two or three hours below the horizon, according to the latitude of the place we are in. Now if a straight line is drawn from the pole to where we stand it will strike the earth at this point. Continue it right through the earth

THE IMAGINARY CELESTIAL SPHERE, AS IT WOULD APPEAR FROM THE EARTH.

The earth in the centre at C. G H, the horizon. P, the north or visible pole. Q, the south pole, invisible because below our horizon. A star between S and H will perform its whole diurnal revolution around the pole P without dipping below the horizon at all, as shown by the dotted line S H. Between S and E more than half its course will be above the horizon, and at E, or the equator, exactly half. Between E and G more than half its course will be below the horizon, and south of G it will turn round the pole Q without rising at all.

in a slanting direction, and it will point toward the other pole of the heavens, or the south pole, which we can not see because of its being below the horizon. Around this line as an axis the heavens seem to revolve. A circle which spans the heavens half-way between the two axes is called the equator. In our latitude it is a little more than half-way from the south horizon up to the zenith. A star in the equator will rise exactly in the east and set exactly in the west, and will be below the horizon just half the time.

If you keep a careful watch of all the stars, you will find that, with the exception of five, they all preserve the same positions relatively to each other during their daily revolution, just as if they were set in a solid sphere of crystal, which sphere itself turned around on the axis we have described. So perfectly do they all seem to keep their po-

sitions that if Job should rise from the dead he would now see Arcturus and the Pleiades just as he saw them when he was on the earth four or five thousand years ago. But there are seven heavenly bodies which do not so keep their positions—they are the sun, the moon, and the five planets visible to the naked eye.

II.—MOTION OF THE SUN AND PLANETS.

If we were only to look at the heavens one or two evenings, we would not observe that there was any change in the relative positions of the sun and stars; but if we should take a good time-piece and watch the time at which a certain star sets or passes the meridian to-night, and then notice the setting or the passage of the same star to-morrow night, we should find that it occurred four minutes earlier, and as long as we chose to watch it we should find it four minutes earlier every day. That is to say, the stars do not, like the sun, revolve around the earth in one day, but in twenty-three hours and fifty-six minutes. Now why is this? To answer this question clearly we must remember that if it were not for the glare of sunlight illuminating the atmosphere, we should see stars in the daytime as well as in the night. Really the whole sphere of the heavens is studded with stars, and they are as thick around the sun as any where else, only that we can not see them. Now a star which sets to-night at nine o'clock in the west will, as I explained, set four minutes before nine to-morrow night, eight minutes before nine the night after, and so on. Consequently, if we watch night after night, we will soon find that it sets in the evening twilight, so that we lose sight of it. This shows that the sun is moving nearer and nearer to the star. If we keep calculating our four minutes earlier every day, we find that in three months it sets six hours earlier, thus it sets at three o'clock in the afternoon, and therefore before the sun. We conclude from this that the sun, after moving nearer and nearer the star, has now gone past it. If we continue our watch for a whole year, we will find that the star sets at the same hour it did a year ago, having in the mean while set at every four minutes throughout the day and night. This shows, therefore, that the sun in the course of a year passes all the stars in succession which lie on his path, and in fact makes a complete revolution around this starry sphere. If we could see the stars around the sun, and should watch the sun from the time that it rose in the morning until it set in the evening, we should find that it moved among the stars by a space nearly equal to its own diameter, and next morning we should find when it rose again that it advanced nearly another of its diameters; and thus it goes day after day, moving nearly two of its own diameters along the starry

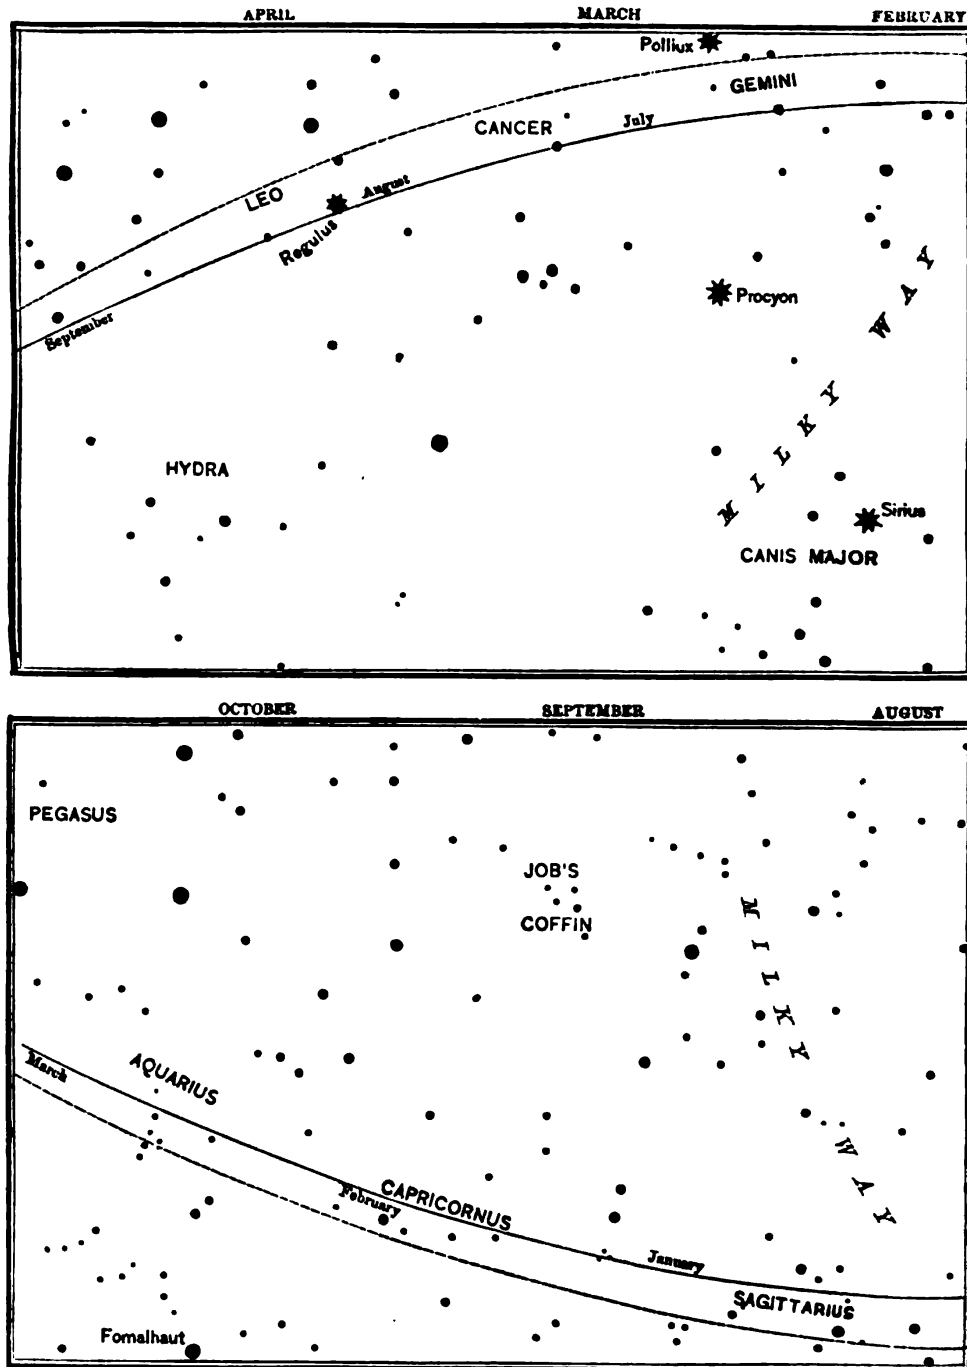

sphere, and this motion in the course of a year carries it all the way around and brings it back to where it started from. The stars, then, seem to rise and set a little faster than the sun. The sun rises and sets 365 times in as many days, while the stars rise and set 366 times. Let me try to make this clear by another illustration: If you watch those two pointers as they pass above the pole, you will see them to-night pass a certain point, let us say, at nine o'clock. To-morrow night they would pass four minutes earlier, and four minutes earlier every night following, so that after three months you will have to look at three o'clock in the evening. Of course daylight will then prevent you from seeing; but they are really there, and you would see them but for the glare of the sun. Three months more they are there at nine o'clock in the morning; three months more they are there at three o'clock in the morning, and you can now see them once more. About the 1st of March they cross at two minutes past twelve in the morning, and on the following night they would cross two minutes before midnight. This brings them across once more at nine o'clock of the same hour and evening on which they started. You see now that on the 1st of March there were really two passages across the meridian, the one taking place just after midnight, and the other just before the midnight following.

This annual motion of the sun around the celestial sphere was one of the earliest astronomical discoveries. The path in which it moves was mapped out in the heavens at an age so early that we scarcely know by whom it was done. If the sun left any trace we could see it as a bright path among the stars; we could see exactly what stars it passed, and on what day it passed over them. That reddish star which we see rising in the east during the autumn evenings is called Aldebaran; the sun will pass directly over that star about the end of May. The twelve constellations through which it passes were called the constellations of the zodiac, and the names Aries, Taurus, etc., which are so familiar to you, were given to them by the ancients.

Now one thing that is very noticeable in this path described by the sun is that it is not every where at the same distance from the pole. If we measure with our instrument, we shall find that on the 21st of March the sun is just 90° distant from the polar star. If we then watch its course, we shall find that it comes nearer and nearer in the three months following. On the 21st of June we find it between 66° and 67° distant. Since the equator is every where 90° distant, the sun is then $23\frac{1}{4}^\circ$ north of the equator. I have explained that the farther a heavenly body is from the pole the longer the time that it is below the horizon. At

the equator it is above the horizon half the time, and below it half the time. Consequently during the time of which we speak, when the sun is between the equator and the pole, more than half his path is above the horizon, and therefore the days are more than twelve hours long. Let us keep up our measurements until the 21st of September. We shall then find that the sun has moved south again until it is 90° from the pole. One-half of its course then lies above the horizon, and the other half below; it is therefore below the horizon half of the time, and the nights are just as long as the days. His southern course still continues until the 21st of December, when we shall find that he is $23\frac{1}{4}^\circ$ south of the equator, and therefore $113\frac{1}{4}^\circ$ from the pole. More than half its course is now below the horizon, and the days are only as long as the nights were on the 21st of June, and *vice versa*. That you may fully understand all this we give on pages 696 and 697 maps of the southern constellations, showing the oblique path of the sun through them during the entire year. It is owing, then, to this oblique motion of the sun that the changes of seasons, and the variations of the length of day and night at different seasons, are due. The result is precisely the same whether we suppose that the sun moves around the earth or the earth around the sun.

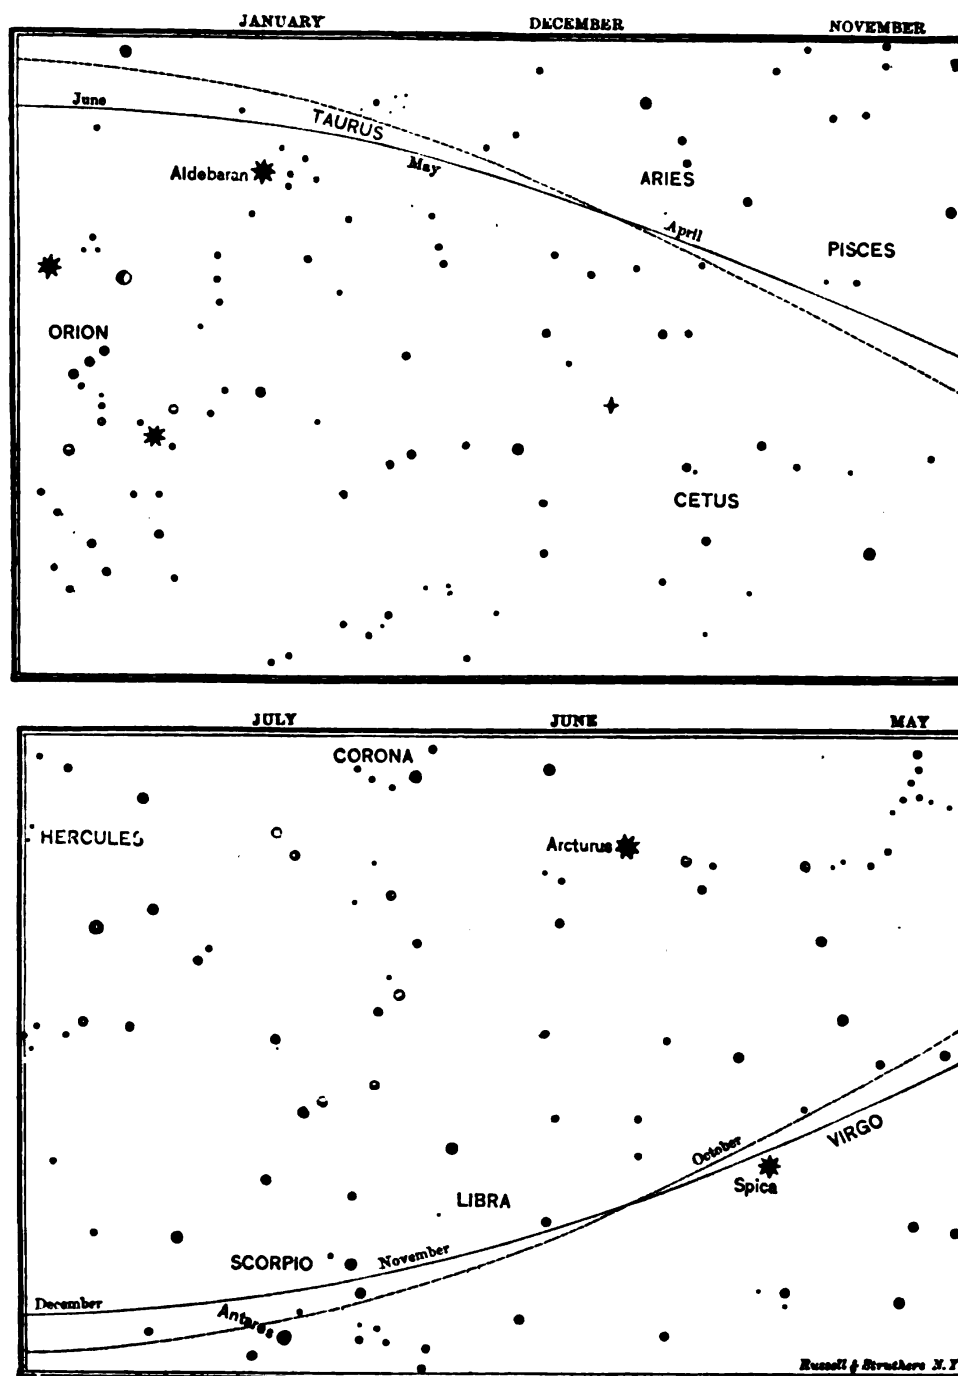

Now let us pass from the sun to the moon. We have in her case a motion among the stars similar to that presented by the sun, which I have just described, only much more rapid. Thus the moon rises and sets later every evening by an amount averaging nearly three-quarters of an hour. If you watch the moon when she has passed her first quarter, and before she is full, you may actually see her motion among the stars. If she is very near a star at the end of twilight, you will see that in the six or eight hours which elapse before she sets she has moved quite a perceptible distance toward the east; and if you look again on the following night, you will see that she is 13° , or nearly so, east from the same star. If you keep up the watch for twenty-seven days, you will find that she has made the complete circuit of the heavens, and is now back again near the same starting-point at which you first saw her. If the sun and stars preserve the same relative positions, she would come back to the sun in the same length of time, and we would have a new moon every twenty-seven or twenty-eight days. But while the moon is going around, the sun is also moving among the stars, and having moved forward during an interval between two new moons, it takes the moon between two and three days to catch up to him again; consequently the time from one new moon to another is about twenty-nine and a half days.

PATHS OF THE SUN AND MOON AMONG THE STARS.

The maps on pages 696 and 697 show all the constellations of the zodiac and other southern constellations, as well as the apparent paths of the sun and moon through them. The continuous line shows the sun's path, or the ecliptic, the dotted one the moon's path, the latter being that which she followed in the middle of 1874. The months at the top of the map show when the constellations under them are on the meridian at 9 o'clock p.m. For instance, in the middle of December at this hour Aries will be on the meridian and nearly overhead; Taurus, including Aldebaran and the Pleiades, will be the next to the east; Orion will be low in the southeast; Sirius and Procyon will be just rising; while the square of Pegasus will be two hours west of the zenith.

Now we can understand how eclipses occur. I have said that the sun pursues a certain definite path among the stars, about half a degree wide, which you could see if he left any trace there; so, also, if you could mark the position of the moon to-night among the stars, and mark its position at every hour during her whole course, you would find that she also has pursued a definite path among the stars, but you would

PATHS OF THE SUN AND MOON AMONG THE STARS.

It takes the sun four or five months to reach that constellation which is now on the meridian at 9 P.M.; he will therefore not reach Aries till April. The months on the sun's path show when he passes the several constellations. Thus in April he will pass below Aries, and in May between Aldebaran and the Pleiades.

It will be seen that the moon now crosses the sun's path at the points where the latter is found in April and again in October. Hence it is only during these months that eclipses occur in 1874. But the moon's path is continually changing in the heavens, the points of crossing (nodes) moving toward the right. At the beginning of 1876 the nodes will have moved over to the right-hand edges of the above maps, and eclipses will occur in March and September.

not find this path to be the same as the sun's path. If it were the same, we should have an eclipse of the sun every time the moon crossed the sun, and an eclipse of the moon every time that the moon passed on the oth-

er side of the earth from the sun. But the two paths are inclined to each other about 5° . They cross each other at a point which, in the month of October, 1874, is very near the sun. The moon's path is south of the sun's

in nearly all that part of the heavens which we can see in the evenings of that month; but it approaches the sun's path, and crosses it near the eastern horizon, and in most of the invisible half of the sphere, or that part below the horizon, the moon's path is farther north. All this will be clear on examining the star maps, where the dotted line shows the path of the moon during 1874, crossing the sun's path in the constellations Aries and Libra.

These two opposite points in which the moon's path crosses the path of the sun are called the nodes. It is very clear that unless the sun is near one of the moon's nodes when the moon herself passes by, the moon will pass above or below the sun, according as her path is above or below that of the sun at this point, and consequently there will be no eclipse. But if the sun happens to be near the node, then the moon will necessarily pass over his face and eclipse some portion of him. Now, as I have just explained, there are two opposite nodes; the one set a few hours ago, and the other has just risen. Since the sun makes the whole circuit of the heavens in the course of a year, he crosses the moon's nodes twice in that time. In 1874 he crossed one node in May, and will cross the other node in November; consequently it is only about these two times that any eclipse can take place during this year.

If the moon always followed the same path in the heavens, we could never have any eclipses but at those two seasons. But if we watch the motions of the moon for several years in succession, we shall find that her path is continually changing. At the present time she passes seven degrees north of Aldebaran; a month hence she will seem to pass the star at almost exactly the same distance; but if you continue your observations for four or five months, you will find that she passes it perceptibly farther north, and in three years you will find that she crosses it at the distance of about ten degrees. After that she would begin to cross farther south, passing nearer Aldebaran at every revolution for eight years, until in 1885 and 1886 she will pass right over it. If the moon's path were painted on the heavens, you would see that every time the moon came round to the same point in her path, which takes place about every twenty-seven days, she would cross the sun's path about three of her own diameters sooner than the month before. In the course of a year, therefore, she will have crossed about thirty-six diameters sooner, or farther to the west. In the course of twenty years you will find that this motion has been kept up until she crosses at the same point she does now, and thus the nodes have made a complete circuit of the heavens. The seasons of eclipses vary, therefore, in the same man-

ner. This year they are in May and October; in five years from now they will occur three months earlier, and we shall have them in February and August; five years more, and they will be in October and May; five years more, in August and February; five years more, and they will correspond once more to what they are now.

The motions of the sun and moon, which I have just described, are comparatively simple; but those of the five planets visible to the naked eye, Mercury, Venus, Mars, Jupiter, and Saturn, are very complicated. Venus and Mercury always follow the sun; they seem to vibrate on each side of him, Venus to the distance of about 45° , and Mercury about 25° . The three other planets seem to move among the stars sometimes in the same direction with the sun, and sometimes in the opposite direction. The general rule in the case of Mars, Jupiter, and Saturn is that whenever they are any where near the sun, or even at right angles to his direction, they appear to move in the same direction among the stars in which he moves, but more slowly. But when their direction is opposite that of the sun, they always move in the opposite direction. This seemingly irregular motion was one which greatly perplexed the ancient astronomers, and to account for it they invented the hypothesis of epicycles. In this hypothesis they supposed a point to move around in the heavens with a nearly uniform motion in the same manner that the sun and moon moved. From this point they supposed an arm to extend, and at the end of this arm the planet was supposed to be carried. This arm they supposed to revolve around once in a year. The combined motions of the point around the heavens and of the planet around the point represented in a rough way the motion of the planet. Of course they did not believe that any such machinery as this really existed. They employed it only as a means of representing the apparent motions of these three planets.

III.—THE TRUE MOTIONS OF THE HEAVENS.

What I have just been describing to you is the apparent motion of the heavenly bodies as visible to an observer here on the earth. You see that by simple observations, such as can be made with the naked eye, we have found that the sun appears to make the circuit of the starry sphere once in a year. We have found the causes of the change of seasons, and the difference of the length of days and nights at different seasons of the year, and we have found in a general way the cause of eclipses, and the reason they do not always occur at the same season.

But in the modern system of astronomy the motions which we have described, excepting that of the moon, are only apparent

motions, not real ones. This annual motion of the sun in the heavens is really due to an annual motion of the earth around the sun. Suppose that I stand in the centre of this room, and that you walk around me, keeping near the sides of the room, and keeping your eyes fixed on me as you move. The direction in which you see me continually changes. Now you see me toward the window; now I am between you and the grate; now I am between you and the door. If you did not know that you were moving, it would seem to you that I was moving around you. Just so, in the case of the earth and sun, the earth moves around the sun once a year; therefore in the course of a year the sun is seen every day in a different direction among the stars. You always see the sun in an opposite direction from that which an observer on the sun would see the earth; and thus, as in your course around me I am successively seen between you and the window, the grate, and the door, so is the sun successively seen between us and all the stars which lie in a certain plane in which the earth moves.

We have started with the diurnal motion of the stars around the earth. This motion is not real, but apparent, being due to the motion of the earth around the axis passing through it. I have described to you two apparent motions, one of the whole celestial sphere, carrying with it sun, planets, and stars around a certain axis of the heavens, and therefore around the earth, every day; the other an apparent motion of the sun, moon, and planets among the stars. To prove the earth's motion every day on its axis we must begin by answering the natural objections to it. The first objection made by the ignorant is that if this were so, objects would fall off the earth on the other side. This objection, however, is scarcely worth talking about with any intelligent person. The evidence of the senses on a large scale shows us that the earth is really a sphere, and even the ancients knew very well that the direction which we call down, *i. e.*, the direction which a stone falls, is not every where the same, but that at every point of this sphere it tends toward the centre of it. In whatever way we suppose the earth to move, there would therefore be no change in the apparent direction in which a body would fall.

A stronger objection is that we have no consciousness of such motion, but that bodies can move about on the surface of the earth with the same apparent freedom as if the earth was at rest. But any one who has ever been in a steamboat knows that we are entirely unconscious of any motion which is regular and uniform. As the steamboat passes an island, the island seems to every one on board to be in motion and to pass the boat, and it is only by the reason of the

thing, and not by any direct evidence of the senses on the part of the passengers, that they know that it is the boat that is moving, and not the island. We have, therefore, no direct evidence whatever that the earth is at rest any more than that the heavens are at rest; but the question whether it is the earth or heavens which move is to be decided entirely by finding which explains the observed facts most simply and reasonably, and of which motion we have most evidence. To one acquainted with the whole subject, the matter is so obvious that arguing it is like having to argue on board of the steamboat that it is the boat and not the island which is in motion. I may say, however, that observations hereafter to be explained will show that the heavens are immensely larger than the earth. Suppose the heavens to move, the motions would be so rapid and so complicated that no imaginable force would account for them; whereas the motion of the earth explains every thing in a most simple manner, and in perfect accordance with the laws of mechanics. But we have two direct proofs that the earth does really revolve. One is afforded by the celebrated Foucault pendulum experiment. If we suspend an immense pendulum from some very high point, like the dome of the Capitol at Washington, and start it swinging, we shall find that it does not swing all day in the same apparent direction. In this latitude we shall find that, after nine hours, it is swinging apparently at right angles to the direction in which we started it. Now by the laws of motion the plane in which a pendulum swings is invariably the same so

PENDULUM EXPERIMENT.

The above figure represents a plane or table on the top of a globe, or at the north pole of the earth. To this table are fixed two rods, from which is suspended a pendulum, moving freely in any direction. The pendulum is made to vibrate in the path *a b*; it will continue to vibrate in this line, and have no apparent circular or angular motion until the globe revolves, when it will appear to have vibrated through the entire circle, to an object fixed on the table and moving with it. It is scarcely necessary to say the circular motion of the pendulum is only apparent, since it is the table that revolves—the apparent motion of the pendulum in a circle being the same as the apparent motion of the land to a person on board ship, or the recession of the earth to a person in a balloon.

long as the pendulum is not touched, and no force is applied to change it. The fact that the pendulum must be swinging in the same direction and that it appears to change shows that the building in which it is placed is really turned around about ninety degrees in the course of nine hours, and would make a complete revolution in thirty-six hours. You ask, Why not a whole revolution in a day? It would make a whole revolution in a day if we were near the north pole; but the pendulum necessarily swings in a vertical axis, and as the direction of the earth's axis to the vertical is here oblique, the earth does not revolve so rapidly relatively to its vertical axis as it does relatively to the real axis. When we reach the equator the axis of the earth is at right angles to that of the pendulum, and there is no motion around the vertical line in which the pendulum hangs. At the equator, therefore, the pendulum will always swing in the direction in which it is started.

The other direct proof of the earth's rotation is afforded by the form of the earth, and the force of gravity at its different parts. If the earth were at rest the weight of bodies on every part of its surface would be the same, and the equal tendency of every part toward the centre would result in the earth being round. But we find by actual measurement that the earth is flattened at the poles and bulges out at the equator. We find also that heavy bodies are lighter the nearer we take them to the equator. This we can attribute only to the centrifugal force produced by the earth's rotation. The proofs, then, that the earth moves are these three: firstly, the Foucault pendulum; secondly, the flattening of the earth at the poles; thirdly, the fact that the apparent motions of the heavenly bodies around the earth every day, and their irregular motions in the heavens, which we have described, can not be accounted for in any reasonable manner by mechanical laws if we suppose them to be real, while on the other hand, if we suppose it is the earth which revolves, every thing is accounted for in the most simple manner possible. In fact, so simply are the apparent motions of the heavens thus accounted for that the revolution of the earth on its axis would have been universally accepted in ancient times had the ancients been acquainted with the laws of motion. It was only because Ptolemy supposed that light bodies would be left behind if the earth revolved from west to east with so great a velocity that he was led to dispute the fact.

But how do we know that the apparent motion of the sun in the heavens which we have described is really a motion of the earth around the sun? So far as the motion of the sun alone is concerned, we can account for it just as well one way as the other. But

when we consider the motions of the planets, we find a system which we can not account for but by the motion of the earth. I have already stated that the apparent motions of the planets may be represented by a combination of two separate motions; the one is that of an imaginary point in a regular orbit around the heavens, and the other is a motion around this moving point. The combination of these two motions makes a curve so complicated that it is difficult to conceive from what cause it could occur, for although we can imagine a planet moving around the sun, it is very difficult to conceive why it should describe a regular curve around an imaginary point, which not only does not really exist, but is itself in rapid motion. Now this motion, in the case of all the planets, does not occur every day, but takes place once a year, and all the planets go in the same direction at the same time, so far as each is concerned. For instance, if the planet Venus is to-day moving east in this imaginary circle, the planets Mars, Jupiter, and Saturn are also moving east in the same circle, and as they curve their motions around toward the south and west, the other planets seem to curve their motions around toward the south and west. Not only so, but the sun also appears to move in this same direction. In a word, besides their regular forward motions around the heavens, all of the five planets seem to be performing an oscillatory motion around an imaginary point, corresponding to that of the sun around the earth. It is impossible to conceive how any force should act so as to produce this motion. The fact that it is common and simultaneous in the case of all the planets shows that it must be produced by some common cause. Now the theory of the motion of the earth accounts for it in the most simple manner by showing that it is not real but only apparent, being due to the motion of the earth itself around the sun. I have already partly explained that when we stand on any body which is moving forward with a regular and uniform motion, we become unconscious of the motion, and all the bodies which we see appear to be moving in an opposite direction. Now if a party in a steamboat which was sailing among a group of islands should describe all the islands as moving together—first to the east, then to the south, then to the north, and then to the west, we should at once reply, "It is the steamboat that is moving, and not the islands." In the same way, it is perfectly reasonable to us that in the case of the planets this oscillatory motion is simply due to the fact that the earth is moving around the sun in the opposite direction, and is therefore not real. Making this hypothesis, we find the motions extremely simplified; we get rid of the motions around imaginary centres entirely, and we find the smaller

bodies moving around the larger one. We know, independent of any such theory as this, that the sun is at a vast distance from the earth, and it is easy, without any very precise astronomical instruments, to assure ourselves that the sun must be a great many times larger than this world. It is therefore much more reasonable to suppose that the small body is moving around the large one than the large one around the small one. When we find these complicated motions reduced to motions which are of the simplest kind, and that without violating any law of probability, we are forced to the conclusion that the hypothesis which thus explains them is correct.

The theory explaining how the motions of the earth and heavens take place is called the system of the world. The apparent and the true systems of the world stand in remarkable contrast to each other. In the former, as it appears to the senses of all from earliest infancy, the earth on which we live is a vast flat plain which never moves. The direction we call down—that is, the direction in which a stone falls—seems every where the same. All bodies tend to fall in that direction in consequence of their own weight. The heavenly bodies seem comparatively small; they are spread out on the surface of a sphere, and move around the earth every day. These ideas are every where wrong. The earth is not flat, but round, like a ball, and we live on a round surface. This every body knows by his own sight who has ever made an extended journey, and the reason for believing it is explained even in our geographies. Secondly, “down” is not every where the same, but is always toward the centre of the earth, and is therefore not the same in any two places. The people of Australia are eight thousand miles under our feet, and we know that their feet when they stand are toward ours. Yet, should we go there, the directions up and down would appear to be the same that they are here. In twelve hours our feet will be in a direction that we now call south, on account of the rotation of the earth; yet we do not feel the change. Thirdly, the earth, besides having an annual motion around the sun, has a daily motion on its axis.

At first sight these doctrines seem completely to contradict the evidence of our senses, but a little thought will make it plain that this contradiction is only apparent. The evidence of our senses can not tell us whether we are at rest or in motion, and therefore there is no contradiction to the evidence of our senses in supposing the earth to be in motion. Again, in traveling around the earth we see very clearly that the direction we call down must be different at every different place, and therefore we know that the evidence of our senses can give us no fixed line of direction. The true system of

the world, then, does not oppose the evidence of our senses, but only some fallacious inference derived from that evidence. Then as regards the sphere: our eyes seem to tell us that all the heavenly bodies are situated at about the same distance from us, we being in the centre of the sphere, around which they are scattered. But again experience and examination show that by merely looking at a distant object we can form no opinion whatever of its real distance. It is true that we can form a very accurate idea of the distance of bodies which we see on the earth's surface, such as houses, fences, trees, etc., but an analysis of all the conditions shows that this is not a mere act of the eye, but more an act of judgment, and we know very well that when the conditions are such that the judgment is deceived by them, we may see just as well as ever, yet our inference as to the distance will be all wrong. No doubt every child who has for the first time seen a mountain through a clear atmosphere fifty miles away has felt sure that it could not be more than one mile, and there is no doubt but it seemed so to him. He thinks his eyes told him that it could not be but one mile, when, in reality, it was only an inference founded on the fact that objects looking as the mountain did were not usually more than a mile or two away.

But the reader must not suppose that because these apparent motions are not real they are therefore to be wholly disregarded. When properly interpreted, the apparent motions may be considered to be equally true with the real ones; for instance, we say that the sun rises in the east and sets in the west; this is perfectly true, provided we remember that east and west are not in the same direction in the morning as in the evening. Even astronomers continually use the expression that the sun and stars pass the meridian, although they know very well that it is only the meridian that passes the sun and stars. And again, in what concerns the change of seasons and the length of the days and nights, the results are precisely the same whether we consider the real or apparent motions, and the fact is that the cause of the change of seasons and of the different lengths of the day at different seasons can be more readily comprehended by a consideration of the apparent motion of the celestial sphere than by that of the real motion of the earth. Moreover, the ultimate object of investigating the real motions of the heavens is to learn with the greatest certainty and precision what the apparent motions are. I make this remark to warn you against the too common error that because the ancients were not acquainted with the real system of the world, all their other ideas in relation to astronomy were entirely fallacious. Observations made by them would be of as much value as if they were made to-day.

IV.—THE THEORY OF GRAVITATION.

When we pass from the apparent to the real system of the world, we have made a great step toward reducing what is seemingly complicated in the heavens to great simplicity. Yet there remains another step by which the laws of the celestial motions are simplified in a yet more remarkable degree, and that is by the discovery of the theory of gravitation. I am persuaded that there exists in the minds of the uneducated public a great misapprehension of what the theory of gravitation really is. It is commonly supposed to be some very recondite and wonderful force acting only in the heavens, which is now almost universally believed in by philosophers and astronomers, but which may nevertheless be entirely superseded by some future discovery. There are at all times many unfortunate people abroad, of course not belonging to the intelligent class, who seem afflicted with a monomaniacal desire of overturning this theory and substituting some new one. Now the very fact that a person denies gravitation is a proof not only that he is not very intelligent, but that he is not intelligent enough to know what gravitation is. Gravitation simply means *weightiness*. The tendency of all bodies to fall toward the earth is really gravitation; and to deny the existence of gravitation entirely is to deny that heavy bodies tend to fall toward the centre of the earth.

Now what Sir Isaac Newton did was not to discover gravitation, for every one who ever saw a stone fall saw an effect of that force. He only discovered that gravitation extended into the celestial spaces. His first reasoning was this: We see that all bodies at the surface of the earth tend to fall toward its centre. This tendency is seen on the highest mountains as well as at the surface of the ocean. How far does it extend upward? Why should it not extend to the moon? We know that the moon is revolving around the earth, and without some force to keep it in its orbit around the earth it would fly off into space, and we should soon lose sight of it. Why should not this force, by which the moon is continually turned aside from the line in which it is moving and kept in a path around the earth, be the same force which causes a stone to fall to the ground? To answer these questions, Newton began by calculating what force would really be required to keep the moon in her curved orbit around the earth, and comparing it with the force which caused heavy bodies to fall to the earth's surface, with the view to learning whether the two forces were inversely as the square of the distance from the earth's centre. Now allow me to state a circumstance which illustrates the exactness of true scientific reasoning in reaching these conclu-

sions. In his first calculations Newton found that the two forces did not correspond. Had he been any other than a man of true science, I fear he would have twisted something so as to make them correspond. Instead of doing so, he laid his theory aside for a number of years. At length he learned that more accurate measurements of the size of the earth than those accessible to him when he made his calculations had been executed by the French astronomers, and that these gave for the size of the earth in English miles a quantity much larger than that which he had used in making his calculations. He now found that when he based his computations on the true magnitude of the earth, the two forces of the stone toward the earth and the moon in its orbit corresponded exactly to the theory. We see from this that Newton did not discover gravitation itself, but only that it extended into the celestial spaces.

Not only does the moon move around the earth, but all the planets move around the sun. If no force acted on them, they would move forward in a straight line forever, and soon be lost in the celestial spaces. The very fact that they move in curved orbits around the sun shows that they must be acted upon by some force directed toward the sun. The most careful and exact observations that were made showed that this force was at all times and in the case of all the planets directed accurately toward the centre of the sun. Knowing the relative distance of the various planets from the sun, it was easy to calculate how strong this force must be in the case of each, and the result showed that in the case of each different planet its intensity was inversely as the planet's distance from the sun. It remained only to show whether the elliptic orbit in which each planet was known to move around the sun would be produced by a force inversely as the square of the distance. This required a mathematical investigation which the scientific men of that day found very difficult; but Newton at length succeeded in solving the problem in a manner which left no doubt. It was now proved that each and every planet was held in its curved orbit by a force acting directly toward the sun, and being inversely as the square of the distance of the planet from it. As this force was to all appearance of precisely the same nature with that which made the moon tend toward the earth, it was quite reasonable to call it gravitation. It differs from the force which makes a stone fall only in being directed toward the sun instead of the earth.

More refined and accurate observations show that the planets are acted upon by comparatively very small forces in addition to the gravitation of the sun itself. The most profound investigations of suc-

cessive generations of mathematicians show that these small forces may be represented by gravitations of the planets toward each other. We thus arrive at the theory of universal gravitation, which may be expressed thus: Every particle of matter in the universe attracts every other particle with a force inversely as the square of the distance which separates them. It is not impossible that this force in some future time may be itself explained by some other law; but the fact of its existence is as evident to the reason and senses of every man who has ever thoroughly observed and investigated the celestial motions as the fact that bodies fall toward the earth is evident to us all from our earliest infancy.

V.—THE TELESCOPE.

Every one knows that this instrument is one by which distant bodies are apparently brought nearer to the eye, but the principles of its construction are not so widely known. Let us begin by considering some elementary optical principles. You know that a body is rendered visible only by the light which emanates from it and reaches the eye. If we can make light emanate from a point of space where there is no body in the same manner it would if a body was there, we should seem to see the body although none really exists. Now the fundamental principle on which the telescope is constructed is this: A certain quantity of light which emanates from the surface of a body and reaches the instrument is to be brought to a single point. The eye, viewing this point, will apparently see the real body there. This point toward which all the rays converge is called the focus, and the imaginary object which we thus see in the focus is called the image of the real body. This image may be viewed with a magnifying-glass, just as we would view any small object held in our hands. There are two ways in which the light which comes from a distant body may be brought to the focus; one is by reflection from a concave mirror, and the other is by passing through a lens or system of lenses like a common burning-glass. The first telescopes were made on the latter principle. We give a figure of a telescope of the simplest construction, as it was made by the successors of Galileo. All the rays of light which come from a star are, on passing through the first lens (called the object-

GALILEO.

glass or objective), bent out of their course in such a manner as to converge to the point F, which is called the focus of the glass. In front of F a little magnifying-glass, or pair of magnifying-glasses, is placed, and the eye, looking into this glass, sees the enlarged image of the point or object the light from which is brought into the focus. In order to keep out all other light except that which emanates from the object, and in order also to make the two glasses preserve the same relative positions, these two lenses are placed in a long tube.

This telescope is subject to a great imperfection, arising from a well-known property of the refraction of light. You know very well from an experiment with a prism that when light is refracted by a lens it is at the same time decomposed into the prismatic colors, red, yellow, blue, etc., the red light being refracted or bent out of its course the least, the blue or violet rays the most. No substance has yet been found which will refract light of all colors equally. The consequence is that as the light passes through the glass, the blue rays, being refracted the most, go to the focus at G, nearer the object-glass than the red rays, which, being refracted least, will come to the focus at F. As all the light is not brought to the same focus, it is impossible to get any accurate image of a star or other object at which the telescope is pointed, but, on the contrary, we have a confused mixture of images of various colors. This defect may be greatly lessened by making the telescope very long; and the astronomers of the seventeenth cen-

HUYGHENIAN TELESCOPE.

tury used to make lenses of thirty, fifty, or even a hundred feet focal length, and raise them up in the air, without any tube at all, on top of long poles. Such telescopes were of necessity very inconvenient for use. So serious and unavoidable did this defect of the refracting telescope appear to be that the making of a refracting telescope which would give a perfect image was for a long time deemed entirely impracticable. But

ACHROMATIC
OBJECT-GLASS.

toward the end of the last century it was found by Dolland, an English optician, that this defect of the refracting telescope could be almost completely cured by making the object-lens of two different kinds of glass. He found by experiments that flint-glass and crown-glass refracted the light almost equally, but that the former disperses it or separates it into these prismatic colors about twice as much as crown-glass. Accordingly, if you combine a prism of crown-glass with a prism of flint-glass having half the refracting angle in such a manner that they should act on the light in opposite directions, the flint-glass would disperse the light in one direction as strongly as the crown-glass in the other direction, and the lights of all colors would pass through the two prisms without

any separation, while the greater refracting power of the crown-glass would cause all the light to be refracted out of its course. The achromatic objective is constructed on this principle. It consists of a double-convex lens of crown-glass and of a concave lens of flint-glass. The latter is ground nearly flat on the one side and concave on the other. Passing through this combination of glass, the light of all colors is brought almost absolutely to the same focus. Perfectly distinct vision of a distant point may then be obtained by means of the eyeglass.

The eyeglass of the telescope is commonly composed of two lenses of short focus. One lens will do; but a combination of two can be so employed as to give much greater distinctness, and enable a much larger portion of the object to be seen distinctly in one view. The magnifying power of the telescope depends on the focal length of the object-glass and the power of the eye-piece. It may therefore be varied by simply changing the latter. The rule is to divide the focal length of the object-glass by the focal length of the eye-piece, and the quotient will give the magnifying power of the telescope. For example, if with a telescope ten feet long I employ an eye-piece of one inch focus, the focal length of the object-glass being one hundred and twenty times that of the eye-piece, will magnify one hundred and

twenty times. If the eye-piece is only of half an inch focal length, the telescope will magnify two hundred and forty times; while, if it is two inches focal length, the telescope will magnify sixty times. Thus with any given telescope the astronomer may employ any power he pleases by simply using the proper eye-piece. This being the case, you may inquire why can not the smallest telescope be made to magnify to any required extent by simply using an eye-piece proportionately small? The reason is that the quantity of light that we get from an object is of great importance. When we look directly at an object we get from it all the light which falls within the pupil of the eye, the diame-

LASSELL'S GREAT REFLECTOR.

ter of which is about one-fifth of an inch. When we look at it with a telescope we get only the light which falls within the object-glass of the instrument, and the object looks dim in proportion to the square of the magnifying power. If we have a telescope of five inches focus, and the aperture of the object-glass is

twenty-five times that of the pupil, we can then employ a magnifying power up to twenty-five times without producing any dimness of the object. But if we carry our magnifying power beyond twenty-five times, the object is dimmed in the same proportion. If we carry it above two hundred and fifty times, this dimness increases so rapidly that in the case of the more distant and faint planets and the nebulae the magnifying power will be more than neutralized by the deficiency of illumination. This difficulty does not apply to the case of a star which has no apparent surface. But there is another defect inherent to small object-glasses. No object-glass will bring the light to a mathematical point in the focus, but the very best glass forms a small round image surrounded by a circle of light. The larger the object-glass, the smaller its image and circle are. This effect is termed diffraction. The consequence is that in looking through a small telescope with a high magnifying power we introduce a certain indistinctness. And if we carry the magnifying power from fifty to one hundred times for every inch aperture of the telescope, the increased magnifying power will be neutralized by an indistinctness. An example of this indistinctness can be very readily seen by piercing a hole through a card with a fine needle. On looking at objects through this hole you will not perceive them clearly, but they will

HORIZONTAL SECTION OF A NEWTONIAN TELESCOPE.

This section shows how the luminous rays reflected from the parabolic mirror *M* meet a small rectangular prism *m n*, which replaces the inclined plane mirror used in the old form of Newtonian telescope. After undergoing a total reflection from *m n*, the rays form at *a b* a very small image of the heavenly body. This image is viewed through an eye-piece with four lenses placed on the side of the telescope, and magnifying from 50 to 800 times, according to the size of the silvered mirror.

all be a little softened and blurred, as though they were seen over water. Their appearance is exactly that which would be presented by a distant object seen through the most perfect telescope under the most favorable circumstances when a great magnifying power is used.

A yet greater foe to astronomical observation is the atmosphere, as all objects seen through it are tremulous and indistinct. If you have ever noticed a distant object along the surface of the ground on a hot summer's day, you have seen a certain waviness of outline combined with a slight trembling. If you look with a telescope, you will find that this tremulousness increases in direct proportion to the magnifying power. In the night it can not be seen at all with the naked eye, but with a telescope it is seen to a greater or less extent at all times. Only on very rare occasions is the atmosphere so still that it does not interfere with the telescopic vision in this way. The higher the magnifying power employed, the more this tremulousness is magnified, and the rarer the cases in which distinct vision can be obtained. It has sometimes been said that Sir William Herschel employed power as high as six thousand on one of his great telescopes. If so, it is not likely that he saw any thing with the slightest distinctness. We sometimes hear it said that the moon has been brought within forty miles by the aid of the largest telescopes. I doubt whether the moon has ever been seen through a telescope with such distinctness as it would be seen with the naked eye at a distance of four hundred miles.

The refracting or achromatic telescope, as I have described it, is that now ordinarily used in astronomical work. But I have said that the rays of light can also be brought to a focus by a concave mirror. A telescope made in this manner is called a reflecting telescope. Most of the celebrated instruments of which we have read, like those of Herschel, Lord Rosse, and Lassell, were of this

HERSHELIAN TELESCOPE.

In this telescope the mirror was so inclined that the image of the star was formed at *a b*, on the side of the telescope near the eye-piece *o*; hence it is termed the *front-view* telescope. As the rays in this telescope undergo only a single reflection, the loss of light is less than in either of the preceding cases, and the image is therefore brighter. The magnifying power is the quotient of the principal focal distance of the mirror by the focal distance of the eye-piece.

kind. Their construction is very simple. The concave mirror, ground perfectly true, is placed in the bottom of a long tube; the image is formed at the top of the tube, as shown in the figure. But the first great difficulty met with in the use of this telescope is that the image being formed in the top of the tube, the observer can not go there to look at it without placing his body in the course of the light which must pass from the star down the tube of the telescope. Three ways of avoiding this difficulty have been employed. One is that of Herschel's: the mirror is very slightly tipped in the tube, so as to form the focus near one edge, as at *a b*. The observer can then put his head at *c*, and look into the eye-piece without cutting off much of the light. Another method is that of Sir Isaac Newton's: a small mirror is placed near the focus at an angle of forty-five degrees with the axis of the tube. This mirror reflects the light horizontally through an opening in the side, where the image is formed, and the observer can view it from this point. And the third method is that of the Gregorian and Cassegranian telescopes. In these a concave or convex mirror is placed near the focus in the centre of the tube, and the light is reflected back again in such a manner as to form a second focus near the centre of the large mirror. A hole is cut through the latter, and the observer sees the image by looking up. This method is far more convenient in use than either of the others.

The question whether the reflecting or refracting telescope is the most powerful is one on which the best opinions differ. It is certain that reflecting telescopes have been made very much larger than any refractors. Those of Herschel and Lassell, for example, were four feet in diameter, and that of Lord Rosse was six feet. If we consider this circumstance alone, we would say that this form of telescope would necessarily be the most powerful. But, from some cause not entirely explained, these instruments have never proved effective in proportion to their size. Sir William Herschel had two great reflectors, the one of two feet, the other of four feet; yet his great investigations and discoveries were made with the two-foot telescope, and I can not find that he was really able to see any thing more with the large one than with the small one. Precisely the same remark applies to Lassell's telescopes. He first made one of two feet aperture, and then a great one of four feet; but he never saw any thing with the four-foot which he had not seen with the two-foot one. Lord Rosse's great telescope is larger than any, being of six feet in diameter; but no considerable discovery was ever made with it, and it is very doubtful whether it will show objects so well as many other telescopes of much smaller size. Besides, a

great reflecting telescope is a very troublesome thing to keep in order, so much so that no such instrument has ever been made much use of by any one except its maker.

The refracting telescopes, though less celebrated than these great reflectors, are those which have done nearly all the solid astronomical work. The great difficulty in their construction is to get disks of glass of the necessary size and purity. This difficulty has been so successfully overcome within the last forty years that the size of the refracting telescope is increasing enormously. The most successful makers of great telescopes are the American firm of Alvan Clark and Sons, in Massachusetts. The instrument recently made for the National Observatory at Washington is the largest refracting telescope ever constructed, and among the most perfect, and it is quite possible that it is also as powerful a telescope as was ever pointed at the heavens.

Now you want to know how the telescope is employed to measure angles. I can not describe all the instruments used for this purpose; we must therefore confine ourselves to the consideration of the simplest form of meridian circle.* This consists of a telescope of moderate size turning in a north and south direction around a fixed horizontal axis. On this same axis is firmly fastened a metallic circle, which may be three or even six feet in diameter. The circumference of this circle is divided by fine lines into three hundred and sixty degrees, and each degree into a number of parts, usually twelve or thirty. In the finest instruments the division lines can hardly be seen with the naked eye. The whole instrument turns on pivots resting on two stone piers. Four microscopes are firmly fastened to these piers in such a position that the division lines on the circle can always be seen through them. Then, as the instrument is turned around, all the division lines will pass in succession under the four microscopes. The direction in which the instrument is pointing is accurately determined by the particular division which is under the microscope at any moment. Commonly no division will be exactly midway under the microscope, and then the point of the circle which is in this position is found by measurement with a fine spider's web, which is placed in the focus of the microscope itself. As we turn the instrument around, the number of degrees and minutes through which it turns is accurately determined by the number of division lines which pass under the microscope. These division lines being all numbered, this determination is very easy. If we wish to find the angular distance between two stars on the meridian, we point the telescope on one of them,

* For an illustration of the meridian circle see the September number, page 522.

SPIDER WEB IN FIELD OF VIEW OF A MERIDIAN CIRCLE.

The star passes across the field from right to left, and the observer notes the time of passing across each of the five lines.

and note accurately the points of the circle, the number of degrees, minutes, and seconds that are under the four microscopes; then we point the telescope on the other star as it crosses the meridian, and again determine the degrees, minutes, and seconds which are under the microscope. The difference of the two gives the difference of the altitudes of the two stars when they cross the meridian. We also determine by means of the same instrument, combined with the astronomical clock, the interval of time which elapses between the crossing of one star and the crossing of another. The combination of this difference with the difference of meridian altitudes affords the means of calculating accurately the relative positions of the two stars.

AUNT JULIE.

FROM THE GERMAN OF FANNY LEWALD.

IN spite of her seven-and-fifty years, there was always about Aunt Julie an atmosphere of that unfading youthfulness which comes from the soul. She was the confidante, the refuge, and the counselor of the whole family. The smaller children went to her with their dolls, and the larger with their love affairs. She interceded with their parents for nieces and nephews, and not only gave counsel, but, when necessary, more solid assistance. She was the model of a good aunt, and if no such thing existed, she would have invented the pattern.

One evening, when we were alone, and she had spoken, contrary to her usual custom, a great deal about herself, she said, after a long silence, "I have been wanting to tell you that I have prepared for you a token of remembrance, which will come into your hands after I am gone." Unlocking a writing-desk, she took out a manuscript, saying, "These leaves contain the recollections of my youth. Read them after I am dead." A few months later, one beautiful spring even-

ing, I opened the manuscript, and read the following narrative:

I was of French descent, born in Berlin in 1796. My mother, very beautiful in her early years, had formed a strong youthful attachment to Herr Von Schlichting, a Prussian army officer. His parents were unwilling that the heir of one of the oldest families of the nobility should marry the daughter of a silk manufacturer, and the young officer was transferred to East Prussia, where he afterward entered the civil service. After a while my mother married the man whom her parents had fixed upon as her husband, for the families of French descent were intimately related together, and family life was based upon the entire dependence of children on their parents.

My father made no great demands on the heart of his young and handsome wife, was deeply absorbed in business, and was content so long as she did the honors of his house well, and was a good mother to his children. He soon accumulated a large property, and set up an extensive establishment, as it is called, and my mother took pleasure in being its head. She dressed well, had attractive manners, and, as she grew older, became more imposing in her beauty. I have never seen a more lovely woman than was my mother. She pleased every one, and this made her take special delight in the intercourse with her friends. At our house was to be met the choicest society of the capital.

Just before my birth, when my mother was in her thirtieth year, at a great festival she unexpectedly met her youthful lover. He had remained unmarried, although he had been informed of my mother's marriage by herself. But to hear that a beloved one is married is a very different thing from seeing her the wife of another and the mother of another's children. Herr Von Schlichting, in spite of himself, could not but experience some pangs when she introduced him to my father; but the entire confidence with which they both treated him enabled him to preserve his composure, and to regulate his future relations with them. He was an honorable man, and believed in the honor of others. He was invited to our house at my christening, and I received from him the name of Julie. As my mother brought to him her children, looking at them with such evident pride, and as he took me after the baptism, he could scarcely keep back his tears, as I have been told.

"May God bless you, and bless these children!" said he, after the service, giving his hand first to my mother and then to my father; and no mention was ever made of the past. He was attached to the ministry at Berlin, and visited our house at first like other guests, but soon came more and more frequently, until there was no day when he

failed to come, though but for a few moments. As neither my father nor mother had any brothers or sisters, the children all became attached to Schlichting, calling him uncle, while all found in him a kind, instructive, and sympathizing friend. My recollections of him, I believe, extend back to my third year. My father was too busy to give us much attention, and when he came home from the manufactory or counting-room he wanted to be quiet, and we little ones were sent away.

Thus six years passed without the slightest interruption of Schlichting's relations with my parents. My eldest sister was now in her sixteenth year, and very probably the thought may have arisen in my mother's mind to give one of her daughters in marriage to such a true man and worthy friend. No one had ever cast the least shade of suspicion upon her relations with Schlichting, so universally was she held in respect, except her mother-in-law. She had never forgiven my mother for being so reluctant to marry her son, and she had often said to my mother, behind my father's back, that she did not deserve to have such a husband. My sister Caroline was her grandmother's idol, who continually gave her presents, decked her out with ornaments and finery, and thus seriously interfered with her mother's influence.

Caroline was not pretty; she was a tall, lean brunette, like grandmother, and had a pair of beautiful black eyes, fine teeth, and handsome hair. Grandmother considered her the best-looking of all the five children, and, when some one teased her about her dark complexion, consoled her favorite by telling her that the best black cherries grew highest on the tree.

At last my father found it necessary to have a serious talk with grandmother in reference to this partiality. He went to see her, and at the dinner-table, after the interview, we all felt that some mishap had taken place. My father was silent, and mother looked pale and troubled. So it continued during the whole day and evening, and it was not until years afterward that I learned what had transpired.

As soon as he had begun to speak of the partiality shown to Caroline, grandmother became violently excited, and maintaining that she had a right to do what she pleased with her own savings, threw out such hints and innuendoes against my mother that at last my father said,

"Speak out plainly. Say once for all what fault you have to find with my wife."

"I will speak plainly, as you ask it," replied grandmother. "You may be pleased, but I am not, to have this councilor day in and day out in your house; and if you think I am, you are mistaken. Other people can see, if you are blind."

"Mother!" cried he, the blood mounting to his head—"mother, may God forgive you!"

He sat down, covering his face with his hands. Grandmother stepped up to him and said, "Do you suppose, then, that the Geheimrath comes every day to the house to see you? Do you suppose that they have forgotten how you stepped in between them? What does such a nobleman want in a citizen's house? Why doesn't he get married? Why doesn't she take Caroline into society with her? Why does she keep the girl, who is old enough to have a husband herself, in the nursery with the children, except that she doesn't want the councilor to notice how long it is since he loved her? Get a husband for the girl, that she may go away and not see what is going on!"

My father's brain whirled. He could not bear his own mother's leering look of pleasure at his anguish. He suddenly rose.

"Where are you going?" inquired grandmother, alarmed at his movement to go away.

"I am going to get consolation from my wife for the suffering that you, my own mother, have given me," said he, with emotion, as he left the room. But he could not banish suspicion, and he felt ashamed to express it to his wife. She saw at once that something unusual and painful had taken place, and asked him what was the matter, and what had been said in reference to Caroline, but received no reply. He said that he would tell her some other time. She had never before seen him in this mood, and her anxiety made her silent and depressed. My father perceived this, and put his own interpretation upon it. "She suspects," he thought, "what it is. She loves him; she has never loved me!" Such a thought to a man who has been married seventeen years is a very different thing from youthful jealousy.

After the children had gone to bed, my mother, not imagining that she was the cause of her husband's depression, said to him:

"Let me know what is the matter, Anton. What did you and mother have to say? What has put you so out of tune?"

"Nothing—really—yet we did not part with the best understanding. Let the matter rest; we have said enough for to-day."

"But what will become of Caroline?" inquired my mother. "Did you make your mother see how she was ruining the child?"

"Why don't you take her into society?" asked my father, in a hard tone, wholly strange to my mother.

"Why do you ask that," replied she, "when you know we had agreed that it would be better for her to wait another year?"

"But why do you oppose it?" cried he. "I have nothing to say against it. Grandmother lays great stress upon her not going

into society. The girl is now grown up, and you yourself—you ought to favor her coming out, but you hold back."

"I hold back!" repeated my mother, gazing at him in amazement. "Why should I hold back?"

"On Schlichting's account!" said he, with the defiance of a man who knows himself to be on false ground, but without being able to look my mother in the face.

"On Schlichting's account?" asked she, as a suspicion of the truth dawned upon her. "What about Schlichting? What has your mother said to you?"

"What makes you suppose my mother has said any thing?" inquired he. And vexed that his wife believed him to be influenced by his mother, he added, "I have eyes of my own, and can see!"

"You have good eyes and a pure heart; such a suggestion does not proceed from you," replied she, looking him frankly and quietly in the face with her large clear eyes. This composure completely disarmed him, but the wound still bled, and with a heavy sigh and a sad face he turned away from his wife.

My mother could not bear to see him thus, and forgetting the injustice that had been done her, said, "Anton, I have been your wife for seventeen years!" The tone with which she said this went to his heart, for it came from the depths of her own, but he could not utter a word. "What have I done to grieve you?" asked she, in an imploring voice.

"Oh, nothing, nothing!" cried he, with an expression of deep suffering. "I know you can not deceive. You have struggled, renounced; I have no reason to blame you. But—but you have never loved me; you love him!" And covering his face with both hands, he exclaimed, "To have to say this, after being married so long!"

Wounded to the very soul, my mother, wholly unprepared for such a loss of confidence and faith in her, as if impelled by an instinct to find protection by the side of her children, hurried quickly into the adjoining chamber, where we were sleeping. She stood with folded hands by our bed, the tears streaming down her cheeks. My father followed her, and at the sight of the weeping wife and mother his heart melted. He took her by the hand, saying, "Forgive me!" She fell upon his neck, and ended her weeping on his breast. They kissed the children, and he begged her to forget forever what had occurred, and led her from the chamber.

But my mother could not be silent. She reminded him of their happy union, their unbroken confidence for so many years, and insisted upon her right to retain his perfect trust in her truth and uprightness of heart. The reconciliation was perfect, and it was attended with the best results. The grand-

mother's influence was once and for all rendered powerless. She came less frequently to the house, Caroline was not permitted to go to see her alone, and Schlichting became more and more endeared to my father, proving a true and indispensable friend as the times became darker and more troubled.

During the several years of war and national distress that followed, my father's affairs became more and more involved, and we all saw that his cares and anxieties were undermining his health. Mother did what she could to lessen his burden. The household expenses were diminished, and my older sisters were set to work, but it made no essential difference. In 1810 my father died, when I was thirteen years old, but really much older than my years. My mother took upon herself the cares of the business and the settlement of the estate, and rented all but a part of the upper story of our house, where we lived ourselves, and made one room answer for sitting-room, dining-room, parlor, and all. My mother never uttered a complaint. She was absorbed in her fatherless children and their future, and in the future of her country.

When the court returned to Berlin, Schlichting came with it, and we knew that he was our mother's sole adviser. He came every day to our house. The disturbances and excitements of the time had tended to make life a deep and earnest reality with some, and drawn them nearer together around the family hearth, while with others they had induced frivolous and dissipated tastes, a tendency to live for the enjoyments of the passing moment, and a recklessness of mind and feeling. At no time has there been such a period of excitement, when the very uncertainty of all relations seemed to add fuel to all passionate attachments. Romantic love-stories, divorces, elopements, were the order of the day, and now the atmosphere seemed to infect also our uncle, whose old feeling for my mother gradually became a warmer passion. My mother, after her mourning was laid aside, felt that it was her duty to go into society with her grown-up daughters; and one evening when she was in full dress, waiting for my sisters, whom she was to accompany to a ball, I was alone with her in the room. She looked so beautiful that I could not help kissing her; and I said to Herr Schlichting, who came in just then, "Only see, uncle, how beautiful mamma looks to-night; more beautiful, much more, than Caroline, or even Tonie! Don't you think so?"

He said nothing, but I could see that he shared in my delight. I left the room, and when I came back my mother was sitting in the same place, but uncle had gone, and she had evidently been weeping. Something warned me not to question her, and I did not exactly know why I pitied her, but I

embraced and kissed her. She drew me close to her breast, and I felt her warm tears on my forehead. But quickly releasing me, she said, stroking my head, "You are a good, good child, Julie; now be quiet, and go and see whether your sisters are ready."

Long afterward I learned what had happened on that evening. She had declined to become Schlichting's wife. She could not become a bride with her daughters unmarried by her side, and uncle appreciated and honored her scruples.

Now came the French retreat from Russia, and the universal uprising for the freedom of the Fatherland.

I become young again when I think of the enthusiasm that prevailed on the king's re-entrance into his capital. It was a holy, a grand epoch, when the German people consecrated themselves to freedom and to their country. We wept when my brother was not accepted as a volunteer.

One morning, as we were sitting together, uncle came in. In spite of his fifty years, he was still a fine-looking man, and that day he seemed to wear an air of peculiar nobleness and dignity. "I have come to say good-by," he said, his face all aglow.

"To say good-by?" inquired my mother. "Where are you going?"

"To Breslau. The army is in want of officers, and I was an officer once, and will be one again," replied uncle. And while my mother, in her surprise, stood silent, with folded hands, I, in my excitement, threw my arms around his neck.

"Uncle," I cried, joyously, "I have always loved you; but that you are going to help where help is needed I will never forget as long as I live. I will love and honor you yet more when you come back."

"When I come back!" said he, and his voice showed emotion. I had not thought upon the possibility of his never returning.

"Oh, you will not die!" cried I. "See, uncle—see, mother—I have the fullest conviction that uncle will come back safe and sound, and that nothing will happen to him. Nothing at all, uncle!"

He smiled and gently stroked my brow. "God grant it be so!" said he; "for I should like to live longer. But I have made all my preparations for the worst, and let it be as God pleases."

I began to weep; my mother's eyes were full of tears, and we could not speak. He was silent a moment, and then requested me to leave the room. After I had gone out he took my mother's hand, and after a while, as if at a loss how to express what he had at heart, he said, "Josephine"—and this was the first time he had called her by that name since the early days—"you refused to become my wife and let me take care of you and yours, and I honor your reasons. But I have lately had to think much of what will

become of my property if I fall on the field of honor; it will go to rich distant relatives, while you are obliged to struggle with anxieties and limited means." Here he stopped, but soon continued, "I have thought of making you my heiress, but you would not consent to that, nor to the adoption of Julie, who is the only one of your children not provided for."

"Oh," my mother interrupted, "be not concerned, my friend, on Julie's account, for she has the fewest and the simplest wants of all my children. She has been brought up in a period of trial and economy, and she will not be quite without means, unless something wholly unforeseen should take place. Don't be anxious about us, but come back safe and well."

He seemed disturbed, but summoning all his resolution, he suddenly asked, "Do you think that Julie would marry me?"

"Schlichting!" exclaimed my mother, greatly moved, "how came you to think of such a thing?"

"I hardly know myself," replied he. "When the dear child turned to me with such abandonment and joy, it suddenly came into my thought that I could at once give her a position in society, independence with you, and a good property, if I could marry her." He stopped, and my mother was silent.

"Julie is still little more than a child," said she at last, as if talking to herself.

"Yes," rejoined he, "and I am almost an old man. But that is why I venture it. To-morrow I go away, and if you consent, I will to-day sign the marriage contract which makes Julie my sole heiress. I can get a dispensation for a speedy marriage; to-morrow the ceremony can be performed, and you know that the happiness of your dear child will be dear and sacred to me if I return."

My mother had known how terrible a thing it had been to struggle against her own heart, having married one who was not her own choice, and she thought what would be my sufferings if I should ever feel a love which duty forbade me to indulge. She at last gave utterance to this thought. Schlichting took her hand, saying, "Do you not know me? Must I say to you that Julie will be dear to me as if she were my own child? Must I say to you, Josephine, that in a moment like this I thought not of a wife or the happiness of marriage for myself?"

My mother rose, opened the door, and called me in. Their evident emotion, but still more their silence, for neither spoke, struck me, and I asked, in an embarrassed tone, at last, what my mother wanted of me. Then uncle came to me, gently raised my head with his right hand, as he often did, and in tender, irresistible tones, asked, "Julie, could you make up your mind to marry me?"

I thought he was jesting, and my first impulse was to laugh; but a further look at him and at my mother showed me that there was no jesting here. My heart began to beat violently, and there was something irresistibly attractive to me in the thought of marrying a man who was going to the war on the morrow. I had always been fond of him, and had never loved any one else, mere child as I was. All at once, as if impelled by an irresistible inward impulse, I exclaimed, "Yes, uncle, most willingly."

"And does not my age frighten you?" asked he.

"If I were not so unworthy of you," said I, giving him my hand, while tears filled my eyes.

"In God's name, let it be!" cried he, as he turned to my mother. "Give her your blessing, and she shall not repent the confidence she has placed in me."

After dinner the notary came, and with him a young man who had been for several days employed in Schlichting's bureau. His name was Clement, and, left early an orphan, he had been brought up by Schlichting, who loved him like a son, and had made him his confidential agent. I had seen him but once before, and he came now to be a witness of the marriage contract.

The next day, just as the clock struck twelve, we were married. After the service was over, and I had promised to be his in life and in death, in good days and in evil days, I threw myself upon his breast, and as he held me there so tenderly and softly, I felt so humble that I could have kissed his hands. All embraced me, and my mother wept as I had never seen her weep before. All but Caroline congratulated me, and when she kissed me she stroked my cheeks as if pitying me, and whispered, "You poor, poor child!" Schlichting left that day to join the army, and when I awoke the next morning all seemed to me like a dream. I often thought of Schlichting, but after he had left us I could form no distinct image of him. He was no longer uncle, and yet I could invest him with no other character.

We had received an invitation to witness the departure of the troops for the campaign from a friend's house on the public square. My brother accompanied mother and Caroline, and I was attended by Clement. I returned to the house for something I had forgotten, and so we became separated from the rest of the party, and did not reach the house until the advance-guard had appeared in sight. The master of the house met us as we entered, saying, "The windows are all full below; you will see nothing here. Conduct the councilor's lady, dear Clement, up to my daughter's room."

I looked around for the face of some acquaintance, but all the ladies were strangers. Strains of joyful music filled the air,

handkerchiefs waved, jubilant shouts arose, and as I turned to meet some friendly eye I was astonished to see Clement standing with face deathly pale and eyes filled with tears.

"For Heaven's sake, what is the matter?" cried I, much troubled.

"Nothing, nothing," said he. But I knew well how deeply it pained him not to have been allowed to serve in the army on account of a weakness of the chest, and I felt a sincere pity for him. I extended my hand, which he pressed in silence. I told him that I would willingly exchange my health for his sickness, if I could enable him to serve his country like the rest. A blush spread over his handsome pale face, and he replied, with a forced smile, "Think not of me; you have something better to think of than a poor invalid left behind." I could not shake off the impression of that forced smile and those sorrowful eyes. In the evening I went to the theatre, having received an invitation to the box of the minister, whose wife showed me truly maternal kindness. My mother usually accompanied me, but this evening she let me go alone with Clement. As I took my seat by the side of my protectress I heard a voice behind me ask who I was.

"The young wife of Von Schlichting," was the reply.

"Impossible!" asserted the questioner; "I thought she must be the betrothed of the young man."

"What made you think so?"

"Oh, because they are such a handsome couple."

My heart beat violently, and I did not dare look round. Whether Clement heard what was said I do not know, but he did not come near me the whole evening.

Circumstances conspired to bring us together. I was requested by the wife of the minister to become secretary of the "Ladies' Patriotic Union," and Clement had charge of the correspondence with different parts of the country. To wear ornaments was considered among us almost a disgrace, and to make sacrifices the highest happiness. Clement had been one of the first to devote half of his income to the general cause, and I could not rest until I had laid not only my money but my few valuables on the altar of my country. A heavy gold chain, the baptismal gift of my mother, and a small ring with a blue forget-me-not, my mother's gift at my confirmation, I handed to Clement, as others their jewels, to be sold; and great was my joy at receiving for them forty dollars.

Some months had now passed away, and a great battle had been fought. At midnight our door-bell rang, and Clement asked to speak with us. We feared the worst, but Schlichting was only severely wounded. Clement produced a letter from a brother officer describing his condition, in which I

was forbidden to leave my mother. I could not rest, day or night; I was in a state of restlessness and distraction for which I could not account.

The wife of the war minister thought that this state was to be attributed to the circumstances in which I was placed, and Clement agreed with her; and all treated me forbearingly, like an ailing child, except Caroline, who told Clement once in my presence that he humored me too much. She tried to divert his attention whenever he approached me. He once remarked to her how unhappy one must be to be called upon so young to feel anxious care for a husband. "Do you call that unhappiness?" she replied. "It is unhappiness to have no one to care for, no one to love, no one to love us. Julie has an enviable lot! Schlichting will get well. Julie is happy every way."

I could not hear what he said in reply, but I saw his eager look of sympathy, and I saw him kiss her hand as she extended it, and then hasten away. They loved each other, I thought. Weeping bitter tears, I exclaimed, "Yes, I am indeed every way happy!"

The next day was my birthday, which all had affectionately remembered. From hour to hour I waited impatiently for Clement, having a sort of superstitious feeling that he would bring me to-day some good news from Schlichting. I went from sofa to window, from window to door, and from door to sofa again. Every one thought my restlessness and impatience very natural. Caroline smiled at it, and once, when I stepped to the window where she was sitting, whispered, "Clement must have forgotten that this is your birthday." All the blood seemed to fly into my face; but the next moment I saw Clement hurrying toward our house, and went down the steps to meet him. He saw me coming, and drew out from his breast pocket a letter, while he held also a bouquet in his hand. In my haste to take the letter it fell to the ground, and as we both bent down at the same moment to pick it up, a ring attached to a gold chain fell from his breast. He concealed it quick as lightning, but I had time to see that it was my ring and my chain. He did not speak, and was deathly pale. I held the letter in one hand and the bouquet in the other, crying and laughing by turns; but I forgot to open the letter. My mother did it for me. It was from Schlichting himself, and assured us of his convalescence, and expressed the hope that he would soon be able to rejoin his regiment. He had also remembered my birthday. They congratulated me on the letter having reached me on the very day, and I was full of a silent, indescribable blessedness. I scarcely perceived when Clement took leave, for he seemed to be still present with me. He had bought the chain and the ring, for I had seen the money received for

them on the books of the society. They must have been dear to him; from his scanty means he had purchased these. I felt that he loved me and that I loved him, and the thought filled me with rapture. I was bathed in an overwhelming flood of bliss; and as I look back upon them, these were the happiest hours of my life. I did not ask what would be the end of it; I gave myself up to the blessedness of this first love.

The next morning my mother asked me when I was going to write to Schlichting. I would have liked to postpone doing it, but how could I explain such a delay? I took pen and paper; twice, thrice I wrote, "Dear Uncle!" Then I remembered that since our marriage I had called him "Dear Schlichting." I sat and sat, and the longer I thought, the stranger he seemed to me. To the uncle I would gladly have confessed all; but to the husband to speak of this!—the pen fell from my hand, and all my golden bliss vanished in the consciousness of my guilt. The spectral thought rose up that I was untrue to my husband, that I loved another, and that other was Clement, my husband's adopted son, who owed every thing to his benefactor. While he was lying ill with his honorable wounds, I, to whom he had given his name—I had thus disgraced him in my heart, and been deluded into a self-deceiving, guilty love. In a brief hour the girl ripened into the woman. The consciousness of guilt changed my silent love into burning passion. I knew not what I wrote; I only knew that I must free myself from my passion and my guilty consciousness. I must see Clement, and see him for the last time.

The minister's wife had invited me to visit her at her summer residence at the lower end of the Thiergarten, and that day at noon I directed my steps thither, expecting to see Clement there. My protectress had gone to the Ladies' Union, but had left word for me to remain until her return. I had no companion but my own thoughts—the most dangerous society that I could well have had at that time. Dreamily I stood and looked out upon the lawn in the rear of the house; suddenly a voice by my side inquired, "Do I disturb you?"

My head became dizzy, and I was obliged to lean upon a flower frame; but I collected myself with strenuous exertion, and replied, "No; I was waiting for you." He looked at me with surprise. "Do not speak," I continued; "I know every thing, and it can not continue so between us." After I had spoken the words I would have given my life to recall them. I felt then what I had done, but I must go on; an irresistible power impelled me. "Clement, you have kept my chain, my ring; I saw them yesterday. By all that you regard holy, give them to me; you must not keep them, gladly, gladly as I would let you. Schlichting is my husband—is your

benefactor; it must not be as it is. I shall not see you again—never again—though it should kill me.”

I could not look at him while I poured forth this passionate outburst. I turned away, and was about to leave the room, for I had said and done all that I intended; but I felt myself embraced by his arms, as he lay at my feet and passionately kissed my dress.

“Let me go!” cried I, attempting to free myself; but he only held me the more firmly.

“No, no!” said he; “this moment can never come again. You must hear me. I must tell you this once how I have loved you from the first hour I saw you; how I can never give you up as long as I live; and how my only wish is to die, die soon, with your name on my lips!”

“O God! God! what am I to do?” prayed I, in the anguish of my soul. “Stand up, Clement, I beseech you, stand up!” He sprang up as I inclined forward to help him, drew me to his breast, and I felt his passionate kisses upon my lips. It was but for a moment that he held me, and I saw how bitter was his remorse, as we stood there face to face, as if paralyzed. It was calm in us as it is when the storm has spent its violence. After some time Clement drew a deep sigh, took the chain from his neck, gave it to me without a word, and then went away. At the door he turned, gazed at me with one long look, and then said, in a low tone, “Farewell, forever!” and I was alone—alone with my great sorrow, my accusing conscience, and my seventeen years.

For three days I remained at home, pleading sickness, and assuredly I was far from well. How I longed to be able to go out freely in the open air, to flee any where, without plan, without end, only onward and far away into the darkness! Now I could not leave the room for a little while without some one wondering why I could not bear to be with them all. On the third evening Caroline came home earlier than usual from the Union, and entered the room with the exclamation, “Only think! Clement is dangerously ill!”

“Who told you so? What is the matter with him?” inquired my mother.

“The war minister himself told me. He has bled at the lungs.”

“When did it happen?” asked my mother.

“Three days ago,” replied Caroline. “He went home from the minister’s summer residence, and was immediately attacked. They say he is very ill indeed.” She burst into tears, and I sat speechless and tearless. “There is no happiness for me in this world,” said she, weeping yet more violently. My mother suggested as hopeful a view of the case as she could, and left the room. As soon as the door was closed Caroline started from the sofa, clasped her arms around my

neck, and said, “Julie, you are kind. Do me the greatest favor one human being can do to another, and I will thank you as long as I live. I must—I will see him.”

“You!” cried I; “you want to see Clement?”

“Do not wonder at me, but help me; you can help me. You must see your husband’s adopted son. Go, and take me with you. Mother must go with us. It will be a kindness to him, and you will be giving more than life to me.”

Terrible was my internal struggle. Ought I to comply? How readily would I have done it! Ought I to see him again, when he had bid me good-by forever? I wavered for a long time; but at last I said, “I will beg mother to go to him, and you can accompany her.”

“But why should I go,” cried she, “and the wife of his foster-father not think it proper to visit him? Who will make allowance for my love?”

One word from me, and I should see him once more. How natural for me to visit him under my mother’s protection! The struggle was a hard one, but this time the sentiment of duty triumphed. Assuming a composure I was far from feeling, I said, “Do not regard me as unsympathizing, Caroline, but my visit can do the poor man no good. Three persons are too many for a call in a chamber of sickness. It will be sufficient for you and mother to go.”

When my mother came back into the room I begged her as a favor to me to visit the invalid. She had already thought of going herself, and it did not require much persuasion to get her to take Caroline with her. I fully believed that Clement would die, and I felt that this was the punishment for my guilt. For the first time in my life, although brought up strictly as a Calvinist, I knelt down and prayed. Philosophy may reject, if it will, the last and highest refuge of weakness and sorrow when they turn to the All-wise and All-powerful for help, consolation, and strength, but in that hour I found what it was to pray. When my mother returned I was calm and strong. She represented his case as not a hopeless one, and told me that, as Schlichting had not been informed of the event, she had retired into the adjoining room in order to write to him. Caroline sat silent during this narration, but as soon as mother had left the room, turned to me with the question, “And you have not once inquired whether he has not sent to you, his benefactor’s wife, any message?”

“I was thinking only of his imminent danger,” answered I.

“Julie!” cried my sister, “why do you make a secret of it to me? Do you think that I am so blind as not to have read your heart?”

I was too terror-stricken to speak. My silence was a confession.

She drew me toward her, and said, "Do you know now what I have suffered?"

I did not understand exactly what she meant, but I felt so greatly the need of relieving my heart that I shed copious tears in her embrace. It was the first time that we had come so near to each other.

"Do you know," she asked, "how much I pitied you when all the rest were so full of joy at your marriage?" And again she said, as at that time, "Poor, poor child!" Then she added, "And what would become of you if Clement returned this love?"

I asked her, whisperingly, "What has Clement said to you?"

"Said?" repeated she. "What was the need of his saying any thing to me? The very first time he came to the house I felt how well we understood each other. He loved me—I see it clearly now—and I live, hope in, and love him in return." Then throwing herself on my breast, she cried, "Forgive me for thus disclosing to you my happiness, my sad happiness, when you must be so hopeless and resigned; but I have suffered so much and so long!"

I was lost in a maze as she went on to tell how she had noticed my growing love, and how she had regarded my endeavors to bring her and Clement together as the result of his express wishes; how all he had said about the inexpediency of a poor man marrying a rich woman had been a proof to her that he did not confess his love because he would not draw her into what he considered an ill-advised match.

"The whole day long," continued she, in the highest excitement, "I had been thinking how I should see him one moment alone; and when I had lost all hope, God himself, I believe, put it into mother's mind to go and write to Schlichting. When she had left the room I gave him my hand. 'I thought you would come,' said he—that Heaven would not grudge me this consolation."

"'Consolation?' I asked. 'What do you need to be consoled for? You will get well, and—you are truly loved!' I could not help saying as much as this, but I did not dream Clement would be so deeply affected. Raising both hands over his head as if in ecstatic devotion, he said, 'O God! this will I be worthy of; I will be worthy of it! Tell—' But just then mother came in, and he broke off. But he held me by the hand, and when we took leave he pressed it passionately to his lips, and said again, so that I alone could hear, 'I will be worthy of it!'"

What could I say? Clement had evidently looked upon my sister as the silent and sympathizing confidante of my unhappy love, and thought that I had sent her to console him. How could I undeceive Caroline? Days passed, and Clement steadily gained

strength and health. But after he had recovered we heard nothing from him, and Caroline could learn nothing of him at the Union, which she visited every day. At last came a letter from Clement to my mother, in which he wrote that he had gone to Feldingen, an estate of my husband's, where his presence was required. Several weeks passed, and we heard nothing further. The overseer at Feldingen wrote that he had not been there, and Schlichting inquired anxiously about him. At last we settled down in the conviction, which Caroline was the first to express, that he had gone to join the army. She confided to an intimate friend at the Union this supposition, relating to her the last interview with him, and his repeated exclamation that he would be worthy of her love. To prove one's love in this way was wholly in the spirit of the time.

In a few days every one was speaking of Clement's love to Caroline, and of his secret departure because he was afraid that we should hinder him from going, as he had promised Schlichting not to enlist. Caroline was every where spoken of as Clement's betrothed, and she called herself so without our being able to say that it was only in her own imagination. This was of no great consequence, I thought, for I had the conviction that Clement would never return. The poet's words continually recurred to me, "'Tis said he wished to die." I wanted him to live, and it seemed to me that we could be dead to each other without his bodily death. My silence and reserve now seemed to me an injustice toward him and toward Schlichting. My inconsiderate confession had driven him away, and my honest confession should restore him to his protector and to life. I sat down and wrote the whole night, pouring out my whole heart to my husband. A few weeks after came a letter from him, directed not to me but to my mother. She went into her room to read it, and when she came back her eyes were swollen with weeping, and her face very pale. Clement had fallen at Kulm.

Two weeks before I received a letter from my husband in reply to that in which I had confessed my attachment to Clement, and the writing of which I had a thousand times repented since his death, my dear mother died. Weighed down with grief, it was with a heavy heart that I opened this letter, for it was to decide my future fate. He wrote: "Where such a sacrifice has been made, and such an atonement offered, there is no farther judgment to be pronounced. I have nothing to complain of, my poor dear child, except the unfortunate illusion which led me, on the impulse of the moment, to believe that I could secure your happiness according to my own plans. I can not restore to you the tenderest of mothers, nor the noble youth, the chosen one of your heart, with whom you

would have been happy if I had not stepped between you. But I promise that you shall find rest at my side, and the love of a father and a friend, if I am permitted to return home."

I need not say how much this letter calmed and moved me, and how sincerely grateful I felt. I was now entirely alone, for Caroline had made a journey into Bohemia for her health, accompanied by her friend of the Union; and meeting there a brother of the latter, who had been wounded at Töplitz, she had felt it to be her duty, as she said, to devote her life to the defender of his country.

At last the army made its triumphal entrance into Berlin. I saw from the window of a friend's house the troops file by; I saw the noble form of Schlichting at the head of his battalion. But with all my feeling of joy there was mingled the painful thought that this was my husband. I had known what it was to love, and my heart and my understanding had both matured during the period of separation. I hastened home to receive Schlichting, and stood there in my mourning garments amidst garlands and flowers, with my heart in deeper mourning than my clothes. It was a strange, sad meeting. He hardly knew me; I had grown much taller. He had left me a merry child by the side of a loving mother in the paternal house, and he found me a silent, pale, solitary woman, in a new and strange place. All this so removed me from him that he met me with a reserved formality which disturbed my composure. We had nothing to say. My husband placed his arm around me, and I kissed his hand. At last he broke the painful silence by saying, "How much we have lost, you and I, my poor child!" Then I began to weep, and the tears refreshed my soul.

But the first days were days of painful constraint for me and for him, notwithstanding all his consoling kindness. Not until I had opened to him my whole heart, not until I had revealed to him all its sadness, was all constraint removed. As a father he took me to his heart, as a kind father he cherished me at his side, and helped me gain fresh strength and a renewed life.

After a few weeks we went into the country. He healed my wounded spirit; he unfolded and formed my understanding; he taught me that the fountain of peaceful content is in the heart. He accustomed me to ask, What have I done, what have I to claim, that so many blessings should crown my existence, while millions are without them? He led me to love duty, to be usefully employed in household matters; and for what I have been and what I am I may thank his wise, true love. Gradually the noble, grand character of my husband shone in upon my soul, and I came to value and to

love him as he deserved to be loved. I was his true and happy wife as long as he lived. I was thirty years old when he died; and as I look back upon the past I bless the hour of my youth when I married him, and I thank him for all, even the sufferings of my earlier years.

Since his death I have lived according to his views and after his thought. I owe it to him that I do not look at events in their individual isolation, but take a broader view of the connections and compensations of all the various relations of life, so that at every moment I endeavor to accomplish its work, and fill it out with love, because the hour comes when we can no longer work or love. To live and to love because life is so short, this was his wisdom. May it be my guiding light in the later and perchance not so beautiful days of my advancing age!

Here ended Aunt Julie's manuscript. It was written two years before her death, and she might have truly said that she was faithful to her husband's principle even to the last hour. May the remembrance of her goodness ever remain fresh in our hearts!

POND-LILIES.

By MARGARET E. SANGSTER.

In early morning, when the air
Is full of tender prophecy,
And rose-hue faint and pearl-mist fair
Are hints of splendor yet to be,

The lilies open. Gleaming white,
Their fluted cups like onyx shine,
And golden-hearted in the light,
They hold the summer's rarest wine.

Ah, love, what mornings thou and I
Once idly drifted through, afloat
Among the lilies, with the sky
Cloud-curtained o'er our tiny boat!

Noon climbed apace with ardent feet;
The goblets shut whose honey-dew
Was overbrimmed with subtle sweet
While yet the silver dawn was new.

The pomp of royal crowning lay
On daisied field and dimpling dell,
And on the blue hills far away
In dazzling waves the glory fell.

And flashing to our measured stroke,
The waters seemed a path of gems,
Beneath whose clear refraction broke
A grove with mirrored fronds and stems.

In music on the sparkling shore
The plashing ripples fell asleep;
We laid aside the dripping oar,
For one delight we could not keep.

In all the splendor farther on
We missed the morning's maiden blush;
The soft expectancy was gone,
The brooding haze, the trembling flush.

THE REPUBLICAN MOVEMENT IN EUROPE.*

By EMILIO CASTELAR.

[Twelfth Paper.]

III.—THE GERMANIC PEOPLES.—(Continued.)

RELIGIOUS IDEAS.—I.

WE have often said in the course of this series that the religious movement transcends the political movement in Germany more than in any other nation. We, accustomed of old to the indifference rooted in the mind of races which profess but one form of worship, and voluntarily or by force support only one religion, having received with cold indifference the discussions in regard to the authority of the Council which declared the dogma of the immaculate conception of Mary, and in regard to the nature of the new article added to the ancient faith relative to the infallibility of the pope—we, who in our resolute belief can as easily add a miracle as take one away from the list of our miracles, or a saint more or less from the calendar of our saints, can not comprehend nor explain how the Germanic races, and especially their Protestant branches, who read and comment upon the religious books almost forbidden to our humility, can excite themselves to the point of fanaticism over the version or interpretation of certain verses of the Bible, about the period in which different chapters of the Gospel were written and published, over belief in free-will or in grace—questions not even discussed in our schools of theology, which submit their judgment to the unquestionable verdict of tradition, and their instruction to the infallible authority of the Church.

But when we consider the influence which religion has exerted upon the life of these peoples, we may comprehend the political importance always attained there by ideas and problems, scarcely supported by our faith of routine in the secluded and luminous sphere of religion and morals. Religion has formed that interior intimate spirit, peculiar to the Germanic races, which isolate themselves severely in their own consciences, and which create and strengthen in this manner the capital principle of their politics, the principle of personality. In spite of all the efforts of philosophers, it is as yet impossible to separate virtue from theological dogmas in practical and in political life. Above our sentiments, above our reason, even above our fancy, extends, like the sky above our brows, the mysterious idea of the Infinite, of the Eternal, through which, after all, the purest human desires have their being, and from which descend inspiration upon the arts, light upon the sciences, the hope of immortality upon this short and fragile life. But

the relation of the finite with the infinite is not the principal characteristic of the religious idea. Its virtue, its creative force, extend to social relations and to political laws. As Plotinus said that every soul creates and carves a body in its own image, we can say that every people tend to form for themselves, in their religion and in their creeds, a soul in harmony with their temperament, their composition, and their history. The Hebrew people see arising in the immense desert on their march from Egypt to the promised land, like the sun of their conscience, the one foreseeing God, who guides them with His column of fire, and feeds them with His rain of manna; and in captivity, when the lash of tyranny falls upon their shoulders, and the dark flow of an alien river runs at their feet, under the willows of exile, to the echoes of the mournful harp, springs forth Messianism, the religion of hope, which other races are to accept and complete. When the Grecian people wrested from nature the idea of the individual city, heir of the antique empires and mother of the future democracies, they carved and moulded the gods coming from the East, and raised in them, in their radiant beauty, the image of man to Olympus. Thus the Egyptian rises on the African continent, between the European peoples and the Asiatic, the middle term of the great syllogism of universal history, the priest who reveals to Greece the mysteries of the Orient, who preserves in his theogony the Magian worship, the light, the soul of Oriental regions, and warms and shelters the germ of Hellenic polytheism, the soul of the Eastern religions. His religion appears the religion of death and of immortality, his sepulchres cities of ideas raised between the confines of two worlds, his mummies the Eastern gods fallen from their altars dead at the feet of their theocracies, embalmed and preserved by mysterious philters, to be resuscitated in Western lands, in Greece, in Sicily, in Italy, by the conjuration of orators, poets, and philosophers. The Semitic cities of Mesopotamia, Nineveh, Babylon, capitals of the Chaldean tribes which traversed the desert with eyes fixed on the heavens, have for their gods the stars, for dogmas the principles essential to their new-born astronomy, for the universal intelligence which pervades and directs the universe the eternal effluence of increased light. Our most ancient progenitors, the Aryans, bore already, in the vague beginnings of their earliest days, in the initial letters of their primitive hymns, the same gods which the Greeks and the Latins were soon to

* Continued from the November number, 1873.

adore in their cities, the Germans and the Solaves in their forests. Heaven and earth; the stars which were lost in the abysses of space, and the sands which vanished in the depths of the sea; the lofty mountains and the clouds which gird them, and the rivers which gush from their feet; the waves which swell crowned with diadems of foam, and the winds which rush unchained amidst the perpetual palpitations of the green waters of ocean; the ether with its resplendent hues, and the air with its winds and zephyrs; the rosy flush of dawn and the mysterious reflex of twilight—all that lives in immensity, all that exists in the infinite, becomes peopled with the differing gods, the souls of things; like Savitar, the producer of life and organisms, who will become the Saturn of the ancient Latins; Añi, the principle of life, the universal heat, the fiery element which cherishes the universe, and which in the course of time is to be Hephestos in Athens and Vesta in Rome; like Indra, which in the far East is the lightning flash, and which in the West is the thundering father, Jupiter; like Varomna, which is the sky, stretched first above the Himalaya and the Ganges, and afterward Uranus, the sky arched over Hybla and the Piræus; like Muntar, the mother-land of the Medes and Persians, Modon, the earth of the Anglo-Saxons, Hertha, the earth of the Germans; as if all the sons of the same Aryan race, in all the extension of time, desired to live and die in the bosom of the goddess, where all had their cradle and all shall have their grave.

And if all ancient peoples, primitive peoples, have adhered to the religion, whether created or accepted by them, which was most in harmony with their character, have not modern peoples in their maturity dispensed with this, and taken from religions only their creed and their morality? No. One dogma, one morality, constitute essentially Christianity. To call one's self justly a Christian, it is necessary to believe in God and his providence; in the redemption of the original sin through the merits of Christ our Saviour; in the spiritual nature and immortality of the human soul; in eternal rewards and punishments after death. It might be believed that there were no possible variations in regard to these fundamental beliefs. And nevertheless every people, every distinct race of Europe, has adapted Christianity to its own character and history.

The Greeks built up a holy city about their seas in opposition to the holy city of the Latins, and there they founded a Church, which has, like the race whose spirit nourished it, a character rather metaphysical than moral—a Church which held the great Ecumenical Councils, the assemblies which constituted our essential dogmas, governing itself through ecclesiastical confederations—sou-

venir of the Amphictyonic Leagues in Greece. The Romans, the great Unitarians of history, carried their unity into the Church; the dogma sacred; the discipline and the liturgy one as much as possible; a pope-king like the ancient emperor-pontiff on the throne of the Eternal City; its prefects and its prætors reproduced in the archbishops and bishops; the Senate in the Conclave; its prestige in the city least Christian and most idolatrous of the ancient world, which would fain preserve its dominion over souls after it had lost its dominion over nations—all which proves that Catholicism is the Roman Empire, and, like the Roman Empire, raises through the dogma of infallibility its Cæsars to gods.

And before our very eyes, in the latest ages of Christianity, the same phenomenon is repeated in all nations. The Spanish people, which is among all the moderns the crusader *par excellence*, fighting for seven centuries against the infidels, and when this work was over, bearing the cross, supported by the sword, to the New World, professes a Catholicism exalted, fanatical, bloody, intolerant as war. The French people, a middle term between the Germanic and Latin races, builds up a Church, a middle term between Protestantism and Catholicism, the Gallican Church, which went so far as to provoke in its highest personification, in Bossuet, an anathema of the pope.

In all the phenomena of the religious revolution in England may be noted the same phenomena of its political revolution. The Anglo-Saxons can no more avoid the Protestant religion than they can avoid liberal politics. An individualist race, they must embrace an individualist religion, and they must serve as a promontory of this religion on the seas. But the incidental cause of the conversion of England was the will and the passion of a king, who wished to establish a formidable authority upon the powerful unity of his kingdom. The hereditary principle of monarchies contradicted in part the thought and purpose of the two great Protestant sovereigns, Henry VIII. and Elizabeth. The first left his throne to Mary, who bore in her veins the blood of the founders of the Inquisition in Spain; and the second to the Stuarts, who were allied to the Guises, the butchers of the Protestants in France. Thus the official English Protestantism had a monarchical and aristocratic character, resembling more the ancient Catholic Church than the other sects of the same branch—the episcopal Protestantism, with tendencies to establish a sort of Britannic papacy similar to that of Rome. When you enter the great cathedral of St. Paul's at London, you at once see a disposition of chapels like the chapels of our churches, showing that the prince who founded it, while his name was inscribed on

the official registers of Protestantism, remained at heart devoted to the dogmas of the Catholic Church. For the sake of the hereditary principle of monarchy England would have returned to the bosom of the Catholic Church had it not been for the opposition of the nation, which felt in its veins the blood of its race, in its conscience the idea of individuality, and in its heart the evangelical sentiment and instinct. Thus the different religious parties were at the same time political parties. The Presbyterians were opposed to the royal predominance in government and to the episcopacy in the Church. The Independents were devoted to the rights of Parliament in their fullest extent, and to religious liberty in all its purity. Cromwell represents the liberal principle in religion and the republican principle in politics, but both, established in authority and in dictatorship, as far removed from the semi-Catholic Episcopal Church as from the levelers and other extremists, the demagogues of religion and politics.

And that which took place in England is seen with greater reason in Switzerland. The chief of the Reformation there is at the same time the chief of a great democracy. The Protestants may number Zwinglius among their apostles and their teachers; we, who are democrats, liberals, republicans, number him among our great tribunes, our heroes and martyrs. Born in the great mountains, which speak of God and of the Infinite; nursed in the bosom of nature, his intelligence nourished by great ideas and his body by wholesome food; mingling with the blood of his heart the purest affections, and with the breath of his lungs the purest air; leading a rustic life in his earliest years; of a temperament robust as the rude and sublime Alpine country; going to sleep throughout his boyhood at the hour when the flocks were folded and the twilight was falling, to wake at the call of the cock, when the sky-larks were taking their flight, and the hope of a new day was awaking in the first flush of morning which whitened the horizon; near to heaven and far from the world, like the mountain birds, his soul bathed in the divine as a star in ether, he preserved in the battles of life the candor of the shepherds, in the labors and innovations of reform a love of tradition, in the midst of cities the aroma of the eglantine and the song of the thrush, amidst the wrath of men and of parties the infinite charity of the air and of the light, free to all beings; and after having conversed with philosophers and saints, drinking at the sacred fountain of Plato and the bitter tears of Job, singing the psalms of David and the odes of Pindar, as if all the currents of the human spirit flowed to pour themselves in his own, he reduced the most abstract ideas to commonplace max-

ims, to scatter them among the people he loved in sermons and prayers. He was a hero in battle, a Sister of Charity in the hospitals, a tribune in the public place, a priest in the temple, every where an apostle. One of those great characters who vary and turn with the breath of their thought, with the force of their will, the currents of time, he died in the battle for truth, in the purifying embrace of a holy martyrdom.

And his reform was born and grew and developed in the midst of a democracy, a republic, a liberty ancient and deep-rooted, partaking of the character of the medium in which it grew, and marching resolutely forward to modify and improve it. Less opposed and less persecuted than other reformers, he appears much more serene. His reform springs from the conscience rather than from passion, and relies more upon reason than upon sentiment. Without breaking so openly as his coadjutors in the common work with the pope and the Church, he restricts himself solely to what he finds expressly set down in the Scriptures. He is an orator, and in his oratory there is more of philosophic light than of the fire of the tribune. He is a priest who preaches grace, and who distinguishes himself by the charity and the grandeur of his acts, who prays and works. The logic of his arguments does not damage the subtlety of his system, nor the force of reasoning the eloquence of his discourses. He is confronted by less opposition, and consequently fights with less revolutionary energy, than other innovators. It is plain that his individual soul is a part of the soul of a great democracy; that his inner education has flowed from the two great schools of nature and society, the country and the republic. His work is at once religious and political. He preaches the merits of Christ, and exalts the rights of every Christian; he tears from his heart the ancient theocratic faith with the same power with which he tears from the earth the feudal traditions. He speaks of the Lord's Supper as of a religious and a democratic communion; he disseminates at the same time a hatred of spiritual tyranny and a hatred of the reactionary aristocracies, and with the revolution against Roman cosmopolitanism, a worship of the Swiss fatherland. He reforms the understanding and the morals. He demands that the priests shall cease to carry souls to the sacrifice before the altars of an unquestionable authority, and that the Swiss shall cease to sell the blood of their dearest children to the armies of pitiless despots, that the cradle of human nature shall not become a pedestal of monarchical tyranny. His doctrine, in fact, is a religion and a republic, the immortal soul of Switzerland, regenerated by this archer of ideas, this soldier of logic, this William Tell of the spirit, who exalts above the ma-

terial nation another more lofty and more enduring than the eternal Alps, the ideal nation of the conscience.

Wherever there appears a great social aspiration, it is impelled or followed by a great religious aspiration. The gay city of Geneva, which was to found the new morality of the modern democratic world, needed, to keep it from falling into the claws of the eagle of Savoy, its covetous and rapacious neighbor, a severe and austere religion, which should renovate society with its doctrines, which should by its discipline subject character to a salutary yoke, which should, on the one hand, touch the lofty summits of theology, and, on the other, the deep perils of politics. It found all this in a stoic youth, French in origin, German in thought, a great writer, as befitted a literary city, a theologian of the school of St. Paul and St. Augustine, a lawyer who united to the most abstract conceptions of metaphysics the clearest notion of right. Widely different have been the judgments passed upon this great man. He has been even accused of fatalism by a narrow criticism, which wastes itself in minute details, and can not see the general effect of great human works. But when we remember that, as theologian and magistrate, he gave democratic discipline to the new idea, and civil and republican character to the new society; that, thanks to this ideal, he created a powerful party even in England against the authoritative tendency and the aristocratic hierarchy of English Protestantism; that when this party was persecuted by priests and kings, it went forth from its troubled homes, from its ungrateful country, spread itself through Switzerland and through Holland, with the word of the new faith on its lips, with its heart and conscience filled with sentiment and idea, ready always to sacrifice life for its doctrine; that a large fragment of this party, embarking on the *Mayflower*, intrusted themselves to the sea, as Moses to the desert, crossed the ocean with the Bible in their hands and Christian equality in their hearts, and founded on the virgin soil of the New World the temple of persecuted conscience, and the government of despised democracy, liberty, and the republic, the glory of America and the hope of Europe—when we remember this grand epic of human progress we forget all the defects of Calvin, all the inconsistencies which he may have committed even against the principle of religious emancipation, and we see him on the lofty heights of history among the redeemers of humanity, shrined in the immortal light of luminous and human ideas.

II.

From this wide excursion through history we learn the truth of the thesis: Every people, every race, every nation, creates or ac-

cepts the religious ideal most in harmony with its political and social tendencies. The Reformation, therefore, is the necessary, the national religion of the German race. The intimate character of this race is individual independence; its historical character is hatred to Rome. The dark forests of Germany, whose air was filled with sinister noises, and whose soil was traversed by wild fires, gave birth to those early invaders who, dying in the infected fields, envenomed with the exhalations of their corpses the skies of Italy. The first hero of the race is that Herrmann who conquered with his huntsman's snares and weapons the legions of Varus, annihilated in the forests of Teutoburg, and desperately mourned in the palace of Augustus. The lips of the young barbarian were learning the Latin speech; on his fingers sparkled the ring of the Roman cavalier; perhaps he did not even comprehend the idea of patriotism; but he sharpened his sword on the stone altars of his gods, and drew it against Rome. The German world, through whose discords he was slain at thirty-five years of age, counts him among its founders and its heroes. If the Germans had no other reasons for this apotheosis, there would be enough in the sufferings inflicted by Rome upon the family of Herrmann: the recollection of his wife, whom he gained by the sword, in captivity and exile; of his son, begotten to continue the lustre of his name, born in exile, and thrown into the sewer of Ravenna, among the gladiators, who, with their combats, wounds, agony, and death, amused the leisure of the Romans.

For four centuries, the first four of our history, the contest lasted between Germany and Rome. Tacitus saw no hope for the threatened Eternal City, except in the discords of her cruel enemies. But the barriers of the Rhine and the Danube were broken at last, the discords ceased, and the German race satiated its hatred in the ruins of Rome. Even the dead awoke from the ashes of the Forum, according to the Roman traditions, and went forth, although pagans, to battle in the clouds, in company with the Christian saints, against the enemies of Rome. But these, like the exterminating angels of the Apocalypse, scattered to the four winds, with their lances vast as comets, the ashes of the venerated mother city of the Latins. Attila, who in our chronicles is the Scourge of God, because he destroyed the Roman Empire, and despoiled the barbarous races that they might bury it, is in the national poems of Germany the epic king, to whom Roman blood is more grateful than wine; for hatred to Rome is the national sentiment of Germany.

But, prodigious city! broken, conquered, killed, deprived of its legions on earth and its gods in heaven, its walls in the dust, its temples in ruins, still it is rejuvenated and

transformed. It places on the vacant throne of the Cæsars the pontiffs. It substitutes armies of penitents for the armies of heroes; the forgotten tables of law it replaces with the prayers of its sanctified doctors; and by means of new dogmas, borrowed from Greece, from Alexandria, from Africa, from Asia, it first claims and then establishes a dominion such as it never possessed in antiquity—a dominion over souls. The Germans received the water of baptism on their brows, the monastery in their cities, the cross in their by-ways and in their forests, bishops in their provinces, Latin in their schools; and a German, a descendant of Genseric and of Alaric, Charlemagne, sustains the doctrine of papal predominance—which means the predominance of Rome—and goes on his knees to receive, over the ruins of the great city, upon his forehead, anointed with Catholic oil, the ancient splendid crown of the Roman Empire. Against this spiritual dominion, which embraces art and science, life and death, the whole German world could do nothing—neither the sword of Herrmann, nor the memory of the sombre and victorious Odin, nor the heavy hammer of Thor, nor the priests gathered in caverns abandoned by the wolves, nor the slopes of the magic mountain of Hartz peopled with sanguinary traditions, nor the orgies of the heights of the Brocken, whither troop in summer nights the queens of the witches, with their mantles like wings of bats, nor the tireless hunters who ride in their giddy round, sounding their shrill bugles eternally, nor the gods who breathe in the winds and wander in the clouds, nor the misty mythology which vanishes in the rays of the new spiritual sun rising over the altars of Rome.

During all the Middle Ages the German Empire struggled powerfully against Rome, but without arising to that spiritual sphere whence descended the light and air of life. Only there, in the distant and lofty region of ideas, lay the true combat and the prize of victory. To destroy modern Rome, it was necessary first to destroy its dogmas. And to destroy the dogma of Latin universality, it was impossible to find another antithesis so radical and profound as the dogma of Germanic individuality. In society, as in nature, the true principles of unity and variety ought to co-exist harmoniously. But they were at that time divided. The German principle was active and prominent in the Renaissance against the Latin principle, as in the time of Otho, of Henry IV., and Frederick II. There came, therefore, necessarily and logically, the foundation of religious nationality in Germany by an outburst of its conscience. The man who rose at this historic moment to represent faithfully the state of the human spirit was Luther. In his humble cradle and in his modest educa-

tion he learned to feel and suffer with the people. Son of a laboring man, a miner, there was in his nature something of the strength and vigor of his father. He was a student from his earliest years, and to provide for his subsistence and to continue at school he gained his bread by singing from door to door. Walking one day in his boyhood with a friend, they were surprised by a tempest, and a flash of lightning laid his comrade dead at his feet. He was so moved by this event that he embraced the religion and assumed the habit of the Augustines. Among them he learned the dogma of grace, which, coming from St. Paul, is extended and affirmed in St. Augustine, broadened and exaggerated in Luther. From the convent he went to Rome, with a mind ready for adoration and prayer on bended knees in the ashes of martyrs, with eyes fixed on the soil of religious authority. When he came in sight of Rome his limbs trembled, his heart fluttered, his hands were joined; he fell in ecstasy before its innumerable domes, and prayed for the benediction of its spirit. So Herrmann was once a Roman cavalier. But when he was in Rome all the soul of his race awoke within him, the genius of his predecessors entered into his stout heart, and the timid youth became a fiery Alaric, longing to sack the city which had hunted Germans for gladiators for their bloody holidays, and had bound them as living trophies to their war chariots in their triumphal processions. At the same time that this warlike spirit awoke in his mind there breathed through his fancy, as it were, a breath of lyric inspiration. He fought and he sung. He composed the choral which whole peoples have repeated, and wrote the invectives which destroyed Christian unity. He denied indulgences, the efficacy of works and offerings, the authority of the pope and of the ancient Church. In continual contests, in the midst of the most powerful enemies, surrounded by the generals of Charles V. at Worms, he persevered until he founded, by the energy of his will and the skilled logic of his ideas, the new nationality of Germany—the nationality which was to be the sanctuary of the emancipated conscience. From Luther came the German language, transformed in his controversies and his Propaganda; from Luther the German science, for all its greatest philosophers belonged to the Protestant branch, and all derived their systems from liberty of conscience. Luther converted the humble Marquis of Brandenburg into King of Prussia, and the King of Prussia into the Emperor of Germany, who has banished the shade of the Spanish Empire in expelling Austria from the confederation, and destroyed the basis of the papacy by taking away from it the city of Rome and the temporal power. Do we not see, therefore, all the importance which the re-

ligious movement has in the political movement of Germany?

Even to-day Prince Bismarck, after having conquered Austria and France, the two Catholic powers, concentrates his most vigorous efforts upon the purpose of fighting Catholicism. Far from aiming at the separation of church and state, which the Anglo-Saxon peoples of the New World have so admirably succeeded in incorporating in their laws and customs, he aims at an omnipotent Cæsarism, in which there is danger of merging the rights of the human conscience, and with them the vitality and glory of Germany. War with Catholicism is the soul of Prussian policy. The Catholics complain that the million of dollars belonging to the secret funds, and the income of the private fortune of the dethroned King of Hanover, and the surplus of the appropriation made for the annexation of Alsace and Lorraine, a surplus amounting to about twenty millions of dollars, are all employed in hiring enemies to the Church of Rome. The dogma of infallibility has been contested, denied, placed in a sort of civil interdict, in contempt of those sound principles which counsel separation of all coercive force from questions of religion and church discipline. This conduct surprised the persecuted Catholics all the more because they expected, even after the war, from certain words contained in the opening speech to the Chambers, and certain visits of the Bishop of Breslau, that above the crown of the new empire would be placed the ancient white dove of the days of Charlemagne, and that the sword, aggrandized in so many victories, might be placed at the service of the popes.

But in the heart of Germany the antipathy to Austria and to France was kept alive and burning by a greater antipathy to the Roman Church. Since Sedan, all the world has seen that the temporal power was lost; and since the moment in which the dogma of infallibility was declared, all the world has likewise seen that Germany was moving onward toward a new schism. And this schism was encouraged by the new-born political power in Versailles, as Lutheranism was encouraged in its beginning by the Elector of Saxony. The great theologian of Munich, to whom the Catholic Church was so much indebted, became chief of the dissenting sect, who called themselves Old Catholics, as the Protestants called themselves the old and true Christians. The new empire did all it could in their favor and against those who admitted the papal infallibility. An ordinance was promulgated full of fines and penalties against the unduly exalted and fanatical preachers. When the pope issued his complaint in an encyclical against the empire, the liberal and ultramontane papers which copied that document were seized. The hand of the gov-

ernment entered the seminaries and managed the religious instruction through the official. The ministry of worship declared that without important modifications the life of the Catholic Church could not continue in Imperial Germany. The clergy, who were very independent of civil authority, depended upon a foreign potentate, who was completely ignorant of the needs and national aspirations of Germany. The lower clergy appeared especially dangerous in the positions where they had been left through an indifference which amounted to blind thoughtlessness. And now that a radical change was taking place in their relations, as they were attacking certain articles of the constitution, it became necessary to examine with the greatest care the critical problem.

Proceeding afterward upon this view, they obliged the clergy to go through the course of the second grade of instruction in the public schools, and to receive three years of theological training in the official universities; to pass examinations presided over by government authority; to submit to close surveillance in the schools, in their churches, and to give guarantees of their zeal for the public good; to fill vacant benefices within a fixed time and fixed limits; to annul all contracts between ecclesiastical superiors and inferiors made in disregard of the civil laws; to admit in their jurisdiction and their penalties processes foreign and sometimes contrary to the canonical procedure; to accept the intervention of ordinary judges in religious trials; to revise, in tribunals named for this purpose, all titles to church dignities—in short, to change from a hitherto independent clergy to functionaries completely subject to the imperial authority.

The Jesuits were expelled in spite of the great respect and little fear which the great Frederick had for them. The bishops who protested were persecuted, fined, and imprisoned. The faithful saw themselves constrained to receive the sacraments from hands which they did not believe pure, and to bend the knee before Catholics whom they considered not orthodox. The matter of infallibility was discussed in academies, pulpits, taverns, and clubs, and was the cause of profound dissensions in the court of the emperor, in ministerial councils, and of noisy scandals and disturbances in the streets. Bismarck appears like those emperors of Byzantium overbearing the councils by the declaration of a dogma, or the caliphs of Cordova regulating the relations between their Christian vassals and their clergy. It is doubtless gratifying to pride to enter like a god into the sanctuary of the human conscience with the word of authority in hand, but, alas! one never violates with impunity the nature of our being, nor attacks with impunity the sanctity of right.

III.

If the schools of philosophy, defining and making clear the idea of right, have contributed to the political and republican movement in Germany, in how much higher degree have the religious schools contributed! It is an effect of our imperfect political and social organization that scientific thought remains in the higher regions of society, in schools, among the privileged souls which have acquired some intellectual culture, while religion embraces life and death, bears in itself the consolation of innumerable griefs, the encouragement of countless hopes. It illuminates every thing, from the heaven of art to the hearth-stone, from the hearth-stone to the sepulchre, kindling at once the heart and the brain, the will and the intelligence, time and eternity.

Religious wars are over. The human race no longer goes to battle for the real presence in the communion, for free-will or grace, for the divinity or the humanity of Christ. But religious controversies are not done with, nor ever will be, while there exist in the world those who bend the knee before sacred altars, and, to learn the meaning of existence and its possibilities, give up their souls to the holy temple, which floats, like the ark of Noah, in a deluge of tears. In every political question there is contained, to-day as well as yesterday, a religious question. The Extreme Right of the Assembly at Versailles does not so much struggle to subject the nation to the authority of the king as to subject intelligence to the yoke of the historic faith, and the Extreme Left does not so much fight for the republic and democracy as for the independence of thought and the reign of reason. The Liberal ministry has fallen in Great Britain, and its fall is due, more than to any other cause, to questions relating to the church and to education—questions of religion. Italy defeated Austria, which forbade her integrity, and France, which retained her capital; she captured the holy empire and the Quadrilateral; conquered by force, she has triumphed by policy; yet she can not take the Vatican nor touch the pope, disarmed, old, and a prisoner, because that involves an immense religious question. Our green northern mountains run with blood; the thunder of the cannon and the roar of the Cantabrian coasts, mingled with the savage cries of war, rise to an implacable and angry heaven. The fire, slaughter, rapine, and ruin are easily explained, for our ancient intolerance is fighting there with our new religious liberty. Every time the question of the East is awakened rise with it, as in the time of the Crusades, Jerusalem, the capital of the Christian world, Constantinople, the capital of the Greek world—questions of discipline, of dogma, of orthodoxy. The Cretan opposes to the Turkish oppressor his right and his

God; the Pole of Warsaw to the Russian of Moscow his independence and his doctrine; the Bohemian moves the bones of John Huss and Jerome of Prague to remind the emperors of Austria that he has sworn to avenge them. In little Switzerland the Sonderbund was a religious matter, and in little Belgium liberals and Catholics fight for power. Bismarck, who did not tremble before the veteran armies of France, trembles before the clergy of the pope. In every political question which is alive to-day upon this old continent there is a most important religious question, something having relation to faith and dogma.

Perhaps they themselves were unconscious of it, but in discussing religious problems, interpreting the Bible, confronting the commentary of the Church with the commentary of reason, examining if the book of Job was Hebrew or Arab, if the book of Judith was anterior or posterior to Christianity—in all these questions, which so faintly concern the problems of our time, the German theologians were storing up torrents of revolutionary electricity, which were to fall in thunder and lightning upon the heads of a generation which, abandoning the old altars at whose feet they had been born and reared, abandoned with equal force and violence, without knowing exactly why, their ancient kings and their worm-eaten thrones.

We have said it before: the eighteenth century is one of the greatest ages of human history. There are unquestionably in the development of the life of our race decisive epochs of an influence more powerful than other epochs, in which the human race appears to have rested from its labors and fatigues. In modern history the ages which, in my opinion, have an exceptional importance are the first century, the fifth century, the thirteenth century, the space comprised in the second half of the fifteenth century and the first half of the sixteenth, and, perhaps more important than all others, the revolutionary century *par excellence*, the eighteenth.

In the first century Christianity and the empire were founded. The idea of man which Athens had constructed, the idea of humanity which Rome had formed, the idea of God which Jerusalem had formed, the idea of the Word which Alexandria had invented—all these ideas are united by the apostles and the martyrs in the conscience, by the philosophers in the reason, by stoicism and the stoic emperors, who stand like gigantic statues in those great times, in the Roman law. Thus arises a new society, that upon it may descend the life of a new spirit.

In the fourth century the unity of the Roman world is broken. The variety and the personality of modern times appear with the first invasions of the barbarians. Pagan Rome is dispossessed of her time-hon-

ored prestige, and the Constantinople of the Christians is founded which is to continue the work of Jerusalem and Alexandria. The federalism of the new-born nationalities opposes itself to the despotic authority of the historic Cæsars. The gods whom Julian revived with a magic but ineffectual philter fall dead at the feet of an obscure Laborer, born in a stable of the people, and who died on a cross among slaves to become the God of future democracies. The Council of Nice, which understood all the perils embraced in the premature heresy of Arius, promulgates the symbol of the Christian faith, and proclaims the divinity of Christ, that He might recover the rule of the world escaping from the disarmed hands of Jupiter, and educate the races which are advancing, hungry and rapacious. The bishops persecuted by Diocletian return, thanks to the rescripts of Constantine, with the marks of martyrdom on their mutilated bodies, to replace the material unity destroyed by the eternal human unity. Modern labor is founded, which creates and produces, by the side of war, which crushes and annihilates. While the heavens are darkened and the fields are flooded in blood, and the torch and sword of the barbarian shine ominously every where, in that terrible time when Amianus, the envoy of Valens, could not count the Goths who were crossing from the other side of the Danube to the empire, St. Augustine, after having saved human liberty from the Manicheans and Divine Providence from the Pelagians, rears in the air the City of God as a province of peace and progress, as a refuge for lost hope.

The tenth century is a century of horror. The idea of the imminent destruction of the world has seized and prostrated Europe in penitence. The world shudders and wavers like a ship beaten by the tempest. All space is tinged with sanguinary reflections, because beyond them comes the angry Judge of the living and the dead, at whose breath the heavens shall roll together like parchment, and worlds shall be scattered like ashes. The whole universe is the nest of death. Labor is suspended. Men only want a shroud. Kings and emperors knock at the gates of cloisters, anxious to exchange their crowns for cowls. The spade falls from the hands of peasants. A horrible pest dries up the blood, and converts live bodies into pustulous sores. The famine is so great that the living dig up the dead for food. The devil takes the place of God; he sits at the ear of kings; he rises to the throne of the Spirit beside the popes. In the air there resounds only the song announcing the Divine wrath; from the earth only the prayer begging mercy and pity. The ignorant world has such an idea of time that many imagine the millennium arrived, and fear that they shall hear resounding in the air the shrill trumpet of

the angel calling the quick and the dead to judgment. But it did not sound, and theocratic feudalism was conquered. The historic panic of humanity died away. Man began to feel the life poured through nature, and his soul fraternized with hope. Paralytic Europe recovered its activity. It rose from its cloisters, casting its shroud away, and went forth to the Orient, the land of miracles, in search of the sepulchre of tradition, to find the cradle of liberty, and to bring the first appearance of democracy into modern history.

In the thirteenth century the testament of Catholicism is written. The Gothic cathedrals are its testament in architecture; the pictures of Cimabue its testament in painting; the Divine Comedy of Dante its testament in poetry; the Sum of Theology of St. Thomas its testament in science; the Seven Parties which unite the Roman jurisprudence with the ecclesiastical, just as the doctors unite the fathers of the Church with Aristotle, are its testament in law; and the two great popes, Innocent III. and Gregory X., wrote with incredible efforts its testament in policy. The thirteenth century is at once the Bible and the universal Gospel of Catholicism. It is reconstructed, resumed, synthesized, because it has arrived at the term of its ideal. Since that critical day all the efforts which humanity makes in its onward journey withdraw it from that ideal, and for this reason the endeavor of Catholicism is to return to the thirteenth century. Return to the Gothic, say its architects; return to artistic mysticism, say its pre-Raphaelite painters; return to the Dantesque poetry, say its poets; return to the Sum, say its philosophers; return to the Parties, say its lawyers; return to the policy of Innocent III., say the most exalted Catholics.

But this will not be possible, because now comes the century of the Renaissance, the second half of the fifteenth century, the first half of the sixteenth. Nature assumed an incredible fecundity. Great men were born as never before, never since, of such lofty quality or in such number. The breath of the Divine Spirit had passed over the face of the human spirit. The soul of modern Europe is due to that creative day. God sends his revealers to the earth in legions. Gutenberg assures perpetuity to the book, the rapidity of light to ideas, the endless propagation of species in nature to the children of genius in the spirit, with a rude alphabet of lead, and a simple machinery of pressure. Erasmus laughs with his immortal laugh at the mystic and monastic follies of the expiring Middle Ages. Hutten turns his pen into a sword, which sweeps away the monsters and enchantments by which superstition had kept the understanding infirm. Luther vindicates the freedom of the human conscience. Ramus and Vives bury

scholasticism, the false theological Aristotelianism, and summon thought to a close communion with nature, and a profound study of itself. Paracelsus finds the true philosopher's stone, the principle of chemical science. Vesalius reveals the secrets of organism in anatomy. Porta recognizes the properties of concave and convex mirrors in the phenomena of vision, and prepares the telescope. Gilbert discovers the properties of magnetic bodies; Cardan the laws of equations of the second, third, and fourth degree, and the double nature of unknown quantities; Paliassy, the Magian potter, the beginnings of geology, the treasures of the fossils; Servet the pulmonary circulation of our blood; Copernicus the modern astronomy, which gives a new movement to this planet, hitherto thought motionless, and makes the eternal and the infinite visible, palpable, experimental. Marcilio Ficino awakes in the gardens of Florence the soul of Greece, evoking it with the divine speech of Plato. Brunelleschi crowns the Christian cathedrals with Roman temples, raised on high in marvelous and audacious rotundas. Leo X. revives from the dust the fragments of antiquity, and exalts them in Catholic apotheoses. Leonardo da Vinci finds the secret of perfect form, and Cellini animates with it marble and bronze, gold and silver. Raphael, Phidias of the pencil, paints the serene Greek beauty in his angels and his virgins. Michael Angelo reaches the sublime in his choruses of Alades, prophets, sibyls. Titian bathes the human form, sanctified and redeemed, in seas of light, in heavens of innumerable colors. Ariosto replaces the sombre dreams of Dante with gay and cheerful visions. Camoens writes the *Iliad* of navigation and labor. Shakspeare describes the very depths of human nature. Cervantes extends the laugh of Erasmus against the Middle Ages, which had not yet passed from the lips of the intellectual aristocracy, to all classes, to all peoples, to all masses. Meanwhile heaven is illumined, the spirit is regenerated, and the human form gains strength and beauty. Vasco da Gama finds the extreme East, the forgotten land of the sunrise, the theatre of the past. Columbus discovers the far West, the unknown land of the sunset. Magellan traverses the southernmost point of America, enters victoriously the Pacific Ocean, and shows Sebastian del Cano the way to go for the first time around the globe; so that heavens, suns, worlds, nature, and conscience are revealed in all their splendor, take on new colors, as if to celebrate with a divine intoxication of life and ideas the birth of liberty.

If the sixteenth century created liberty of conscience, the eighteenth century created the liberty of reason. In this sense it is less poetical, but grander, than the sixteenth century. And through its charac-

ter, its tendencies, and its ideal, Germany begins in the eighteenth century the great religious movement which is to exert as much and as important influence in politics as the philosophical movement, but with a very essential difference; that is to say, that while the philosophical movement remains isolated in schools, and only through successive derivations reaches politics, the religious movement animates, inflames, and agitates the heart of the masses. The eighteenth century is an age of reason and practical sense; an age which disperses the Jesuits and brings together the philosophers; in which councils are succeeded by assemblies and conventions; in which the rights of man are at once proclaimed in America by the United States, and in Europe by France.

VENUS.

A BIOGRAPHICAL SKETCH.

ONE glorious evening in October a little caravan might have been seen toiling up a steep hill in the vicinity of New York; said caravan consisting of a furniture truck filled with the personal property of Professor Douglass, and a wagon, containing his wife, a young friend of the family, Alexander M'Shane, and a quantity of loose articles too numerous to mention.

The professor had gone on ahead with his daughter Madeline.

Mrs. Douglass glanced nervously at the heterogeneous mass of familiar articles piled up before them, and, sighing heavily, looked at her companion.

"If only Madeline has put a few things away out of that first load, Aleck," she said, wistfully — "got out the tea-kettle, you know, and wiped off a few cups and saucers! I'd so like to have a cup of tea for the professor!"

Aleck turned upon the poor lady so loving a smile, so bright and cheery withal, that it lighted up his plain face wonderfully.

"That will be all right, Mrs. D.," he said. "We'll have up that stove in the twinkling of an eye, and we'll make those old cups and saucers jump. I had an eye on the tea-caddy myself; and before you know where you are the professor shall have a cup of tea that'll make his hair stand on end. As to Maddie, you know, we can't expect her to bother with these things."

Mrs. Douglass was silent a while; then she turned her sad brown eyes upon Aleck.

"It's a great change for Madeline," she said, "a very great change. She's been used to so much excitement, adulation, and amusement, I don't know how she'll get on; but it was all we could do. You see, it was ruinous living in the city; the rent was so high, and there were so many incidental expenses, and the professor's sight becoming impaired,

he has not yet made up his mind how to place himself."

Aleck listened as respectfully as if he had been a condensed drawing-room of afternoon callers; but Mrs. Douglass at last came back to the consciousness that she was not talking to Mrs. Grundy, but only to poor Aleck M'Shane.

"It was all we could do, Aleck," she repeated; "we should have starved in that great hungry city."

"Oh no, Mrs. D.," cried Aleck, hastily; "not quite; no, indeed. I assure you I'm a humble individual in my way, but I could have kept the wolf from the door with this red right hand of mine."

He flourished the puny, bloodless hand of a city clerk in the air, and Mrs. Douglass laughed, and put her hand lovingly on his shoulder.

"You're such a good fellow," she said; "it's a pity you should waste your life here dangling after Madeline. She's so spoiled you can never tell whether she cares for you or not; and I'm sure, the way we're situated now, I don't see why you should sacrifice—"

"Ah, Mrs. Douglass," cried Aleck, "it is the situation now that has the charm for me. Maddie, being dencedly lofty, has given all her purse-proud friends the slip; the fiat has gone forth that neither rich nor great shall be allowed to enter our humble domicile, and sneer at its unfrescoed walls. I may thank the good Goddess of Poverty for the privilege of sharing your retirement."

A turn in the road here brought the cottage in view, and they found Madeline enthroned upon a pile of mattresses upon the porch, and the professor botanizing in a neighboring field.

"What a lovely view we've got!" said Madeline. "I've been hoping you'd get here before the light leaves the shores yonder; it was wonderfully beautiful an hour or so ago, but it's been fading gradually ever since. There's only a remnant of its glory left. Come and look at it while it lasts."

"I'd be delighted," said Aleck, "but I'm in a deuce of a hurry just now to get up the kitchen stove. Just persuade it to stay till the fire's lighted, and some cups and saucers washed, and the tea put to draw, and I'll be on hand."

Aleck followed Mrs. Douglass to the kitchen. When he got back to the porch his hands were rather sooty, and a broad black bar rested on his nose; but it had grown too dark for Madeline to see these imperfections, and she was persuaded to go in and have a cup of the tea that was warming the heart of the professor.

The next morning Aleck jumped out of bed at sunrise, and ran down the stairs two steps at a time. He had determined that the old kitchen, which had looked rather cavernous and gloomy the night before,

should greet its poor tired mistress with a welcoming fire. What was his surprise, his horror, to find Madeline standing in a helpless attitude upon the hearth-stone?

"Why, Maddie," he gasped, "what's up? You're never awake at this hour!"

"But I mean to be," said Madeline, turning upon him savagely. "Do you think I'm made up of selfishness and greediness and meanness, that I will let poor mamma toil like a slave while I lie at ease in my bed? I mean to get up every morning and do the work, and all that sort of thing, only I don't know what to do or where to begin." Here her voice faltered. "I think it would be so much better, Aleck, if we were all dead!"

"O Lord! no, Maddie," said Aleck, collecting all the loose sticks from the packing, and making a blaze upon the hearth. "Oh no. You'll think better of it yourself presently. There are capabilities in this old house that don't shine out on the surface. Here's this old fire-place, for instance—you don't see this sort of thing in a modern dwelling. All it wants is wood, plenty of it."

"An expensive luxury," sneered Madeline. "How are we to buy it?"

"Bless your soul, Maddie! we don't want to buy it. The common kind of wood that can be bought wouldn't suit us at all. I'll tell you what it is," pursued Aleck, "I didn't waste all my admiration upon the scenery as I came along; I left that for brighter eyes and handsomer ones to enjoy. I was prospecting, Maddie—keeping an eye out for the main chance—and really it seems like Providence. You know, people are building, and pulling up trees, and the lots hereabouts are filled with huge boulders of wood. Just the thing for us, you see, to surreptitiously cause these boulders to disappear from their present abiding-places, to tumble them over and over till they reach our premises, then to lever them into that capacious fire-place, and inserting a few precious pine knots under them, cause a tremendous blaze to radiate the darkest corner of this old kitchen; all this, Maddie, will be my delight

"Of a shiny night
In the season of the year!"

Madeline condescended to smile, the kettle began to boil, a sunbeam stole in at the window, and shone upon the newly swept floor. When Mrs. Douglass came down, breakfast was smoking upon the table.

"Why, Madeline," she cried, in surprise, "and Aleck! I thought you were both asleep."

"Madeline says you're to be a lady," said Aleck, "and she's to be Cinderella."

"And you the prince, perhaps," said the good lady, with happy tears in her eyes.

A fortnight afterward Madeline, becoming disgusted with rural joys, declared again to Aleck that it was her settled conviction it would be better if they were all dead.

"If a body had any thing to amuse one—even a parrot would do," she added, "or a monkey!"

"I'll bring you home a parrot to-day," said Aleck, hastily devouring his breakfast.

"A white one, please," said his tyrant, languidly.

"Certainly—any color you like," said Aleck, and strode away to the store.

But Aleck did not know what a rare avis a white parrot was. Leaving it till after business hours, he went down in search of parrots, and found that such a thing as a nice white one was not to be had for love or money; the green ones were dilapidated, belligerent, and profane; so he went home pondering over the awkwardness of persuading Madeline that even this miserable little request was an inordinate one. He thought of his love for her, and the hopelessness of his ever having money enough to offer himself to Madeline, even if she'd have him, which she wouldn't; of that horrible tread-mill of a store that was devouring him body and soul; and whether he hadn't better go to South America and find his uncle; when suddenly he heard a low, whining cry. It was so human and so piteous that Aleck stood still and listened. It came from the direction of the wharf, and was repeated again and again, till Aleck made his way to the very verge of the rotten old piles, and discovered that one of them had been dislodged, and in falling had caught and pinned fast the little leg of a Scotch terrier, that had no doubt come to grief in the pursuit of rats. It was a good hour's work to extricate the leg from its captivity, and when it was taken out, the question was whether it was worth the trouble, for it hung loose and limp, all bloody and bruised, and was evidently broken in two places. Aleck turned a little sick, and held the dog over the water a minute, thinking it best to drop it in and let it drown at once and be rid of its misery. But it was so plucky, never making a moan from the time it heard Aleck's voice, and now it looked in his face so honestly and touchingly, and so Scotch withal, that Aleck's heart warmed to it, and he had the bravery to take this poor dirty maimed little creature home to Madeline instead of the white parrot.

"It's a compound fracture," said the professor, who had studied surgery in his youth. "The creature is in such a state of emaciation and weakness I don't think it can live; but if you'll hold it, Aleck, I'll set the bones and do what I can for it." But Aleck's hand trembled, and an awkward faintness came over him. Mrs. Douglass had long since left the scene, and it remained for Madeline to help her father in this delicate and difficult operation. Aleck held the candle instead of the dog, and at such an angle that the hot grease was in danger of dripping on the poor little victim, and the poor professor was

thankful that his sense of touch was so gentle and accurate. Aleck's head was turned with the piteous extremity of the dog, and the wondrous beauty of Madeline, as her lithe, supple form bent over the lap of the professor, her white fingers held firmly but caressingly the shattered leg, and her radiant eyes, filled with the first tears Aleck had ever seen therein, shone down upon the little sufferer with subdued yet glowing splendor.

"If I thought she'd look upon me in that way," thought Aleck, "I'd go out immediately and splinter my leg in a dozen places."

But all Madeline's sympathy and affection were lavished on the dog; it became the pet of the household; and because it was so undeniably ugly, they called it Venus.

Aleck had certainly saved its life by digging it out of the débris of the wharf, but this would have been useless without the skill of the professor in setting the broken bones, and the professor could have done nothing without Madeline's help, and when all was done, the dog wouldn't have lived if Mrs. Douglass had not come to the rescue with her coddling soups and delicacies; so it became a house-that-Jack-built matter of gratitude with Venus, and she loved each and all of them with a limitless devotion.

A long, sad winter closed in upon the professor's family, and Aleck saw many more tears in Madeline's beautiful eyes. Mrs. Douglass's face wore a look of anxiety akin to despair, and each and all suffered alone, not daring to whisper to each other, or even to themselves, the awful calamity that threatened them.

Only one of them had courage to approach the professor when at times his head sank upon his breast, and his soul shrank from the pitiless thoughts that assailed him. Always in the bitterest of these moments a cold soft substance insinuated itself into the drooping hand of the professor, and turning, he found it the nose of Venus.

Only the professor knew, and he scarcely dared own to himself, the inestimable value of the dog as she cuddled close to his feet day by day, half guiding the footsteps that grew more and more distrustful of confidence.

Oh, the misery of getting skillful with the sense of touch, the bitterness of finding the face of his wife growing dim and indistinct to him—a hazy veil spreading itself between him and the eyes of his daughter!

Harder and harder became the strain upon his wasted sight as he toiled over the heap of manuscript in his laboratory—many a prayer escaped his lips that he might get his work into shape before the end came.

"You see," he said one day to Aleck, upon whom he had called for help in an experiment, "if the book can be published, it will be valuable in its way; there is in it the patient work of a lifetime."

And at that moment the awkward hand of Aleck jogged the professor's arm, and out of his grasp upon the table dropped the jar of dissolving acids, which liquid rapidly and effectually licked up and effaced sheet after sheet of the precious script, while Aleck and the professor, powerless to save, looked on in a horror that partook of petrification. An ashy quiver trembled upon the professor's lips. "The work of a lifetime!" he murmured.

"And you can't—" gasped Aleck. Then he remembered all. The blood mounted up into Aleck's head, he became mad for a moment, and seizing the heavy crucible, would have dashed out his brains, had not the strong arms of the professor compassed him about.

"Be comforted," he said. "God is above us all!" But poor Aleck rushed out of the laboratory in hot haste to Mrs. Douglass and Madeline, crying, "I've ruined us all, every one of us. I'm going to find my uncle, and if I make a fortune, you'll see me again; if not, good-by forever!" He took Mrs. Douglass in his arms and kissed her over and over again, but only once did he stoop and touch the white brow of Madeline. As for Venus, she had gone to the professor. Then Aleck went from the hearth-stone of the little cottage, and it saw him no more from that day.

Deprived of Aleck's cheery boulders, the hearth-stone grew cavernous and cold, the low black rafters, no longer echoing his merry quip and jest, hung ponderously low over the drooping heads of the little family.

Days and weeks and months wore by, and not a word came from Aleck.

"The nasty sea has swallowed him up," said Mrs. Douglass.

"Heaven forefend!" said the professor.

But Madeline cried out that he had forgotten them all. And I wish she could have seen Aleck when she said that cruel word—seen him and looked into his heart, as he galloped over the Southern plain, his tawny hair hanging long upon his shoulders, a Mexican saddle beneath him blazing with jewels, his long shanks half covered with embroidered leggings, his sombrero hat, and his silver spurs! And this gay cavalier, who would have delighted her eyes, was as loyal as when of yore he belonged to her body and soul. His head was full of schemes for making money so fast that he could fly in search of her, and his heart full of bitterness for her seeming cruelty and neglect; for he had written twice, and even thrice. He had tried them each and all—Madeline, Mrs. Douglass, and the professor—and he was half tempted to invoke the gods in behalf of Venus, for he had gotten no answer, not one.

How could he? His uncle, whose moral education had been sadly neglected, abstracted each of those letters from the mail-

bag, and after reading them, with considerable interest and appreciation, had touched them to the blaze of his cigar, and watched them fall into ashes upon the broad veranda.

"The lad is clean daft," he said, shrewdly, "and a word from this quean would lure him away just when I want him the most."

As the second winter was closing in, affairs at the cottage wore an ominous look, for the professor's sight became but a glimmer, and Madeline, going over to town one day, tricked out with the old splendor, looking as grand and queenly as when her poor father sailed on the tide of prosperity, caused a profound sigh to well up from the heart of her poor mother, and with it the wish that Madeline was a trifle less lofty in style, so that the situation would be less incongruous.

But Madeline returned at eventide with a glow on her face that rivaled that in the western sky.

"Congratulate me, mamma!" she cried. "I've been to see Madame Chappelle."

"Not to order a new dress, surely?" cried the poor lady.

"No, dear," replied Madeline, "but to seek for a situation. They've been dissatisfied ever so long with that homely young woman in the show-room; they want a figure like mine there, mamma—tall and graceful and statuesque. I'm not to prick my dainty fingers with a needle, only wear out all my good clothes in receiving visitors and taking orders. And we must get to the city, mamma: it is, after all, a great sheltering old pile for the poor. They herd in there together, and the houses close about them, the streets and alleys hedge them in, and they get comfortably lost from sight in the great surging crowd of humanity. The moment an impecunious family ventures toward the suburbs, a melancholy conspicuousness marks them for its own, and they become the mere puppets of a malignant notoriety. And oh, mamma, don't cry, please don't, for, now that I can do something, I shall be so happy!"

So in an amazingly short time the professor's family became part and parcel of that vague but powerful class known as the working mass of the metropolis. And, in God's good providence, even the professor was inspired to take a stand on a down-town sidewalk, for the sale of spectacles and optical auxiliaries of various kinds, Venus guiding him to and fro, keeping a sharp eye upon passing pedestrians, and watching the sales warily. The sad Homeric face of the professor and the sharp fidelity of Venus becoming one of the landmarks in the vicinity, they were treated with the success and respect their various excellences merited.

So the years went by, and in course of time Madeline's capacity for business developed, and it became a specialty of hers to manage the bridal toilet in a manner mar-

velous to behold, to loop the veil and arrange the orange blossoms, to drape the train, and deftly pin the over-skirt so that every curve of the Honiton or point should be seen to advantage—all in such a way that the somewhat faded charms of many a passée bride bloomed out for that once with a brilliancy that perhaps made the sudden and irremediable collapse all the more painful to those interested.

At evening parties and stately balls Madeline was in such demand that it became a great favor to secure her undivided attention, and anxious mammas begged for the loan of her magical touch with tears of eagerness and entreaty.

In the mean while Madeline's cheeks grew less rounded, her brilliant color waned, her face lost its perfect oval, and the great, wistful, melancholy eyes shone from it like load-stars in distress. There were weary hours for poor Mrs. Douglass, and bitter tears shed, and sighs and regrets unspeakable; but these were in secret, where no eye could see, save those of Venus perhaps, whose lugubrious sympathy was always close at hand. "To think, Venus," sighed the poor lady, "that she was once the prettiest of them all, and fit for any nabob in the land!"

"Boo-hoo!" whimpered Venus, with so lamentable a sniff that Mrs. Douglass fell to laughing, and forgot her griefs for the moment.

One morning Madeline was sent for to assist in the invention of a toilet for one of the belles of the season. This young lady had apparently succeeded in ensnaring one of the matrimonial prizes then in the market, and to bring the chase to a successful conclusion a grand ball was to be given by the anxious mamma. The tempting trophy was in the reception-room, making a morning call.

"For you see, Miss Douglass," said the mamma to Madeline, who was taking a brief advantage of the capacious dining-table for the cutting out of material, "he has all his time to himself, and nothing to do but kill it the best he can (it would be much better to graduate the puffs on the train). He has millions of cattle on the plains (put all the fullness in the panier, I think), and sends all that sticky material here for rubber overshoes (I'd cut it low on the shoulders), with a diamond mine all to himself in Brazil—"

Here the door opened, and the daughter entered with a graceful step, but thunder on her brow, for the piercing whisper of her mamma had penetrated to her ears, and she had caught a few of those chaotic sentences. Perhaps some of them had reached her companion, for he glanced with an amused smile after her through the open door, and a pair of big wistful eyes looked into his just for one second; then the door was closed. But Aleck started up—for of course it was he—

and looked about him in bewilderment. The amused smile gave place to a flush of eagerness, a wild yearning.

"Who was that within?" he cried to his fair companion, when she came back to him.

"Only mamma," she replied.

"There was somebody else," he said. "Those eyes never belonged to your mother!"

Whereupon the young lady became coldly reticent, and resisted all further entreaty. Aleck, sighing heavily, bade her good-morning.

"What a fool I am!" he murmured, as he took the reins from the hands of his groom, "always looking for the needle in the haystack. The eyes weren't like Maddie's, after all; too hollow and sad;" and casting his own upon the sidewalk, he saw a figure emerge from a side door of the house he had left. The face was veiled, but the form was pliant and graceful, and the walk was like—yes, certainly like Maddie's. He drew up his horses for a moment, stared wildly after the receding figure; saw it get into a stage and vanish; then cursed his stupidity for letting it escape.

"But I can't," growled Aleck, "rush up to every woman I meet, and tear the veil from her face. I can't break through doors in strange houses to look after familiar eyes. What in the name of Heaven am I to do?"

At supper that night Madeline told her mamma that she had seen that day the Grand Sultan whose handkerchief was in such demand.

"He isn't so very bad-looking, mamma. He wears his hair long, and his eyes are eager enough to dart through a deal plank. He watched me till I got into a stage to get rid of him."

"Was he insolent?" said Mrs. Douglass, hastily.

"No, no," said Madeline; "only I think he thought he had seen me before."

Her cheeks glowed with the old vermilion; her eyes shone with the old splendor, and she ate not a mouthful—not one.

But she was called no more to assist in the toilet for the ball, nor did she get one other glimpse of those eager eyes. She heard of him often and in various ways. At last, when the season was at its close, she learned that the matrimonial prize had escaped the grasp of all those eager competitors, and was about to sail to Brazil to look after his estates.

The one bit of news consoled her for the other. She would rather hear of his going to Brazil than getting married. There was something in the latter probability unbearably bitter; and as to the other, it was better, perhaps, that he should be lost to her sight and hearing, for the mere mention of his name had become a matter of nervous anxiety to her of late.

The fact was, Aleck had really taken passage in the big steamer that was rapidly lading for the voyage south. He had grown so tired of looking at handsome faces and following graceful forms, only to be disappointed and baffled to the verge of madness, that only that night he declared to a friend, with whom he was walking to his hotel, that not even *Venus* herself could tempt him further, when suddenly a little dog snapped the chain that bound him to a blind man, and rushed upon Aleck, squealing and whining, every stubby hair on end with very joy.

"Why, it is *Venus* herself!" cried Aleck, catching her in his arms, and gazing with delirious ecstasy upon the broken chain that in some vague but tempting way led straight to Madeline.

His friend, having no experience with the canine race, and a deadly horror of hydrophobia, went rapidly across the street, and waved a cordial good-by to Aleck.

"We'll meet at the hotel at dinner," he added.

But Aleck did not dine at the hotel that evening. Finding that *Venus*, after the first greeting, would not remain in his arms, but struggled to the pavement again, and, uttering a short, sharp cry, started off on a trot, Aleck followed her as best he could through highways and by-ways, under the poles of carts and the noses of horses. At last she turned down a dingy street, and ran straight along till she reached a little rickety two-story building, up the rotten stairs of which she clambered, and scratched twice with her paw at the closed door on the landing.

"God be praised," cried the voice of the professor within; "it is *Venus*!" and a clatter of joyous feet hastened to the door.

Aleck fell back and gasped for breath as it opened and a young woman stooped upon the threshold to caress the dog. She was in the full light of a dusty sunbeam that struggled through the casement. She was worn, she was wasted; all the brilliancy and glow of her old beauty were gone; but, oh! oh! she was Madeline!

Finding a big form looming over her, she looked up and saw Aleck, with the old yearning love in his eyes—heard him falter out her name. A blue pallor spread over her face; she clutched the landing for support.

"Mamma," she said, "here is Aleck M'Shane. I think I'm going to faint."

Then Aleck's tongue was loosed. He got down on his knees in the dingy corridor, and held out to Madeline his trembling hands.

"Don't faint, Maddie!" he said; "don't, for God's sake, do any thing as cruel as that, when I've just found you, after thinking the earth had opened and swallowed you all, and the fortune my uncle left me would be of no use, after all, to any of us. For I warn you if we don't go down there and take care of it straightway, it'll disappear like the

snow-flakes yonder. The India rubber'll melt, the herds gallop off, the diamonds hide in the wool of the seekers, the stocks go down to zero, and I'll be the poor devil again you used to despise!"

"Despise!" echoed Madeline, tears of joy, of humility, of gratitude, of love, falling on his outstretched hands. Aleck kissed them away with rapture, and looked up at a white, wonder-stricken face bending over them both.

"If you'll let me take supper with you to-night, Mrs. D.," he said, "it'll help me to believe in the reality of the thing. I'd be fit to cut my throat if I awoke and found all this a dream."

Then he turned to the professor.

"Could you find it in your heart, Sir," he said, touching reverently the professor's hand, "to go with me to Brazil? As God is my judge, I believe that your advice and presence there will save me from ruin. It is plain to be seen, Sir, that the dog was sent to me."

"Yes, yes," said the professor, "by a higher power."

It was a more frugal meal than ever again was set before them, but I don't remember a happier one.

As for *Venus*, she sleeps now on a Persian rug, wears an immense diamond on her stubby tail, and fares sumptuously every day; but stretched that night on some straw in the corner, she tasted the rare felicity that is given sometimes to the humblest agent of God.

THE GOLDEN CITY.

IT must be fully three years ago that I looked for the last time upon the brown and purple hills that flank the dark red light-house of Shinnecock Bay. I had bid a curt farewell to my native village of Southampton; had seen the bare Shinnecock hills, rich with so many a mellow hue, sink below the eastern horizon; canoe on back, had trudged across the portage at Quogue, to find at last, after fourteen hours' work, the Great South Bay opening out smooth and limitless in the light of the fallen sun.

The boat grated softly against an inner beach of the sands that shut, in grassed or wooded succession, the sadness of the Atlantic from the placid bay. As the shadows of the earth wheeled upward to the zenith, broad even sheets of darkness were dropping every moment quicker on the path I had trod. No place was left for hope except among the glories that lay radiant as the houses of the gods about my goal.

Chance had it that just there I gazed for the last time upon the Golden City. Never before had it started into such reality. The gold was pure, the dwellings those of over-earthly beings. On every tower gleamed its

silver battlements, and waved its banners in royal pride. Surely along its streets the passers could not be otherwise than joyful and majestic, the houses stately and magnificent.

It mattered little then that I, friendless and without kin, was merely a hired man bringing to its owner through the chain of bays the paper canoe that, with delicate curving prow, lay like a feather upon the shallow at my feet. I had my hopes. I was shaking off a slough, hastening to a new, an active life, in the greatest city of the land.

The singular experiences of that night and the following days have remained clearly cut in my remembrance. These I wish to relate.

It was early spring. As the magnificence of the Golden City faded the last crows flew cawing to the arms that old and stunted pines writhed from sheltered nooks along the coast. The uncouth form of a cormorant passed with quicker beat up and overhead to choose night quarters further east. Then the sudden hoarse bark of a heron startled me from the chill that had begun to lay an unnoticed grasp upon its houseless guest. I had been lost in thinking how easy a thing it looked to sail up the horizon to those joyous walls. Between them and the clear wave at my feet was there not an open road?

The scanty drift-wood half buried in the sands furnished exercise and at last a fire. When, having sparingly supped, I crept below the overturned canoe, sleep floated me out in a moment from the main-land of reality.

Yes, this was in truth that Golden City I had seen so often far away. I was in it, and face to face with its inhabitants, whose beauty and nobleness of bearing fancy had not exaggerated. A brilliant race, of fine torsos, whose lithe, well-knit frames supported solid heads, moved about on solid feet; a rosy people, quick-eyed, courteous, full of energy and slow fire; each hard at work with a blithe will. How awkward and dull was I by contrast! But they showed no heed of my imperfections. Therefore, taking heart, I resolved that I too should soon become as beautiful and polished as they. Ah! I sighed, it will be long before I can rival even drivers here in good manners.

Glowing with delight, I strolled on. Aromatic perfumes shed themselves over certain streets, where flowers and vines were cultivated in and about the houses; the freshest odors of cleanliness arose from dwellings plainly of the poorer class. In the grander ways enormous masses of gold and marble, cunningly proportioned, shot proudly up, each a miracle of beauty and good taste.

Into the open doors of one of these I ventured. Every thing within was in perfect

keeping with the exterior; the minutest object, the rear walls, were as elaborately wrought and adorned as the fronts. On a half-completed building thoughtful workmen hurried their work as if they loved it.

Buildings were like the race that raised them, beautiful without and within.

Upon the quays, where clean and civil stevedores were singing at their work, the sailors lounged in genial groups. I saw them now and then lend a hand when any thing called for assistance. Nor were there any idle inspectors or watchmen to be seen; the merchant knew he could trust to his workman's honor.

Crossing the broad clean street that lay between a stately row of warehouses and the water, I looked in at a merchant's office. It was a charming scene of comfort and geniality. A number of bright-faced clerks were busy at desks, wonders of convenience, and among them, like a father surrounded by his children, sat the head of the firm.

His was not a hard, calculating face, but plainly that of a warm-hearted friend and instructor. Rising at that moment, and stepping to one of his clerks, he proceeded to show him why he thought it better to buy coffee at the present market price. To this end the two consulted books, and did some calculating. Another clerk, much interested, begged to be allowed to listen. The merchant referred to former accounts and the most private books of the firm.

"When you set up for yourself," I heard him say, "this point will be of great value to you."

It was only necessary to look at the clerks to see they loved him.

I must have presented an unprepossessing look at the door; but the merchant bowed in the kindest way.

"Enter, Sir, enter. I see you are a stranger. Is there any thing in which I can be of service?"

The most timid would have been emboldened by such a greeting. I went in. I told him I wanted employment, and was encouraged to say that a place in his establishment was a piece of luck I had hardly hoped to meet.

Naturally too bashful to mention salary, my embarrassment was relieved.

"I make it a rule to pay low at first," he said, "at least until I can form an opinion of my clerk; but of course you will have enough to live on comfortably," mentioning what to my mind was a little fortune. "You will doubtless wish to see a little more of the city before you settle down to work. I will give you a letter to an old friend of mine who has had bad luck in business. He will take good care of you."

This was a merchant who had lost his fortune, and, too proud to allow his friends to reinstate him, took boarders in his family

until he had recovered. As I was a stranger, my new friend walked a little way with me.

The business houses were marvels of comfort and stability; their credit was on a par with their architecture. Such a thing as an embezzlement of funds, he informed me, had not occurred for years. The business men retire as soon as they have amassed a respectable fortune, and devote themselves to literary and scientific pursuits, or such employment as each one likes. An immense fortune was a thing hardly known. It had been found that many moderate wealths made a better community, and fostered great financial undertakings better. Thus it happened that young men never inherited an overgrown fortune, but for some years at least were compelled to work. Most of those who could afford it lived permanently in the country; a few passed the winter in the city, but the transportation was so swift and convenient that a man could have both city and country within fifteen minutes of each other.

Other surprises delighted me as I left my friendly employer and journeyed alone into the town. The carriage I used was roomy and elegantly furnished. It contained a dozen handsome chairs that fitted the figure. By touching a spring the back sank, and a foot-rest arose to form a lounge more or less reclining as one wished. It was an unfailing pleasure to lean back and watch through plate-glass windows the handsome passers, noting the while the wonderful effects in architecture. For the buildings, like the people again, seemed to harmonize one with the other. There was no overcrowding of one edifice by the other; each was built with subtle regard to the needs of its neighbors, so that all fitted into harmonious groups.

The gentleman who asked my fare in an apologetic tone surprised me by asking the smallest known coin for all this luxury. I entered into conversation with him. He gave me a ticket to a debate and lecture by members of a conductors' club to which he belonged; the picture of his club might have been that of a palace. He also informed me that the driver, who guided his beasts entirely by the voice, was president of a great society for the promotion of kindness to animals. But that of which he seemed the proudest was the fact that a member of his club had originated an association to afford relief to certain Northern and Eastern cities cursed with drunkenness. Great success had been obtained in the worst hot-bed of the vice. When he called this town Boason I struggled hard with memory to place the name.

If I had felt embarrassed at meeting my employer, what was my awkwardness at being ushered by a little fairy into a lofty drawing-room, and seeing a beautiful lady advance from between two folding-doors?

But she had in a still greater degree the high-bred calm, the cultured interest, that quiets and attracts. The soft rustle of her simple but peculiar robe had hardly ceased when I was already feeling for her all the respectful adoration my mother might have won, had she been spared me in such radiant shape.

With an enthusiasm bordering on religion I kissed the smooth hand she held out to mine.

"Madam," I said, "you see before you a rude country boy, who would give part of his life if he could make your house his home; I am rough, but I can learn to be more worthy of a place at your table and citizenship in this wonderful city. I know you will assist me with your motherly advice; the gratitude will be the pleasantest sentiment in my after-life."

She looked with large clear eyes into mine. "My son, you are thrice welcome."

Perhaps it was due to my feeling of utter inferiority, but I never felt more than the most respectful adoration for the daughters of my hostess. It is nothing to say they were lovely. Loveliness was so common in the Golden City that, had it not been for the great variety, beauty would have lost its effect. As it was, the tendency was to turn attention to character rather than looks.

Not seldom I plied my hostess with questions. "How is it," I once inquired, when she had refused a frank, handsome visitor the permission to take one of her daughters to the opera—"how is it that in so advanced a city two pure and wise young people can not go to a public entertainment alone?"

"My dear boy," she answered, "it is not exactly a violation of proprieties, but persons in our position can not be too careful. Besides, Angelica has been rather neglectful of late of her lessons in matrimonial science, and the professor must not find her unprepared."

I looked over at the slender Angelica talking joyously with her manly admirer in the light of a chandelier, and marveled at house-keeping in connection with her.

"Greek, you mean?" said I.

"Oh no! Greek she pursues without need of a push. But the æsthetic side of domestic life is too subtle for a young girl to grasp readily; whereas Sappho, for instance, whom I hope you too will some day read, is only too readily devoured by an imaginative girl."

Supposing very naturally that my hostess's family was an unusual specimen of high breeding, I entered with some anxiety the drawing-rooms of a friend of the family who gave a ball. The invitations had been informal, but every one was elegantly dressed. This elegance I found was partly simplicity and partly the variety of a good taste, which effected what it chose with the commonest material.

Visions of loveliness passed in light or earnest converse with admiring cavaliers, but among them all I caught not one envious look, nor did I overhear one ill-natured remark. The radiant daughters of the Golden City seemed to have many things to talk about. Books and music formed the staple; wit and happy retort sparkled here and there in a careless gayety which was never impure. Sometimes a couple would become involved in an earnest discussion on some more serious or abstruse topic, but in almost every case an elder member of the party would laughingly interrupt, and remind them of what was fitting to the occasion.

In dancing I noticed that the women were not seized by the waist after the coarse practice usual at our rustic balls; only the hands touched, while the figure was free to take as graceful shapes as the dancer could assume.

In spite of my unattractive exterior, all were kindness itself. Some spoke to me without ceremony: on gratefully alluding to it, I was told that the art of reading character and temperament at sight had been so much cultivated that most of the company, particularly the women, could tell in a few moments the likes and dislikes of a stranger, and how far he was worthy of kindness.

My informant pointed out a young man who seemed very much neglected by the fairest of the assembly.

"This youth," she said, "has come among us with letters bearing the most distinguished names beyond the sea. He is of royal blood, and immensely wealthy. Yet there are few of our better classes who can not gauge him as an individual, and—you see the result!"

I was promising myself on the morrow a thousand new surprises of the perfect commonwealth when the party broke up. It was hardly midnight, yet the air struck singularly chill. I shivered—and awoke!

The drift-wood fire had long smouldered to a little heap of ashes and scattered brands, my blankets were wet with a heavy dew, and the first dawn faintly brightened the east.

The harsh change had left me dreary. The fire was slow in kindling. Mechanically a frugal breakfast was prepared and eaten. But heat and food work wonders with the saddest landscape. I was almost cheerful as I placed the canoe in the shallow, balanced carefully into the seat flush with the water's edge, dropped paddle vigorously, and shot away into the Great Bay.

A sudden exhilaration fell upon me. I had read of second-sight. The dream was present to my mind. I felt it was a premonition of the glad reality toward which every sweep drew me a little nearer.

The morning breeze had followed in a long dark line. Now it was on me. Step-

ping masts and spreading dainty sails of muslin, I steered, paddle under arm, for that point on the open horizon where I had seen the Golden City the night before.

How long I sailed! The sun came up, and stood above, strange with a haziness that did not conceal distant things. On and on! Now the wind stopped, and, paddling forward, the light boat seemed to eat the distance. At last, when I began to fear that an unknown current held me back, although seeming to fly like a bird on the way, I saw the further shore. Far ahead it lay, a long flat cloud hanging on the horizon.

Had I run as I intended, Fire Island Light would have long ago shown up. Could a storm last night have broken through the narrow strip of grass-bound sand, and was I being drawn out to sea? On this coast every winter sees a change. Sometimes a great storm blocks an inlet with sand; then to save the fisheries a furrow must be laboriously traced, through which the sea may stretch a tiger paw and scoop a passage out. Sometimes again, at some unlooked-for point, the ocean tears open a new inlet, and the fishing smacks put to sea above the spot where houses have stood for years.

Had this last happened? I felt surer of one thing than of any other this eventful day: the run had been due west; from the quarter where I had seen the phantasm Golden City the keen lifted nose of my boat had never swerved.

I looked behind.

There, far to left and rear, arose the well-known warning finger of Fire Island Light; over against it the scattered cottages of Babylon; beyond both—miles on miles it stretched—the Great South Bay.

Well, it was useless to wonder. The fact was that in some way I had passed beyond the bay. More than that, I was above! I must be on an air-river, passing over what heretofore had been solid earth!

All this flashed across me in an instant. Another moment and I was plying the paddle desperately in the direction of the long dark cloud. The situation was accepted.

The warmth brought about by rapid work began to thaw my frozen wits. This, I said to myself, is the very place where I saw the Golden City. Last night I visited it in my dream; to-day the fancy of sailing up to it in person is coming true! The real Golden City! If the dream surpassed the city to which I have been journeying, how much more glorious than the dream must this one prove! It looks dark now, because the light strikes at the wrong angle; but, as I near, the gold will come in sight!

Now, although the boat was flying like the wind, I could detect little increase in the object toward which I was going. As aid from me was useless, I stretched myself at length, and fell to considering it.

A wedge-shaped darker mass could be distinguished by clouds of a lighter texture. But as I looked the central mass began to contract, just as a jelly-fish in motion draws itself together before it beats the water.

Earth it was not, nor was it cloud. Something between the two lay in a great promontory, bathed by two shining rivers which met at the point; the broad upper end disappeared in the north.

A mist passed rapidly over the object. For six hours the obscuration was complete. From the moment I saw it again the central mass grew bigger and bigger, like a bellows, sucking from the north and across the rivers the material of which it was composed. This must be the force, I thought, which is hurrying me. There is certainly ground for alarm, for who can say what fate awaits a person drawn into that mysterious centre?

It was about four hours that I had lain watching the peculiar shape, when suddenly a great black cloud arose behind it; from a form like a fist shot five great fingers to the zenith and slowly closed upon the darker mass. Then began a violent contraction; vast quantities of the mass were quickly ejected in every direction; the hand rose a little and stood threatening. Thereupon a portion of that cast out returned, but the greater part did not follow.

It was useless to conjecture; I could only lie and watch. Luckily I was provisioned for several days.

At the end of six hours I was near enough to be sure of the fact that this was not a cloud, but rather a great sponge. Moreover, when it began to contract once more, I suspected that the material ejected was a swarm of living things.

The ensuing hours were long. There was evidently no Golden City here, but I was impatient of the drawing aside of the veil, and the consequent tide which must bring me close.

The moment came. With indescribable swiftness I was hurried toward the mass, and found myself floating before one of many regular projections which fringed it on the shining rivers.

It took some time to realize all the strangeness of the place. The projection was quaking like a bog, but a landing-place was not to be seen, had I dared to trust myself to land.

Suddenly upon the extremity of this jetty I espied a living being. It was a man with a head the size of a fist, hollow chest, and broad, thin shoulders. His back seemed to have fallen away, but any loss was made up in front, for his waistcoat protruded as if several good-sized pillows had been stowed beneath it. This being regarded me contemptuously, and answered my hesitating questions in Elizabethan English.

"Can't land here—government property. No baggage, I see; so it wouldn't pay to go through yer. Golden City? You bet—for our ring it is. Look here." He thrust his hand into his waistcoat and pulled it out full of gold pieces.

As this was said with a horrid laugh, I shot on. Upon the next projection stood his counterpart, giving orders to a crowd of workmen who differed from ordinary humanity in a less degree.

"What gang do you belong to?" he asked. Then, seeing my puzzled look, "Oh, I see, you're a green hand. I'll get your papers cooked in a minute. You've time to do the neat thing by us a few times. This here belongs to the Poor Man's Friend, but I can fix you all right."

I clambered with some anxiety to the trembling pier. A large tin boat lay alongside, from which bottles and bales of bright-colored rags were being discharged. Carts jostled each other in confusion as they sought to come and go.

I now perceived that I was on the edge of a thick population. The dark mass I had seen was a city, a sort of flat comb, full of man-like bees. The houses, if those long lines of windows and doors were houses, had nothing green growing about them. Here and there stood idle men dressed in broad-striped clothes with chains on feet and arms.

Pointing to these men, my companion reassured my distrust by informing me that he had belonged to the police. I naturally asked for information.

The dress of the police, so he informed me, was to make them more conspicuous; the chains, to prevent too swift a motion, or any tendency to use the club unreasonably. Thus criminals were allowed fair play.

As we turned to leave the pier I saw a horse and cart drop through the dock, which closed upon them again. Very little notice was taken of this.

We picked our way along the filthy street. I was oppressed with doubt whether this was real mud I was walking through, whether the buildings and vessels had any reality beyond the life-like pictures of a day-dream. But I was awake and rational.

I now began to feel the restless hurry of the populace; it seemed as if I too must be at something. They worked, walked, talked, twice as fast as any other beings I had ever heard of; yet, in spite of their quickness, what they did seemed to result in very little. It was not surprising that they looked spare and sad.

We turned into a dingy office guarded by the striped police and packed with ruffians baser than my guide. Two of the ugliest sat before a table on which stood a box. Shoving a little paper into my hand, my friend motioned me to put it in the box. As I did so one of the men looked as if he was

about to object, but my friend hastened to assure him that it was "all right."

At this moment a cry of murder arose in the room, and a man fell to the floor. The murderer was immediately congratulated by his friends present, and one of them asking his reason for it, he replied he was rather sorry, but he was a little mad at the time. Under cover of the stir occasioned by the murder I slipped out, although I knew my friend had more for me to do.

On the street I came in contact with a tall, sallow citizen hurrying by with an eager look on his face. He fell to abusing me, but at a second view changed his tone.

"Ah! I guess you are a stranger, Sir. Excuse my hastiness; you will allow something for provocation, I am sure. May I inquire where you come from?"

"The Great South," I answered.

"Sir," he cried, with enthusiasm, "I knew it at first glance. A noble, chivalrous son of the Sunny South. Let me grasp a hand that has never been soiled with sordid labor, but has curbed the steed, or ministered to the wants of happy slaves. Sir, dine with me to-day! Here is my card. Enough, enough; your face and land be your credentials. I am overwhelmed with business; these railroads will be the death of me!"

So they have railroads, I thought. Well, I'll let him rest in his delusion, and dine at his house.

I remembered perfectly my dream, the more so for the bitter contrast the present reality (for I could swear it was reality) presented. Nevertheless, I thought I saw an indistinct general likeness just here with a scene of that dream.

In pursuance of the idea I looked about for the office of the merchant who had agreed to employ me in the unreal, but at least more golden, city.

After wandering along a little further, hustled by coarse fellows in rags or fine cloth, assailed with curses by ruffians in carts, I reached the office.

"Well, what do you want?" I heard a gruff voice ask. It was my merchant!

The room was small, dirty, full of grim desks. At these sat a number of thin, sal-low clerks, who were hard at work doing nothing. None looked up.

The voice issued from a little inner room, wherein sat a corpulent Golden Citizen of a forbidding aspect. Craft and avarice had made bad work with the expression of his face, but I vaguely traced a resemblance.

Feeling as if I knew him, inspired perhaps with the confidence a dream or a reality which is too unreal inspires, I told him I was a stranger in search of employment in the Golden City.

"Got nothing for you!" he cried, in an angry tone. Looking over his shoulder, and seeing what a different figure I cut from the

rest of his townsmen, he asked where I came from.

"Southampton," I said. "By canoe."

"What! From Oversea?" he cried, getting up and bowing backward at me as if he had a hinge in his back.

I now perceived the inconvenience attaching to the build of most of the men of the Golden City. Having no backs, and large development in front, it is only by doubling backward that they can bow. The facility is different; in general the greater the peculiar development the harder to bow; but strong excitement, like fear or hope of gain, has a pliant effect on the stoutest.

"I see," he went on; "you are doubtless one of those adventurous noblemen from Oversea, who, tired of the pomp and luxury of his ancestral estates, has braved alone the dangers of the passage, and now, by taking a seat in a counting-house, desires to learn thoroughly the virtues of this mighty city. Welcome, Sir!"

He placed a dry hand with long thin fingers in mine, and seemed pleased, but uncomfortable, when I shook it warmly.

Gazing at him attentively, I perceived on either side of his waist certain mouths, as of purses, which closed with clasps. He had a nervous way of clicking with them. This began to make me wonder whether his figure was naturally so enormous in the waist, or whether a kind of wallet hung from chest to knee.

"Ah!" he answered, proudly, "you, if patient and fearless, may some day have a similar one. It requires a painful operation, which we pass in early childhood. It is really nothing more than a distension of the outer coating of the heart. With me, you see, it has been very successful. The rest of my heart does all the necessary work; but look how large the coating has grown!"

He unclasped one of the slits, and turning to the gas-light above his desk, showed me bundles of green, yellow, and white slips within. Several rolls of gold shone among them; the green paper I recognized as money.

"Why," said I, "it's well you haven't more gold. Even a little more paper, and you could not get away from here at all."

"Very true. A profound thinker, with a capacity for that quick generalization for which your countrymen of Oversea are so famous! It does form a painful burden at times, especially when you have to carry your friend's paper also. But as to gold, I do not care for it. Currency is the only convenient and respectable exchange. It will gradually emancipate us from foreign influence."

"You believe, I suppose, in inflation?" said I, at hap-hazard, having heard the word a good deal used by the loudest talkers in our village.

"Inflation, Sir," said he, solemnly, "is the

discovery of our century. It is the invention which will place the Golden City and our land at the head of the world. Inflation is the key-note to success, public and private."

With the feeling that all would come in the sequence of my dream, I hinted something about a lodging.

"Ah!" said he, "I forgot. An old friend, who failed very disgracefully the other day, has set up a boarding-house. His wife runs it until he can resume. He has taken his cue from our general government, and is buying up his own paper at five cents. He will be a rich man yet. Sharp fellow! and his wife the most pushing woman in the city! But you have come without baggage, of course. They wouldn't like that; I will see."

We left the office together. The street was swarming with hurrying forms; some of which were not so grotesque, to my ways of thought, as others. Thus, as we turned up what was called Wallet Street, we passed a fine-looking man, dignified and unwalleted, with features of unusual size and strength. He was plainly clad, and bore a portfolio under his arm. The better-looking passers would often raise their hats respectfully, but my merchant had nothing for him but scorn.

"Oh, he's a writer fellow who thinks he knows every thing. Why, he's had ever so many chances to make money by writing up the winning side, and has always refused. Afraid, I suppose!"

Here a passer, who was an exact duplicate of himself, caught his arm.

"A son of Lord Southampton," I heard my merchant whisper. Thereupon the other doubled back until he almost touched the ground.

Just here we passed men engaged in various peculiar ways. Certain of them were seated at revolving tables, on which smoked little bowls of an amber-colored liquid. This they would taste, with countenances of the deepest wisdom. Others thrust canes into barrels and tasted what adhered; while still others plucked down from bales and fell to picking it to pieces, their faces showing the greatest concern.

My comrade winked one of his small eyes. "It's all humbug," he whispered. "They don't know any more after than before."

Ever since my arrival I had been changing minds as to the reality of all I saw, but as I went up the street doubt was the stronger. The houses became more shadowy and rotten-looking, and the inhabitants more lunatic and grotesque. It was darker too; suddenly the truth came upon me that we were advancing into a fog. I thought to see a connection between its density and the size of the wallets.

The frequency and size of these had an ex-

citing effect on my friend. A very large one made him enthusiastic.

"There, young man," said he—"there is a man I tell my children to bow to with reverence."

"That great ugly yellow man, with a worried look?"

"Worried? He may well be! I wish I were worried by the same thing. That man is worth ten sextillions!"

A flat building, with a hideous flight of great steps, loomed out on the right through the thickest fog. A man of slender proportions stood near by, and reached his hand through the blank stone wall. Each time he did so he withdrew it filled with gold pieces. He would then look warily about, and throw them excitedly across the street to certain men standing before a building ornamented in pewter. These cast them in at the doorway.

We had turned and reached the door of this latter, when my friend, seizing me excitedly by the hand, hurried me in. "Look there!" he cried, in triumph.

We stood above a room more like the rat-pit at Mooney's in Sag Harbor than any I had ever seen. On its circular floor a crowd of citizens, larger walleted than I had thought existed, were tearing about, in and out; now in clusters, now rushing many upon one, as if to overwhelm him. But at first no one seemed hurt.

Some were the size of balloons.

"How," said I, "can one man support such enormous weights as some of these pouches?"

"That's just it," he answered. "Inflation, my dear fellow! Some of them are stuffed with straw, and others are full of gas."

The din and hubbub were terrific. A grotesque figure mounted on a kind of tribune, and holding a paper from which he wished to read, beat terribly with a great wooden hammer upon his desk to procure a little quiet. No one took the smallest notice of him, however; but each continued rushing upon his neighbor, his arm upraised, and sawing the air with forefingers outstretched, screaming unintelligible cries until red in the face.

But every now and then, after vainly trying to keep down, one would rise from the floor, his arms and legs hanging miserably from his inflated middle, and float out through the sky-light, left open for that purpose. Then all the rest would shout and gesticulate still more furiously.

"Gone up, gone up!" came hoarsely from their midst.

An equally unhappy fate overtook certain others. Whether in sport or earnest was not plain, but one or a certain set of men would draw either ox-horns on their heads or bears' claws on their hands, and set upon a single comrade or a small knot of men.

At the touch of these magical instruments

the wallets of the assailed would often explode with a report, or collapse with a dull clang. In the former case they were over-inflated; in the latter their greatness had been simulated by a cleverly contrived lining of brass.

"What becomes of them?" I asked, with some concern.

"The Great Black Hand squeezes them out."

I turned willingly away from the scene of painful eagerness below me. As we worked our way out through an anxious-looking crowd, I caught by sympathetic reflection the worry and care which seemed to torment them all. Something oppressed me vaguely.

"I thought," said I, sadly, "that stocks going down was a bad sign."

"Oh no. Some people are scared at this, but it all stimulates business. Immediate cause is as follows. The farmers out West must have lower freights on railroads to send their crops to market. Now when Weed gets things fixed, he'll have a law putting down freights. But Weed has just got control of all the railroads and the central government, and when he puts freights down, railroads will stop making money, and stop paying people who hold their stock. Consequently no one wants to keep their stock, every one tries to sell at any price, and down goes your market! You arrived very opportunely; this is a Wallet Street panic."

"But I thought inflation was the cry."

"Oh, well, every thing can be overdone. We must have low freights. Why, the West is standing still. Hasn't been a new road chartered for two months."

"But if the existing railroads make no profits out of low rates, how can you expect people to invest their money in new ones—for I suppose they build the roads?"

"Well, when Weed gets going you will see the right thing done. We'll have government railroads, and all these presidents and stock manipulators can pack up. You have no such troubles in your well-governed land."

I thought of the only government and the only railroad I had ever seen—old Judge Sammis and the Sag Harbor branch.

The gloom, physical and moral, that hung over Wallet Street made me hear with little surprise that most of the men I had seen were really blind, although they moved about as if they saw. It was a relief to turn into the main artery of this extraordinary place, a narrow street firmly wedged with vehicles, which moved on a few inches every five minutes. The air was thick with curses. It seemed to madden the drivers to see the furious crowd boiling past them. Indeed, these exasperated men were, I think, the only citizens I had seen at a stand-still.

The fog was lighter at a point where five roads met; we gained an open space.

Looking up, I saw the dim outline of the Great Black Hand streaming high above us in the sky. I besought my friend to explain more fully its meaning.

His face fell.

"I suppose," said he, meditatively, "we love wealth here so much because it is so easily lost. Other things—knowledge, for instance—are kept without difficulty, and therefore are not so valuable. Now the Great Hand is the surest ruin to wealth. It comes suddenly and without warning; it attacks great and little fortunes alike; the city shrinks in its grasp, and the country about is filled with despairing fugitives. Many wallets burst; some victims are sacrificed. It is stagnation to drag on existence in the country; fresh air and exercise only plague them with regrets. To win back their former joys they must drudge as before by day, and hurry out into the country at night, until with swollen wallet they may perhaps return to die within the limits of the Golden Town."

"That accounts for the sadness I see on every face."

"Many business houses closed their doors when that shadow fell upon them yesterday. Clerks and principals have been hurried into the outer world. That over there we call a Suspension. It wasn't the directors' fault; they are very good fellows; it was a railroad did it."

At a certain point the way was blocked with workmen, poor women, pinched clerks, and needy of all classes. They were besieging a green door. This had been a place of deposit. The day before payments to depositors had been refused.

"But," said I, "if a railroad with high freights has brought them to this, what ruin will not railroads bring when low charges begin?"

"Well, they've got to come down all the same. Oh, we would do very well if people would only circulate their money. Just now they hoard it, instead of buying foreign clothes and wine, and that makes a tight money market."

I remembered the bottles and ribbons I had seen discharging when I first set foot in this unnatural place.

"This," said my guide, pointing to a low, dingy-looking building standing in a garden—"this is the Golden Hall, where the city officers preside. It cost fourteen millions, and is not yet finished. Let us go in and see Weed."

We entered, and found that all the partitions had been knocked away to form a hall. This was to accommodate an immense man who sat on a wheeled chair, and whose wallet was so marvelously distended that it had to be supported on a trestle. He had a bloated and cunning face. It was plainly his disfigurement which lent him such weight

in public estimation, but he also enjoyed the name of the Poor Man's Friend, and his two body-servants were judges.

As soon as he caught sight of me he spoke with a thick voice,

"Well, young feller, voted for me yet? Yes? How often? Only once? Well, you're green yet. Do better next time. Here, take hold."

He handed me a piece of green paper, which promised to be a hundred dollars.

"You're a deep hand," said my friend, with evident admiration, as we left the hall. "Voted already, and for Weed! You will do. You ought to have been born in the Golden City."

I learned several interesting particulars about Weed. He was governor, mayor, and comptroller all in one. The citizens had argued that a new and empty man would only repeat the same story, and plunder till he too was full. It was better to keep Weed, now he had gorged himself. There was now a direct communication between his wallet and the treasury; in fact, it was the treasury. My friend added that there was great discontent, but that Weed held the cards, and to all complaints asked, mildly, "what they were going to do about it."

Noticing a deep moodiness on the face of my friend, I tried to find the cause. At last, in a burst of confidence, he told me a sad tale of oppression. It appeared that the tax-collectors of the general government had passed his goods as correct, but that government spies had been introduced into his office, and had unearthed a small under-valuation that no one had perceived. To avoid the closing of his business and a long litigation with a powerful government, in which his reputation would have been ruined, he had consented to compromise the claim. The tax unpaid was ten dollars. He had been forced to buy himself off for one hundred thousand!

"But you are not guilty; and this is supposed to be a free country."

My merchant shrugged his shoulders. "They say," said he, "that the tax officers don't know when an under-valuation occurs, and so they must have spies and a Seizure Bureau. They are an ignorant set. Don't know their geography even."

"But can they not learn in time?"

"They don't stay long enough for that. You see, they are appointed because they are friends of influential persons in the government. The tax-collector pretends to examine them for office, but it is all a farce, and then as soon as government changes they are cast out of place."

Alas! thought I to myself, what hope for this sordid land? The general government is as rotten as the city!

We took a conveyance into the heart of the city. It was a cylinder on wheels, with

narrow benches on the sides. Upon these sat two lines of people, while three or four rows stood or leaned at different angles between them. No one could move; it was oppressively hot; and a little bell kept ringing every moment near my ear. The vehicle lurched violently, the windows rattled, and every now and then the horses fell down. My comrade thought he was indulging me in an aristocratic whim when he agreed to take a seat with me on the top.

All at once the wagon came to a standstill. On the street a ruffian had called on us to stop, and now compelled it by leveling a pistol at the driver. He was uglier, but showed more back, than most of the citizens.

A scream arose from the shapes within, "Don't shoot! don't shoot!"

"Well, get out, then—every mother's son of you!"

The whole party hurried out in a moment. The man was soon surrounded by a crowd, which seemed to sympathize with him, but advised him to have mercy on us. Under cover of this diversion the passengers rushed in again, and we drove away.

"Poor fellow! he's drunk," said my merchant, and hastened to speak of other things. He began a eulogy on the city. I could not but marvel at the strangeness of his modes of thought, the singularity of his taste. An overgrown structure, loaded with coarse decoration, made him hope that some day the whole main street would be built exactly like it. Yet the existing architecture was monotonous enough. Here and there a building had tried to lift itself above its comrades, and wore a smirk of self-conceit. Such were always out of place in regard to their surroundings. They called attention by incongruous ugliness, instead of pleasing the eye by harmony with all about them. But wherever one had presumed to shove itself above the common level, a neighbor was engaged in a still harder effort at notoriety.

My friend informed me how much his carriage cost as we drove to the dinner to which I had been asked. On the most fashionable street we were ushered into a narrow house. Large paintings and solid stone pitchers eight feet high were the ornaments of the hall. The drawing-rooms, lit by calcium lights, contained a number of citizens and citizenesses of the most approved Golden City shape. Presented as a scion of Oversea nobility, any thing awkward in my dress or manner was admired for its high-bred oddity.

By careful questions to one and another of the guests I learned a good deal of news concerning the town, and confirmed some of my own observations.

The day of the Golden City is limited to twelve hours, six of which are so brilliantly lighted that night may be said to have no existence. The shortness of the day probably accounts for the haste with which every

thing is done, a haste that strangers feel very painfully, and which, sooner or later, they imitate. Like watches that after a certain time will tick alike, the stranger gets his pulses beating to the common tune, and loses all estimate of time according to his old standard.

The city has two movements each day—a contraction at dusk, and an expansion at sunrise. Its buildings can not be otherwise than soft, for, like a gigantic sponge, it squeezes out its inhabitants in the evening, only to draw them, and many new citizens besides, back again into itself in the morning.

But the Bigwallets can buy dwellings in the upper city, and when the ebb comes they catch and lodge in these; the Little-pouches, on the other hand, are cast out over the rivers or far beyond the town. Such were the semi-diurnal movements I had marked from my canoe, but little had I then guessed their meaning. I remembered the sparkling mist that hid the city for six hours, and the swelling of the central mass, which had been stopped by the grasp of the Great Black Hand.

The women at length arose and left the room. The men staid. Our host now led the talk to his own travels and affairs, giving us his opinion of certain members of his own profession—the law—who had objected to certain transactions he had had with corrupt railway magnates. While he denounced his opponents, and strove to prove himself an honest man, I wandered over to a window-seat, where I was delighted to find the face that had so pleased me in Waller Street, that of the "writer fellow."

The benevolence of this citizen's features emboldened as much as his intellectual head and dignified presence pleased me. It was not long before I had frankly acknowledged the sad impression the city had made.

We talked a long while. In the kindest manner my new friend gave me to understand how harsh my judgment was, but how natural that so inexperienced a person should so err in that direction. Suddenly he turned and pushed open the casement.

"Look steadfastly down, and tell me what you see," he said.

I leaned out, and gazed steadily down at what seemed a chaos of gray clouds. As I looked my eye-sight seemed to pierce the clouds, and I saw below a great town. After a little while I seemed endowed with a telescopic power to see the going and coming of the inhabitants, and all the details of the city.

Surprised, I drew back to cast a questioning look at my friend. He smiled in a kindly way, and closed the casement.

"At present you could not see as much again. It will take time for you to regain the power by yourself. But what surprises you?"

"The difference," said I. "The picture I

looked at a moment ago was a residence of beings not all bad—no, nor all good either. I am confused. I seem to have seen three cities, but which of the three is the real one I can not decide."

While I pondered in great doubt at the moment of my own identity, a general move was made. When we entered the drawing-room I was compelled to recall myself. Then I found that while I still perceived the grotesqueness of my surroundings, I had become alive to the good points in those about me. I could not but mark the lack of good health in the citizenesses, but I enjoyed their sprightliness, and learned to admire their fragile beauty. These ladies were undoubtedly absurd. They wore a deep sole on one of their shoes in order to cause them to lean very much to one side, but they defended the fashion cleverly. They wore great loads of hair on their heads, and their clothes were alarmingly open about the breast; but this, too, was a matter of habit.

I should have enjoyed my friend's sumptuous house more had I not been informed by my late host that the merchant's establishment was on a scale his earnings did not warrant. Indeed, it seemed that in spite of his apparent wealth many knew him to be insolvent.

This tormented me much. But another cause contributed to my discomfort. I had been sleeping so much in the open air on hard ground that the sight of the soft bed, the closeness of the room, oppressed me with a leaden weight. I suddenly remembered the canoe—a boat not mine, but intrusted to my charge, to be delivered in good condition to its owner. How could I have forgotten it? What chance was there to find it safe?

I slipped from the house and hastened down the city. Yes, there it lay, untouched. I was tempted to explore the quiet river by the light of the thousand lamps. Stepping into the narrow boat, I skimmed forward toward the upper town.

All at once the light vanished. I was in utter darkness, and borne away by a descending stream. After a little I heard below me, I was sure, an even beat and rush of water. A moment later it began to lighten; a bank loomed up through flying mists; a moon started into sight and stood above. Then I saw the houses of Yonkers, and the stern light of a steamboat hastening down the Hudson.

Yonkers was my destination, and I had reached it; but how?

Some explanation to the incredulous seems imperative.

There is, then, a bare possibility that, wind and tides agreeing, a canoe containing a man in a trance might float out to sea through Fire Island Inlet, in at the Narrows, and up the Hudson.

But I was not insensible, truly!

MY BOOKS.

By JOHN G. SAXE.

As I well I love these books of mine,
That stand so trimly on their shelves,
With here and there a broken line
(Fat "quartos" jostling modest "twelves"),
A curious company, I own;
The poorest ranking with their betters:
In brief—a thing almost unknown—
A Pure Democracy—of Letters.

A motley gathering are they;
Some fairly worth their weight in gold;
Some just too good to throw away;
Some scarcely worth the place they hold.
Yet well I love them, one and all,
These friends so meek and unobtrusive,
Who never fail to come at call,
Nor (if I scold them) turn abusive!

If I have favorites here and there,
And, like a monarch, pick and choose,
I never meet an angry stare
That *this* I take and *that* refuse;
No discords rise my soul to vex
Among these peaceful book-relations,
Nor envious strife of age or sex
To mar my quiet lucubrations.

And they have still another merit,
Which elsewhere one vainly seeks,
Whate'er may be an author's spirit,
He never *uninvited* speaks;
And should he prove a fool or clown,
Unworth the precious time you're spending,
How quickly you can "put him down,"
Or "shut him up," without offending!

Here—pleasing sight!—the touchy brood
Of critics from dissension cease;
And—stranger still!—no more at feud,
Polemics smile, and keep the peace.
See! side by side, all free from strife
(Save what the heavy page may smother),
The gentle "Christians" who, in life,
For conscience' sake, had burned each other.

I call them friends, these quiet books,
And well the title they may claim,
Who always give me cheerful looks
(What living friend has done the same?);
And, for companionship, how few,
As these, my cronies ever-present,
Of all the friends I ever knew
Have been so useful and so pleasant?

Editor's Easy Chair.

THE characters in the old English novels who swear copiously upon every occasion, and who clinch the most indifferent and vapid observations with a sound and a damme, are not now held to be masters of a forcible style, but merely of one that is brutal and repulsive. Indeed, the one characteristic common to all the great masters of style is restraint and moderation. They do not heap epithet upon epithet and superlative upon superlative, but a superior gravity and sweetness always attend them. A painter would technically say of the best literary style that the prevailing tint is a cool gray. For even in the most highly wrought passages the words are so fit and expressive that there is no sense of excess, or, so to say, of mere noise. The masters understand their instrument. They never strain it, and they scorn to play tricks with it. Hence their style is both forcible and flexible, but without effort or grimace. How many a musical virtuoso seats himself at the piano and struggles and wrestles with it, smiting the keys as if to produce the variety of a full orchestra, tugging for an impossible effect, and by his contortions and fury fixing attention solely upon the painful and inadequate performance! You see a posturer or a gymnast; you do not hear music. But when Rubinstein seated himself in the same place the mastery was so perfect that the instrument vanished, leaving only music.

This cool moderation and freedom from excess are finely shown in Hawthorne and Thackeray, and a late reviewer points out the same quality in Bryant's poetry. And since it is always so delightful and effective, why might it not be wisely cultivated by writers for the daily press? Their proper aim is to be really effective; yet they—or rather we, since the magazine and the newspaper are not now widely separated—we constantly confound effect with sensationalism. The mistake is like the effort to be emphatic by the use of italics. Milton and Addison and

Burke and Bacon and Emerson and Hawthorne are much better models than Mr. Pott, of the *Eatauswill Gazette*, with his brush of vermilion. Mr. Pott is a blackguard, but blackguardism is not force. To call an opponent a pitiful whelp and imbecile caitiff, to describe a magistrate as a muck-worm and an earwig, or a stupid rascal and a fat-witted knave, is not vigor, but extreme feebleness. A common drab, or a bar-room sot, or a "dock-walloper" is a master of that kind of force. To call such writing strong and masculine is as ludicrous as to call spitting in a man's face a neat retort. "A reptile contemporary," said Mr. Pott, "has recently sweltered forth his black venom in the vain and hopeless attempt of sully the fair name of our distinguished and excellent representative, the Honorable Mr. Slumkey." The contemporary is further described as a crawling creature, a nameless wretch, and fiendish. Mr. Pott, and Mr. Slurk of the *Independent*, would both undoubtedly have thought Addison's *Freeholder* excessively tame. Had they read Addison's exquisite satire upon the Tory fox-hunter who exclaimed that there had been no good weather since the Revolution, and who, although he had not time to go to church himself, had headed a mob at the pulling down of two or three meeting-houses, they would have probably asked what of it, and have sneered at the namby-pamby Miss Nancy who had not vigor enough to call a Tory a d——d old fool.

Mr. Sanborn, in a late article upon Journalism and Journalists, mentions Mr. Greeley's sneer, that "of all horned cattle a college graduate in a newspaper office is the worst." Had Mr. Greeley been a graduate, he might, indeed, have expressed his dissent with an opponent by saying, "You lie, you villain, you lie!" but he would hardly have thought it a forcible style of writing in any other than the fish-market sense of force. A style which would not become hon-

est men in conversation, which would be justly thought coarse and vulgar, does not change its character because it appears in a newspaper. It remains coarse and vulgar, and those who are not of that kind know it to be so. The other day a newspaper described a public man as an oaf and a witless zany. If "calling names" is vigor, it was forcible writing. If not, it was as forcible as profanity, but no more so. The object of criticism of public men and measures is partly, at least, persuasion. If a public officer is pursuing a wrong or injudicious course, the editor calls attention to the fact, and shows why it is wrong or impolitic. It is certainly conceivable that the officer wishes to do right, and will candidly consider arguments. But that he may do this there must not only be arguments to consider, but arguments stated in a way to lead to consideration. When, therefore, the newspaper solicits his attention by saluting him as a fatuous maggot, he knows, and every body else knows, that no argument is intended, but only ribaldry and denunciation. When a man exhorts you, "Come, let us reason together," by squirting foul water in your face, something else than reasoning will probably follow.

If, however, it be too visionary to suppose that newspaper comments are of any use, or are meant to produce any impression except that of impudent smartness upon the part of the writer, then Billingsgate epithets may as well be considered forcible as the finest passages in literature, and Mr. Pott is very much superior to Milton or Addison. It is, nevertheless, a foolish illusion to suppose that moderation of phrase and courtesy of tone are signs of weakness or tameness. Junius is not most effective when most vituperative, and Junius is swiftly passing into oblivion. The French at Fontenoy who politely invited the enemy to fire first were not cowards, nor did they spare their own volleys. Even Sir Lucius O'Trigger does not come upon the ground and denounce his adversary as a malignant pismire; but his aim is not less sure because he lifts his hat before he raises his weapon. Many a young writer for the press is weak—that is, full of superlatives and fury—because he is afraid to be strong—that is, moderate and reasonable—and one good way for him to correct his style, and thereby to command attention and influence, is to reflect as he writes that his readers are quite as thoughtful and intelligent as he is, and that the public which most newspaper writers seem to have in mind does not really exist as a newspaper-reading public. Those persons, for instance, who think that their opponents in politics are all knaves or fools are not readers of newspapers; while those who are readers do not need to be told, to prevent them from transferring their allegiance, that every thing which the other party does is base and corrupt, and that all its leaders are scoundrels. And the same intelligence which enables a reader to retain his convictions, although he knows that many honest and able men differ from him, also enables him to perceive that fury is not force nor sheer blackguardism vigor.

THE return of the victorious crew at the Saratoga University Regatta and the reception in New York may justly be described as "jolly." That word of universal application in the mouths

of the English, from the praise of a Madonna of Raphael to that of a saddle of venison, was never fitter than on this great occasion. The old song invites all concerned to give a loose to joy and pleasure, and the dons of Columbia College and the revered graduates and alumni had evidently turned out for that very purpose. When the throng reached the college, the president fairly overflowed with enthusiasm, and embraced the world in his generous eloquence; and at the Windsor Hotel Mr. Coudert made a speech of welcome which sparkled and foamed with entire abandonment. "Your worthy president," said the orator, "made an address at the college, and I am sorry he did so, for he just took the wind out of my sails. [Laughter.] I had language of chaste eulogy prepared for you, but when he pictured the maidens of Hong-Kong dreaming of you, and the dark-eyed sisters of the Ganges rejoicing at your success, I felt then that he had played me a scurvy trick—if he will pardon me the utterance." It was capital fooling, and never were there a happier set of heroes than the blue-and-white-ribboned victors, or a more sincerely congratulating company of friends than the alumni. Every man who had ever graduated at Columbia felt that he had taken fresh honors. They were all admitted *ad eundem*. The halt and decrepit, the lazy and gouty, Columbians from the year '20 up to this chief and glorious year '74, all thought that they too had won the great race. To be sure, they had not actually held the oars, but that was nothing. It was Columbia that had led the field, and they were as much Columbia as any Goodwin, Timpson, Seligman, Cornell, Rees, Rapallo, or Griswold of this blessed year '74.

It was a sudden splendor for Columbia, for somehow it had not been considered a foregone conclusion that the city boys would win. One damsel we knew had ventured before the great day to name Columbia against Harvard and Yale, but her choice was greeted with the good-natured laughter of those other champions. But when, the day after, Harvard and Yale were warmly proving to each other, now on one side that nothing was plainer than that Harvard fouled Yale, and now on the other that it was evident to an unprejudiced child that Yale fouled Harvard, Columbia fluttered serenely over the contest in triumphant white and blue. Certainly it was a great day for Columbia, and the maids of Hong-Kong and the houris of the Ganges may well attend to the matter. For it is rumored that the awful question of co-education has invaded even the sacred precincts of the Columbia trustee meetings; and when the learned president in his speech to the Olympian victors declared that on that day the existence of the college was known in Bombay, Calcutta, and Hong-Kong, did he mean to invite these dark-eyed ones to share the Columbian recitation and lecture rooms? It is true that the allusion to maidens and sisters was the gloss of the later commentator at the Windsor, but his remark may be supposed to be the fruit of which the presidential hint was the blossom, and we may surmise that our staid and sedate Columbia means to lead in other contests than those of the oar.

And now that the noise of the captains and the shoutings have died away, what shall be said of the annual university regatta? Last year

there was great doubt as to the victory whether of Harvard or Yale, and the feeling was very sore. This year—Harvard third, Yale ninth: a foul, and great fury. Nothing can be more desirable than physical training with the collegiate studies. Indeed, the air of the academic halls fairly hums with the music of *mens sana in corpore sano*, which seems to the young athlete the most comprehensive and conclusive argument. "Let me assure you," said the president of the college to the young Columbians, "in the name of the Faculty and the Board of Trustees, whom I represent, that it will be their pleasure to aid and assist you in carrying forward any thing that may tend to the physical development of the students." There is not a college president or professor in the country who would not, within reason, say the same thing. "Fear God and walk a thousand miles in a thousand hours," is the golden rule of muscular Christianity. It is the protest against monkish sentimentality and morbid weakness. So might the athletic collegian say, "Cut ponies and win the boat-race." It would be an exhortation to honest study and to generous exercise. But the student should not forget that one star differeth from another star in glory. The purpose of colleges and delightful studies is not to graduate Mr. Westons nor brothers Ward, however deftly they may handle the oar and walk from pole to pole. It would be a misfortune if an accident or an episode should become of more renown or importance than the purpose itself. If on the day of the Saratoga victory the existence of Columbia was for the first time known on the Ganges and the Hydaspes, as is very probable, let the reflective Columbian consider that Oxford and Cambridge were known at Hong-Kong before Putney was heard of. Noble sports, athletic exercise, generous gymnastics, high physical development, are to be promoted in every excellent way. Is the university regatta an excellent way?

THE bold attitude of Bismarck in subordinating the Roman Church, the power once supreme over nations, to the laws of Germany has naturally exposed him to assassination. The Church should not, however, be held responsible, except so far as its teachings tend to justify the means by the end, and so far also as it resists real education and enlightenment. Yet for centuries every fearless and powerful foe of the hierarchy of Rome was in danger of the fanatic's dagger, and the student of history will not forget that Muretus congratulated the pontiff upon the massacre of St. Bartholomew, and that a medal was struck in commemoration of that bloody night. To the Northern races there is something peculiarly repulsive in assassination, and there is perhaps but one assassin who is regarded with any kind of admiration. The heart refuses to condemn Charlotte Corday. "I killed one man to save a hundred thousand; a monster to save the innocent; a ferocious beast to save my country!" But assassination can no more be tolerated or justified because one assassin seems to have been a benefactor to the race than despotism because despots are sometimes good men. Madame De Staël praised a beneficent despotism to the Emperor Alexander of Russia. "Ah, madame," he replied, "it is only a happy accident."

The heart refuses to condemn Charlotte Corday, but the man who shot at Bismarck may plead her example. That is the evil. It is not enough that the purpose seem to the actor to be pure and his spirit sincere. Young Blind believed a republic to be the guarantee of the popular welfare, and that Bismarck prevented its establishment. Bismarck, therefore, to the ardent and honest mind of the young man, was the foe of the race. To slay such a foe was a sacred duty, and to fall in the attempt was to die a martyr to humanity; so he fired at Bismarck. Kullmann, we may easily suppose, thought the same man to be the enemy of souls and the viceroy of the devil; and he fires also. The purpose of both was pure, and both were undoubtedly sincere; but could such considerations excuse them, society would crumble into chaos. For what reason has the assassin to doubt that his victim is as sincere as himself, and by what right does he presume to judge, and then execute his judgment beyond redress? The wise Italian Massimo d'Azeglio, the story of whose beautiful life renews faith and hope for Italy, said, most truly, "Nothing can excuse assassination, because it is an act of treachery in execution of a sentence pronounced without trial by an incompetent tribunal."

But not only does it furnish an example which would legitimate murder upon the plea of honest intention, but it defeats its own purpose by stigmatizing the cause for which the act is done. The bigot Philip of Spain set a price upon the head of William of Orange, that is, he offered a reward for his assassination. But when William fell under the pistol of Gérard his blood stained Philip's Church, and all the perfumes of Araby could not sweeten the spot, nor all the holy-water in the world wash it away. To the reasons which already inspired and satisfied every foe of the Church in his hostility was now added another which made that Church more hideous and damnable to him than before. And so, since Kullmann tried to assassinate Bismarck in the interest of his Church, the doom of that Church in Germany is surer. Many a man who had thought the Chancellor of the Empire too summary and stern will now think that he understood the enemy better than those who censured him as harsh, and will feel that Rome is the foe of Germany. The measures of repression will not only become severer, but they will be felt to be indispensable; and every priest and congregation upon whom the hand of the government falls more heavily may truly say to Kullmann, "It is you who have smitten us."

It is still a question in the debating society, and it is sometimes gravely argued by grave men, whether assassination may not be justifiable. If a man is willing to sacrifice himself to help his cause, it is asked, what does it matter whether he does it by surprising the enemy in the field or camp, or by attacking him at home or in the street? But the cases are not the same. Treachery is the essence of assassination, while the soldier in the field expects the assault, and if he is surprised, it is by his own negligence. Even a duel is, in a certain sense, fair play—at least so far as mutual knowledge is concerned; and the duelist, however miserable a figure, is manlier than the bravo. The love of fair play, which is one of the noblest instincts of civilized

man, demands that justice shall be done without treachery: and although the victim of the assassin may sometimes fall without a tear from a single eye or a pang in a single human breast, and to the joy of all men, yet the assassin is forever named among the most odious of mankind.

WHEN the Englishman, Captain Barclay, walked a thousand miles in a thousand hours, the stakes amounted to a hundred thousand pounds, and the captain himself had sixteen thousand depending upon the result. This was in 1809. In 1811 another Englishman, Thomas Standen, then sixty years old, walked eleven hundred miles in as many hours for a trifling wager. And now Miss Richards, of Stapleton, near Bristol, an English girl, has walked a thousand miles in a thousand hours that her father might win a wager of fifty pounds. But had she walked for her own gain, her father would have had the legal right to pocket the money she earned, which he would probably have regarded as a providential reward for being the parent of so distinguished a pedestrian. The readers of Miss Mitford's interesting and painful biography will remember that the money which she earned went constantly to the relief of her spendthrift father, not indeed with any grudging upon her part, but none the less regularly and surely. By the same laws of the realm if a drunken laborer's wife earns a few scanty shillings for the support of her children, whom their father abandons to starvation, he may confiscate the money to buy a dram for himself. Even in Massachusetts, one of the most enlightened of States, there are, or, if they have now been repealed, there were until very recently, laws of equal injustice, and equally revolting to every reasonable and generous mind.

In the usual vein of those who are exasperated by the mere mention of "woman's rights," it may be said that a woman who unsexes herself and flies out of her sphere, and forgets the nature of the family and of the marriage contract, and of the greater importance of her personal purity and all the mystic considerations of sex, so far as to walk for a wager, ought not to be rewarded, and the money that she wins ought to be taken away from her as a warning to all other women not to walk a thousand miles in a thousand hours, but rather to tend a thousand babies in the same time. Yet this argument, however conclusive in the case of the woman who walks for money, seems to be less powerful when applied to that of the woman who washes for money, and to support her children. Nor does the other argument, that the woman is represented in the making of laws by the man, and that consequently she must be held to have assented to the law, help the matter. The wife of the drunken laborer might reply, with as much cogency as can be expected of feminine wit, that she at least was not represented by her man, and that she did not acknowledge in any degree that through him, or any other man or number of men, she had had any voice in the making of laws which took out of the mouths of her children the food which she had honestly earned and put into them. There are, indeed, living women who are as perverse in this matter as James Otis was a hundred years ago. He said that he did not acknowledge virtual representation or theoretical representation, and asserted that the

only representation which he understood was that in which he had a direct personal voice. He insisted that that was English doctrine, and the Continental Congress said that it was the cause of human nature. The perverse washer-woman striving to save her children's food feels the same truth, although she can not express it. She does not say that taxation without representation is tyranny; but with all the love of a mother's heart she feels and knows that to forbid her to feed her children with the bread which she has honestly won for them is the sharpest possible wrong.

There are probably very few persons who know the facts who will not agree with her; and the supreme common-sense which fortunately is continually revising all institutions and traditions naturally asks whether an intelligent community which permits women to decide whether they will work at all, and in what way, and for how long, and for how much, might not consistently and wisely suffer them to dispose of the money that they earn. And if this be conceded, the same common-sense inquires how this freedom can be better secured than by the method which experience has shown to be the most efficient in securing it to men. Let us respect the facts of sex and the true idea of woman and her work, but let us also be very careful not to accept the theory of Sultan Mitford as that true idea, nor to suppose that the difference of sex incapacitates half of the human race from knowing what is best for them.

WHEN John Quincy Adams was appointed minister to Russia, in 1809, as we read in his interesting diary, which his son is now publishing, he arrived just in time to assist at a *Te Deum* at the French ambassador's for the victory of Wagram. One day the imperial princess satirized the ambassador for his fondness for a certain road which led from St. Petersburg. The reason of his partiality was well known ("Who is the woman?"); but with nimble wit the ambassador turned the laugh by replying, "Yes, madame, but I have another reason for liking the Peterhof Road: it enables me the sooner to receive the news of the frequent victories of the Emperor, my master." Mr. Adams was in Russia when Napoleon Bonaparte was at the pinnacle of his glory and power, and he mentions an adherent of the Corsican who shared with others the belief that Napoleon would probably cause himself to be worshiped. Within a year or two later he invaded Russia, and was ruined. When we look back to the Europe of 1809-10 it seems to us an epoch of the deepest and gloomiest uncertainty; but the people of the time saw nothing abnormal in the situation. Relieved from the shadow of the French Revolution, they felt the contrast fair. Imperial power had returned, and order with it. The French Revolution had spent itself like a furious tornado.

One day Mr. Adams and Count Romanzoff, the Russian Prime Minister, were speaking of England and the Napoleonic war, and, alluding to Lord Grenville, Mr. Adams said that he presumed he could have nothing to dread at present from the Jacobinism or republicanism of France. "The count smiled, and said that, to be sure, when one reflected upon the whole history of the French Revolution, and saw that vio-

lent republicanism thus terminate in the greatest excess of monarchy, it ought to be a great lesson for mankind." He thought the Revolution ended, but in five years from that time Napoleon was at St. Helena. There are many who think with Count Romanzoff—who deem it inexplicable that a country which saw the horrors of '93 does not keep quiet lest they should return. But the simple explanation of the Napoleonic empire, legitimate monarchy, the citizen monarchy, the provisional governments, the republic of '48, the *coup d'état*, the Second Empire, the government of September, the Commune, the Versailles Assembly, Thiers, and M'Mahon, is that Count Romanzoff was mistaken: the Revolution did not terminate in the greatest excess of monarchy, for it did not end at all. It is permanent; and sixty-four years after the conversation between the Russian Prime Minister and Mr. Adams we see a situation as temporary and doubtful as that of the Corsican whose parasites wondered if he would assume the god.

In the perfect repose and almost apathy of our own political situation, the actual uncertainty of France seems to be incredible. There are three pronounced parties in that country, not parties of administration, but of the form of government—the monarchists, imperialists, and republicans. The executive chief was elected for seven years by a majority of the representatives of the three. Since his election each of the three has striven to secure its own purpose and to gain the chief to its side. But he has now declared that he was not chosen to help either of them, but to keep order for seven years, at the end of which time France might determine the form of the government as it preferred. This is the merest personal government. Yet out of seven hundred and six members of the Assembly there was but a majority of forty-one against the dissolution of the Assembly, so that it is not extravagant to suppose that there may presently be a majority in favor of it, when, if the opinion of shrewd students of the situation be correct, a republican Assembly would be elected, which would call a *constituante* that might provide for an immediate republic, and terminate M'Mahon's powers. But as the marshal does not admit that the Assembly which elected him can limit or shorten his power, he would still less concede that right to any body which might assemble by the authority of this. Thus the folly of the coalition which produced the septennate is obvious. For what can it do with its own creation? The Frankenstein glares at it, and it is confounded. If it should refuse the supplies, the marshal would probably tax in the name of France; and he has the power of the army in a hopelessly divided country, unless during the long session of this Assembly the sentiment of the country has singularly changed. Bonapartists, Bourbons, and republicans could not act together against the dictator, because they would distrust each other more than they would oppose him. Each would be hoping to use him against the others, while he, as the representative of order, and with the army in hand, and with the general conviction of his personal honesty and patriotic purpose, would necessarily be the master of the situation.

This is the France of to-day and of this summer—the France of the Revolution. Nor can there be peace, or at least a real repose, until the

party which is most in accord with the spirit of the age and with the tendencies of the country acquires a numerical majority adequate to satisfy the opposition that its hostility to the form proposed is hopeless. Then there can be for France the same kind of tranquillity that there is in England and in this country, where the opposition to the form of the government is really very insignificant, and where, therefore, politics are not revolutionary, but normal and peaceful. That this result may not come without the gravest social changes is very possible. The world is not yet finished. There is even something yet to do in our own beloved land. In the universe of which our globe is a little point nothing ever stops. *Ohne Hast; ohne Rast.* Without haste, without rest, all moves forever on. The statesman who bears that steadily in mind, and who dismisses all theories of what are sometimes called "the order of things," or "the decrees of nature," knowing that fresh observation and new experience constantly disclose newer orders and fresher decrees, will "go forth to meet the future without fear and with a manly heart."

"MR. EASY CHAIR," writes a young woman in the West, "having received the ordinary education of girls in my position, I came home to find that in an emergency I could make myself useful in the family. I learned to do general house-work, and enjoyed it most heartily. The emergency having passed, my occupation's gone. I try being the life of the breakfast-table, the sunbeam of the family, etc., but all to no purpose, unless to convince me that I'm not made of that sort of stuff. There are two old people in the family, and I help to make their lives more comfortable. So the years go on, and I seem to have nothing to show for them. Improving one's mind and getting ready for possibilities are such tiresome things when you are conscious all the time that by a little bound you can clear the barriers and be right in the midst of the possibilities. I'm hungry for work, and what I ask of you is to prove to me that I'd not be desperately selfish in seeking it, even though it called me from home, or so filled mind and time as in a measure to exclude home thoughts. And I appeal to you because I am sure that I am only one of a class."

So writes Mistress Anna Scattergood, and she is right in supposing that she is one of a class, but wrong if she supposes that it is a class composed solely of her own sex. Every youth of imagination, whose mind is active and whose lot is solitary, is restless with the same discontent, and hears the bells of the city far away sweetly and vaguely ringing, "Turn again, Whittington, Lord Mayor of London." Up among the secluded hills there is many a Master Scattergood painfully following the plow or mowing away the hay in the torrid heat of July, who sees before him an endless vista of barn-yard and furrow, a straitened life of hard and silent labor. With him too the years pass, and he also seems to find nothing to show for them. He sees with Mistress Anna the possibilities, and would fain give the one clearing leap that would land him in the midst of them. Sometimes he tries it, only to discover that he can not escape himself. It is very possible that she too would find that

what she wants is not work ; that her discontent is not a fault of circumstance, but the result of temperament, and that the remedy is as near her now as it will ever be.

Yet if it be otherwise, and her ennui is a summons to a real activity, as is so often the case both with men and women, she need not ask if she may properly obey it. Let her consider the lives of women who differed essentially from each other : Mrs. Somerville, for instance, Miss Austen, Mrs. Fry, Rosa Bonheur, Madame De Staël, Florence Nightingale, Angelica Kauffmann, Maria Mitchell, Mrs. Stowe—"if God have called any of you to explore truth or beauty, be bold, be firm, be true!" Only it must be always remembered that the dissatisfaction and the longing are not always the proofs of the power nor

of the vocation. There is many a youth of either sex who has warmth and quickness of feeling, and a free poetic facility, who writes verse with ease and sweetness, but who is very far from being a poet. A vague discontent must not be mistaken for more than it is. The wise college preacher, who can never be enough commended, said to the graduating class, "Many men are troubled about what God meant them to do : but, young gentlemen, my experience teaches me that God means very few of us to do any thing in particular." So, Mistress Anna Scattergood, if you know what it is that you seek, and it is something useful and honorable, and you desert no nearer duty in going to find it, you need not fear that your going would be "desperately selfish," or selfish in any degree.

Editor's Literary Record.

HISTORY AND BIOGRAPHY.

A History of Germany, from the Earliest Times, by CHARLTON T. LEWIS, is a valuable and interesting account of the German people. There is no history that deserves better to be studied, and we have in this volume a careful compilation from Müller and other sources of all that the general reader has probably time to learn of the progress of the great race from which we draw our origin. Germany is the parent of the Reformation, of public instruction, and of many of the best elements of modern civilization. Mr. Lewis has given a clear account of the nation from the obscure dawn of its history to the period of Prince Bismarck. The important epochs of the Reformation, the Thirty Years' War, the wars of Frederick the Great, and the recent contest with France are carefully described, and this compact volume will be as useful to the general reader as to the college and the school. The additions and corrections which Mr. Lewis has made from various sources are also very acceptable.

German history, indeed, takes us back to the period when our ancestors lived in huts and caves, and were as wild and almost as untamable as the Sioux and the Pawnee. From such a source has gradually grown up all our civilization and manners. The process has been long, the way devious, the reverses of progress often apparently irrecoverable. It has been more than once doubtful if the strength and unity of Germany had not passed away forever. In the struggle with Gregory VII. she was torn by fatal discord ; in the wars of Charles V. and in the Thirty Years' War particularly the people perished, and the land was laid waste. When Napoleon ravaged Germany its nationality seemed ready to disappear under a foreign domination ; had Napoleon III. conquered, there would have been short shrift made with German principles. Yet it is a striking proof of the slow progress of humanity that when we get our first glimpse of the German race it is struggling with the Gaul, and the last page of its history that has yet been written is a war between the rival occupants of either bank of the Rhine. Nor have the characteristics of the two races much changed. The German of Tacitus who lived in huts and caves

was thought honest, simple, and brave ; the Gaul treacherous, changeful, vain. The two races are now lodged in palaces, but are still nearly the same.

Yet while Germany has given colonists and a new infusion of blood to France, it does not appear that the Gallic people have ever crossed the Rhine to mingle with the Germans. The Franks overran Gaul, the Visigoths had preceded them, the Normans followed. The tendency of emigration seems still westward, and it is not impossible that Germany may again lend fresh vigor to the French race, as it did in the days of Clovis or Rollo. The age of sanguinary contests ought soon to be passed. The people of each country must at last take into their hands the control of peace and war. When this is done the contest of the Gaul and the German will be ended, and it will be found that no two races can be of more use to each other than those who have been so long contending in vain. On both banks of the Rhine may yet bloom the fruits of a lasting tranquillity.

The German wars have usually been wars of principles. The most terrible of all the European civil contests was the Thirty Years' War. It was an effort on the part of South Germany to repress free thought, and to bring back slavery, and had the popes and the emperor been successful, there would have been a complete destruction of all that has made Germany valuable. Mr. Lewis gives a striking account of the wasted cities, ruined cottages, desolate country, the wild ravages of Wallenstein's army, and the slow march of the Swedes. All German literature and progress had nearly died. It was a dreadful desolation in the path of European history. To its escape from its tyrants Germany owes its present independence ; otherwise the Gallic legions might have overrun it at will. The history of Germany indeed enforces the necessity of its unity.

Passages from the Life of Charles Knight (G. P. Putnam's Sons) is abridged from the larger English autobiography. It introduces the reader to one whose whole life was devoted to the diffusion of popular knowledge, and to whom all English-speaking people owe a large debt of gratitude for his earnest and indefatigable services in

this direction, the results of which are to be witnessed not only in the publications in which he was directly concerned, but also in the impetus which he was largely instrumental in giving to the production of cheap literature. As the benefits of his life have been felt not less widely in America than in England, so ought his name to be known. His public career began in 1812; the preface of his autobiography is dated 1863. The book contains, therefore, a record of over half a century of literary industry. Part of that time was spent as a journalist, part of it as publisher and editor, part as author. His connection with the Society for the Diffusion of Useful Knowledge, his labors in editing and publishing "The Library of Entertaining Knowledge," *The Penny Magazine*, *The Penny Cyclopaedia*, *The Pictorial Bible*, *The Pictorial History of England*, and *The Pictorial Shakespeare*, illustrate the nature and extent of his public services. When his literary life began the whole power of the government was exerted, directly or indirectly, to discourage if not to suppress cheap literature. The newspaper stamp was fourpence, the advertisement duty was three shillings. Criticisms on public men or measures subjected the publisher to fine and imprisonment. In 1814 William Cobbett was sentenced to two years' imprisonment and a fine of a thousand pounds for an attack upon military flogging. In 1825, for an item correctly reporting a flagrant case of personal cruelty, the proprietor of the newspaper was mulcted in damages and costs five hundred pounds. Not until 1842 could the defendant in an action for libel prove the absence of actual malice, and a readiness to retract and apologize. Other difficulties in the way of cheap literature were nearly or quite as great. There were no telegraphs, no steam-carriages. Printing was done by hand; not until 1814 was even the *London Times* printed by steam. Mails were irregular, postage high, and country districts not supplied at all. The newspaper had to be sent out by personal messengers. Wood-engraving as a means of popular illustration was almost unknown. Charles Knight was one of the foremost to introduce it for that purpose. The life of one who began his literary career under such circumstances, who lived to see literature as cheap and plentiful as it was in 1863, and who himself was one of the principal agents in producing the change in public sentiment, which now demands the universal education that it once resisted, is one of the great lives of the century. The record of such a life is well worth study, not only because of the pictures which it affords of the "good old days" for which men ignorant of history still curiously sigh, but even more because of the inspiration to noble living which such a record affords to every reader able to catch the meaning of a life radiant with hope of the future, and strong with an unselfish and a beneficent purpose.

We read the first volume of the "Bric-à-Brac Series" with so much interest that we expected too much in the second, *Anecdote Biographies of Thackeray and Dickens* (Scribner, Armstrong, and Co.). The life of Thackeray has never been written, and, Mr. STODDARD tells us, will not be, "if his wishes and the wishes of his daughters are respected." We are at a loss to understand the nature of that sensitiveness which objects to

a complete and adequate biography, and does not object to scraps and fragments of the life, such as Mr. Stoddard has collected for us here. The paper on Thackeray's literary career, reprinted from the second series of *Spare Hours*, by Dr. Brown, of Edinburgh, serves measurably well the purpose of a true biography, though brief. The rest of the book is altogether anecdotal in character, and those anecdotes which are new are not remarkably good. The same may be said even more truthfully of the sketches concerning Dickens. These are, in the main, impressions concerning him by different writers, the chief value of which consists in the fact that they present him in different aspects, or as viewed by different minds. The reminiscences of Dickens do not add at all to the attractiveness of his character. There is nothing in Mr. Forster's "Life" which tends more to destroy the illusive conception of the novelist's character presented by his writings. In brief, Mr. Stoddard has done all that could be done with his materials; but he has gleaned in a field which has been well reaped before, and in which even careful gleaners have preceded him, and it is not his fault that he finds but little wheat, and that of a light quality.

POLITICAL ECONOMY.

In his latest work, *Some Leading Principles of Political Economy newly Expounded* (Harper and Brothers), Professor J. E. CAIRNES gives us not a systematic treatise on the science, but "an attempt to recast some considerable portion of political economy." In form it is mainly a criticism upon the most important terms in use, and on certain received processes of reasoning. But the author's mind grasps his problems in all their relations; and even where at times his direct argument seems trivial, he is apt to throw out incidentally broad statements of principle and suggestive remarks of extraordinary value. The book challenges the attention of students, first, by pressing to its logical results the truth that in the aggregate "supply" and "demand" are but two names for one fact, the various products of labor offered in exchange for one another. The discussion is not free from passages of mere verbal controversy, which, like the greater part of every library and of nearly every treatise on the subject, would become waste paper if once terms were scientifically defined; yet the firmness and vigor of the author in reducing to their simplest elements the conditions of exchange, and in thus sweeping away a throng of common and plausible fallacies, make it singularly instructive. And Mr. Cairnes brings a real contribution to the systematic development of sound doctrine in his lucid derivation of the notion of "normal price" from the equilibrium of supply and demand in relation to a single commodity. In discussing the nature of the "normal value" measured by this "normal price," our author advances a new doctrine, which high authorities in England regard as making an era in the progress of the science. In the received theory of English economists, "normal price" represents the cost of production, which is defined as the outlay of the capitalist for the wages of labor, whether paid directly to the laborer, or indirectly, in the purchase of machinery or material, together with the profits on the capital. On this definition, as explained by Mr. Mill, Professor

Cairnes makes an eloquent attack. It assumes, he says, the capitalist's point of view, and regards the cost to him as the true cost of production, whereas the cost, not to him, but to mankind, is the question, that is, the toil and sacrifice of the laborer himself. A careful study of the author's elaborate theory on this subject will win approval for his warning that economists are often misled into reasoning as if the interests of capitalists were the interests of mankind. The reader will also recognize the importance, in considering the working-man's life and rewards, of studying the degree of sacrifice exacted of him by his peculiar industry. On these subjects Mr. Cairnes gives us many fertile and instructive remarks. But the entire argument out of which they grow is in this place irrelevant. It is sentimental rather than scientific; verbal, not logical. "Cost and remuneration," he says (p. 49), are "economic antitheses of each other;" but in Mr. Mill's definition "these two opposites are identified, and cost, which is sacrifice—cost, which is what man pays to nature for her industrial rewards—is said to consist of wages and profits; that is to say, of what nature yields to man in return for his industrial sacrifice." It is strange that a thinker so strong should be able to confuse for himself a thought so simple. The whole question is one of wealth, not of physical or mental experiences. Before production there exists certain capital, in raw materials and in food, clothing, and whatever else the laborer may consume. During production the material is transformed, and the food and clothing are furnished to the laborer in wages, and consumed. After production the manufactured article exists, and the capital, represented by wages and the raw material, has disappeared. What measures the cost of production? Clearly, the capital that is gone, and the value of its use until replaced, that is, the wages of the laborer and the profits of the capitalist. Is it to be imagined that our notions of the cost of production will be more definite if we attempt to measure the physical pain, effort, and weariness, the mental reluctance, discontent, or longing, which the laborers may have experienced in their work? Fortunately for the work before us, its argument is not seriously affected by this error, except as it weakens the author's grasp of his own doctrine of normal value, and confuses for him the unquestionable law by which "normal price" is identified with the cost of production.

The most original and novel part of the book is the discussion of international trade. The rugged exposition of this subject in Ricardo's famous seventh chapter has been an offense to many students, who could find no central principle uniting it with the received analysis of trade in general. The mere circumstance that the buyer and the seller belong to different political communities is plainly no good reason for an entirely new law of exchanges between them. Even Mr. Mill, though his review of the subject much diminished this difficulty, left it without a clear explanation. Professor Cairnes here draws the first satisfactory comparison of international with domestic trade. He shows how the peculiar doctrine of the former grows out of the general laws of exchange, and is in perfect harmony with them. He thus makes a long step toward a complete theory of commerce.

We regret the want of space for an outline of this most instructive discussion, which, however, will be eagerly read in full by all who care to understand the subject.

We can but invite attention to Mr. Cairnes's searching review of the old battle-ground of the economists, the relation of the demand for commodities to the wages of the labor producing it (Part II., Chap. 2); to his temperate and unanswerable criticisms upon the policy of the trades-unions (Part II., Chap. 3 and 4), the whole of which are, in principle, equally applicable to the cause of "the Grangers" in this country; and to his complete refutation of the current pleas by which the protectionist theory of legislation is upheld in the United States (Part III., Chap. 4). Throughout the work Professor Cairnes shows a familiarity with the economical history and conditions of our own land such as we find in hardly another British writer living; nor can thoughtful Americans read his survey of our present financial and commercial situation (p. 364-372) and not find a full explanation of the prevailing depression in industry and trade, with hints of the only remedies. Yet on one point he has seriously erred in his diagnosis of our troubles. He insists (p. 373) that our depreciated currency has had no perceptible influence upon our foreign trade. It can not stimulate imports or check exports, he argues, because prices are raised only in greenbacks, not in gold; and "the nominal gain in greenbacks on the importation is exactly balanced by the nominal loss when these greenbacks come to be converted into gold or commodities." This would be true if the greenbacks were depreciated as much when measured in gold as when measured in commodities. But such is not the case. When the currency is inflated, the whole mass of it is depreciated, gold included. Whatever depreciation is due to the excessive amount of currency alone is shared in by coin and paper equally. Whatever depreciation is due to distrust in the solvency of the government issuing the paper falls on the paper alone. Hence gold continues to be depreciated, and sells for a lower value in greenbacks than its normal value, as long as the whole influence of the credit of the government goes to sustain the paper. Besides this, gold itself, the chief demand for it, that for circulation, being suspended, is in excessive supply. In recent years it has been out of use at once in the United States, France, Spain, Italy, Austria, and Russia. This fact could not but have a powerful influence in depressing its price. For these reasons gold values have been excessively high in the United States for the last six years, far higher than in any specie-paying country; this has been the best market in the world to sell in, and we have consumed an immense amount of the products of other lands, obtained in exchange for our credit, which is yet to be redeemed. We are confident that Professor Cairnes, on reconsidering the subject, will ascribe the present deplorable prospects of American trade and industry very largely to this cause, and not, as in the work before us, exclusively to our tariff system, absurd and ruinous as it is. For the book displays the author's candor and zealous love of truth, side by side with his vast knowledge of his subject and his comprehensive grasp of its principles; and it is a delight to read the writ-

ings of one who, though neither his logic nor his style can be called exact or finished, still, on the whole, steadily prosecutes his scientific method as if inspired, and yet wholly unswerved, by a moral purpose.

NOVELS.

EDWARD EVERETT HALE has written no better story, and no more genuinely Christian story has ever been written by any one, than *In His Name* (Roberts Brothers), originally published as the Christmas number of *Old and New*, and now given to the public in a book form. It is a tale of the Waldenses, and is very simple in construction. Félicie, the daughter of Jean Waldo, a well-to-do and conservative burgher of Lyons, is poisoned, through a mistake of her mother, by a draught of home-made medicine. The young Florentine physician who is summoned declares that only one man can save her, John of Lugio, once a priest, an adept in the art of medicine, now a fugitive because of his reformed faith, hiding from persecution among the mountains. The adventures of the messenger who is dispatched for John of Lugio, and John's adventures in getting to the city and his patient, and the escape of both from difficulties, and their triumph over obstacles by the use of the Waldensian pass-word, "For the love of Christ," with its response, "In His name"—this constitutes the plot of the story. Its moral the author states simply and beautifully at the close: "We shall be worth reading about, if what we do is simple enough and brave enough and loving enough for any body to think that we do it 'for the love of Christ,' or for any body to guess that we had been bound together 'in His name.'"

Mrs. OLIPHANT's *For Love and Life* (Harper and Brothers) is one of those stories whose plot turns almost wholly upon peculiarities in the structure of English society; but its interest depends on the struggles of a young man for love and life, and this interest is common to all humanity. Edgar has discovered, at five-and-twenty, that he is not, as he has theretofore supposed himself to be, the heir of a great estate and of an old and honorable name. He is bereft of his fortune and his position; and at an age when most young men commence life equipped and full of hope and ambition, he commences it with all that had been cherished and dear swept away, and he himself unprepared and unequipped for its battle. How he gathered up his strength, how he put it forth, how he fought the battle of life, and how he finally won a victory, this is the story which Mrs. Oliphant tells. There is a side plot which adds complexity to the novel, but neither impairs nor enhances its significance. It is eminently healthful in its moral tone.

MISCELLANEOUS.

The Trial of the Rev. David Swing (Jansen, M'Clurg, and Co.) is an official report, in a volume of nearly 300 pages, of the ecclesiastical proceedings in the prosecution of that distinguished preacher for heresy. The evidence in this case is of no particular importance, and forms a very small part of the volume. The book is chiefly devoted to reports of the arguments *pro* and *con*, and the opinions of the various members of the Presbytery before which

the trial was conducted. It thus possesses an interest apart from the case, since it is a reflection of the sentiments and opinions of leading thinkers in the Presbyterian Church not only on the theological points involved, in which the public take very little interest, but also concerning the liberty of the pulpit to frame and phrase its teachings according to the light of the nineteenth century, unrestricted by the formulas of the past—a question in which the entire public takes a very vital interest.

The Old Masters and their Pictures, and Modern Painters and their Paintings, by SARAH TYTLER (Roberts Brothers), are compact and convenient compendiums of art information for the use of schools and learners in art. They exhibit no traces of original examination of the works of the great artists, such as appear in almost every page of Mrs. Jameson's works, and none of independent power as an art critic; but neither do they exhibit that egotistic self-confidence which is so often mistaken by the possessor and occasionally palmed off on an unsuspecting public for the genuine critical faculty. Whatever a conscientious examination of books of art could enable the author to do, she has done; and if we can not applaud her for the delicacy of her perceptions, we can at least commend her for the modesty which substitutes the opinions of others for opinions which she evidently hesitates to form, or at least to express, for herself. The fact that her works are compends renders the second less valuable than the first, for literature affords less material and a less sure guide in writing about the modern painters than about the old masters. The former subject requires original research and independent art knowledge. It is therefore perhaps not strange, but it is certainly unfortunate, that living painters are so briefly and so imperfectly treated, that of American landscape painters Church and Bierstadt are almost the sole representatives, and that among the artists of the present century the names of such well-known painters as Mrs. Murray, Paul Weber, Inness, Hart, Bradford, De Haas, and Beard are not mentioned at all. But the reader must remember—this may soften the criticism, though it does not correct the defect—that the book is of English origin; and, remembering this, he will certainly be gratified, and possibly even surprised, that American art is so distinctly recognized, though so imperfectly described.

Apart from any other consideration, *Summering in Colorado* (Richards and Co.) would be a remarkable book, as an attestation of the degree of civilization which exists in a region which a few years ago was inhabited chiefly by wild beasts and savages; for the book is both printed and published at Denver, and the good taste, typographical and otherwise, displayed in it would do credit to any publishing house, and would fairly cause some very respectable houses to blush, if a house can be ever said to blush. It is, in substance, a readable guide-book to Colorado, useful for the tourists, who are going yearly in increasing numbers to the American Switzerland, and interesting to the would-be tourist, who is compelled to read at home of scenes which he can visit only in imagination. It lacks a map and illustrations. There is one edition, however, which contains a number of excellent photographs of natural scenery.

Editor's Scientific Record.

SUMMARY OF SCIENTIFIC PROGRESS.

THE *Astronomical* record for July includes the discovery on the 28th of the month, by Borelli, of the fourth comet of the year, which body, however, has not been visible to the naked eye. The comet of Coggia, after steadily increasing in size and brightness until it became quite a conspicuous object, moved very rapidly southward, and was no longer seen in the northern hemisphere, but remained visible for some weeks later to the southern half of the earth. On account of the proximity and brilliancy of this comet, its examination by the spectroscope and polariscope, as well as by the photometer and the thermopile, has an especial value. It would seem that the nucleus is an incandescent solid, but that the head and tail are of extremely fine solid particles, possibly the condensed vapors of the nucleus. The evidence seems conflicting as to the existence of a true gas among the minute bodies composing the tail. The question as to the chemical constitution of the nucleus and tail is still in an unsatisfactory state, owing to our ignorance of the peculiarities exhibited by the spectra of bodies at a very low temperature.

Mr. Lockyer has published a highly interesting sketch of the appearance of four faint successive envelopes arising from the nucleus of Coggia's comet, and forming its head, precisely as was observed by Bond in the case of the great comet of 1858. Although none of the other great telescopes of the world have reported any confirmation of Mr. Lockyer's observations, yet the peculiarly favorable atmospherical circumstances under which his observations were made, with the great telescope of Mr. Newall, assure us of their reliability.

The question of the existence of a satellite to the planet Venus has been revived by Dr. Vogel, who urges upon the observers of the approaching transit of Venus some attention to this subject, as the satellite, if it exist, may perchance be visible on the disk of the sun. The arguments of Drs. Vogel, Klein, and others produce a strong presumption in favor of the existence of such a body.

Professor Adams brings to the notice of British astronomers a proposal to erect a suitable monument in commemoration of the services to astronomy of Jeremiah Horrocks. It will be remembered that to Horrocks is due the credit of the first successful prediction and observation of a transit of Venus. It is not improbable that a tablet to his memory will be erected in Westminster Abbey.

In connection with the Venus transit it may be noted that according to our information the six French observing parties have been most generously equipped, and have in part already started on their voyages to the northern and southern hemispheres. Janssen himself will observe the transit from Yokohama, and will afterward proceed to Siam, where he intends to observe the solar eclipse that will be central there.

Professor Wright, of Yale College, has published the results of observations made on the zodiacal light with a delicate spectroscope. The latter shows only a faint spectrum, such as would be given by sunlight reflected from the ring of small bodies that seems to attend the sun.

In *Terrestrial Physics* we notice a communication from Mr. Hind, of Windsor, Nova Scotia, who calls the attention of geologists to the possible influence upon the variation of ocean level of changes in the shape of the equatorial section of the earth.

The deviation of the earth's equator from an exact circle is, indeed, probable, but is a quantity too small to be calculated with certainty in the present state of geodesy, although both English and German savants have made attempts in this direction. Mr. Hind has the credit of having suggested a vera causa, though one whose efficacy we are not at present able to estimate even approximately.

The general theory of the circulation of the waters of the ocean, as it has been maintained during the past ten years by Dr. Carpenter, is now found by him to be not materially different from that deduced by Leuz, the Russian physicist, over forty years ago, and most ably expounded by him. Leuz's theory, as Dr. Carpenter now calls it, has, indeed, been explained in several of the best German works since the date of its first conception, but seems to have escaped the notice of British students until a recent date. Observations of deep-sea temperature were made in 1823-26 by Leuz, on Kotzebue's voyage around the world, by means of ordinary unprotected thermometers, whose errors, as due to the pressure of the superincumbent water, were, however, carefully investigated. According to Leuz, the coldest waters are at the bottom of the ocean, and a bottom current is always flowing from either pole to the equator, the surface currents being in the opposite direction.

In *Molecular Science* much interest attaches to the complete investigation made by Osborne Reynolds into the questions stated by Professor Crookes as to the influence of heat on the force of gravitation. Reynolds shows that the minute forces of repulsion that Crookes has observed and attributed to the action of heat are, in part, if not wholly, due to the evaporation of minute portions of aqueous or other vapors condensed on the surface of the balls with which the experiments were made. Professor Reynolds's experiments seem to afford a new confirmation of the kinetic or dynamical theory of gases, according to which the process of evaporation from a surface serves to increase the pressure thereon; thus the evaporation of one pound of water at a temperature of 60° F. suffices to maintain a pressure of sixty-five pounds for one second on the evaporating surface; with mercury the effect is three times as great. Similarly, the ascent of hot air from a heated surface would, according to the kinetic theory, be attended with a diminution of pressure equivalent to half a pound acting for one second for each unit of heat.

Perhaps the most important *Chemical* investigations now in progress are those of Julius Thomsen, who still continues his long series of labors in the department of thermo-chemistry. Of this branch of chemistry he is rapidly making almost a new science by itself.

An interesting test for gallic acid is communicated by Procter. A very feeble alkaline solution of sodic or potassic arsenate is added to a

solution containing gallic acid, and the mixture left exposed to the air. An intense green color is rapidly developed, and if the mixture be undisturbed, this change will begin at the surface, giving the brilliantly colored layer above, resting on the colorless one below.

Nadler describes, but does not name, a new alkaloid derived from morphine.

Peligot has noticed some peculiar crystals formed in glass at Blanz. It seems from his investigations that glass by devitrification becomes converted into a mass of crystals of one composition imbedded in a matrix of another. This observation seems to have important bearings upon chemical geology.

Several new minerals have been described since our last reference to the subject. Among them are four silicates from North Carolina, discovered by Dr. F. H. Genth, of Philadelphia. He names them Kerrite, Maconite, Willcoxite, and Dudleyite.

Oellachite is a micaceous mineral from the Tyrol, remarkable for its containing barium.

The most important domestic item in connection with the subject of *Geology* since our last report is the passage of a law by the State of Pennsylvania authorizing a new geological survey of that commonwealth, to be conducted according to the most approved principles of research. A Board of Commissioners has been appointed to direct the enterprise, consisting of prominent representative men from different parts of the State. They have employed Professor James P. Leslie, the veteran geologist, to take charge of the work, and have given him the privilege of selecting his assistants. His general plans must be submitted to the Commission for their approval, after which he is allowed to carry them out without restriction or interference.

The *Geographical* record for the year begins to be quite interesting, various expeditions having been fitted out both in America and the rest of the world for initiating or continuing explorations. The parties of Dr. F. V. Hayden and of Lieutenant G. M. Wheeler are now in the field, busily occupied, each being divided into a number of sub-parties, provided with topographers, geologists, and naturalists, with the promise of rich returns of facts and material to be worked up in the coming winter.

Professor E. D. Cope, who has been heretofore a member of Dr. Hayden's party, has joined that of Lieutenant Wheeler, and expects to do good service in the department of vertebrate paleontology.

Among the other expeditions promising to yield important results are those of Mr. Henry W. Elliott in Behring Sea, and of Mr. William H. Dall, who, under the direction of the Coast Survey, continues his geographical labors in the same region.

Mr. Pertuiset, previously best known as the inventor of a very efficient detonating powder, has been prosecuting certain researches in Tierra del Fuego in behalf of the Chilean government, and expects to furnish an elaborate report on the subject.

Mr. Forest is doing good work in Australia, endeavoring to open up an extensive district in that continent.

The death of Dr. Livingstone is not likely to put a stop to efficient measures for African ex-

ploration. It is announced that the *New York Herald* and the *London Daily Telegraph* have combined to continue researches in the interior of that continent, an expedition provided with all the necessary means and appliances being about to take the field in a short time, with unlimited facilities at its disposal. Henry M. Stanley, the discoverer of Livingstone, has charge of the expedition, and will doubtless give a good account of this international labor.

The exploration of the Libyan Desert, under Gerhard Rohlfs, of which so much has been said from time to time, has been brought to a close, the parties having returned to Cairo on the 17th of April. The success of the expedition fell far short of the anticipations of its projectors. Sixty camels were lost in a futile attempt to reach the oasis of Kufarah, insuperable physical obstacles in the way of shifting sands and the absence of water meeting the travelers. They, however, added considerably to our knowledge of the geology and ethnology of the country. Remains of temples and other archaeological objects were investigated by them in the oasis of Dachel and elsewhere, to be hereafter fully illustrated and described. The geological observations were also of much interest, verifying or correcting previous impressions on the subject.

Reference has already been made to the very important explorations of the Abbé David in Thibet and Western China, and to the very large number of new and remarkable types of vertebrate animals collected by him. It is to be regretted that a large portion of his more recent acquisitions was lost by the shipwreck of his vessel in one of the rivers of China. A Russian officer, Captain Prijewalsky, has lately followed somewhat in the same path, and has duplicated many of the species referred to.

Mr. B. E. Steere, an American gentleman, has just completed quite an important exploration of Formosa, in which he devoted himself especially to the collection of specimens for the University of Michigan. He also obtained extensive vocabularies, which will doubtless be an important addition to philological material.

No important expedition to the polar seas has taken the field this year, the efforts to get up a British exploration appearing to have failed. Several parties have, however, fitted out vessels for visiting Nova Zembla and Spitzbergen, voyages to that region having become a favorite summer adventure. Among these parties is that of Captain Wigans, who hopes to obtain traces of the Austrian expedition on board the *Tegethoff*, of which nothing has been heard for two years, and in regard to the fate of which much apprehension is felt. A Russian search expedition is also being fitted out, as probably an Austrian also, and it is proposed to offer a large reward for information, and thus enlist in the search the hardy seal and whale fishermen from Norway and other portions of Scandinavia who annually visit those inhospitable regions.

The American surveying vessel, the *Tuscarora*, under Captain Belknap, is still actively engaged in its labors in the Pacific, and continues to forward to the Navy Department at Washington, in addition to its charts and notes, rich collections in the way of soundings, specimens of natural history, etc., gathered by its officers. These soundings have been placed in the hands of Pro-

fessor Hamilton L. Smith, of Hobart College, Geneva, who has undertaken to examine and report upon them.

The latest advices from the *Challenger* are from Melbourne, at which point she arrived on the 17th of March last, having visited Kerguelen Land and other localities in the antarctic seas proposed as stations for the parties to be engaged in the observation of the transit of Venus. The observations and the collections made by the *Challenger* since leaving the Cape of Good Hope have been of equal interest with those preceding that date, and, like the others, have not only added very much to our acquaintance with the physics and natural history of the deep seas, but have also suggested important generalizations in regard to general geological conditions and the formation of sedimentary strata. Among those of the highest importance may be mentioned the explanation of the gradual passage of the chalky ooze abounding in shells and other calciferous matter into a uniform homogeneous red mud with little or no trace of calciferous life, the former condition occurring down to a depth of about 1500 fathoms, or along the ridges of the sea-bottom, and the latter representing the much lower levels between them. In the opinion of Sir William Thomson this is due to the fact, as shown by observation, that the deeper strata are very rich in carbonic acid, this forming more than one-third of the gaseous component of the water. This composition, together with the very great pressure exercised, causes a rapid solution of carbonate of lime, leaving only the other constituents. This has its counterpart in various well-known terrestrial strata, where a limestone abounding in shells, etc., passes insensibly into a slate entirely free from well-marked organic remains, excepting those originally of silicious or membranous character. It is difficult to exaggerate the value of such observations in their geological relationships.

We have nothing special to record in the matter of *Botanical Science* beyond the sending to the press by the Smithsonian Institution of a very important work upon which Mr. Sereno Watson has been engaged for several years past, namely, a complete synonymical and reference list of all the plants of North America. This will probably be completed in the course of the present year, and will furnish to the student the means of becoming acquainted with the botany of this continent; and will doubtless be a very satisfactory substitute, for the time at least, for a general descriptive work on the same subject. The latter, we are happy to learn, is in the course of preparation by Professor Gray and his assistants, and its publication in part will, we trust, soon be announced.

In this connection we may refer briefly to the greater enterprise manifested in the New World in the way of preparing and printing works on the natural history of a large area, as compared with Europe. We already have, thanks to the appreciation by the Smithsonian Institution of the need of them, treatises upon the mammals, the birds, the serpents, various groups of insects, the fresh-water and land univalves, the marine and fresh-water algae, etc., of America north of Mexico, all prepared by competent naturalists at the instigation of that institution.

An interesting lecture on *Anthropology*, by Dr.

Gustav Thanlow Kiel, appears in *Zeitschrift für Ethnologie*, setting forth the designs and scope of the orders issued to officers of the navy by the chief of the German admiralty, at the instance of the Berlin Society of Anthropology, Ethnology, and Prehistoric Archaeology. A careful perusal of it by some of our own legislators might impress more forcibly on their minds the duty of saving from oblivion the knowledge which we may now acquire of the habits, beliefs, and implements of our savage tribes, in order to throw light upon the "early history of mankind."

A paper, by Mrs. A. W. Buckland, on "Mythological Birds ethnologically considered," was read before the Anthropological Institute on the 4th of July. The authoress insists upon the value of these "Bird Legends" as a guide to the history of many tribal relations among men.

A very valuable contribution to ethnological data will soon appear in the shape of a map, to be published by the Anthropological Society of Berlin, on which will be marked all the localities in Germany in which barrows or other prehistoric remains have been found. The Smithsonian Institution has for a long time contemplated the compilation of a map of this kind with reference to the mounds of our own country, and has made considerable progress thereon.

Mr. Henry Gilman publishes a paper in the Smithsonian Report for 1873, on the "Mound Builders and Platycnemism in Michigan." Professor Busk and Dr. Falconer were the first to call attention, in 1863, to this peculiar conformation of the leg bone in the human remains from the cave on Windmill Hill, Gibraltar, giving it the name of "*platycnemic*." M. Broca, in May, 1864, independently observed the same condition in tibiae from Chamant and Mainton, in France. Similar bones were noticed at Montmartre by M. Bertrand. Professor Wyman found the same peculiarity in Florida mounds, and first established the existence of platycnemism among the northern tribes by an examination of these specimens mentioned by Mr. Gilman. With reference to the bones exhumed from the great mound on the river Rouge, Mr. Gilman says, "The tibiae present in an extreme degree the flattening or compression peculiar to platycnemic men." In the fourth annual report of the trustees of the Peabody Museum of American Archaeology and Ethnology Professor Wyman refers to the same specimens. In the circular mound on the Detroit River the transverse diameters of two tibiae are 0.42 and 0.40 respectively of the antero-posterior diameters, exceeding any platycnemism observed before or since.

It is well known that General Di Cesnola, whose wonderful discoveries in Cyprus excited so much attention, and whose collections are now the property of the Metropolitan Museum of Art in New York, signified his intention, after disposing of his earlier gatherings, of returning to his field of labor, and of continuing his investigations on a large scale with the aid of the funds thus acquired. This promise he has carried out, and the discoveries now making bid fair to nearly if not entirely equal in interest those of his former explorations. He has already found some localities where the works of man in his earliest and most primitive condition have been

detected, forming a very great contrast with those of the later Phœnician, Greek, and Roman occupants of the island.

Mr. Rivière, whose discoveries of prehistoric remains at Menton, in Italy, excited so much attention a few years ago, has given the subject a fresh stimulus by the exhumation of another human skeleton in one of the caverns, characterized like the former by striking race peculiarities.

Of general *Zoological* interest is an article in *La Revue Scientifique*, by Professor Giard, entitled "The Transformation Controversy." He refers to certain papers on the embryology of ascidians and the supposed origin of vertebrates by Kowalevsky, a young Russian zoologist, and his fellow-countryman the illustrious and now aged Von Baer. Though in 1828 the latter wrote that all animals were derived not only ideally but historically from a common original form, yet he does not now favor the more advanced developmental views of Kowalevsky and others. The article is essentially a summary of the views of Von Baer, some of which Giard holds to be incorrect.

Little has been known of those singular creatures called "hair-worms" beyond the fact that in their early tadpole-like stage they somehow get into the bodies of various kinds of insects, notably grasshoppers, within whose bodies they are found coiled up. We now have the promise of learning more about the habits and mode of development of these worms. M. Villot has published in the *Archives de Zoologie Expérimentale* the first part of a monograph on the hair-worms. They are oviparous, laying numerous minute eggs agglutinated by an albuminous substance, and forming long white strings. The young are parasitic, and pass through a number of metamorphoses, and at different stages live in different animals, as, for example, in one stage encysted in the aquatic larvæ of flies, and afterward again in the mucous layer of the intestines of fishes.

The dog is sometimes infested in China and Japan by a long slender worm allied to the Guinea-worm, and described by Dr. Leidy under the name of *Filaria immitis*. In two cases lately reported in English journals the dogs died "after three days of great suffering," and it was found on examination that the ventricles and auricles of the heart were completely blocked up by the presence of a large number of these worms.

A singular fact in the structure of some of the higher worms (annelids) has been observed by Professor Moebius, who figures a species (*Leipoceras uviferum*) with external ovaries. Another worm has been said by Sars to carry its eggs in pouches resembling a swallow's nest along the hinder segments of the body. Other anomalous modes of carrying the eggs are noticed in the same paper.

The mode of moulting of the lobster is for the first time described in the *American Naturalist*. It is thought after attaining its full size only to moult once a year, at some period between May and November. On November 8 one was observed to cast its skin. It drew its body out of a rent in the carapace, or shell covering the front division of the body. The shell splits from its hind edge as far as the base of the rostrum or beak, where it is too solid to separate. The

body is drawn out of the anterior part of the carapace. It has been a question how the creature could draw its big claw out through the small basal joints. The claw, soft, fleshy, and very watery, is drawn out through the basal joint without any split in the old crust. In moulting, the stomach, with the cartilaginous masses and bands, is cast off with the old integument. The length of the animal observed before moulting was six and a half inches, immediately after, seven and a quarter—an increase of three-quarters of an inch.

The poison of the scorpion has engaged the attention of De Bellesme, a student of Claude Bernard. He finds that the poison of *Scorpio occitanus* acts directly on the red blood globules of the vertebrate animals, especially the frog, causing them to agglutinate and obstruct the capillary vessels, and thus stop the circulation of the blood, producing death. The passage of these altered globules through the capillaries of the brain causes the convulsions, vomiting, vertigo, and other marks of congestion. When the quantity of poison is sufficient to cause rapid death, it takes place by embolism and arrest of circulation.

Additional examples of male siluroid fishes carrying eggs in their mouths are afforded by the two Indian genera, *Arius* and *Osteogobius*. Inside of the mouth of the males of several species of *Arius* and of *Osteogobius militaris* were from fifteen to twenty eggs, some of which were in an early stage of development, while in others the eyes of the embryo were very distinct, and even the young could be perceived moving about. These eggs filled the cavity of the mouth, and extended down as far as the branchiæ. The fishermen asserted, adds Dr. Day, that these adult fishes, which averaged about eleven or twelve inches in length, invariably carried about the eggs in their mouths until they were hatched. Every one of these was a male; and the proportion captured was five to every female. During the period of gestation the males fast, while the females eat as usual, doubtless a necessity for the due production of their eggs.

While ornithologists are in this country studying with so much interest the distribution of birds, we notice an interesting essay by H. J. Elwes in the Proceedings of the Zoological Society on the distribution of Asiatic birds, illustrated by an excellent map.

An extremely valuable work, in quarto form, has just appeared in San Francisco, in the best style of paper, printing, and engraving, on the marine mammals of the Pacific, by Captain C. M. Scammon, of the United States Revenue Marine Service. Captain Scammon has utilized his abundant opportunities in the preparation of a treatise upon the whales, porpoises, grampuses, and other cetaceans, as also the seals, sea-lions, fur seals, and the like, of the Pacific Ocean, which bids fair to be the standard work on the subject for many years. It gives much hitherto unpublished information in regard to the natural history of the seals and cetaceans, together with a complete account of the rise, progress, and present condition of the whale-fisheries in those seas, the illustrations furnishing an excellent idea of the species themselves as well as the circumstances under which their capture is under-

taken. A systematic catalogue of the cetacea of the west coast by Mr. Dall adds much to the value of the book.

A rediscovery of a long-lost American mammal has been made during the present year by Mr. La Munyon, of Kansas, this gentleman having actually secured and sent to the Smithsonian Institution a specimen of the black-footed ferret, a large weasel, described by Audubon thirty years ago from a single specimen, and of which nothing additional has been heard to the present time. The animal is said to be an occupant of the burrows of the prairie-dog, and to be its inveterate foe.

The prospect of important additions to the department of *Natural History* during the year is very good, especially in connection with the transit of Venus expeditions. Of the nations taking part in these, especially the English, German, French, and the American, all the parties have gone fully provided with collectors and apparatus for securing objects of interest; and in addition to these a special expedition has been undertaken by some German naturalists, among them Dr. Karl Moebius, to the Mauritius, for natural history purposes.

The American transit vessel, the *Swatara*, will leave at Kerguelen Land, in addition to the astronomical party, one naturalist, Dr. Kidder, of the navy, well provided with collecting apparatus. She was last heard of at Bahia, on her way out.

The zoological station of Dr. Dohrn, of Naples, of which so much has been said within a few years, has been completed, and is more than accomplishing its promise of usefulness in providing means for carrying on natural history research. Similar facilities are furnished in this country by the Anderson School at Penikese and by the United States Fish Commission, having its head-quarters for the summer at Noank, Connecticut.

The great success of the Brighton Aquarium, which, it is said, has already divided ten per cent. the first year to its stockholders, has induced the initiation of other establishments of a similar character, one being now under way at Manchester, under the direction of Mr. Saville Kent, and promising well for the future. It is to be hoped that an aquarium in the Central Park will not long be a desideratum, the opportunities for obtaining interesting objects being fully equal to any enjoyed abroad. Such an establishment would doubtless pay all its expenses, and something more, when once in full operation.

Referring again to the natural history school at Penikese, we may remark that this was opened on the 9th of July with some forty or fifty students, a selection having been made from a much larger number of applicants.

Under the head of *Microscopical Science* we notice an excellent paper by G. W. Morehouse, in the *American Naturalist* for May, "upon the markings of the diatomaceæ under high powers and careful illumination." The writer concludes that the perfect box-like form and elaborate ornamentation exclude the idea of a blind process of chemical crystallization, referring, we suppose, to Max Schultze's so-called "Artificial Diatomaceæ," and Mr. Slack's experiments with silica films. He is wrong, however, as to the siliceous build of the frustule according to its environments; it is by no means the case, as stated by

him, that those contained in gelatinous envelopes are less developed in strength of shell and bracing; for example, *Encyonema prostratum* is an exceedingly stout form, and contained in remarkably stout tubes, while *Fragilaria striatella*, attached to algæ in running brackish water, is so feebly siliceous that it will not stand acid treatment at all. Closely connected with microscopic examination of markings and structure of diatoms, we may notice the result of Professor Abbe's researches, published in a late number of Max Schultze's *Archiv*. He arrives at the conclusion that the limit of capability is almost reached by our best microscopes, and that all hope of a deeper penetration into the material constitution of things than such microscopes now afford must be dismissed, experiment and theory both showing that the changes wrought by diffraction, in the examination of very minute structures, are such that different structures may give the same microscopical image, or like structures different images.

The question of foraminiferous structure in *Eozoon canadense* is again opened by the well-known authority upon this subject, Mr. H. J. Carter, who alleges that not only is this condition entirely wanting, but that *Eozoon* presents none of the features of an animal. An abstract of his paper, which was published in the *Annals of Natural History*, may be found in the July number of the *Monthly Microscopic Journal*, and so far as the foraminiferous structure is concerned, Mr. Carter appears to have established his position. Dr. Carpenter has replied, and this we will notice hereafter. Geologists will await the final result of this discussion with great interest. Specimens of the so-called "ague-plant," described by Dr. Bartlett in a communication to the Chicago Society of Physicians and Surgeons, and published in the March number of *Grevillea*, 1874, having been examined, prove to be a passive, inert, chlorophyllaceous algæ, met with in suitable situations all over Europe; and in this connection we notice Dr. Greenfield's paper, read before the London Medical Microscopical Society, and the discussion at the April meeting, as to the part played by fungi in diphtheria; the subject is still *sub judice*.

Omineyganck has lately made an announcement of much practical value in *Domestic Economy*, should it prove to be confirmed by other observations, namely, that a small quantity of chloroform thrown into burning petroleum will produce an instantaneous extinction of the flame; and he suggests the propriety of keeping on hand a large quantity of chloroform in establishments where petroleum or any of its derivatives is used for any purpose whatever, satisfied that a timely application will always prevent the dangers resulting from accidental ignition or explosion.

An announcement not uninteresting to the housekeeper is made of the discovery of a method of manufacturing artificial vanilla undistinguishable from the natural article, and to be sold at a much less price. This is derived from coniferin, a substance obtained by a cheap process from the inner bark of the pine-tree.

The various enterprises relating to the subject of *Fish-Culture* have been carried on vigorously since our last report both by the State and general governments. An appropriation was made

by the last Congress for the propagation of food fishes, having special reference to shad and salmon. Owing to the late date at which the appropriation became available, nothing was done by the United States Commissioner in the way of hatching shad south of Albany; but through the aid of the New York Commissioners a large number of young shad were shipped from Castleton, New York, on the Hudson. When this locality was exhausted the celebrated fishery at Holyoke, Massachusetts, on the Connecticut, was taken up, with the aid of the Fish Commissioners of Connecticut, and a very large number were hatched out there, and widely distributed. The aggregate of such shipments by the United States Commissioner is said to amount to considerably over three millions, deposited in suitable localities in many of the States of the Union.

The United States Commission has also renewed its operations in the way of breeding salmon on the Upper Sacramento, in California, and on the Penobscot, in Maine, with the prospect of securing thereby many millions of eggs, which, as heretofore, will doubtless be duly distributed to the Fish Commissioners of the States.

In addition to the shad-hatching labors of the States of New York and Connecticut, just referred to, a similar enterprise has been prosecuted by the States of Pennsylvania and of Massachusetts.

An instance, as gratifying as it is useful, of the ways in which science, in the broadest sense of the word, can be applied to the improvement of *Agriculture* is to be found in the *Journal of the Royal Agricultural Society of England*, of which the volume for 1873 is now before us. The most important article, perhaps, in this volume is a report by Messrs. Lawes and Gilbert of experiments on the growth of barley for twenty years in succession on the same land. This report, filling 197 pages of the *Journal*, describes one of the several famous series of experiments performed at Rothamstead, Herts, England, on the effects of different manures on different crops raised year after year on the same land. These experiments, by far the most extensive and valuable of the sort that have ever been made, have furnished an additional confutation of the so-called "mineral theory" of Liebig, and have thrown a great deal of light upon the questions as to the natural productive capacity of the soil, the theory of the rotation of crops, the amount of nitrogen in manure required, under various conditions, to yield a given increase of a grain crop, the effects of the unexhausted residue from previous manuring upon succeeding crops, and the loss of constituents of manure and plant food by drainage.

The same volume contains an elaborate report by Professor Voelcker on the characters of pure and mixed linseed-cakes. As chemist to the Royal Agricultural Society, Dr. Voelcker is called upon to examine, usually, during a single year from one hundred and fifty to two hundred samples of various kinds of feeding cakes. In samples of commercial linseed some twenty-five different kinds of "weed seeds" were found, the proportions of the latter varying in the different samples from one and a quarter to seventy per cent. The list of adulterating substances occurring in the feeding cakes examined by Professor Voelcker is still longer. The only ones of these materials which were positively poisonous were

curcas and castor-oil beans. In rape-cake black or wild mustard was frequently found in such quantities as to render it unfit for feeding purposes. In many cases of injury to animals from feeding cakes the cause was to be found in the rancid or mouldy condition rather than in any positively poisonous quality of the ingredients.

In this connection we may mention another kind of artificial food for domestic animals which is attracting considerable attention of late—the so-called "meat-flour." The Liebig Meat Extract Company, at Fray Bentos, in Uruguay, South America, slaughter annually nearly 80,000 beef cattle for the preparation of their extract. Until lately the residue from this manufacture, consisting of flesh, connective tissue, blood, bones, etc., has been thrown away. The company are now utilizing this material by making it into products known as "meat-flour," guano, and bone-dust.

The muscular tissue is cut into fine pieces, and treated with warm water, forming a broth, which is boiled down for the meat extract. The flesh, from which the broth has been removed, is dried and ground fine. It forms a grayish powder, containing about ten per cent. water, twelve and a half per cent. fat, and seventy-four per cent. albuminoid substances. In some of the German experiment stations the value of this meat-flour as a food for swine has been tested by experiments, the results of which have been, in the main, very satisfactory.

On the value of "Australian Concentrated Mutton Soup" as a food for pigs, some experiments have been recently made by Dr. Voelcker, but with hardly as favorable results as those above mentioned. This mutton soup is made by concentrating the liquor in which have been boiled the meat and bones of sheep for the manufacture of tallow. Two kinds of extract are thus prepared, the one intended for human food containing less "true meat juice and extractive matters" and more gelatine and water than Liebig's extract, but capable of being made into a "good, wholesome mutton broth." The second kind is recommended for food for pigs and dogs. Dr. Voelcker's experiments indicate that at the price proposed for this—£25 per ton—it could hardly be an economical substitute for pease or other concentrated food for pigs, though it might be profitable for use in small quantities to promote the digestion and assimilation of an excess of other food.

Several accounts have lately been published of examinations of the Fray Bentos guano and bone-dust above mentioned, by Hulwa, Peters, and Krockner, German chemists. The guano, consisting of the dried and pulverized flesh, connective tissue, blood, and some bone, is a yellowish-white powdery material, with a guano-like odor, and contains six to seven per cent. nitrogen, and twelve to eighteen per cent. phosphoric acid. The bone-dust made from the steamed and finely pulverized bone is a clean, nearly white, and quite fine powder, containing about three and three-fourths per cent. nitrogen, and twenty-five per cent. phosphoric acid. In 1873 the amount of these fertilizers furnished to the European market by the Fray Bentos Company alone was computed at from 4,000,000 to 5,000,000 pounds.

An important observation concerning the analysis of commercial fertilizers is reported by Dr.

Maercker, of the experiment station at Halle, in Germany. Superphosphates, as commonly manufactured, even when made of such fine materials as bone-black or bone-dust, contain, besides the fine powder, larger particles that have clumped together in the process of treatment with acid. On separating the finer and coarser portions of several samples of such fertilizers, and analyzing them, Dr. Maercker found from 2.8 per cent. more to 4.3 per cent. less phosphoric acid in the finer than in the coarser portions.

In *Engineering* we can record that during the past month the final test of the strength of the Illinois and St. Louis bridge was made, under the supervision of Captain J. B. Eads, the chief engineer. The test consisted in moving out abreast and simultaneously over each one of the three spans two trains of seven locomotives each. The total weight was about five hundred and sixty tons. The two trains were stopped on each span, and the amount of deflection noted. The experiment was also modified to indicate lateral deflection. The result of the tests agreed almost exactly with the theoretical computations already made, and the trial proved highly satisfactory.

From abroad comes the information that the plans for the railway which is to ascend Mount Vesuvius are now complete.

A new Thames tunnel at London is projected, which is intended to provide a road and railway communication from the East India Dock road on the north side of the river to the Woolwich and Greenwich road on the south. Its total length is placed at 600 yards.

The last reports from the St. Gothard Tunnel state that in all 1840 meters had been accomplished.

The iron steam-ship industry of the country is likely to flourish for the immediate present at least. The Pacific Mail Steam-ship Company, it is said, is about to build three new steamers to add to the fleet it already has afloat, to be constructed on the model of the recently launched *City of Peking*, to be each of 3000 tons burden, and to cost \$600,000. The American Steam-ship Line of Philadelphia likewise proposes to increase its fleet by the addition of two more vessels of the same size and build as the *Pennsylvania* and her sister ships. This work, it is said, is all to be finished within the next twelve months, and is to be given to the Delaware River steam-ship builders.

The employment of steam on canals seems to be an accomplished fact. Six boats are now plying on the Erie Canal, and twelve others, it is said, are shortly to be added, all of them capable of making the trip from New York to Buffalo in five days.

In connection with *Mining* industries, we may notice that another coal-cutter is to be operated in the Brazil (Indiana) coal-field. The machine in question is the Winstanley, an English machine which has acquired some reputation abroad. It is described as very similar in its make to the Brown machine which we have already noticed. The introduction of machine-cutters is a matter of much interest to all coal operators.

The latest published statistical reports announce that the production of precious metals on the Pacific slope reached during the last

quarter century \$1,583,644,984, of which California mines produced three-fourths, nearly the whole of which was in gold. The amount obtained is now increasing rapidly, owing partly to the opening of new mines, but chiefly from the introduction of improved methods of extraction. The yield of the Pacific slope last year was \$80,287,436, against \$70,236,914 in 1872. The increase is mainly in silver.

In connection with the same general subject is the statement of the extent of coal deposits west of the Mississippi, given in a recent governmental report. From this it appears that this coal area is no less than 513,000 square miles, scattered throughout eleven States and Territories. Of this area Kansas claims 80,000 square miles; Iowa, 24,000; Missouri, 24,000; Texas, 30,000; and Dakota, 100,000. Thus far, however, but little of this has been developed.

We may record, as a novelty in the *Mechanic Arts*, the fact that Dr. Kuntzel, one of the inventors of the much-talked-of phosphor-bronze, has discovered what is claimed to be a great improvement in railway and other bearings, the same being a peculiar mechanical combination of phosphor-bronze and soft metal.

Some recent experiments in duplex telegraphy are reported from New York, which are said to have proved highly satisfactory. The improvement in question permits, it is claimed, of the simultaneous transmission of four messages at once on one wire, and either message can be dropped at any way station on the circuit. Nor is this all. The old duplex system can be applied to the new invention, and by this combination four messages can be sent simultaneously over the same wire in opposite directions between any two terminal points.

Of general interest, not belonging to any subject previously enumerated, we may mention the celebration, at his New World residence, Northumberland, Pennsylvania, of the one hundredth anniversary of the discovery of oxygen by Dr. Priestley. This occupied two days, the 31st of July and the 1st of August, during which an interesting episode consisted in the exchange of telegrams with a body of men celebrating the same event in Dr. Priestley's life by unveiling a statue erected to him at Manchester, England.

The deaths to be recorded since our last notice are not very numerous, although embracing some eminent names. In our own country we have to mention those of Isaiah Hoopes, of West Chester, Pennsylvania, a veteran botanist, and of Mrs. Louisa Audubon, the aged relict of Mr. John James Audubon, and for nearly half a century his devoted assistant in his scientific enterprises. The domestic catalogue includes also Mr. Henry Grinnell, of New York, so well known in connection with the arctic explorations of Dr. Kane, Dr. Hayes, and Captain Hall; and Mr. George R. Crotch, an English entomologist of much promise, who had come to this country recently and made it his home. Of names abroad, we have to mention those of Rev. R. T. Lowe, known in connection with the work on the fishes of Madeira; Professor Cipoletti, of the astronomical observatory of Florence; Dr. Aloys Pichler, of Germany; Dr. Stoliczka, who was connected with the Indian Geological Survey; and Mr. Henry Stephens, an English agriculturist, and author of the *Book of the Farm*.

Editor's Historical Record.

POLITICAL.

OUR Record is closed on the 21st of August.—

The Alabama Democratic Convention, at Montgomery, July 30, nominated George S. Houston for Governor. The political platform severely denounced the Civil Rights Bill.

The Utah election, August 3, resulted in the return of George Q. Cannon, the Mormon candidate for Delegate.

The elections in North Carolina and Tennessee, August 6, resulted in Democratic majorities.

The Louisiana Republican Convention at New Orleans, August 8, indorsed the present State administration.

The Pennsylvania Republican Convention at Harrisburg, August 19, indorsed the present State and national administration. The Hon. E. M. Paxson was nominated for judge of the Supreme Court.

The Tennessee Democratic Convention at Nashville, August 19, nominated Judge Porter for Governor, and in its political platform advocated the payment of the bonds of the government in greenbacks, and the "abolition of the present odious national banking system."

The returns of the Ohio constitutional election, August 18, indicate the rejection of the new constitution by a large majority.

General Custer, in command of the Black Hills exploring expedition, in Dakota Territory, has made two important reports to the government since his command left Fort Lincoln early in July. According to these reports, the Black Hills region is in its floral beauty a new Florida, and in its treasure a new El Dorado. As a grazing country it is not to be surpassed. Veins of lead and strong indications of silver have been found. Veins of gold-bearing quartz crop out on every hill-side. There are also unlimited supplies of timber.

The British Parliament was prorogued by a Speech from the Queen August 7. The Queen expressed her pleasure because of the reductions in taxation; the passage of the Factory Act, by which the health of women and children will be promoted; the passage of the act reforming church patronage in Scotland, which will, by removing controversy, conduce to the religious welfare of the people; and the passage of the Public Worship Bill.

In the French Assembly a vote was taken on dissolution, July 23, after the rejection of M. Casimir-Perier's constitutional bill. The result was a vote of 340 for dissolution and 370 against. On the 31st M. Gambetta made an important speech against prorogation. The organization of the septennate he declared to be as impossible as that of the monarchy. He made a powerful appeal for the establishment of the republic, "which would give peace and union to France," and concluded by demanding that the state of siege be raised. Subsequently a motion to raise the state of siege was rejected by a vote of 282 yeas to 366 nays. Then a motion to adjourn from August 6 till November 30 was carried by a large majority.

On the night of August 9-10 Marshal Bazaine, assisted by his wife, escaped from his prison on the isle of Sainte-Marguerite.

The Spanish republic has been recognized by England, France, Germany, Holland, Italy, and Belgium. The Carlists have recently suffered a series of defeats.

The International Congress, having for its object the establishment of an international code for the mitigation of suffering during war, was convened at Brussels July 27.

The Pope has declared his intention to create four new cardinals.

The Japanese expedition against the tribes of Formosa guilty of outrages against the Loo-Chooans has been successful, but there is fear of a war between China and Japan on its account.

MISCELLANEOUS.

Notwithstanding the extraordinary inducements now held forth to persons desirous of settling in this country by the unusually low rate for passage which the present competition between the ocean steam-ship companies has effected, the returns at Castle Garden show a steadily diminishing stream of new-comers as compared with 1873 and previous years. Those who come are, however, of a higher class. The average number of steerage passengers coming to New York in previous years was about 250,000 per annum. Between January 1 and July 1, 1874, the total of arrivals has reached only 73,353, and it is doubted if the whole number during the current year will reach 100,000.

In the year 1873 there were 156 firms employed in the production of silk fabrics in the United States, 61 of which were in New York, 30 in New Jersey, 25 in Pennsylvania, 22 in Connecticut, and 12 in Massachusetts. The total value of products was \$19,894,874. The number of operatives was 10,651.

DISASTERS.

July 26.—A destructive deluge in Pittsburg, Pennsylvania, resulted in the loss of over one hundred lives.

August 5.—The steamboat *Pat Rogers* was burned on the Ohio, below Aurora. Over fifty lives lost.

August 15.—Collision on the Pennsylvania Railroad near Trenton. Three men killed and ten wounded.

July 26.—A land-slip at Alarra, in Navarra, Spain, caused the death of over two hundred persons.—A Carlist magazine exploded at Quiza, killing thirty men.

OBITUARY.

July 31.—At South Natick, Massachusetts, the Rev. Gorham D. Abbott, in his sixty-third year.

August 10.—In Chicago, Illinois, the Right Rev. Henry J. Whitehouse, Bishop of the Protestant Episcopal Diocese of Illinois, aged seventy-one years.

August 1.—In England, death announced of Dr. Charles T. Beke, the African explorer, aged seventy-three years.

August 18.—In England, death announced of Sir William Fairbairn, the distinguished civil engineer, who built the first British iron ship.

Editor's Drawer.

WE have received from an eminent American jurist the following interesting narrative:

Near the close of the seventeenth century that renowned judge, Sir John Holt, Lord Chief Justice of England, esteemed by his contemporaries, as well as by men of after-ages, as an embodiment both of the law and of justice, was presiding at the assizes held in and for his native county of Oxford. A decrepit old woman was put on trial, charged with the crime of witchcraft. The history of the case, the offense of which the prisoner was alleged to be guilty, were laid before the jury by the Attorney-General prosecuting for the Crown. The Chief Justice listened to the opening of the case with unusual earnestness, for there was recalled to his memory a curious incident connected with his own early life. When a student at the University of Oxford his habits were wild and irregular, and he gave no promise of his great future eminence. In company with several other young students he had been for several days on a carouse through some of the country places in the vicinity of Oxford. Young Holt had separated himself from his companions, and riding up to a way-side inn, without any money in his pocket, he yet directed his horse to be fed and an ample dinner prepared for himself. Strolling into the kitchen, he noticed the daughter of the hostess was sick, and was told by her mother that she was a great sufferer from fever and ague, and that the doctors had been unable to cure her. The young collegian at once declared his ability to effect a cure. Taking a piece of parchment, he wrote upon it a cabalistic word in the Greek characters, bound it tightly upon the wrist of the girl, and then assured her that while she retained it she would have no further return of her chills and fever. He remained at the inn for several days, and the girl had no return of her sickness. When demanding his bill, the grateful mother said she had no charge against him, and only regretted that her limited means would not permit her to make him more ample payment for the healing of her daughter. He rode away in triumph. And now, as he sat on the bench as the Lord Chief Justice of England, he knew that the decrepit old woman on trial for her life before him was the daughter of the woman who kept the way-side inn, and upon whose wrist he had bound the parchment charm forty years before.

She had followed in his own footsteps, and had been using the charm for the benefit of her neighbors and friends. The Chief Justice called her up, and as she unfolded some old greasy rags, she presented to him the well-worn parchment with the cabalistic word in his own handwriting written upon it. It is needless to add that the woman was at once discharged. If the great Chief Justice had previously entertained any doubts on the subject of witchcraft, they were now removed.

There is a curious sequel to the incident above related. Some twenty-five years ago the writer of this article was sitting in the private office in Wall Street of the late Mr. S—, then a wealthy retired merchant, and acting president of one

of the principal Wall Street banks. He was a quaint, curious man, fond of the marvelous, and disposed to belief in spiritualism, then first coming into prominent notice. Our conversation had been continued for some time, discussing Scottish second-sight, supernatural appearances, and especially Kidd's buried treasures, when he suddenly changed the subject, saying, abruptly, "I can cure the fever and ague." On asking how, he produced a small piece of parchment with a cabalistic word written on it in the Greek characters, saying it must be bound on the wrist, and the disease will disappear or go away. He did not tell me how or when he had obtained the wonderful charm. Nor was I at that time aware of the trial before referred to, and sure I am that he could have had no knowledge of it. A hundred and fifty years had come and gone since the fallacy had been exposed by Lord Chief Justice Holt. It is probable that at some time during the forty years preceding that trial the woman possessing the pretended charm had communicated the secret, and given a copy to some friend emigrating to America, and that it may have been handed down through successive generations, and perhaps in some cases effecting cures by and through the imagination. It has been said that sometimes violent exercise and sometimes strong impressions on the mind will ward off attacks of what are called fits of ague.

THE ways of jurors are peculiar. In California, as in New York and elsewhere, when locked up to consider upon a verdict, there are parentheses in the discussion which are more or less filled up with fun. Recently in Truckee, California, a jury had been out four hours, when the judge sent the sheriff to ascertain whether they were going to agree. The sheriff put eyes and ears to the key-hole, and then he brought the judge. Together they opened the door. On a table in the centre of the room stood a bottle of whisky, and around it the hilarious twelve were marching in single file. The foreman carried on his back a bass-drum, upon which the man behind him was pounding. Next, a juror playing on a snare-drum; then a shrill whistle, imitating a fife. The rest were singing. "We couldn't agree on a verdict, nohow," said the tipsy foreman, in reply to the judge's reproof, "and we didn't think 'twas any hurt fur to have a soc'l time, s'long's we was a congen'l party." Then they all took just one.

THE late Senator Sumner was a discriminating man, and precise in his manner of statement. At the sale of his personal effects in Boston, ninety-five dollars were paid for an old Roman lamp, bearing the inscription, "The good shepherd giveth his life for the sheep," to which Mr. Sumner had added, "*of all colors.*"

HUMOR has not yet died out in the British Parliament. A few days ago Colonel Egerton Leigh, in a speech of ten minutes, asking for fair play for the fair sex, illustrated the difficulty of getting women to give evidence against their husbands in case of assault, by telling a story of a poor woman who came up with a broken nose,

and screening her brute of a husband by the assertion that she had bitten herself. "These fellows," said the colonel, "ought to be hanged, and I should like to see them hanged; but it requires a good deal of interest nowadays to get hanged."

Besides this we have an Irish member who voted, May 8, *against* closing public-houses in Ireland, and who voted, May 16, in *favor* of closing museums on Sunday in England.

The creed of — may be described
As "Toddy and Te Deums;"
Keep church and public open wide,
But shut up all museums.
The vote is good, and pleases well
Both brewer and divine;
It says, "The Sabbath sacred is—
Sacred to Beer and Wine!"

Much depends upon the way in which things are stated. For example, in one of our Western exchanges an account of a steamer accident is given, in which the reporter says, "The only passengers were T. B. Nathan, who owned three-fourths of the cargo and the captain's wife."

The following, which we do not remember to have seen before in print, is worthy of preservation in the Drawer: In his eulogy of the late Chief Justice Chase, Mr. Everts told a characteristic anecdote of Mr. Lincoln. It was in reference to the distribution of government patronage that he said, at the outset of his administration, "I am like a man letting rooms at one end of his house while the other is on fire." And this ludicrous simile is certainly an incomparable description of the system as he found it.

The following bit of dialogue is reported to have occurred between a Briton recently arrived in our home of freedom, and one of those sterling citizens of the Washoe region who have such an airy and winning grace of manner:

"Deah me, this is disgusting" (holding up his knife and gazing fixedly at its point). "This is eithaw the second or the third hair—I think it's the third—that I've found in this buttah!"

"You've not been in 'Merica long, I judge?"

"No, Sir; I arrived here yesterday morning."

"I thought so; otherwise you would not have complained of hairs in the butter."

"Not complain of hairs in the buttah! You suppwise me, Sir. How could I do otherwise?"

"Those hairs, Sir, are natural to Washoe butter; in Washoe the white sage creates hair. In a country where all the cows feed on the white sage, do you think it likely that the butter will be bald-headed? Would you like to try a box—ten dollars? You are rather weak on the north pole."

ONE of the peculiar people of Kansas is J. W. M'—, a justice of the peace and land agent in one of the thriving towns of that State. Not long since he was called upon to perform the marriage service, and he improved it in the following manner: "Therefore, by virtue of the authority vested in me by the laws of the State of Kansas, and the rules and regulations governing the land-office at —, I hereby pronounce you man and wife. Whomsoever I have joined in wedlock let no man part asunder. I charge you to be true to each other. True love is as

scarce in Kansas as honest men in our Legislature. Be always true and loving to each other, even if the chinch-bugs eat your corn, and your cattle die of Spanish fever. Take a homestead or piece of railroad land in this county, one with a good spring on it preferred (my partner knows where there is a good piece), and you will be comparatively happy. Happiness in this world consists of man and wife loving each other and playing checkers. It is a pity there is so much deception, but if your hearts throb in unison and laborers receive two dollars a day, you can consider yourselves in luck. A-men."

BRIGHT sayings are always to be heard in the courts, and the regret is that so few are willing to take the trouble of noting them down. The following will be appreciated by members of both bench and bar:

Sergeant Manning, a very nervous man, was arguing a case before the judges of the Common Pleas. He had a large number of books before him, almost sufficient to constitute a library. While reading the report of one of the cases a number of books tumbled off the table in front of him. He said, "My lords, it is reported in two other books in the exact words."

Mr. Justice Maule said, "Are you sure it is exactly the same?"

"Certainly, my lords."

Maule replied, "Why hunt for the other books? Read the same case again out of the one you have in your hand."

Of course every body laughed. The books were found, and Manning left the court.

AN Ithaca man thinks this ought to be put somewhere in the Drawer: Recently, on the train between Mount Pleasant and Burlington, Louisiana, a little girl traveling with her parents attracted the attention of the passengers by her brightness. A gentleman went to her seat and asked her if she wouldn't go home with him, adding that he had a nice little boy that she could play with. The little girl's eyes sparkled and her cherry lips rounded up when she said, "I am going to have a little brother of my own the first of November." Some of them laughed, and some didn't, but they all looked pleasant.

A BOSTON lawyer sends this:

"Twenty years ago, just after I was admitted to the bar in Maine, I called one evening on the young lady who has since become my wife. I made friends with her little brother Addie, and when he ran out of the room heard him ask his mother, confidentially, 'Mamma, do you think angels' wings are strong enough to carry lawyers to heaven?' The good woman's answer was lost in the 'Hush, dear!' but in the battle of life since then the question has come back more than once."

AN effort was made at the recent session of the Evangelical Ministerium in Allentown, Pennsylvania, to consolidate the German Lutheran papers in New York and Pennsylvania. The journals to be united under this proposition are the New York *Herold* and the Allentown *Zeitschrift*. It was resolved by the New York Synod that the two should be united and published under one name as the organ of the Ger-

man Lutheran Church. During the discussion which arose on the subject on the floor of the New York Synod a learned divine proposed that the name of the new paper should be "The New York *Herold* in Union with the Allentown *Zeitschrift*." Another equally prominent clergyman suggested that as the name was to be so long, it should be printed in a curved line, and in the centre there should be a vignette of Martin Luther, standing Bible in hand, with this motto, "Here I stand, God help me, I can not do otherwise." The two propositions seemed to meet with very general favor, when Rev. William Hoppe, late pastor of Zion's Lutheran Church, of Lancaster, thought he saw a weak point in this arrangement, and stated it thus: "Gentlemen, you are about to reach a consummation devoutly to be wished, the establishment of a German Lutheran newspaper which shall stand before the world as the great exponent and defender of the Lutheran creed. Let us see what the name of this journal would look like when once printed as suggested. It would, I think, read something like this, 'The New York *Herold*; here I stand, God help me, I can not do otherwise, in union with the Allentown *Zeitschrift*.'" The members of the Synod shook with laughter, and the pompous newspaper name, it is needless to say, was forgotten amidst the echoes of their merriment.

In the beautiful cemetery in the city of Kenosha, Wisconsin, is a fine monument, on which is clearly and neatly cut the following:

Emigrated to the land of Paradise.
My dear Pet meet me at the gate of Paradise.
I will be there by Nature's fast Express.
Until there we meet a loving adieu.
P.S.—W. B. is coming soon.

SENATOR JONES, of Nevada, tells the following incident in the career of a queer character of the name of Pokebury, who some time back dwelt in Nevada—a lawyer of some promise, who came to nothing through drink. Losing all his clients, he went to mining, and joined a rough miner by the name of Spokes. At the end of a week Pokebury appeared in town with a black eye, a swollen nose, and lacerated garments. Of course we were anxious to know all about it.

"Well, you see," said he, "Billy and I were partners, and I like Billy, for he's a well-meaning man for an uneducated cuss. But Billy and I dissolved partnership, we settled and struck—leastwise we struck each other, and Billy settled. Our first little difference was of an astronomical character. We divided the day different. Billy divided on 6 A.M., and I divided on 10 A.M., and Billy, instead of allowing for astronomical difference, said I was a lazy dog. But I didn't mind that, for Billy was my partner, you see, and had a right to his views. Then we differed on ablution. Billy ablated before breakfast, and said I was a dirty dog, for, you see, I always ablate after breakfast. But I didn't mind that, for people will differ, and so long as the difference don't affect business, what's the odds? But the third difference was just a little too much for me. We were sitting down to beans and slap-jacks, and Billy blowing about my being a greedy dog, when suddenly the fellow said to me, 'I'd thank you for those molasses.' This was too

much—no man can say 'those molasses' to me and live, and I just took him in the countenance with a right-hander that settled him and his insulting bad grammar together. That's the way we dissolved. I'm in town, and I guess Bill will be here in a couple of weeks."

In no State in the Union is that delicate regard for one's feelings manifested in a higher degree than in Michigan, especially where the object of attention, owing to some technical irregularity, has found himself temporarily in the hands of the law. As an example, please to take your eye in your hand, and, as the baseballist would say, pitch over the following account of a court scene in Detroit:

"John! oh, John! come out here and face the music," called 'Bijah, his head in the corridor and his body in court; and John Campbell came out.

"It seems a pity that a young man of twenty-seven, good-looking, large nice feet, lots of muscle, and a sore nose, should stand here charged with vagrancy," said his honor. "While all the rest of the world is moving and rushing and working, you fall asleep on the wharves."

"Can't help it, Zur," replied the prisoner, in a mournful tone; "can't get wor-uk any where."

"What kind of work have you been seeking for?"

"Wa'al, suthin kinder easy, for I ain't well."

"No, I can see that," remarked the Court; "your red nose, mournful eyes, large ears, and close-cropped hair all speak of a journey to the silent tomb at no distant day. In a little while, in a few more days, as it were, you will be laid away to sleep forever, and the world will forget that you ever lived."

"Yez, Zur," replied the prisoner, trying to look still more sad.

"Nevertheless, it is my duty, before you are laid away, to send you up for ninety days," said the Court, "and 'Bijah will see that you have a free seat on the wagon."

THE following humorous hints from a correspondent are offered in view of the unprecedented number (over three hundred) of college titles that have rushed like a fresher over the country during the late Commencement season:

D.D.'s may be carried, one in each hand, always ready for exhibition to delighted friends. It is safe to look over the Latin beforehand, with the aid of a friend if necessary, as an easy translation of the M.S. is desirable on such occasions. Nothing is more touching at an evening entertainment than to see a parchment with blue ribbons and magic seal gracefully unrolled upon the table, while the company are charmed with a little speech referring in delicate terms to the "honor conferred," the "recognition of a hard-earned reputation," and the "rising glories of *alma mater*."

D.D.'s may be worn as intellectual shoulder-straps. If the men are *light* and the titles heavy, this mode is recommended for hot weather. Of what use, in fact, are titles if they can not be seen? They are supposed to be the visible *insignia* of glorious triumphs won on intellectual battle-fields. During the war a newly fledged lieutenant could be seen Sabbath after Sabbath sitting alone in the gallery of a large church in

Chicago, his shoulder-straps the admiration of the whole congregation. When Tripp was made adjutant, in order to see how his title sounded, he crawled into an empty barrel, we are told, and shouted at the top of his voice, "Adjutant Tripp!" "Adjutant Tripp!" So a young doctor, to ascertain how his new title would sound in the parish, shut himself up in his little study, and called out as loud as he could without disturbing the neighbors, "Dr. Bugbee!" "Dr. Bugbee!"

This reminds us of the time the good doctor "winked out." One day Bridget rushed into the parlor, full of company, wringing her hands and crying, "Dr. Bugbee is dead!" "Dr. Bugbee is dead!" None having heard of the doctor, there was a solemn pause in the conversation, when Kate, that witch of a girl, said, slowly, "Well, that is bad, but not as bad as if Mrs. Bugbee was dead too!" Then even Bridget was seen to laugh through her tears.

A professor in a Western college had a cat named "Analytical Geometry." As the cat died rather suddenly, it was thought that perhaps its name killed it. Whether the good doctor's death was also hastened by carrying the weight of "honors conferred" is not known. It is known, however, that the corner-stone of the Capitol building of a Western State, on which a multitude of persons seeking immortality had carved their names, fell to pieces in the spring before the building was erected, crushed probably by the weight of respectability.

D.D.'s may be worn in the hat, thus giving the upper portion of the body a swaying motion, like a head of wheat heavily loaded. Care should be taken in such cases not to confound these titles with "bricks in the hat," which also give to the body a swaying motion. Some ships are loaded to the beam, and some doctors are so overloaded with dignity and dogma that they go under. How many doctors could be profited by Rusticus, who warned his studious son against overstudy, by reminding him of that law of physics by which only a given quantity of matter can be put into a given space! So he said only a given quantity of knowledge can be crammed into the head at one time—any more would crack the skull open! A wit has irreverently suggested that there are doctors of divinity now living whose skulls from the pure effects of dogma have begun to crack behind!

Truth requires us to say, however, that some doctors do not regard their parchments with as much deference as the importance of the MS. requires. When Humboldt died his friends found a room full of neglected ribbons and parchments—a sad disregard to "honors conferred."

Colleges generally confer these titles; but there is one instance on record where a D.D. was conferred in another way. When Quantrell was sacking Lawrence he hunted in vain all through that city for a noted abolitionist preacher, asking for him every where, always putting a D.D. before his name. The State University of Kansas has recently put another D.D. after his name. The first title is heathen—the last Christian.

Doctors of divinity are generally said to differ about as much as other people in natural gifts and graces. A professor in a theological seminary in the West is accustomed to tell the following story to his class about once a month:

"A gentleman got off from a ferry-boat in an Eastern city, and walking up to a stranger, said, 'Do you see those two men yonder?' 'Yes,' replied the stranger. 'Well, they are two doctors of divinity in our town, and their preaching only differs in one respect. In their sermons one always goes in at the same hole, the other always comes out at the same hole.'"

A ministerial wit in the West, who has not yet received his D.D., kept a body of teachers convulsed with laughter during a convention with his humorous sayings. One day he happened to mention the fact that he belonged to the sacred profession. One fellow from the country, gasping with surprise at this confession, was heard to exclaim, "A minister! Wa'al, I do declar'! If I was out shootin' ministers, he's the last man I'd snap at!"

The manner of obtaining D.D.'s sometimes employed, if written out, would furnish an amusing chapter.

A prosy minister, member of a board of trustees of an Eastern college, was accustomed for several years, when the time came for conferring honorary degrees, to retire from the board. Having received his D.D., he was never known thereafter to go out during session.

News came one day that a bill had passed the Legislature of Missouri granting a charter to a certain college. On receiving the news a few active friends of the college immediately got together, organized themselves into a board of trustees under the new charter, and after conferring a long-desired D.D. on one of their members, adjourned. News came next day that the bill had *not* passed the Legislature. But this divine, *merely out of respect to his associates*, wore his title to the day of his death.

An eloquent divine went to Washington during the war, but could not find accommodations at the hotels of the overcrowded city. A bright idea flashing over him, he walked up one of the broad avenues and rang the door-bell of one of the finest mansions in the city. A lady coming to the door, the doctor, a man of fine personal appearance, addressed her about as follows:

"Good-morning. I am the Reverend Dr. So-and-so, president of such a college in the West. I am a stranger in the city; have come to the capital on a brief visit; but can not find accommodation at the hotels. Would you be so kind as to refer me to some place in the city where I can find entertainment?"

The lady said, with a pleasant smile, "Why, doctor, we know you by reputation, and should be very happy to entertain you ourselves. Come in."

The doctor went in, and found sumptuous hospitality. After supper the host handed the doctor the Bible, who read a portion of Scripture, and engaged in prayer, the host responding "Amen" from time to time. The prayer grew warm at last with a fervid eloquence, and the "amens" rained down profusely. By-and-by the doctor began to pray for the country, and the "amens" grew fewer and more uncertain; but when he closed with an address to the God of battles and a fervent petition for the success of the Federal arms, "*the amens*," in the language of the narrator, "*dried up very rapidly*."

The family, although Southern sympathizers, treated the doctor with magnificent hospitality

while he remained in the city, and invited him to call and see them whenever he should return.

THE late Hon. Sam Galloway, of Columbus, Ohio, was a remarkably homely man. On one occasion, while dining with a personal and political friend in Chillicothe, the six or seven year old daughter of his host, who had been intently studying Galloway's face, said, loud enough to be heard by all at table,

"Ma, didn't that man's mamma love children mighty well?"

"Why so, my dear?" asked her mother.

"Oh, just 'cause she raised him!"

DURING the late session of the Presbyterian General Assembly in St. Louis the hotels were very much crowded, and so it happened that Colonel W. E. Gilmore, of Springfield, Missouri, was put to bed with a reverend Bourbon Democrat who had a great deal to say about politics.

The colonel listened in silence until the parson began to talk alightingly of President Lincoln, who, he assured the colonel, he personally knew, and that Mr. Lincoln "was a very ordinary man, Sir! honest enough, perhaps, but of no talents, Sir!" etc., etc.

"Your estimate of Mr. Lincoln," replied the colonel, "differs remarkably from that of the rest of the world. It is strange how universally people of all classes have been mistaken! Why, a great many actually regard him as the savior of our government."

"It is a positive *sin*, Sir, to talk of Lincoln as the savior of this country," said the parson. "God Almighty saved the country, Sir! And it would have been all the same if any body else than Lincoln had been President at the time."

"Well, maybe so," rejoined Gilmore; "but then, parson, *I think it required less Divine power to save it through Lincoln than it would have required to save it through—say, old Jim Buchanan, for instance! There was a great saving of Divine power, anyhow.*"

A CORRESPONDENT at Aston, Iowa, says:

Your capital hit at "red tape" in the army recalls a circumstance of the rebellion: At the battle of Chickamauga, General Willich, commanding a brigade, had by some very slight omission incurred the displeasure of General Rosecrans, the commanding general. General Willich was sent for, and notified by the general commanding that he could for the present consider himself under arrest. Then came the following dialogue:

GENERAL R. "General, consider yourself under arrest, and leave your sword here until your case is tried."

GENERAL W. "Yes, general, I will consider myself under arrest, and shust" (here the Germanic of General W. began to explode) "so soon as dis fight's over I'll come and fix him up."

GENERAL R. "But, Sir, I want you to consider yourself under arrest *now*."

GENERAL W. "Of course I do; and, Shiner! Rosecrans, as soon as I gits off this fight, I'll be up and settle this thing."

GENERAL R. "But, Sir, I can't let you go into

this fight. You are under arrest. I will assign a commander to your brigade."

GENERAL W. "You send an officer to fight my boys? He can't do it; they don't know him. Me they know; I teach them; I fight them, and none of the boys would know how to fight or what to do only when I goes with them. My boys belong to me. Yea, *me*, General Willich. *I command the brigade, and I must fight the brigade.*"

By this time the red tape of General Rosecrans had failed, and General Willich was requested to return and "fight his boys," which he did to the honor of himself and the cause. And that was the end of it.

IN the Rev. T. De Witt Talmage's *Old Wells Dug Out*, a volume of sermons recently published by Harper and Brothers, he introduces the following anecdote:

"I saw an account the other day of a little boy who was to be taken by a city missionary, with some other boys, to the country to find homes. He was well clad, and had a new hat given him; but while the missionary was getting the other children ready to go, this boy went into the corner and took the hat he had thrown off and tore the lining out of it. The missionary said, 'What are you doing with that hat? You don't want it. What are you tearing the lining out of it for?' 'Ah!' said the boy, 'that was made out of mother's dress. She loved me very much before she died, and I have nothing to remember her by but the lining.' And so the boy tore it out and put it in his bosom."

The preacher "improves" the incident by asking, "Would you not like to have one shred of your mother's religion to remember her by?" etc., etc., etc.

APPROPOS of the present time, when politicians are about to mount stumps and warn us against the iniquities of the other side, Mrs. Partington has evolved from the depths of her inner consciousness one of those remarkable aphorisms that have so endeared her to the American people. Speaking of a platform orator, she says: "Dear me, how fluidly he talks! I am always rejoiced when he mounts the nostril, for his eloquence warms every cartridge in my body."

A GOOD story is told of Rev. Mr. B——, of —, in Massachusetts:

An old lady in his church was told by some one who did not like his theological sentiments that he was an *Arminian*. She was greatly distressed at the statement, and went at once to her pastor to ascertain from himself if the charge was well founded.

"Mr. B——," she said, "I've heard that you are an *Arminian*, and I've just come right to yourself to know if it's true."

"*An Arminian*, my good woman," said Mr. B——: "*why, I was born in Danvers!*"

"There, there," said the old lady, hastening back to her informant, "I knew it couldn't be so, and it isn't; for I went and asked himself, and he told me he was born in Danvers!"

The old lady evidently thought the term *Arminian* had some relation to geography, and that her minister's birth in Danvers settled the question.

HARPER'S NEW MONTHLY MAGAZINE.

No. CCXCIV.—NOVEMBER, 1874.—VOL. XLIX.

THE BAHAMAS.

HOPETOWN HARBOR, ABACO, FROM THE LIGHT-HOUSE.

WE had been steaming south in the fine steamer *City of Merida* for two days, followed by raw northerly winds, when the wind suddenly shifted to the south. The change in the temperature was magical. Overcoats were thrown aside at once, and all hands were called aft to spread the awning; the waves went down, the clouds disappeared, the cold gray color of the sea turned to azure, and every breath of the "sweet south" seemed to sing a welcome to enchanted isles where reigns perpetual summer. On the fourth night we passed the Elbow Light, on the northeast angle of Abaco, and sighted Hole-in-the-Wall at midnight. Many of us also now saw for the first time the Southern Cross gleaming over the bow, while the North Star and the Bear were still visible on the quarter. At dawn a long, low line of green keys lay abeam, and soon we saw the graceful groves of cocoa and the spires of Nassau gleaming in the sun, now rising in a cloudless sky. The steamer drew too much water to go over the bar, and therefore came to anchor outside of the lighthouse at the western end of Hog Island, a beautiful coral islet three miles long, which, by furnishing a breakwater cheaper and safer than that of Plymouth or Cherbourg,

enables Nassau to claim the best port in the Bahamas. Boats of all descriptions darted from the shore, manned by negroes, presenting sometimes a diverting variety of raggedness in the slender wardrobe prescribed by conventional propriety rather than by any need of protection against the weather. As we rowed in over the bar the first object to attract our attention was the absolute clearness of the water—hyaline, as a poet might truthfully call it—which enables the eye to see every thing on the white sand bottom, and the vivid, almost dazzling, green hue of the surface, mottled with varied tints of the same color, giving exactly the appearance of polished malachite. On landing, amidst a hubbub of negroes, we found the streets of almost snowy whiteness, intensified by the glare of the white walls, so that straw hats and shade umbrellas were at once called into requisition. One very soon gets accustomed to this, however, and the effect could be greatly modified if the worthy citizens would only content themselves with lower walls around their gardens, or would color those they have with some sober gray. This is evident when one rides out beyond the city, where the roads are of precisely the same character, but much more tolerable,

Entered according to Act of Congress, in the year 1874, by Harper and Brothers, in the Office of the Librarian of Congress, at Washington.

VOL. XLIX.—No. 294.—51

because lined with verdure instead of staring white walls.

It was a charming transition from the glare of the streets to the cool, spacious verandas of the Royal Victoria Hotel, which occupies noble grounds on an elevated position commanding a superb prospect over the city, the harbor, and the ocean beyond, and a breakfast of turtle steak, chocolate, and tropical fruits freshly plucked reminded us again that for a while at least we were free from the furnace-heated prison-houses of the North, and the icy, capricious, penetrating winds of our Northern spring, if it is not a misnomer to call it spring.

Nassau, as is generally known, is not only the chief town of the island of New Providence, but also the capital of the Bahamas. There the Legislature meets and the Governor resides. The Government House is pleasantly situated, and the approach to it is appropriately adorned by a colossal statue of Christopher Columbus. Governor Henessy, the present incumbent, is a courteous and intelligent gentleman, with enlightened views regarding what can promote the welfare of the islands, and those who have attended the elegant entertainments at the government mansion can testify to the kind and graceful hospitality of Mrs. Henessy. The Legislature is elected once in seven years, and generally includes several colored members. The black population largely predominates, for not only did the early set-

tlers own slaves, but many cargoes of captured slavers were taken to Nassau and left there to shift for themselves. They are generally tall and well formed, and very civil in their demeanor, and great crimes are very uncommon among them. Theft and licentiousness are their chief "irregularities;" but these vices are not confined to the Bahamas, "the more's the pity," and it is creditable to the people that the spacious and handsome prison recently constructed at high cost is half empty, which gave the jailer a curious uneasiness, because, as he said to me, he had a piece of road-mending to be done in the broiling sun of mid-day, and the number of criminals under his charge was not equal to completing it within a given time! The old prison, a rather picturesque building resembling a mosque, is now turned into a public library; the cells, once filled with pirates and boozy blockade-runners, now form the alcoves of a very well arranged library, stocked with some six thousand volumes, generally well selected, and open to the use of the public. As this institution is near the hotel, it is of great advantage to strangers sojourning on the island.

Some of the mulattoes display considerable talent as artisans. The shell-work they produce shows exquisite taste and skill; and Bethel, the best ship-builder of the group—and a very clever man he is, too—is of the colored persuasion. Captain Stuart, who commands the light-house and revenue

GOVERNMENT HOUSE.

schooner, is a man of commanding appearance and marked intelligence, and is regarded by the negroes of Nassau as "a sort of god round heah," as they phrase it, because he foretold the great hurricane of 1866. The colored people of Nassau are much addicted to church-going, and it is pleasant of a calm evening to hear the singing from the churches all over the town. Poppy Rumer, as he is familiarly called, a quaint, unique character, is their most noted preacher, and many of his curious sayings and eccentricities are current. He is in addition a man possessed of intellectual power, and is thoroughly in earnest. Old Gunnybags is another noted character of Nassau, a modern Diogenes, who takes up his residence in Grantstown, the suburb affected by the black gentry. The old fellow, not to speak disrespectfully of him, was crossed in love in his earlier days, it is said, since which melancholy event he has worn a suit of gunny bags of a fashion not borrowed from Paris, and has slept in a hogshead laid on its side under a wall by the way-side; owing to the narrowness of his quarters and the heat of the climate, he cooks his meals in the open air. A little beyond are the places called Jericho and Jerichobeyond-Jordan, which show what thrift the negro can display on occasion.

As a class, however, the negroes of the Bahamas are far more superstitious than religious. They are great cowards at night, shutting up their cabins tight as a drum to keep out the wandering powers of darkness, and their belief in fetichism is almost incredible. The obeah men drive a thriving business, and it is seldom a sponging boat goes to sea without first enlisting the valuable aid of the man-witch or warlock. They are said to be lazy, and certainly they seem to take life very easily, lying on the ground sometimes for hours under the full blaze of the noonday sun, chewing the end of a sugar-cane, or brawling in grandiloquent and often meaningless rodomontade at the street corners. But there is little need of exertion when it takes so little to supply their immediate wants. The pastoral of one of the ritualistic priests, giving directions for the observance of Lent, created "inextinguishable laughter" in Nassau last spring, for among other follies he forbade the eating of sugar. As sugar-cane forms the staple article of food with the negroes, a strict observance of his directions would have been followed by lamentable results. But I think the charge of laziness unfounded, if one but considers the severe labor the negroes often accomplish, as, for example, in the sponge fishery, which gives employment to the owners and crews of five hundred licensed craft of ten to twenty-five tons burden, and is carried on with some risk from the weather, and much hardship, for the sponges are two or three fathoms below the surface, and must be torn

OLD GUNNYBAGS.

from the rocks with hooks attached to long poles. The position of the sponges is ascertained by means of a water-glass, which is a simple oblong box a foot square, open at the upper end, and containing a pane of glass at the other; on holding this perpendicularly over the water one can see every thing through it as clearly as in an aquarium—fish, sponges, coral, or shells. The Bahama sponges are chiefly of four sorts, sheep-wool, which is the most valuable, reef, velvet, and glove, and although inferior to the finest Mediterranean sponges, are very strong, and serviceable for washing carriages, surgery, and the like. The sponge boats usually get in on Saturday, and the sponges are assorted in the markets, each boat-load and variety by itself. On Monday they are disposed of at auction, only members of the sponge guild and those making genuine offers being permitted to bid, which is done by written tenders.

Wrecking is another branch of business for which the Bahamas have long been famous, owing to their intricate navigation. At one time this was very lucrative, but it has been falling off of late years. Formerly every thing saved from a wreck was sold at auction in Nassau; now all goods not of a perishable nature, and undamaged, are reshipped to the port of destination. Collusion between ship-masters and the pilots was also frequent, but increased vigilance on the part of the insurance companies has interfered with this nefarious business, while

SPONGE YARD.

the numerous light-houses recently erected by the government, with noble self-sacrifice, have operated in the same direction. The uncertainties attending money-making in this precarious way have their effect on the character of the people, as is the case when the element of chance enters largely into business; the prizes in the lottery are few, but are occasionally so large as to excite undue expectations, and thus unfit many for any pursuit more steady but less exciting. For months they will cruise about, watching and hoping, and barely kept alive on a scant supply of sugar-cane and conchs; then they fall in with a wreck, and make enough from it, perhaps, to keep them going another year. It is not a healthy or desirable state of affairs.

One Sunday morning a commotion arose quite unusual in the uncommonly quiet and orderly streets of Nassau. There was hurrying to and fro, and the sound of voices shrill and rapid, caused by some sudden and extraordinary excitement. The wharves of the little port were thronged and positively black with eager negroes, and great activity was noticeable among the sloops and schooners. Some were discharging their cargoes of sponges, shells, fish, and cattle in hot haste; others were provisioning or setting up their rigging; others again were expeditiously hoisting their sails and heaving up their anchors; while the crews, black and white, sang songs in merry choruses, as if under the influence of great and good tidings. What could it all mean? It meant

ENTRANCE TO PORT NASSAU.

BLACKBEARD, THE PIRATE.

this: another vein in the Bahama gold mines had been struck, another lead discovered, and the miners were off to develop it, each hoping to be the lucky one to turn out the largest nugget, and retire on it for life. In other words, news had just been brought of the wreck of a Spanish vessel on the Lavadeiros Shoal, one hundred and fifty miles away. She was none of your wretched colliers or fruiters, with a cargo valueless to wreckers, but a ship whose hold from keelson to deck beams was packed with a thousand tons of choice silks and stuffs for the black-eyed brunettes of Havana, just enough damaged to oblige them to be sold at auction in Nassau, where all wrecked goods must be brought for adjudication. Verily, we thought, "it's an ill wind that blows nobody any good;" the misfortune which has wrung the soul and perhaps ruined the happiness of one or two in far lands has made glad the hearts of several thousand darkies, mulattoes, and whites in the Bahamas. Here is a text for La Rochefoucauld, the modern cynic.

The manufacture and exportation of salt has also been one of the most lucrative pursuits of the islands. With the single exception of Andros Island, which seems to be still in a formative state, there is not a freshwater lake or stream in the whole group; but lakes of some size, containing more or less salt, are found on many of the islands. Vast quantities of salt have been made at Exuma, Long Island, Rose Island, Inagua, and Turk's Island. The latter is now under the jurisdiction of Jamaica, and the production of salt at the other islands is at present in a very languishing condition, the result of the high duties imposed by our government on the article, which act in two ways,

like a two-edged sword, forcing our people to pay a higher price than they otherwise would for what salt they consume, and effectually crippling one of the most important trades of the West Indies.

But the branches of business which in past years have brought most wealth into Nassau have been buccaneering, privateering, and blockade-running. The buccaneers were at one time in high feather there; they bought up or captured the governors, toasted and roasted the people when recalcitrant, and hiding behind the low keys in their little vessels, sprang out, spider-like, on any unwary trader quietly sailing by. Blackbeard, who is represented in the accompanying cut from an old print, was the most celebrated of the ruffian chiefs who at various times ruled over these islands. An immense silk-cotton-tree stood until within a few years on Bay Street, in Nassau, under the broad branches of which he administered high-handed justice, and caroused with his harridan dames. He was finally killed off the coast of South Carolina in a desperate fight, and the land had rest for certain years, the escutcheon of the colony bearing since that time the significant legend, "*Expulsis piratis, restituta commercia.*"

After the pirates came the privateers of the Revolution. Fincastle, Lord Dunmore, when he left Virginia came to the Bahamas, of which he was appointed Governor, and he was followed by many Tories. Although not a great man, his is one of the most noted names connected with the history of the Bahamas. Traces of his administration still exist in many places. There is a quaint fort named Fincastle behind the hotel, curiously resembling a paddle-box steamer, and the country-seat where he resided, now called the Hermitage, is still standing by the water, admirably situated, surrounded by a noble grove of oaks and cocoa-palms. Royal Island, having a snug little harbor easy of

FORT FINCASTLE, NASSAU.

THE HERMITAGE, COUNTRY-SEAT OF LORD DUNMORE, AT NASSAU.

access, was a rendezvous where arms and stores were concealed, and royalist privateers made it a common resort during the American Revolution. An old stone house still remains there which has doubtless witnessed many wild, mysterious scenes in days gone by.

We may add in passing that one of the most noted characters who ever figured in Nassau was Blennerhasset, notorious for his relations with Aaron Burr. It will be remembered that after the excitement produced by the trial had blown over, Blennerhasset passed off the scene; but Blennerhasset still lived. There is excellent authority for stating that the Bahamas, a refuge for so many rovers and adventurers, gave him a shelter during the closing years of his life. Leaving his wife, whom the classic oration of Wirt has made famous, to care for herself, he there assumed the name of Carr, and received the position of Attorney-General. The secret was known to but few. Another wife consoled him for the absence of Mrs. Blennerhasset, who once discovered his retreat, but was spirited out of the island, and maintained elsewhere on a separate allowance. Those were roistering days, when gentlemen drank hard, played high, and fought duels like devils—days now fortunately passed, it is hoped, forever, at least in Nassau—and Blennerhasset acted his rôle well, by no means a looker-on in Vienna.

And now we come to the most remarkable episode in the history of the Bahamas, the part they played in the Southern rebellion, about which a volume of entertaining information could be written. On the 5th of December, 1861, the first Confederate vessel arrived from Charleston, with 144 bales of cotton; and between that time and the close of the war 397 vessels entered Nassau from Confederate ports, and 588 sailed thence for Southern ports. Of these the steamers were to the sailing vessels in the ratio of three

to one. Of the clearances 432 were ostensibly for St. John, New Brunswick, and of the total number only thirty-two carried the Confederate flag—a pretty fair indication of the amount of complicity and lying practiced about that time by her Majesty's subjects and officials in Nassau, and of the value of the British capital engaged in this unjustifiable traffic. In nothing is this connivance on the part of a neutral power more evident than in the case of the *Florida*, or *Oreto*, which was three times seized by the commander of the British man-of-war *Bull-dog*, and three times released by the decision of the insular Admiralty Court on grounds afterward prudently disavowed by the home government. The plea of Mr. Anderson, the counsel for the prosecution, was culpably weak, and it is a well-established fact that \$80,000 were brought from England and divided between the late Chief Justice Lees (who received \$20,000) and other parties in Nassau engaged in this iniquitous transaction, a legal luxury for which England has since paid several millions.

During the Confederate years the little town actually swarmed with Southern refugees, the captains and crews of blockade-runners, cotton brokers, rum-sellers, Jews and Gentiles of high and low degree, coining money and squandering it as if they owned the secret of the transmutation of metals. They played toss-penny in the verandas of the Royal Victoria Hotel with gold eagles! The shops were packed to the ceilings; the streets were crowded with bales, boxes, and barrels—cotton coming in, Confederate uniforms and pills of lead and quinine, to pepper patriots and patients, going out. Semmes and his bold boys twisted their mustaches at every corner, danced involuntary reels and hornpipes from groggery to groggery, and from the waxed floors of the Government House, where they were

always sure of a cordial reception, to the decks of the *Banshee* and *Alabama*, or brandished their revolvers in the faces of Union men, whose lives were too uncertain to insure thereabouts in those roistering days. Aspiey little paper called the *Young Punch*, edited by a witty Confederate in Nassau, gives a glimpse of the state of things then existing, and shows that there was some real fun connected with blockade - running. A rather grim joke was played at the expense of the rebels *via* Nassau. A large invoice of prayer-books was brought from England and reshipped

to Charleston with the express understanding that they were suited to the devotional wants of the Confederacy. Quite a number had been distributed before it was discovered that the prayers for the President and Congress of the United States had not been altered!

It is to the disgrace of our country that some of the goods smuggled into the Confederacy *via* Nassau were from Northern ports, as, for example, ship-loads of pistols brought from Boston in barrels of lard. On the other hand, there are many instances of noble patriotism on record. The name of Timothy Darling, Esq., is deserving the honor and respect of every true American. A native of Maine, but long a resident of Nassau, a British subject, and one of the principal merchants and politicians of the Bahamas, he was more than once offered the agency of the Confederacy, and always firmly declined—a proposal which, as the event proved, would have been worth many hundred thousand dollars to him.

During the continuance of the war the weather was exceptionally fine even for the West Indies; no hurricanes and but few gales of any violence occurred. Every thing went on merry as a marriage-bell, and the policies of vessels clearing for Nassau might well have omitted the words "wind and weather permitting." But in the year succeeding the fall of Richmond, 1866, occurred the most terrible hurricane experienced in those waters during this century. The

PUBLIC LIBRARY, NASSAU.

ocean rolled completely over Hog Island into the harbor in surges so enormous that the crest was even with the gallery of the lighthouse, sixty feet above the sea. Houses and forests went down before the wind like reeds; many which withstood its force when it blew from northeast collapsed when it shifted to southwest. In twenty-four hours the city was like a town sacked and burned by the enemy, and a large part of the wealth accumulated during the war had disappeared into thin air. The island has never entirely recovered from the blow. Those who are inclined to believe in special providences may find food for reflection in the circumstance that no Union man had his house wrecked or suffered any considerable loss. The dwelling of Mr. Adderley, an Englishman, whose principles forbade his engaging in any Confederate business, stood uninjured, while substantial buildings adjoining on either side were leveled to the ground. This is, at least, a curious coincidence. It is not to be supposed, however, that hurricanes or violent weather are frequent in the Bahamas. Formerly they occurred once in two or three years, in August to October, but now blow at longer intervals. There has been no hurricane since the one of 1866. The prevailing winds are north to south, round by east, taking the form of trade-winds from the eastward during a large part of the year, and it is rarely that the heat of mid-day is not cooled by a breeze from the sea. Great and sudden changes in the

weather are unknown; the rainy season begins in May, and during the summer a moderate quantity of rain falls, but from October to May the climate is dry and the temperature equable, ranging from seventy-three to eighty-five, and the invalid who goes there for consumption or neuralgic and rheumatic complaints always breathes a pure and health-inspiring air, free from either excessive moisture or malaria. For those flying the rigors of the North we can imagine no climate offering greater attractions and advantages within easy distance than that of Nassau, even the famed charms of Florida suffering in comparison, owing to its excessive rains and changeable temperature at the season most desirable for invalids, which, other things being equal, are always greater on the main-land than on a small island, where the air is equalized by the surrounding sea. It is fortunate for those who unhappily need such a resort that they can find in Nassau ample accommodations, and almost every essential comfort. The Royal Victoria Hotel, already alluded to, was erected by the colonial government in 1861 at an expense of \$130,000, and has since then been visited by many of our first people. The rooms are cheerful and neatly kept, and it is the aim of the government that it should be all that invalids, tourists, and pleasure-seekers could desire. The facilities for yachting and fishing at Nassau are admirable, fast yachts being al-

ways on hand, while the neighboring keys present charming resorts for picnic parties, and the variety, beauty, and savage character of many of the fish render fishing a sport of more than ordinary interest. The beautiful Lakes of Killarney, in the interior of New Providence, abound with wild duck, and those who care to cruise as far as Green Key will find lots of pigeon-shooting.

The drives around Nassau are also very charming, often leading by the sea-side. There are few scenes more replete with quiet but exquisite and satisfying beauty than the drive to Fort Montague toward sunset; on one side, groves of palms, lithe and graceful as nymphs, gently swaying their undulating plumage in the evening wind; on the other side, the sea murmuring on the yellow sand; in the distance, the city and the port limned against a sky ablaze with the glory of the tropics. The roads are always excellent, and of such a nature that the horses, when shod at all, are only shod on the fore-feet. With a few exceptions, they are small and meagre to a degree that renders Rosinante corpulent in comparison, being fed chiefly on sugar-cane stalks. It is curious that on islands generally the equine race, while exceptionally hardy, has a tendency to dwindle in size. But while appearances would lead one to expect a similar condition in the vegetation of the Bahamas, the reverse seems to hold good. With but one or two exceptions the islands are low calcareous

ROYAL VICTORIA HOTEL.

SILK-COTTON-TREE, NASSAU.

rocks, probably the summits of peaks once rising far above the sea, and enlarged and re-elevated by coral insects since their submergence. The limestone is gray, and so hard as to strike fire when exposed to the weather, but soft enough below to be shaped with saw and hatchet, while the layer of soil scattered over it is so thin as to make it impossible to understand how any thing but scrub and goats could flourish upon it. Any Yankee so enterprising or hare-brained as to introduce the latest improved plow into Nassau would be considered a fit candidate for the Insane Asylum behind the bishop's residence. And yet there is not a plant of the tropics that may not be made to grow there, and many of the temperate zone. The mahogany is common, chiefly on Andros Island, and might be made a lucrative branch of commerce if there were roads to transport it to the sea. The variety called the horse-flesh is exceedingly durable, and is exclusively used for the frames of Bahama vessels. It seems to rival oak for this purpose. The pine reaches a good size in the interior of New Providence, where the palmetto is so intermingled with it as to present a suggestive blending of the vegetation of two zones. The wild pine-apple or air-plant, which lives in the branches of forest trees, holding sometimes a quart of dew in its silver-gray bowl of spiky leaves, is also an interesting object. The satin-wood, lignum-vitæ, yellow-wood, fustic, and cedar grow every where,

and cocoa and date palms abound, together with the *Ficus indicus*, a species of banyan. Of the East Indian banyan a very perfect specimen exists near Fort Montague. The banana, tamarind, sapodilla, mango, coffee-plant, guava, custard-apple, orange, sugarcane, mammee, and almost every vegetable production of the tropics grow more or less in the Bahamas. The oranges of San Salvador or Watling's Island are exceptionally sweet. How such vegetation can thrive on a mere basis of rock is a perpetual mystery. I visited an orange plantation outside of Nassau where the gray rock was completely honey-combed with depressions called cave-holes. On the bottom of these was a little soil, and there the trees grew and flourished in clumps of eight or ten. One of the most singular trees in the Bahamas is the silk-cotton, which attains a large size, not only reaching a good height, but spreading laterally over a wide surface, and buttressed at the base like a Gothic tower, evidently an adaptation by nature to support it in the absence of any perpendicular hold it might have in a deeper soil. The roots also extend to a great distance, creeping over the rock like vast anacondas, and clinging to every crevice. The bolls are full of a soft brown cotton, resembling floss silk, but not adhesive enough for use. One of the most remarkable specimens of this tree is one behind the Government House. Its roots extend nearly the eighth of a mile, and then

shoot up into another magnificent specimen in the grounds of the Royal Victoria Hotel, in whose branches a large platform has been constructed.

The cactus and aloe are, of course, common, and especially the Sisal aloe, from which manilla rope might very well be manufactured with a little enterprise, as might also be added regarding the production of castor-oil, as the plant grows abundantly on the islands. The pine-apple flourishes in San Salvador and Eleuthera, and the chief supplies of that delicious fruit which reach our markets are from the latter island.

The cruise to Harbor Island and Eleuthera is one of the most interesting within easy distance of Nassau. It can be made in a yacht or in one of the many little schooners constantly plying to and fro; keys are always in sight, and a lee can be made at any time; while one can return by way of Abaco, where a cruise in the sounds on either side of that island, and a visit to the curious little settlement called Hopetown, inhabited by descendants of the buccaneers, present various attractions. Spanish Wells, on the island of that name, is a singular place. Planted on the low beach, the houses are huddled together in inconceivable disorder, and built on posts to raise them above the sea waves, and also to keep them free from the incursions of the hermit-crabs, which live in the rocks in vast numbers, and often come

out at night and prowl over the land. Before every house is an oven—it was baking-day when we touched there—and the smell of fresh bread could be observed before we got to land. It was also ironing-day, and before every cabin flat-irons were ranged on coals. The women wear the peculiar oblong paste-board sun-bonnet which was common years ago in our rural districts, called in some places "rantaruskoots," and their appearance is not especially attractive; but then I did not see them in their best bibs and tuckers, and dress does make a difference. The school-house is thatched with palm leaves, and is a quaint little building. The school-master told me they lived on conchs and fish, and he had not tasted meat for two months. If fish makes brain, the Bahamians ought to be intellectual to a degree; but facts do sometimes conflict with theories. From Spanish Wells the track lies over a succession of coral reefs, through which the passage is of the most intricate character; one of the worst places, a long zigzag reef, is called the Devil's Backbone. Were it not for the extraordinary clearness and vivid malachite tints of the water, and that wherever a reef rises near the surface it is indicated by a complementary color of green, it would be next to impossible for a vessel to work into the port. The brilliance of these tints at mid-day also causes the deep water beyond to appear purple; and this tint, in a milder form, is carried into the sky,

STREET IN NASSAU.

HARBOR ISLAND.

which is rosy to the zenith on a bright day. The port of Harbor Island is spacious, and so protected by reefs and bars at each entrance as to be the safest in the world for vessels not drawing over nine feet of water, after they once get inside of it. It is formed by a low island stretching across a bight at the northeastern end of Eleuthera. On the inner slope of this isle is situated Dunmore Town, containing 2500 inhabitants, next to Nassau the largest settlement in the Bahamas. A very pleasing little place it is, encircled by beautiful cocoa-nut groves, and dreaming by the green water in an air of solitude and peace which is very bewitching to one who is weary of the rush and giddy whirl of the nineteenth century, while the cool trade-winds always moderate the heat. On the ocean side of Harbor Island is the finest beach I have seen, of very fine, delicate pinkish sand, hard as a floor, a glorious galloping ground for the half dozen ponies in the place. The people depend for fresh-water chiefly on wells sunk in the drifted sand immediately back of the beach. When the well is dug it is protected from falling in by three or four barrels, one over the other, and the rude curb is guarded with a padlock. The sea-water filters through the sand into these wells, and becomes sweet as ordinary spring water. A gale of wind destroys the wells once in three or four years, and excavating new ones is a dangerous process. The inhabitants gain a livelihood cultivating pine-apples on Eleuthera. A fleet of two hundred boats is owned in the settlement. Every morning at sunrise this little fleet spreads its wings to the trade-wind, and wafts eight hundred men and boys, black and white, to the lovely beach and cocoa-nut groves on Eleuthera, two miles away; every night they return. The pine-apples begin to ripen in April, and only grow to advantage on a peculiar red soil that is always thin, and is found in but few dis-

tricts. The plantations are on undulating ground, the highest in the Bahamas, and are skirted by mahogany, logwood, and cocoa-nut groves, overgrown with the brown love vine, and abounding in scarlet-flowered hop, clitoria or wild pea, and various other flowers, while the song of the brown thrush resounds in every thicket. A pine field when the pines are ripe looks as if it were on fire, the scarlet of the spiked leaves forming a flame-color with the vivid orange-yellow of the fruit. There are two principal varieties of the pine-apple, the scarlet and the sugar-loaf, the latter of which is the best.

Some charming excursions may be made from Harbor Island: one to the Glass Windows, a limestone arch eighty-five feet above the sea. The walk from Bottom Cove to the arch is remarkable for the beauty of the land forms, the whole effect being heightened by the peculiar stalks of the aloe rising here and there, like solitary bronze columns, lifting a massy coronal of golden flowers against the sky, while on one side, owing to the narrowness of Eleuthera at that spot, the green water of the coral reefs is close at hand, and on the other actually blue water, for Eleuthera is on the extreme edge of the Banks, serving for some seventy miles as a breakwater for the rest of the group against the vast surges of the Atlantic, which rise there suddenly sometimes without any wind, and last for several hours. The natives call these windless risings of the sea rages; they are probably caused by a heavy storm blowing at a distance. In 1872 a very extraordinary tidal wave rose without warning at the Glass Windows, washing under the arch and entirely over the island, carrying away several young people who were enjoying a picnic there. The account of the rescue of one of them is a thrilling and remarkable story, too long for narration here; but those who visit Harbor Island will find Mr. Cole, the intelligent and courteous school-master.

quite willing to repeat the narrative of an astonishing adventure, of which he was himself an eye-witness. Near Gregory's Harbor is a cave extending 1100 feet under-ground, enriched with stalactites of a brilliant brown hue. It is really worth visiting. There is also a large cave at Long Island, besides several smaller ones on other islands of the group. We may add before leaving Harbor Island that the traveler can find tolerable accommodations there at the house of Mrs. Stirrup. The cuisine is by no means elaborate, and the rooms are not sumptuous, but they will do for a week or two. South by east of Eleuthera is Cat Island, or Guanahani, celebrated as the land first seen by Columbus, and called by him San Salvador. Most of our readers must here be prepared, however, for a surprise, when it is stated that in all probability it was not Cat Island, which Columbus named San Salvador, but Watling's Island—a smaller isle a little more to the southward and eastward. The facts in the case are these: contrary, probably, to the general opinion, it has never been definitely known which was the island entitled to the honor; but about fifty years ago, when historians were busy with the voyage of Columbus, they undertook to settle the question by comparing his journal with the imperfect charts of the Bahamas then existing. Navarette fixed on Turk's Island, which later investigation has proved to be erroneous, while Irving, supported by the strong

authority of Humboldt, argued for Cat Island, and since then this has been generally accepted as San Salvador, and it is so designated on our charts to this day. But the English reversed their opinion some time ago, and transferred the name of San Salvador to Watling's Island, and it will be so found on their latest charts. The reasons for this change seem conclusive. Lieutenant Beecher, of the English navy, proves conclusively that Cat Island can not be San Salvador, and that Watling's Island answers the conditions required better than any other island lying in the track of Columbus. His two strongest reasons against Cat Island are that Columbus states that he rowed around the northern end in one day. The size of Cat Island makes this physically impossible there, while it is quite feasible at the other island. He also speaks of a large lake in the interior. There is no such water on Cat Island, while such a lake does exist on Watling's Island.

The lamented Agassiz contemplated an exploration of the Bahamas; and that there is abundant room for scientific investigation in the botany, shells, fauna, and perhaps the geology, of the group is evident at a glance, for they have never been thoroughly investigated. Catesby's work on the fauna of the Bahamas is valuable as far as it goes, but can hardly be called complete. Nassau, as a sanitarium for invalids, can not be too highly recommended.

GLASS WINDOWS.

SIBYLLA CUMANA.

By COMMANDER WILLIAM GIBSON, U.S.N.

MOON-CURVES of shore, and promontories and isles.
 A many-purpled sea flowing in and round.
 Wrecks of antiquity and yet elder myth.
 A rubbish, half on land and half in sea,
 Of Rome's once sumptuous sea-side luxury.
 Phlegræan fields, where Titan force still heaves
 The uncertain bases of the vernal hills.
 Volcanic bowls, smouldering and boiling yet,
 Or brimmed with cool oblivion of the wave.
 A ghastly tunnel in the sunny cliff
 Of one fair lake that bears Avernus' name.
 A narrow chamber of Cimmerian gloom
 And Phlegethonic steam (the Sibyl's grot).
 A green hill, crowned with venerable walls
 Of an Acropolis, and a lonely shaft
 Of fluted Doric, where Apollo's fane
 (The Sibyl's lover erst and tutelary god)
 Was reared by Dædalus, hither voyaging
 With wings, as fabled, or invented sails.
 And the hill honey-combed with labyrinths
 Of caverns, opening on the sunset sea
 (The hundred mouths of Sibylline oracles).
 The Acherusian lake. The Elysian fields,
 Clothed in the delicate atmosphere of spring,
 Sprouting with young vines, redolent of the fruit
 And flower of orange, true Hesperian gold,
 And the wide whisper of the violet.
 A round and vaulted ruin, temple or bath
 In times imperial, where two women danced
 The tarantella to a tambourine,
 That echo made orchestral: one a girl,
 Like a Bacchante in abandonment
 To her own grace, with pure Hellenic face,
 And plash of blue-black hair, and flashing eyes;
 And one a weird sexagenarian crone—
 Types of the Sibyl in her youth and age.
 These reminiscences of a long day
 By Baiæ's and more ancient Cumæ's shore
 Set me to dreaming of the mystic maid
 That sold the books to Tarquin. Me she led
 To no ancestral and prophetic shades,
 But through the gates of Sleep, ivory or horn,
 She brought me, with the scent of roses dead,
 One Sibylline leaf—a poem of her youth,
 Set to love-music by the Lyric god.

And as I read, or, rather, as the words
 Made subtle melody to my inner ear,
 I saw a maid of pure Hellenic face,
 And liberal hair the hue of starlight waves,
 Like my young contadina, but more fair—
 And how unlike the sweet and solemn eyes!
 The Graces, the wise Hours, and Harmony
 Modulated her mien; the perfect pose
 Of drooped head, flower-like on the swan-soft throat
 And shoulders; every undulating line
 Of beauty flowing from her virgin zone
 Clasped 'neath the ripening apples; the pure limb
 Bared by the looped-up robe; and sleeveless arms,
 A moulded music lessening to the hand,
 A lucid arch in sunlight, that threw half

Her face in rosy shadow, while the other
 Hollowed a dainty cup of warm wet sand,
 Glistening like diamonds. For the fervent West
 Ran in white splendor over Cumæ's beach.

This solitary Figure—and a Voice,
 Like the Greek chorus, in my dreaming ear.

Phœbus Apollo, beautiful Apollo,
 His golden locks laved in Castalia's fountain,
 With glitter of feet and of his shapely tunic,
 To me, that eve, out of a shining haze,

Moved, and spake wingéd words: "O youthful Sibyl!
 The wise soul and the tender charm, in shadow
 Of thy sweet brows, constrain me to thy service.
 Speak! is there any boon a god may give?"

I answered: "Life is brief, and death is dreadful.
 My thoughts, far-darting as thy shafts, O Phœbus!
 Pierce the veiled Ages—I fall at the threshold.
 I would my years were many as are these sands!"

Then he: "The grudging Fates exact conditions.
 Pause: they demand therefor a virgin Priestess.
 Years I can give, not fadeless youth: youth withers
 With the renunciation of young love.

"Lo! I that, in the deep folds of Parnassus,
 Am Lord of Song and Divination, warn thee.
 Erato's mirth, and not the Pythia's fury,
 Should mould the lyric of thy life. Expand,

"O Rose-bud, to the sun-warmth! Flower to flower,
 Goddess-like, lean to me in frank surrender
 Of balmy breath and bosom; for my passion
 In a rich sunset's rose descends on thee.

"Choosing the ephemeral rapture of the roses,
 Fertile of other roses, other raptures,
 Fulfill thy womanhood. Trust me. Like the Pleiads,
 Wed with a god, and night may win a star!"

Thus said or sang—for all his words were music—
 Striking a golden lyre with golden plectrum,
 The Lord of Light. And chanted, Io Pæan!
 The dear heart and the mind within my breast.

He drew me to him, one immortal moment
 Folded in unconsuming night of fire,
 Like a live brand, thrilled by the breath ambrosial
 And the relentless tyranny of his kiss.

Ai! Ai! the sweetness of it! No accession
 Of maiden shyness moved me; but strange horror
 Suddenly shivered through the soft desire,
 And wrenched me shuddering from the god's embrace.

And he made moan: "Unblest in love and friendship,
 My monuments are Hyacinth in flower,
 Lencothoe's frankincense, and Daphne's laurel.
 O Sibyl! cruel to thyself and me,

"The Parcæ do but fright thee, being jealous:
 Thy choice is free." Ai! Ai! the sadness of it!
 For something hardened in my breast. I answered,
 Coldly: "Forgive me, Phœbus, and farewell!"

"If pure and pale as lily-of-the-valley,
 Chaste as the rose-bud with its folded petal,

"HE DREW ME TO HIM, ONE IMMORTAL MOMENT."

And cold as rose or lily carved in marble,
Must be thine oracle—I am content."

Deep voices in the hills muttered approval;
The wide skirts of a goddess rustled near me;
Wings of a mighty eagle, swooping o'er me,
Darkened the world: it was the bird of Jove!

An angry Sun-god, nevermore my wooer,
Left the lone beach to shadows and to voices;
With shadows and with voices lonely ever,
The long, slow years have made me what thou see'st.

Then—with that deep-dissolving power of dreams
To make the mutable seem natural
As are the unfluctuating forms of life,
To fuse yet not confuse identity—
The Sibyl was an ancient woman, like
In little to the maiden of the shore.
A turban crowned the centuries on her brow
Wave-marked, as are the rocks; her features, worn
With vigil, fast, and hunger of the heart,
Had lost the memory of mobile grace;
And all the peach-bloom was a parchment scroll,
Wrinkled and written o'er with awful things.
But yet her eyes were lustrous as in youth,
Far-looking, listening, lofty, as if she heard
Voices from a sublimer sphere, and saw
Into the infinite Silence yet beyond,
Wherefrom we came, and whereunto we go.

One Figure, altered yet the same—a Voice
Of mournful cadence in my dreaming ear.

Oh, wisely for the welfare of mankind
Is Isis veiled! We, from the world apart,
Gain but a glimpse—and never smile again!

Gain, at this price, half-knowledge worse than none:
As moonlight is more dangerous than the dark,
Because deceptive, to the mariner.

One with Earth's life-voyage and vicissitudes—
Its wake the setting suns, its mast-head peaks
Rolled heavily against the rosy dawns—

Isis is all that hath been, that shall be—
Lo! while I speak, thy Present is her Past!
The immediate active Future is thine own,

If but the space 'twixt flash and thunder-bolt.
Look not beyond. The irrevocable Hour
Shape into ever-ready moulds of Love;

And aim to round thy duties with thy days
To perfect form; not willing to defer
Work at thy hand to hands behind the veil.

Be happy and make happy: morn tells morn
Apollo's golden rule for gods and men.
Yet is the best of bliss sweet scorn of self.

I, crowned by Sorrow, bid Aurora sing
With all her larks! Olympus doth send down
Its Iris on the thunders to the fields.

O fair Youth, cull the blossom in the prime!
No god forbids; and the gods envy thee
Thy cherished flower and its divine response.

O Maiden, with the May-bloom on thy cheek
And in thy heart, be generous while 'tis May!
Give while the gift makes sweeter all the world.

O Mortal, knowing nothing, Death is wise
With all of knowledge—Love! and leave the rest
To Hades and the Father of the Gods!

NAPLES, August, 1873.

DECORATIVE ART AND ARCHITECTURE IN ENGLAND.

BY M. D. CONWAY.

[Second Paper.]

IN passing from the consideration of works of a public and semi-public character I can not refrain from paying some tribute to the most influential decorative artist whom England has produced, and whose death in April last all lovers of beauty are still mourning. Mr. Owen Jones carried into decorative art that spirit of archaeological accuracy—one might almost say that profound scholarship—which was brought into pictorial art by Delaroche in France, Baron Wappers in Belgium, and Maclise in England. It is said that there was but one thing in England which the Shah of Persia wished to carry back with him to his palace—the Alhambra rooms at the Crystal Palace; but of all their possessions there is hardly one that the London people would so unwillingly part with. Yet it is probable that as little as the Shah the thousands who every week find in those rooms their *châteaux en Espagne* realize what it really cost to put them there. Mr. Owen Jones had passed his youth and his early manhood journeying both personally and mentally on the track of the race of mankind to which he belonged: he had studied the mystical figures and lines of Egyptian temples; he had pondered the principles by which reason and truth find expression in stone amidst the ruins of Greece; he had learned the secrets of simplicity and grandeur in Rome, where were poured the converging streams of beauty from many tribes, each bearing its freight of faith and aspiration to be deposited in marbles and monuments which are the gospels and bibles of a primitive world. By this path, which meant for him a growing culture, he came to dwell on the heights of Granada as the recluse and devotee of Beauty, and when he thence returned to his native land he brought with him a new era. He expended a fortune on the grand folio

of colored drawings of the Alhambra, which brought him no return, but a single copy of which now is a collector's fortune. When proposals were being received for the decoration of the glass palace of the International Exhibition of 1851, Mr. Owen Jones offered to Prince Albert and the royal commissioners his plans. The prince held out against them for some time; but the fascination was on him, and again and again he returned to the exquisite designs, until he gave in. He selected Owen Jones with some tremor, but every year since the palace has been transferred to Sydenham has shown that it was the most felicitous incident of his life to have encountered the right man for a task which was to be of far more permanent importance than he supposed. Since then Mr. Owen Jones has not only given the large interiors of the great business establishments that beauty which makes many of them worthy of study and admiration, but he has won for himself and his country the highest honors of the three great Continental exhibitions. It was with some amazement that the world found itself pointed to England as the leader in decorative art by the French Exposition of 1867. "It requires," said the official catalogue of that exposition, "but a slight insight into modern domestic life in England to perceive how great a change has taken place within the last ten or fifteen years in the internal embellishment of the dwelling-houses of the upper and middle classes of society; and there can be little doubt that the extension of art education will lead still further to the production and appreciation of articles which combine the three requisites of fitness of purpose, beauty of design and ornament, and excellence of workmanship." It might be supposed by those who have not seen this master's work that it consisted merely

Vol. XLIX.—No. 294.—52

OWEN JONES.

in clever imitations of the Moorish and other designs with which his name is associated; but, on the contrary, his chief excellence was that he showed how the ideas and principles which underlie the great works of the past were capable of being led out into new forms and adaptations. In taking the chair at the Society of Arts in 1851, on the occasion of a lecture on the arts and manufactures of India by Professor Royle, Mr. Owen Jones, having accorded superiority to the Indian and Tunisian articles in the exhibition of that year over all contributed by Europe, added: "Many of these specimens have been purchased by government for the use of the School of Design, and will no doubt be extensively circulated throughout the country. But it is to be hoped that they will do more than merely teach us to copy the Indian style. If they only led to the origination of an Indian style, I should think their influence only hurtful. The time has arrived when it is generally felt that a change must take place, and we must get rid of the causes of obstruction to the art of design which exist in this country."

The *Daily News* (to an editorial article in which on the death of Owen Jones I am indebted for these notes concerning him) truly says, "It was to bring the beautiful in form and color home to the household, and to mingle its subtle influences with the whole frame-work of social and family life, that the great designer we are lamenting labored all his life with the patient, unselfish enthusiasm of one to whom, though full of the keenest sympathy with all the great historic movements and events of his time, his art was his life."

The devotion of such a scholar and refined gentleman as Owen Jones to decorative art has helped to make an era in that kind of work. Before that it suffered in England from being regarded as a sort of upholstery, implying neither talent nor culture. Some gentlemen of culture and wealth recognized the

genius of Mr. Owen Jones at a time when the Prince Consort was still inclined to regard him as a superior kind of upholsterer or house-painter, among whom must be especially mentioned Mr. Alfred Morrison, well known for his antiquarian and numismatical accomplishments. His residence in Carlton House Terrace is the truest monument of the genius of Owen Jones, and it is a work which need fear no comparison with any other, of whatever age or country. It makes the chief palaces of Northern Europe vulgar. Sâdi tells us of one recovering from an ecstasy, who said he had been in a divine garden, where he had gathered flowers to bring to his friends; the odor of the flowers so overcame him that he let fall the skirt of his dress, and the flowers were lost. Some such account one must needs give of a visit to Mr. Morrison's house. A thousand of the touches, the felicities, which combine to produce the happiest effects in this mansion can by no means be conveyed from the place where they would appear to have grown. I will only mention a few suggestive features of this system of decoration.

The house is one of those large, square, lead-colored buildings of which so many thousands exist in London that any one passing by would pronounce characteristically characterless. It repeats the determination of ages that there shall be no external architectural beauty in London. Height, breadth, massiveness of portal, all declare that he who resides here has not dispensed with architecture because he could not command it. In other climes this gentleman is dwelling behind carved porticoes of marble and pillars of porphyry; but here the cloud and sky have commanded him to build a blank fortress, and find his marble and porphyry inside of it. Pass through this heavy doorway, and in an instant every fair clime surrounds you, every region lavishes its sentiment; you are the heir of all the ages. Entering a room for reading and writing near the door, we are conscious of a certain warmth of reception even from the walls. They are of silk, made in Lyons after a design by Owen Jones. The shade and lustre are changeable, but the prevailing color dark red. The design is as if an endless series of the most graceful amphoræ had suddenly outlined themselves, and the lines had taken to budding off into little branches. The surface is Persian, and the whole sentiment of the room is Oriental, without having in it a single instance where Oriental work has been copied. The carpet is Persian, but the design is by Owen Jones, the most noticeable figure being the crossed squares, making a star shape to match a similar one on the coffered ceiling. This tapestry of silk starts a theme, so to say, which is carried with harmonious variations throughout the building, expanding in the larger rooms, until it recalls every variety of Etruscan shape, and taking on the most beautiful colors. There is a Blue Room, a Pink Room, a Yellow Room; yet in no case is there any thing "loud" or garish in the tints. The ceiling of the reading-room is somewhat after the fashion of the best Italian work of four centuries ago, a kind of moulding in deep relief, which probably ceased to be much used because it was found difficult to make it without incurring the danger of its falling, so great would be the weight. But Owen Jones invented something which he called "fibrous plaster," by which the most heavily coffered ceilings can be made with perfect security. It consists in first making the shapes to be used in wood; the wood is then covered with canvas, and this canvas is covered with repeated coats of the finest plaster, which is rubbed down into any mouldings required, and painted. The coffers here are star-shaped, and in each an inverted convoluted shell of gold. It is an indication of how finely the decorator has blended Oriental lustres and classic designs that the various

antique objects and fine metal-work, done by the best Spanish, Italian, and Viennese workmen, after classic models, every where set about the rooms, have an easily recognizable relationship with the scrolls and forms on carpets, ceilings, and walls.

But neither the Lyons silk nor the Persian carpets can be pronounced unique in the same sense as the wonderful use of various woods made in this house. In the dado, jambs, chair-boardings, we find no carved work, but simply the most exquisite combinations of ebonized and many-colored woods. Some of these, as the Indian holly, are so fine that the grain is invisible to the closest inspection. Other woods are so soft and beautiful that they have the surface of flower petals. Trees belonging to every land and clime of the earth have sent here their hearts, and, without a particle of pigment being used on any one of them, they gather to form rosettes on the chimney-pieces, cappings for the dados, and finest featherings around the doors—white, golden, red, cream-colored, brown, and these of every shade. The tables and chairs of several rooms are of this tarsia-work of forms untouched by staining or by metal.

In the library the book-shelves, which do the duty of a dado around the room, have alternate doors of glass and wood, and the latter are adorned with a foliation over two feet high, growing from the bottom of the panel and leafing out at the top, which can not be surpassed by any ancient marquetry. Above these shelves the green and gold lustres of the wall rise to a cone, which has the appearance of a blue and gold enamel, above which is an early Tudor ceiling of checker pattern between reliefs of a large star with four shadings of different colors, or star within star, golden, dark, and white. The chimney-piece here may be regarded as a large arched cabinet, with fire-grate beneath, having two wings, in which are contained specimens of porcelain from Persia and Cashmere, which, old as they are, have an appearance of having been designed by the decorator of the room, who certainly never saw them until they came into the harmony he had prepared for them.

The drawing-room, whose windows overlook St. James's Park, is a very large apartment, whose division, if it ever had any, has disappeared, giving an unbroken range to the eye, which, whether it takes in the whole effect, or pauses to examine a detail, is simply satisfied. The fretted ceiling; the frieze of damask picked out with gold; the tarsia dado, a necklace surrounding the room; the chimney-pieces, one of which Lepec of Paris was two years in making—they are all fine without frivolity, cheerful without fussiness. One mantel-piece reminded me of what Baron Rothschild is said to have remarked once when a fop was displaying his malachite

shirt studs—"Very pretty: I have a mantel-piece of it at home." Some of the incised ornaments here are gems indeed, but in no case have they the appearance of being set there for their costliness; they are all parts of the general artistic work. One of the best features of this drawing-room is that it is not stuffed with things. The objects in it are comparatively few, yet they are sufficient in number and variety, and being beautiful and interesting, one can look at each without being bewildered, as in some houses where an idea seems to prevail that the model for a reception-room is a museum.

Mr. Morrison is a strenuous opponent of the general belief that the arts are deteriorating. He believes that as good work of any kind whatsoever can be done now as in any other age of the world, if one will only look carefully after the men who can do it. His experience has certainly been fortunate in discovering those who are able to make entirely original designs, and yet conceived in a purely artistic spirit; but then he has had all Europe at his command. The best metal-workers he has found in Spain and Vienna. In the former country he found out Zouloaga, a workman residing in the little town of Eybar, and from him has obtained chased and engraved metal-work such as almost any of our connoisseurs would be apt to date before the Renaissance on a cursory glance. One piece of work by Zouloaga is in the drawing-room, a large coffer, nine feet by three, covered with all manner of figures and scrolls in iron, wrought in relief, and with a finish which would have made Andre Buhl himself rejoice that his own fine cabinet (of which Mr. Morrison is the fortunate possessor) should have found a place under the same roof with that of the Spaniard. Mr. Morrison told me that he felt sure the man could do a fine piece of work if encouraged, so he advanced him a thousand pounds, and told him to begin something on that. Zouloaga worked at the coffer for four years, and its owner saw at once that he had but paid an installment of the real value of this marvelous work.

But though Mr. Morrison has had to go to Spain for ornamented metal-work, to Paris for his mantel-pieces, to Lyons for his silk, he has found that in no other country than his own was he able to secure the best wood-work. It may be, indeed, that if his desire had been for the most perfect carving, he might not have had the satisfaction of obtaining it in his own country—though some of the workers that Mr. George Aitchison appears to have got hold of may render even that doubtful. But in pursuing inquiries as to the means by which the exceedingly bold designs of Owen Jones for ornamentation with the colors of woods could be carried out (and the inquiries were not confined

to this country), Mr. Morrison found that no house out of London was prepared to undertake a task that necessitated importations of select woods from all parts of the world. In Mr. Forster Graham, Owen Jones found a man able to enter into his ideas and to give practical effect to them. Indeed, the famous architect and decorator acknowledged his indebtedness to Mr. Graham for some effective suggestions for the improvement of the original designs. Those who know Mr. Morrison will easily guess that he too was by no means a mere by-stander while the work was going on. At any rate, he may now rejoice in having secured a home that has converted some portion of his wealth into a more real value, and of having thereby enabled one idealist to realize his vision. For there is nothing in this house not harmonious with its purpose. Every chair is as philosophically as it is beautifully constructed, and nearly every one is different from the other—one suggesting the perforated chairs of the Delhi palaces, and another the old Saxon throne in Westminster Abbey. It is related of a sensible and busy banker that on being visited by some one, he said, "I have a line or two to write; pray take a chair." "Do you know who I am, Sir?" said the visitor, haughtily; "I am the Envoy Extraordinary of ——" "Oh, are you?" said the banker; "then pray take two chairs!" This little story occurred to me as I was looking upon Mr. Morrison's chairs, and I fancied the Envoy Extraordinary, if asked to take one, would probably have considered it as a significant mark of respect.

There is no sham in this house—no wood pretending to be metal, and no iron affecting to be marble. As each particle of a rose under the microscope has the rose's beauty, so here each part of the mansion bears witness to the care and taste with which the whole is constructed—the table-leg as truly as the Lepec mantel-piece. We may ascend the magnificent stairway, past the globes of light upheld by bronze candelabra rising seven feet from the floor, and as we go from story to story find good, painstaking work meeting us every where, in the bedrooms, the nursery, the closets, some of the best ornamentation in the house being a pale blue and gold scroll surrounding the sky-light at its top.

It is a pleasure to know that decorative skill has not passed away with Owen Jones. The house of Frederick Lehmann, Esq., in Berkeley Square, is the *chef-d'œuvre* of Mr. George Aitchison, one of the most celebrated architects and decorators in England, who has made the most of very favorable conditions, has called to his aid congenial artists and carvers, and has completed rooms which one would fain see themselves hung upon the walls of the Royal Academy, and not merely the designs of some of them, which

are, indeed, exhibited there this year. The house is ancient, and, though not very large, built liberally and substantially, evidently in the days when Berkeley Square was near enough to "the country" for space to be of less consideration than now. In the course of the recent improvements there was found behind an old chimney-piece a playing-card upon the back of which is written an invitation from a Mrs. Murray to Lady Talbot to pass the evening at her house; and Mr. De la Rue declares that no card of a similar character has been manufactured for a hundred and fifty years. Even farther back in time than that we may safely place the old-fashioned, nearly square hall—about twenty feet by seventeen—which is at once hall and vestibule. It contains tables, cabinets, and a stand for flowers, and the modern decoration sympathizes with what appears to have been the old idea of a vestibule—a sheltered cortile. The general tint is a very pale green, the surface-paneling large, and ornamented with stems starting from a common root and ending each in cones. The stems and cones curve toward each other, and form a sort of circular grouping. A door on the left introduces us to the library, whose walls are shelves of richly carved walnut, above which is a dark leather frieze, which elegantly sets off the treasures of ancient pottery and other antique objects which make the interesting finish of the well-stored book-shelves all the way around the room. At a certain point the books prove to be dummies, an unsuspected little door flying open at a touch and revealing a lavatory. In this library, where startling effects of any kind would be out of place, there are no plays of color, but ample light falling upon the exquisitely carved table for writing in the centre, which is the most remarkable for its conveniences and contrivances that I have ever seen.

Ascending to the drawing-rooms, we enter first a small apartment, whose floriated ceiling gives the effect of a bower. Between this and the golden cornice is a cove of inlaid gold, upon which are traced leaves of wistaria, interspersed with light pink clusters of the phlox. The chief ornament is a large cabinet reaching nearly to the cornice—ebony and ivory—recently brought from the Vienna Exhibition; it contains specimens of Eastern porcelain, etc., collected by Mr. Lehmann, who would appear to have voyaged around the world and found relics of all civilizations and all the ages of art. This, however, is but an anteroom to the chief drawing-room, with which it communicates by a large double sliding-door. This door, and another like it which admits to the dining-room, are truly superb. They have a frame of ebonized wood inclosing panels of finest-grained amboyna. The ebonized wood is foliated with gold, and the long cen-

tral panels are adorned with ovals of olive-colored wedgwood, presenting classical figures. The smaller panels above and below have at their centres squares of the same ware. Each door has a capping of gold floriation, and a draping of French embroidered silk, at once heavy and delicate, like tapestry. The walls are of a dark reddish-brown color, arranged in large panels (from floor to cornice) inclosed by a fine painted edging. This background elegantly sets off the pictures, which are all excellent, some of them being among the best water-colors of Turner. The ornament which chiefly strikes the eye in this room is a matchless frieze, painted by the eminent artist Albert Moore, the design being peacocks, their long trains in repose. The cornice above this is of the egg pattern, with a fretting above. The ceiling is, in a manner, paneled; that is, it has on each side stiles or beams crossing each other, making the large central space and the side spaces almost deep enough to be called coffered. These cross-beams are finely feathered with gold, and the inter-spaces are adorned with curved boughs, with small pointed leaves terminating in round decorative flowers. The fireside of this room is highly ornamented. The grate is antique in general appearance, but novel in structure; the silver owls (life size) sitting on either end of the fender bar and the old brass mountings of the fire-dogs have come from the past to guard a grate which slides backward and forward as the regulation of the heat given out may require. The tiles are representations of six varieties of humming-birds, a paroquet, a sun-bird, and several other feathered beauties. Near by is a folding screen of brilliant Japanese silk. The room is covered to the border of the parquetage with a bright Persian carpet. In the dining-room the original ceiling, with dark oak reliefs (curved), has been retained—not happily, I am afraid, such ceilings always absorbing too much light. Mr. Aitchison has given the spaces a luminous decoration, but nevertheless the dark wood-work above can only be retained by the use of a corresponding shade in the furniture. This furniture is of rare beauty. The side-board is most delicately carved, and the serving table inlaid with medallions of ivory, the designs of which, by Albert Moore, represent various animals and fruits suggestive of the uses of the room. There is a chimney-piece of ancient work—ebony, with side pillars and excellent gold settings; but a comparison of this bit of last century work with the furniture recently made is likely to raise a question in the minds of those conservatives who insist that the making of beautiful things is a lost art. It is a pleasure to find hung in a room where each object bears the trace of really fine art that portrait which has long been acknowledged to be the ablest

FRONT SERVING TABLE—MR. LEHMANN'S HOUSE.

work of Millais, representing Mr. Lehmann's little daughter seated on a Minton garden seat on a lawn. When this picture was exhibited at the Royal Academy a few years ago a writer in the *Fortnightly Review* pronounced it the work which, among modern English productions, most recalled the peculiar vitality and sentiment which have given the old masters their fame. I had the pleasure of seeing the little lady herself in her own boudoir, to make which beautiful, Mr. Aitchison appears to have put forth his talent as earnestly as Mr. Millais to paint her picture. A blue border incloses the large panels of the walls, on which are *fleur-de-lis* spots, and a bittern at each panel centre. The frieze is painted in graceful floriations of lemons, and the cove above is adorned with balsam and jasmine. The apartments of this little girl, thus tenderly but not gaudily adorned, open into the sleeping-room of her parents. This also is simply beautiful. The walls are of a delicate blue shade, and all the textures appear as if inwoven with softened sunshine. Mr. Smallfield's genius has here been brought into requisition, and he has painted beautiful groups of flitting birds over the doors. The same artist has painted boughs of apple blossoms upon the door panels in the boys' room. But his finest work is a frieze in Mrs. Lehmann's boudoir—for such her monogram woven in the Persian carpet and carved in the marble mantel-piece announced it to be—which consists of doves, swallows, and flowers in pots. Mrs. Leh-

mann's boudoir is on the same floor with the dining-room, from which it is separated by a charming little sitting-room. The walls of this last-named room are entirely covered with the finest Gobelin tapestry, above which a deep cornice of chased gold supports a cove, chocolate, with decoration of silver leaflets.

No wall-paper at all is used in this house. The ornamentation of the walls throughout has been put on by the hand, and generally by pouncing. Perhaps it may be well enough to state that the method of pouncing is far more expensive than that of stenciling. In pouncing, the figures to be painted on the wall are first pin-punctured on paper; this paper is then laid on the wall and beaten with bags of colored powder. When the paper is removed each ornamental form is delicately outlined on the wall in innumerable fine points. It is then necessary that the decorative artist should trace the figures with a pencil, and afterward paint them. Stenciling, which is less costly than this by about one-third, consists simply in direct painting through perforated metal, though it is necessary in most mural work that the blank interstices so left should be painted over by hand. The latter work is, however, always more stiff than the pounced. The friezes have been painted on canvas, of course, since no gentleman would allow his possession of works by such artists as those whom Mr. Lehmann has employed to depend upon his remaining in any particular house. It is indeed a very significant thing that

such men as Albert Moore and Smallfield should have been found ready to undertake work of this description; for though it is a return to such work as Giotto and Michael Angelo were glad to do, we have heard of late years occasional sneers at "mere decoration." Rightly speaking, *all* art is mere decoration. There are other instances also where the artists of the greatest eminence have done excellent work of this character. In the house of the Hon. Percy Wyndham, Belgrave Square, there is a grand staircase which has on the wall near one of its landings five life-sized classical figures by Leighton, the Academician, and at the top a deep frieze of cormorants, storks, and other wild birds; and the dining-room of the same beautiful mansion has been elegantly adorned by Mrs. Wyndham—herself an artist—aided by Mr. V. Prinsep.

The pleasure with which I have visited Mr. Lehmann's house is just a little tempered by the difficulties I have found in the effort to convey some impression of it. When I passed down the stairways amidst the delicate hues lighting them up at every turn, and through the doorways curtained off from halls by rich Oriental draperies, and found myself again in the embowered square at the front of the house, I felt conscious of an utter inability to give any reader an adequate conception of the decorations amidst which I have invited him to wander in imagination. Let any one who has passed a morning in visiting the interiors of the old Venetian palaces attempt to describe them! He will have a dreamy impression of soft colors fading into each other, of apartments

that have caught on their walls the tints of rosy morning and golden evening, and held them in a thousand little contrivances to catch such sunbeams, and he will feel that the subtle influences of beauty have overpowered his analysis. The finer secrets of art elude detection, much more explanation, like those of nature.

The houses I have been describing are those of millionaires. Whatever may be thought of the large sums expended on their mansions, they do not suggest the remark made by a wit to a gentleman as remarkable for spending little as for making much, "You can not take all this gold with you, and if you did, it would melt." They have preferred that their gold should be transmuted in this world, and into forms that are none the less beautiful for being costly. They are men who occupy a somewhat abnormal position even in wealthy London, and one which admits of a correspondingly rich and even grand environment. They have occasion, and are able, to have rooms which relate them to a large and cultivated world, while they can reserve for domestic privacy apartments which fulfill the want which to others is the only end of a home—a centre amidst a busy and weary world for friendship, love, and repose. Even in these grand palaces one may, indeed, witness a modesty and reality which contrast favorably with the at once stimulating and exhausting splendors of the princely dwellings of the past. There is no attempt here to heap into the rooms the great works of art which appropriately belong to the community, and should be set up in edifices built for

TOP OF SERVING TABLE—MR. LEHMANN'S HOUSE.

the common benefit. One perceives, too, that the time has passed away when Madame De Guerdin could define the life of an apartment as consisting in "fires, mirrors, and carpets." The life of an apartment consists in the degree to which it subserves its end. The decoration of the salon may well sympathize with the gayety of festive occasions, for it does not exist for the family alone; but in the more private rooms the tired limbs will require rest on chair or couch, and equally the eye will need rest upon soft and subdued shades.

There will, however, arise in the mind of many a reader of the poor descriptions I have been able to give of these two houses (which represent an exceptional class) a moral misgiving. Is not all this a waste of money that might have been expended for greater and nobler purposes? Is not all this mere luxury and extravagance? Well, in the first place, it is difficult to draw the line between the beauty which Nature seeks as she climbs to flowers and man as he decorates his dwelling, and the luxuriousness which makes external beauty in itself an end rather than a means. Take away all that has been added to our homes by art, and we all become naked savages living in mud or log huts. But, in the second place, what about this "waste of money" so often charged against expensive decorations? Poor Zouloaga, working in a little peasant village of people poor as himself, might not have the same charge to bring against the wealthy Englishman who found him out. He and a host of artists and artisans in this and other countries might find more wisdom in Rhodora's philosophy, that

"If eyes are made for seeing,
Then Beauty is its own excuse for being;"

and they might add that if the taste and skill which are able to make beautiful things exist, there may be good reason why a demand should also exist for what they can supply. I do not propose to argue the vexed question of political economy concerning the degree to which luxury is justified by its distribution of capital among laborers, but it seems very clear that there can be no reason to deplore the free or even lavish expenditures of the wealthy for objects which are not in themselves pernicious. It has been one particularly gratifying incident of the passion for decoration in this country that it has been the means of opening to women beautiful and congenial employments.

Miss Jekyl, who was one of the first to take up this kind of work, attracted the attention of Mr. Leighton, Madame Bodichon, and other artists by her highly artistic embroidery, and has since extended her work to repoussé or ornamental brass-work—especially sconces—and many other things. She has, I hear, acquired not only distinction but

wealth by her skill, some specimens of which are exhibited in the International Exhibition at South Kensington this year. There also may be seen the work of other ladies who have followed in her footsteps, some of the finest being by a Miss Leslie, a relative of the celebrated artist of that name. Indeed, there has now been established in Sloane Street a school for embroidery, which has succeeded in teaching and giving employment to a number of gentlewomen who had been reduced in circumstances. Miss Philott, whose paintings have often graced the walls of exhibitions, and have gained the interest of Mr. Ruskin, has of late been painting beautiful figures and flowers on plaques, which, when the colors are burned in by Minton, make ornaments that are eagerly sought for. A Miss Coleman has also gained great eminence for this kind of work. Miss Lévin, the young daughter of a well-known

POT DESIGNED BY MISS LÉVIN.

artist, has displayed much skill in designing and painting pots, plates, etc., with Greek or Pompeian figures. Many of these ladies have begun by undertaking such work as this for personal friends, but have pretty generally found that the circle of those who desire such things is very large, and that their art is held in increasing esteem among cultivated people. It is even probable that the old plan which our great-grandmothers had of learning embroidery will be revived in more important forms, and, with the painting of china, be taught as something more than the accomplishment it was once thought.

It has been found, too, that artists, architects, decorators, and the numerous workmen they employ have great respect for any

woman who can do any thing well, which contrasts favorably with the jealousy which the efforts of that sex to find occupation in other professions appear to have aroused. One example of this is particularly striking. Nearly twelve years ago I heard of a young lady of high position who was making almost desperate efforts to win her way into the medical profession. She had taken a room near one of the largest hospitals in London, to which she was not openly admitted, that she might study cases of disease or injury, but where, through the generosity of certain physicians, she was able, as it were, to pick up such crumbs of information as might fall from the table of the male students. By dint of her perseverance means of information and study increased. I visited her room near the hospital, and found this young lady surrounded by specimens such as are conventionally supposed to bring fainting fits on any person of that sex at sight. I found that, being excluded from the usual medical and surgical schools, she had been compelled to employ lecturers to teach her alone. Fortunately she had the means of doing this, but it amounted to her establishing a medical college, of which she was the only student. That lady is now known as Dr. Elizabeth Garrett-Anderson, an eminent physician, who has done not her sex alone but this entire community a great benefit, by showing that a woman's professional success is not inconsistent with her being a devoted and happy wife and mother. By the side of the long struggle through which she had to go to obtain her present position—a struggle in which many a woman with less means and courage has succumbed—I am able to place the experience of her younger sister and of her cousin, Agnes and Rhoda Garrett, who have entered into a partnership as decorative artists. These young ladies, it may be premised, have by no means been driven to their undertaking by the necessity of earning a livelihood. They belong to an old family of high position, and are as attractive ladies as one is likely to meet in the best society of London. But like the better-known ladies in the same family, Dr. Garrett-Anderson and Mrs. Professor Fawcett, they are thinkers, and they have arrived at conclusions concerning the duties and rights of their sex which forbid them to emulate the butterflies. A few years ago, when the decorative work of such firms as Messrs. Morris and Co. began to attract general attention, it appeared to them that it offered opportunities for employment suitable to women. They determined to go through a regular apprenticeship; and though they were met by looks of surprise, they were not met with any incivility. One gentleman allowed them to occupy a room at his offices, where they might pick up what knowledge they could in the art of glass-

painting, and here they awaited further opportunity. The architect who had been connected with this glass-staining firm separated from it, and, having begun a business of his own, accepted the application of the Misses Garrett to become his apprentices. They were formally articulated for eighteen months, during which they punctually fulfilled their engagement, working from ten to five each day. Of course there were good stories told about them. Some friend, calling upon them, reported that though the interview was interesting, the ladies could not be seen, as they were up on a scaffolding, lying flat on their backs close to a ceiling which they were painting. From that invisible region their voices descended to carry on the conversation. The ladies themselves were quite able to appreciate all the good-humored chaff attending their serious aim. When their apprenticeship reached its last summer they went on a tour throughout England, sketching the interiors and furniture of the best houses, which were freely thrown open to them. They have now started in business for themselves at No. 3 Cornwall Residences, Regent's Park, with fair prospect of success. Mr. J. M. Brydon, of Marlborough Street, is the architect who has the honor of having had these ladies for apprentices; and they assure me that during their stay there and in their work since they have met with no act of incivility. Occasionally the workmen may stare a little at the unaccustomed sight of ladies moving about with authority, but they are most respectful when they find that there is intelligence behind the authority. From a friend of these ladies I heard a significant anecdote. They directed that a certain kind of mixture with which paint is generally adulterated should not be used. When they came to look at the work they found that the mixture had been used, though it is what no untrained eye could detect. They called the painter to account, and he said he had used very little of the mixture indeed.

"That is true," said one of the ladies, "but we told you not to use a particle of it."

The painter was amazed, and at last said, "Will you be kind enough to tell me how you knew that mixture had been used?"

It is precisely this *knowledge* which every where secures respect. The Misses Garrett have made themselves competent decorators; they undertake the wall decorations, upholstery, furniture, embroidery, etc., as fully as any other firm. Nor are they the only firm of women engaged in this business. Two ladies of high position and education—Mrs. Hartley Brown and Miss Townshend (the former a sister of Chambrey Brown, Esq., a very accomplished architect)—have set up in the same business at 12 Bulstrode Street—a quaint and interesting old house, by-the-way, built by the famous Adames, with a frieze

representing some of Æsop's fables. These ladies, who have been employed to decorate the interiors of the new Ladies' College (Merton) at Cambridge, have not only devised a number of new stuffs for chairs, sofas, and wall panels, but also for ladies' dresses. In the ancient code of Mann it is said, "A wife being gayly adorned, her whole house is embellished; but if she be destitute of ornament, all will be deprived of decoration." It is not a little curious to find the remote descendants of those whom Mann thus instructed including female dress among the concerns of decorative art. This is, indeed, theoretically done in the lectures given at South Kensington, and Charles Eastlake has interspersed some valuable hints concerning ladies' dress in his work on *Household Taste*. But the practical way in which Mrs. Hartley Brown and Miss Townshend have taken up the matter indicates, if I mistake not, a quiet revolution which has been for some time going on in certain London circles. It is said that the artists of England once thought of getting together and making some designs for dresses, which they would recommend to ladies; they did not do so formally, but they have certainly availed to modify very materially the costumes visible in thousands of English drawing-rooms. The "pre-Raphaelist lady" with her creamy silk, short-waisted and clinging—at once child-like and great-grandmotherly—is now a well-known figure in evening companies. But there is no uniform for ladies any more. At a fashionable party lately I was unable to pick out any two ladies out of a hundred whose dresses were cut alike, and the variety of colors suggested a fancy-dress ball. Yet these colors were all of moderate shades, and Hippolyte Taine himself must have admitted that very few of them were "loud." It would not at all surprise me if the world which has so long laughed at the Englishwoman's dress should some fine evening glance into one of these quiet Queen Anne interiors and feel as if the ladies in their Queen Anne costumes—and the other rich but also quiet variations of it now becoming frequent—are among the most agreeably dressed of womankind. But I must return from this digression.

The Misses Garrett appear to have an aim of especial importance in one particular. They tell me that they have recognized it as a want that a beautiful decoration should be brought within the reach of the middle class families, who are not prepared or disposed to go to the vast expense which the very wealthy are able and willing to defray, thereby occupying the most eminent firms. They believe that with care they are able to make beautiful interiors which shall not be too costly for persons of moderate means. This can surely be done, but it can only be through a co-operation between the owners

of the house and the decorators which shall make it certain that there shall be nothing superfluous. If an individual wishes a beautiful home, especially in dismal London, it is first of all necessary that he or she should clearly understand what is beautiful, and why it is desired. The decoration will then, in a sense, be put forth from within, like the foliage of a tree. In each case the external beauty will respond to an inward want, and be thus invariably an expression of a high utility. Nowhere more than in the homes of the great middle classes is there need of beauty. Their besetting fault is a conventionality which often lapses into vulgarity, and their thoughts (so called) are apt to be commonplace. The eye is often starved for the panuch. The pressure of business sends every man engaged in it home fatigued, and yet it is only when he enters that home that his real life, his individual and affectional life, comes into play. On the exchange, in the office or shop, he has been what commerce and the world determine; he has been but perfunctory; but now he shuts the door behind him, and his *own* bit of the day is reached. What is the real requirement for this person? Does a house that furnishes him bed and board suffice him? or, which is of greater importance, does so much alone suffice others who dwell habitually in it?

In the ancient Chinese Analects we read that Kih Tsze-Shing said, "In a superior man it is only the substantial qualities which are wanted; why should we seek for ornamental accomplishments?" Tsze-Kung replied, "Ornament is as substance; substance is as ornament: the hide of a leopard stripped of its hair is like the hide of a dog stripped of its hair." It would be difficult to find in literature a finer or more philosophical statement of the deep basis of Beauty than thus comes to us from a period of near three thousand years ago, and from a race whose applications of decorative art to objects of every-day use are models for Europe. The spots of the leopard are the sum of its history; its hair is the physiognomy of its passion and power; it bears on its back the tracery of the leaf and sunshine amidst which it hides, and the purpose of the universe hides with it. Transferred to floor or sofa in a room, the coat of that cat is a bit of the wild art of nature, full of warm life, purely pictorial; more beautiful than the skin of our domesticated cats, because these have been adapted to other purposes, and reduced to an environment of less grandeur. But strip the two of their hair, and they are only larger and smaller pieces of leather, and the depilated hide of a dog is the same. All of which confirms Tsze-Kung's dictum that ornament is substance, and it at the same time suggests the converse truth that throughout the universe there must be substance to insure true ornament. When we

ascend to the region of finer utilities—those, namely, which are intellectual, moral, spiritual, social—we discover that household art is another name for household culture. What germ in the child's mind may that picture on the wall be the appointed sunbeam to quicken? What graceful touch to unfolding character may be added by the modest tint of a room? Who can say how much falsehood and unreality have been shed through the life and influence of individuals by tinsel in the drawing-room and rags up stairs?

Just now we are the victims of two reactions. Our ancestors made external beauty every thing, and the starved inner life of man rebelled. Puritanism arose with grim visage, turning all beautiful things to stone. From it was bequeathed us a race of artisans who had lost the sense of beauty. A reaction came, in which the passion for external beauty displayed itself in an intemperate outbreak of gaudiness and frivolity. We are sufficiently surrounded by the effects of that reaction, sustained by wealth without knowledge or taste, to make Charles Eastlake's description appropriate to ninety-nine out of every hundred English homes. "This vitiated taste pervades and infects the judgment by which we are accustomed to select and approve the objects of everyday life which we see around us. It crosses our path in the Brussels carpet of our drawing-rooms; it is about our bed in the shape of gaudy chintz; it compels us to rest on chairs and to sit at tables which are designed in accordance with the worst principles of construction, and invested with shapes confessedly unpicturesque. It sends us metal-work from Birmingham which is as vulgar in form as it is flimsy in execution. It decorates the finest possible porcelain with the most objectionable character of ornament. It lines our walls with silly representations of vegetable life, or with a mass of uninteresting diaper. It bids us, in short, furnish our houses after the same fashion as we dress ourselves, and that is with no more sense of real beauty than if art were a dead letter. It is hardly necessary to say that this is not the opinion of the general public. In the eyes of *materfamilias* there is no upholstery which could possibly surpass that which the most fashionable upholsterer supplies. She believes in the elegance of window-curtains of which so many dozen yards were sent to the Duchess of —, and concludes that the dinner-service must be perfect which is described as 'quite a novelty.' Mr. Eastlake well says, also: "National art is not a thing which we may inclose in a gilt frame and hang upon our walls, or which can be locked up in the cabinet of a virtuoso. To be genuine and permanent, it ought to animate with the same spirit the blacksmith's forge and the sculptor's *atelier*,

the painter's studio and the haberdasher's shop." Under the influence of such scornful words as these persons of taste and culture have risen in reaction against the reaction, and the result is that there are now in London several thousands of homes which have filled themselves with those old shreds of beauty which Puritanism cast to the winds. Most of these are the homes of artists or virtuosi, and as they have thus set the fashion, a still larger number have tried to follow them. A genuinely old thing is competed for furiously, and as it is apt to go with the longest purse rather than the finest taste, we find the past as often re-appearing in a domestic curiosity-shop as in a beautiful interior.

Now Puritanism in its day was one of the most useful of things, and if we do not see the traces of beauty which it has left, the fault is in our own eyes. The artists know very well that if it had spared the old tapestries and furniture for the main uses of our present society, the effect would be as unlovely as if our homes were all buttressed and turreted in feudal style. Feudalism and Puritanism have alike left to us just as much of the styles of their ages as we need—enough to give, as it were, a fair fringe to the appropriate vestment of to-day. A house made up of antiquarian objects is a show-room, a museum, but not a home. We have fallen upon an age when cultured people know that external beauty is but one means to integral beauty, and when the prophets of that higher end can see that the very flowers of the field are ugly if they drink up that which ought to turn to corn and wine. Much is to be said for the antiquarian taste if it does not run into an antiquarian passion. It may safely be admitted that our churches need not be sombre nor our services gloomy, that a few good pictures would not harm the one, nor more poetry and music the other; but what is to be said of those who find in albs and chasubles and incense-burners the regained Paradise of man?

But if there can be no real beauty secured by building for a life that is to be lived in one century a mansion that grew out of another, as little can a high taste be satisfied by the conventionality of its own time, which admits of no relation between the individual and his dwelling-place. In a normal society each man would be able to build his house around him as he builds his body, and to take the past, the east, the west, for his materials as much as brick or stone. "Let us understand," says the wisest adviser of our time, "that a house should bear witness in all its economy that human culture is the end to which it is built and garnished. It stands there under the sun and moon to ends analogous and not less noble than theirs. It is not for festivity, it is not for sleep; but the pine and the oak shall gladly descend

from the mountains to uphold the roof of men as faithful and necessary as themselves, to be the shelter always open to good and true persons—a hall which shines with sincerity, brows ever tranquil, and a demeanor impossible to disconcert; whose inmates know what they want; *who do not ask your house how theirs shall be kept.*"

One residence particularly has connected itself in the course of my observations with the high place given, in this extract from Emerson's chapter on "Domestic Life," to the individuality so essential to a home, and so difficult to obtain. Those who have found delight—as who has not?—in the paintings which the American artist, Mr. George S. Boughton, has given to the world will not be surprised to learn that he has built up around him a home worthy of his refined taste and his delicate perception of those laws of beauty which enable it to harmonize with individual feeling without ever running into eccentricity. Few of those who have enjoyed the fine hospitalities of Grove Lodge, Kensington, can fail to recognize that the much-admired residence is as unique a work of the much-admired artist as any of those charming pictures of his which so tenderly invest the human life of to-day with the sentiment and romance of its own history. Passing lately through his hall, touched every where with the toned light of antique beauty, to his studio, the picture which he was just finishing for the Royal Academy appeared as a natural growth out of the æsthetic atmosphere by which he was surrounded—some girls of Chaucer's time beside an old well and a cross, filling the water-bottles of pilgrims on their way, amidst the spring blossoms, to the shrine of St. Thomas à Becket, "the holy, blissful martyr," at Canterbury. The embowered English landscape closed as kindly around the figures and costumes and symbols of the olden time as they do now about the features of a new age; and no less harmoniously do the ornaments and decorations of this beautiful home surround the cultured society which the young host and hostess gather to their assemblies. The house is, as I have intimated, remarkable for the impression it gives of being the expression of individual taste. It might well enough bear on its threshold that signature which bears such increasing value, so truly does it represent the man—as free from ostentation as from conventionality.

Entering the door, we find ourselves in a square vestibule, separated from the main hall by rich and heavy curtains of greenish-blue tapestry. The walls are here, for a distance of one-third of their height from the floor, covered with a paneled wainscot colored in harmony with the hangings. For the rest, the walls are covered with a stamped leather papering of large antique scrolls, outlined in gold. A rich light fills this lit-

tle apartment by reason of the quaint and deep-hued glass of the door and side window. In these both roundels and quarries are used. In the door there are roundels above and quarries beneath, furnishing a neat border to larger stainings representing marguerites and clover blossoms on a blue ground. Above the door is a curious horizontal glass mosaic, set in lead, as indeed are all the squares and circlets of both window and door, with bees and butterflies at the angles of the irregular lines. The zigzag flight of the little winged symbols of industry and pleasure required that the pieces of glass should be irregular, and this result was secured by an odd device. The decorator having come with his oblong pane of precious glass, asked how he should cut it up. The artist promptly ordered him to let it fall through some feet on the door-step, and then gather up the fragments. This was done, and as the pieces came of the fall, so were they put together, with the bees and butterflies at their angles. The effect of this irregularity is very fine indeed, as setting off the precision of the patterns in the rest of the door.

Passing through the curtains, we enter a hall running about two-thirds of the depth of the house to the dining-room. The hall is lined with fine old engravings and cabinets, with here and there an old round convex mirror. The general color of the walls of the dining-room is sage-green, thus setting off finely the beautiful pictures and the many pieces of old china. There are several cabinets which have been designed by Mr. Boughton himself, and a *buffet* somewhat resembling that drawn by Charles Eastlake (Fig. 12, *Hints on Household Taste*), but improved, as I think, by being made somewhat higher, and having a small ornamental balustrade on the top shelf. And I may here say that Mr. Boughton's art has enabled him to make his many beautiful cabinets, the antique ones as well as those designed by himself, particularly attractive by introducing small paintings on the panels of their doors or drawers. These figures are generally allegorical and decorative, and are painted upon golden backgrounds. They are of rich but sober colors, and usually female figures with flowing drapery, great care being taken that their faces shall have dignity and expression. In some cases an old cabinet has small open spaces here and there which will admit of medallion busts and heads being painted, and if care be taken that the colors shall not be too loud, and especially that the designs are not realistic, the beauty and value of the cabinet are very much enhanced. The *buffet* to which I have referred has a curtain over the arch beneath, and such an addition may be also made to a cabinet which rests upon legs with good effect as well as utility, if care be taken that the color of the curtain shall not be obtrusive.

This dining-room is lighted by a large window set back in a deep recess, curtained off from the main room with hangings of red velvet, and exquisitely environed by original designs. The window is composed of the richest quarries, holding in their centres each its different decorative flower or other natural form, and these being collectively the frame of large medallions of stained glass representing Van Eyck, Van Orley, and the burgomaster's wife from Van Eyck's picture in the National Gallery.

It is a notable feature of the ideas of glass decoration, and, indeed, of paper decoration, in houses where English artists have superintended the ornamentation, that realism in design is severely avoided. In this respect I can not doubt that we are in London far more advanced in taste than those decorators of Munich, and some other Continental cities, who try to make the figures, in their glass at least, as commonplace real as if they were painting on canvas. Even if the material with which the glass-stainer works admitted of a successful imitation of natural forms, the result could not be beautiful. No one desires roses to blossom on his window-panes, nor butterflies to settle on the glass as if it were a flower. The real purpose of the glass can never be safely forgotten in its decoration: it is to keep out the cold while admitting the light; the color is to tone the light, and prevent its being garish; and if, further, any form is placed upon the glass, it is merely to prevent monotony by presenting an agreeable variation from mere color. But the form must be in mere outline, transparent, else it suggests an opaque body, which were a denial of the main purpose of the glass, *i. e.*, to do away with opaqueness. Even when the ornaments on the little panes are thinnest, they are hardly suited to the English sky, which sends us little superfluous light.

The drawing-room at Grove Lodge is adorned on the theory that its function is one which requires a degree of richness bordering on brilliancy, which were out of place in a study, or studio, or sitting-room. Here are to be happy assemblies of light-hearted people in gay dresses, and the room must be in harmony with the purpose of pleasure which has brought them together; but then the drawing-room must not obtrude itself, it must not outshine their lustres nor pale their colors; rather it must supply the company with an appropriate framing, and set them all in the best light. I have rarely seen a more picturesque drawing-room than that at Grove Lodge, and none that has seemed to me a more purely artistic creation of a beautiful out of a rather unpromisingly constructed room. A paper of heraldic pink roses, very faint, with leaves, in mottled gold, makes a frieze of one width above a wall-paper of sage-gray, which has no discernible

figures at all on it. This sage-gray supplies an excellent background to the pictures—which are moderate in quantity, charming in quality—and for the picturesque ladies, who are too often fairly blanched by the upholsterer's splendor, as they might be by blue and silver lights in a theatre. At the cornice is a gold moulding and fretting, making an agreeable fringe to the canopy (as the star-spotted ceiling may be appropriately called). The ceiling is not stellated, however, with the regularity of wall-paper designs, but with stars of various magnitude and interspaces. It must be, of course, a room in which the deep tones of color preponderate which could alone make such a ceiling appropriate. In this instance it is rendered appropriate not only by the character of the hangings of the room, at once rich and subdued, and by the carpet, which Mr. Boughton has had made for this room, the basis of whose design is the greensward, touched here and there with spots of red, but also by the fact that it is a double drawing-room, lighted in the daytime only at the ends, and requiring therefore a bright ceiling. There are two old Japanese cabinets: one is richly chased, but with nothing in relief except the gold lock-plates, and some twenty-eight hinges (themselves a decoration); the other is more complex, and has figures in relief. In addition to these there are two cabinets of unique beauty, designed by Mr. Boughton—one possessing a beveled mirror running its whole width at the top, the other with panels on which the artist has painted Spring and Autumn in gold.

Before leaving this charming residence I must mention that some of its best effects have been produced by the extraordinary lustre of color and quality of surface in the stuffs used for curtains, furniture covers, and upholstery. These are such as are not ordinarily manufactured, and can be procured in London only by searching for them. Manufacturers in this country, and no doubt in America also, are in the habit of bleaching their stuffs as white as possible, and the consequence is they will not take rich and warm dyes. The secret of those Oriental stuffs upon whose surface, as they appear in our exhibitions, English manufacturers are so often seen looking with despair, is that they never bleach to whiteness any thing that is to be dyed. If the Eastern dyers should put their deep colors upon a surface bleached to ghastliness, their stuffs would be as ghastly as our ordinary goods speedily become. The Oriental dyer simply leaves the natural color of the wool or cotton creamy and delicate, and the hues never turn out crude and harsh, as do those of English stuffs. This bleaching, moreover, takes the life out of a natural material, and is the reason of the superior durability of colored Oriental fabrics.

AMONG THE WATER-FOWL OF THE WEST.

THE MALLARD.

LONG ISLAND, Barnegat, Chesapeake Bay, and Currituck have each enjoyed an enviable reputation among the shore shooters, long unchallenged by any presumptuous rival within the scope of our domain.

Little did the denizens of Fulton Market in years gone by dream of the paradise in store for the lover of sport in the vast Western country, of the numberless resorts for their favorite birds on the boundless prairies, of the endless chains of miniature lakes abounding with their favorite food. But the encroachments of civilization, the multiplication of steam-vessels, and, above all, the continual hammering of the myriads of shooters who swarm around the larger cities of the Atlantic sea-board, have had a tendency to exterminate and to drive the main flight of our water-fowl to more quiet retreats in the West, while the more tempting grain fields and rice lakes offer to these fowl greater inducements to abide in their new home. Vast tracts of marsh and meadow which once offered a fine feeding ground around the bays and creeks of the coast are now an almost barren waste, where few birds can be seen, except fish ducks, such as coots, alowives, loons, sheldrakes, divers, etc., none of which offer any temptation to the true sportsman.

We will consider none but the edible species, the true game birds. Among these the

glorious mallard has a prominent place, from its greater abundance, from the wide range of country where it is found, and the quality of its flesh. It is a universal favorite at the table, and is more marketable than all other varieties combined. It affords, too, a wider field for genuine sport than all others. The canvas-backs of the Chesapeake, it is true, draw many lovers of the sport, who for years have practically known no other field, and who can recapitulate volumes of exploits among the red-necks and canvas-backs of Chesapeake Bay. As a favorite for the table this magnificent bird ranks first, when size and flavor are both considered. The wild celery upon which it delights to feed imparts to it a delicious flavor, and gives it the pre-eminence. Nowhere can we find its fit comparison save in the blue-winged teal of the West, which in September, after fattening on the wild rice while "in the milk," emerges a "perfect roll of butter," and in point of flavor and delicacy is not surpassed.

The black duck, which seems to be identified with the sea-coast, is also a great favorite. More wary than any of the other varieties, extremely sensitive to the approach of man, quick of perception, and exceedingly shy, it is the very ideal of a game bird. No sportsman returns with a round score of black ducks strapped over his shoulders, the result of a day on the marsh, but has earned the credit due to pa-

THE TEAL.

tience, perseverance, strategy, and accurate aim. The bag tells the story. "That fellow lay low for black ducks." So closely is the black duck allied to the mallard—there being but a slight variation in the plumage—that it is hardly worth the while to class them separately. Yet it is singular that throughout the vast migratory track of the West this bird is almost unknown. The mallard is every where; the teal, the widigeon, the pintail, the blue-bill, the red-neck, canvas-back, and all the favorites generally, are found in greater or less numbers as the locality favors; but rarely the black duck, which seems to be confined to the coast, and therefore doomed to extermination.

The Canada goose, too, while it frequents the sea-board of the Atlantic and Pacific and the whole of the country lying between—while it swarms on the vast grain fields of the West, destroying countless bushels of corn, pasturing on the sprouting winter grain, yet it does not exist on the Atlantic coast south of Currituck. During the winter months spent on the inlets and among the sea islands of South Carolina, when the bays teem with water-fowl, not a goose can be seen. There is no food for them.

The ducks visit the old rice fields during the night, and return in the morning, lying off in the bays during the day, and occasionally taking a trip among the innumerable creeks, where they become an easy prey to the sportsman concealed behind his blind of palmetto leaves, which encircle his skiff. Many days have we spent on the Waccamaw,

Winyaw, and Muddy bays, and among the labyrinth of creeks from Georgetown Bar to North Inlet, the favorite shooting ground of the Georgetown district—many score of black ducks and mallards, rice-fed birds, have we brought to the water, but during all our sojourn there we never had the pleasure of drawing a bead on an "old hunker."

That they make an occasional visit so far south on the coast may be true; but it is beyond their natural bounds. We have made havoc in their ranks in the vast corn fields of Illinois. We have taken a stand in the centre of a large corn shock, and have seen them come in myriads from the large swamps in the vicinity—always making their entry at a certain point instinctively, and their exit at another, if undisturbed. Here, sportsman, is your field, if you can kill a goose! if you never did, ten to one if you draw a feather. Nothing is more deceptive than a long line of old hunkers bearing down on the hiding-place of a novice at goose-hunting. The size of the bird, the clack of their goose-talk as they approach a feeding ground, the apparent proximity of the noisy fellows as they seem to fly almost in one's face, create the impression in the mind of the uninitiated that they are only a few feet off; but when he suddenly rises and fires, to his chagrin he discovers that the flock has turned about at some eighty yards distance without a scratch. Many a splendid shot have we lost in this way through the nervousness of some amateur sportsman, who was sure of almost any other bird, and who could make his right and left shots very creditably, but who had never shot a goose.

The Canada goose is a heavily fledged bird, and bearing down in a direct line upon the hunter is no easy prey, until it is passing or has passed. It is better to wait until you can see its white tips; then a quartering shot under the wing will bring down your game. Four drams of good powder, an ounce of shot, No. 2 (which is coarse enough), and a little attention to the business will usually settle your goose question.

But shooting geese on the vast wheat fields in early spring or late in the fall, after the winter wheat has sprouted nicely, is another thing. Here are miles of expanse like the ocean, without cover of any kind; there are the geese, numbering thousands; the knolls are black with them. Now is the time for strategy. You must select a windy day—for they can not rise down the wind—provide yourself with a team of oxen and an old sled; lie down; allow the oxen to graze gradually toward them, making a circular tour toward the last, so that it will bring you to the windward; and work toward them until you notice symptoms of alarm, shown by the double note of the old gander. Now is your chance. To your feet before they

GOOSE-HUNTING ON THE OPEN PRAIRIE.

can gather! you are near enough. They must pass to the right or left, for they can not rise in any other direction. Each man select his birds, and if you do not bag two each, you should never shoot at a wild goose again, unless absolutely in self-defense.

Much cunning is exhibited by these birds in localities where they are frequently disturbed. We have often seen them in the great swamps of the Bureau Valley along the Illinois come in about dark, when it was just too late to draw a sight, noiselessly stealing along, so as to evade the random shot of the hunter returning to camp after a long day's work. So attached are they to their old grounds, and so liable to be pursued at night by reckless adventurers, that after a few warnings they baffle the most intelligent. Should their line of entry be discovered to-night as they come across the marsh from the south, to-morrow night, if you watch, you may hear the vibration of their wings as they pass over the timber to the north, in their approach to the old rice pond, or open water of the big slough. Upon all other occasions, and also when disturbed, they exhibit their usual propensity to indulge in gabble and goose-talk.

The most prominent among the varieties in the West is the Canada goose. The next, and existing in great numbers, is the white-fronted or laughing goose, called by many, "brant." Of the regular brent-geese we have but few. We killed one out of a flock in the Illinois River, in 1860, on a sand-bar, and believe it is the only flock we ever saw in that valley. The brent-geese is about half the size of the Canada variety, and is about two-thirds as large as the white-fronted, mottled, or laughing goose. But in the absence of the regular brent-geese, the mottled bird known as the laughing-geese carries the name of *brant*. And *brant* it is, so far as the average shooter is informed; for

few of them have ever seen a brent-geese—and this is the only bird which, to their knowledge, ever bore the name. These same fellows call a partridge a pheasant, and an English snipe a woodcock.

It is amusing to watch a flock of laughing-geese as they approach a favorite feeding ground or a resting-place. They come first in the regular acute-angle line of flight. Suddenly they break ranks, and with one accord the whole flock begins a series of evolutions, tumbling and turning high in air, and then descending in a most comical and irregular manner, to the amusement of the observer, all the while indulging in a jabber more resembling the merry laughing of a bevy of school-girls than any thing else, from which peculiarity they receive their name. As a table bird it is highly esteemed, and is generally preferred to the Canada goose. In point of numbers it exceeds the latter in this locality, while in other parts the ratio is reversed.

They visit the West in March and April, on their regular migrations to the lakes and bays of Northern Minnesota, the British possessions, and Labrador, remaining with us sometimes as late as May in small detachments. Many are killed before they reach their northern breeding grounds. After raising the usual brood, and replenishing their thinned ranks, they gather for the autumnal return flight, and in October we see them wending their way to their old and favorite haunts, until the cold weather drives them southward to the great marshes of Arkansas and the Lower Mississippi. As they pass north in March, generally before a southerly gale, which carries them along with little apparent effort, their coming is welcomed as a harbinger of returning spring. They come, too, in large numbers, accompanied by all the usual varieties of water-fowl in even greater profusion.

It is a pleasure to witness one of these

pilgrimages; and a trip to the West at the proper season, if for no other purpose, will repay the ornithologist. No sooner has the ice left the rivers, and the southerly gales secured the ascendancy, than the flight of water-fowl begins, line after line, flock after flock, all bent in one direction, and with one common purpose. If much rain has fallen, and the numerous ponds and sloughs of the prairie are

WILD GEESSE IN A CORN FIELD.

full, large numbers alight in their passage, and visit the large corn fields of the stock-raisers, where they pick up the corn which is trodden under foot by the feeding herds. Sometimes these vast tracts are covered with water after the spring rains, and before the frost has entirely left the ground; the cattle have cleaned the ranch, and the waste corn which lies trampled in the mud and water becomes a rich harvest for the weary birds; and here they congregate, acres upon acres of wild fowl of every variety. When fully alarmed by the sound of the gun, they rise with a noise like that of distant thunder, in tens of thousands, until the air is thronged with them. Should the spring be dry, and there be little water on the prairies, they pass over the locality, alighting occasionally in the rivers or in the adjacent ponds, but seldom break ranks until they reach the more extensive marshes of the Calumet, Winnebago, and other streams, or the lakes of Wisconsin and Minnesota.

The Calumet Marshes, near Chicago, are, and have been for years, a favorite spot, where these birds in their pilgrimages mostly gather. This, however, is becoming to such an extent a resort for sportsmen, pot-hunters, and every variety of the genus *homo*, in search of ducks and a "good time generally," that we fear its days are numbered.

Here you will find the sterling representatives of Chicago's favorite clubs, her renowned "shots," who come in their marsh rig—a bottle of cartridges and a belt full of whisky—untrammelled with by-laws or resolutions of club origin, and far beyond the reach or influence of the Woman's Anti-whisky League. They secure some primitive "dug-out" of ample dimensions and sufficient breadth of beam, and with a unanimity of purpose worthy of the undertaking, they sally out to make that marsh the hottest place for ducks that the imagination can conceive, until the last bottle of ammu-

nition is exhausted, when they join in the favorite chorus,

"Oh! we'll never get drunk again,"

buy up of some more successful shots enough ducks to make a show at home, and beat a hasty retreat cityward.

The Calumet promises little for the sportsman of the coming generation, through the incessant hammering of the mob of sportsmen that congregate there, and, like the Atlantic coast resorts, in a few years it promises to be the abiding-place of the solitary heron, with an occasional sprinkling of crow-ducks, divers, and here and there a pensioner. This continual hammering drives the birds to other localities, and the main flight passes entirely over the locality, to stop only where they can escape this incessant warfare.

A man may be a good quail or snipe shot, and may be able to kill chickens admirably well, for this requires little skill or judgment—any boy who can handle a gun can bring down his prairie-chicken—but mallard duck shooting is another thing. If the birds are young and green—the first of the fall flight—they can be secured easily within twenty yards. But suppose them to be full-fledged, and that it is later in the season, with the wind light, while the birds fly wide, what are the chances of the ordinary marksman? Ah! then it is a different business, requiring tact and experience. I have seen good "shots," who could kill quail, woodcock, and snipe, shoot all day at ducks, and only succeed in crippling a few. Most of their shooting has been done at point-blank range, which, when applied to duck-shooting under ordinary circumstances, fails. The barrel is always a tangent to the line of flight of the shot, which describe an arc of a circle, and always fall after leaving the muzzle. In aiming point-blank at a duck on a cross shot forty yards away, if you do not aim ahead proportionately to the veloc-

A CHICAGO CLUB MAKING IT HOT FOR DUCKS ON THE CALUMET.

ity of the bird, and above in proportion to the distance and the natural fall of the shot, your bird will seldom grace your game-bag, unless you make a "scratch," which is often the case.

Take for example a blue-bill or a teal, coming down the wind, and *they* mean business when they fly: these are admirable subjects upon which to experiment if you are in doubt. Suppose a line of blue-bills come whizzing by twenty yards high and forty yards distant. You aim at the leader. What is the result? If you drop any, it will be one of the last in the line.

The most sportsman-like way to kill ducks is over decoys, and this requires much practice and experience in handling decoys. For to a novice it is more than likely his decoys will be in his way, and instead of drawing birds to him, he will drive them off. In the first place, secure a gun of proper weight and length. There is not so much depending, however, upon the gun as upon the man behind it. Most modern guns are good, and a good "shot" will kill birds with a musket. Select a gun about No. 11 calibre, with solid metal at the breech, and tapering very light at the muzzle; for one great object in water-fowl shooting is to have a good weight of metal at the breech of the barrel, since in constant hammering with light guns your shoulder will suffer after a day's work. Nine pounds is a good weight for a thirty-inch gun of No. 11. Properly handling this gun, you can do all the execution which opportunity may afford. Cumbersome duck guns are useless. I have

done some of my best shooting in the creeks of South Carolina with a No. 12, eight pounds; and one day, while there, I made a handsome bag of black duck and mallard on Marsh Island, in Winyaw Bay, near Georgetown Bar, with a fifteen-dollar gun—a No. 12, thirty inches—but I observed the ordinary well-settled rules in duck-shooting. For a short neck a straight-breech gun is absolutely necessary, and for a long neck the reverse. The eye always follows the object, and the gun should be suited to come right to the line of vision without changing the motion of the eye at all. Therefore, in selecting a gun, place the gun at the hip, or present arms, fix the eye on an object, close your eyes, then raise your gun quickly to the shoulder, open your eyes and see what the gun covers, and what would have been your chance of hitting it if a bird. You are then precisely in the position of a person shooting woodcock in a dense thicket: your eye is so busily engaged in following the bird that you can not stop to look for the sight; but the ear, the eye, and the hand follow each other instinctively, and you have the bird without ever seeing the gun at all. This is quick work, and is called "snap-shooting." Now a gun with which you can do this is a good one for ducks, provided you load it properly, and observe the other rules.

Early in the season, when the first of the flight comes down, and most of the birds are young and quite green, falling an easy prey to the sportsman, No. 8 shot will do the work effectually. But later in the season they are well fledged, will bear heavy pound-

ing, and get away under ordinary circumstances. Then four drams of coarse powder is a charge for a mallard, and an ounce of shot—*never* more than that. The size of shot should be governed by circumstances.

For mallard, No. 8 will answer until the birds become large and strong; then use No. 6 shot.

Provide yourself with a set of large decoys; anchor them in the right place, being careful to set them in such a position that the birds will always draw in front of you, being careful at the same time not to place yourself in such a position that they will draw every time right in the line of sunset or sunrise, as the case may be. Observe that ducks always draw, in alighting, head to the wind, and your position should be such that you have the wind on your right shoulder, when the birds will draw from the left. Push your skiff in the sedge, and cover it well with grass, wild rice, or whatever is most prominent, and always endeavor to conceal it. Have a suit of clothes as nearly the color of the sedge as you can. A black hat or cap is fatal. A dirty white cotton cap, such as is worn in summer, is good, if you rub it up with oil and iron rust, so that it will appear about the color of surrounding objects. Every thing prominent and striking is to be avoided. In such a rig you can take your stand. As soon as you see a flock, drop; watch the line in which they draw; move not a muscle while they circle around. When they come up the second time, and set their wings for a drop, select the first, and if you are patient you are sure of your bird. Then the whole flock spring, and you select the nearest, which is, in fact, a better shot, for he is going from you, climbing as no other bird can climb. The result—a pair of mallards. Let them lie, for there will be more along soon. Mark! there comes an old drake. He has his wings set, and is making a bee-line for the decoys. Let him

swing first, and then take him as he draws. He likes not the looks of these decoys, on a closer scrutiny, and is inclined to make a tour of inspection. Here he comes, right on your quarter. He springs—you are discovered. Drop him. There comes a flock of pintails. They see nothing but the decoys. Don't let them light; but when they draw and bunch, get a quartering shot and rake

the line with No. 8 shot. Lie down: there come three mallards. Watch when they draw; they often cross each other. The two outside birds are drawing together. Now is your chance: the three birds are yours.

This is decoy shooting, such as is practiced in the marshes by those who understand it.

The most favorable days for duck-shooting are cold, windy days; the heavier the gale the better; it keeps them on the wing, and they can not lie out in the bays and ponds, nor seek a cove to the windward and fly low. Great judgment is required in selecting a good spot in which to work decoys. The country and the habits of the birds must be studied, their lines of flight, the changes which the shifting of the winds produce, where they feed, when they feed, their favorite haunts. The mallard duck loves company. Thousands of them can often be seen in a small pond no larger than a city lot, and by the exercise of judgment and skill you can bag a couple of dozen easily.

One of the most successful days the writer ever had was in Southern Minnesota, on Pine Creek, where a slough was discovered in which a thousand mallards were quietly resting. My comrade was bent on crawling up for a shot, and with difficulty did I persuade him to refrain. "Put down your gun," I said to him. We walked up, drove the ducks out, took our position at the windward end in the black flags, and prepared for their return. Shortly a couple of mallards rounded a point of timber not far distant and made a straight line for the slough. One apiece we dropped them. Then the work was begun, and in less than two hours we had secured eighty-eight mallards. Of the vast myriads in the great rice marshes of Minnesota few have any idea who have never beheld them in the season. This is the great migratory track, and here are their

THE DRAW—BIRDS SWINGING ROUND.

TWENTY-EIGHT AT ONE SHOT.

principal feeding grounds. In September, 1860, on an island in the Illinois River, the writer made a shot across a line of blue-winged teal preparing to migrate, and with a charge of No. 8 shot, with a No. 5 single heavy gun, he killed twenty-eight birds at one shot, and with a small No. 12 gun he killed fifty-four in fifteen minutes. This was done in the presence of Moses Osman, Esq., one of the editors of the *Ottawa Free Trader*, and now of Fairbury, Illinois. This shot was published at the time, and counted good, although it was a "poor day for ducks."

The valley of the Illinois was once a vast feeding ground for water-fowl on their passage, and even now is frequented by thousands. Bureau Valley is a favorite resort, lined with sloughs, rice lakes, and marshes, with easy access to the corn fields. The water-fowl cling to this home with a tenacity worthy of protection. Thousands are sent from Chillicothe, Henry, Peoria, Spring Lake, and Pekin to the market of Chicago, to be shipped to the Eastern cities, while Calumet, Winnebago, Green River, and the lakes of Wisconsin furnish their quota for the tables of the Eastern epicures. Great is the slaughter; but they return from the Northern breeding grounds next fall with their broken ranks replenished. Occasionally a drought destroys their harbors on the prairies, and we see few ducks. Then reports come to us that Western Iowa is teeming with ducks and geese, for the flight has

followed a track three hundred miles west for water, where they are comparatively undisturbed. But after a mild winter a wet spring, to fill up the marshes and sloughs, brings them back to their old track again.

While I write (March 5, 1874) the flight is passing north, and the papers announce, through advices from one of our clubs, that Calumet is teeming with myriads of ducks. The market bears faithful evidence of the truth. The Klimman boys, the great duck-hunters of the Calumet, are reveling once more in their favorite and lucrative sport.

A few years since I was one of a party of four who came out from the East year after year, each of us a crack shot. None save myself had ever been West. All had shot from Long Island to South Carolina, but had no conception of the vast multitudes of water-fowl in the West. We procured tents and other appliances, and struck out for Chicago, and thence to the town of Chillicothe, at the head of Peoria Lake. A storm had just passed, a driving storm from the northeast, which filled the marshes. A stiff norther was blowing a gale. The main flight of fall birds was coming before the wind down the valley in countless numbers. From twenty to fifty flocks could be seen bearing down across the head of the island, and making for the old Goose Pond, Spring Branch, Black Partridge, the Big Slough, and other resorts, until the swamps seemed alive with water-fowl. We got our boats, camp,

rig, and provisions, and made for the opposite shore. Such a sight, said one of our party, he had never witnessed any where along the coast, and he never expected to witness a grander one. Here was game without limit. Barnes pulled away at his pipe with his eyes fixed on the long black lines of geese as they turned over the head of the island a mile north, making a bee-line for the sloughs, and adding to the already dense masses. We pulled down stream, passed the island, and went to the main shore to survey the country. We worked across the marsh in a line for the Goose Pond—an almost inaccessible marsh, about a mile long, filled with wild rice, and protected by timber, secluded and safe. Here, upon a projection of timber growing out of a sort of floating bog, we pitched our tent and built our camp fire. Abbott took his decoys and went for the mallards, while we got the camp in order and secured enough of sedge-grass with which to make our beds. The condition of the ground was such that we found it necessary to build a foundation of twigs upon which to lay our sedge-grass to keep it dry while we were preparing. Abbott was at work, and a more beautiful sight we never saw. Every flock apparently came straight for those decoys, and before dark he had bagged sixty mallards. He came in and we repaired to supper, after which we were enjoying our quiet smoke when a fine setter dog of Abbott's came at full speed for the tent. We stepped out, and in the darkness were two large eyeballs glaring from an old fallen tree, and a yell such as I never heard before greeted our ears as the eyeballs disappeared. A couple of trappers in search of musk-rat and mink were camped close by, and from them we learned in the morning that a large lynx had been prowling around the night before.

We remained on this spot about two weeks, and then changed our camping ground for

the Big Slough, whence our facilities for reaching the market were excellent, and we had regular access to the mails. Continual pounding for two weeks in the Goose Pond had driven the birds away to the other ponds. The wild rice grew here the alternate years, and this year there was abundant cover and feed, and with a will we went to work.

That the reader may not indulge in too generous an idea of the luxury and ease of camp life in a duck country, where the great object is to secure a full supply and the cream of the sport, we will point out some of the duties incidental to our daily routine.

The birds begin to fly at daybreak, and then it is very necessary that each man shall be in his place, probably a mile or two from camp. At four o'clock we indulge in a hearty breakfast, which with us usually consists of fried ducks' livers, buckwheat cakes, fried potatoes, and coffee. Each man has his boat, in which are his decoys, safely stowed away the night before, a good paddle, a pole, and a pair of oars. Often two go together in one skiff; but, although more companionable, it is more difficult to work about in the dense rice, over the ooze and black flags, when oftentimes speed and dispatch are necessary, and nothing but extreme buoyancy of the boat will permit quick motion. One man is also less likely to be detected by the ever-watchful eye of the duck than two. One man seldom indulges in unnecessary talk when birds are flying; two are generally exchanging ideas, when a flock near at hand is startled by the sound, and turns away, unobserved until too late.

We decide where each man will go, and usually arrange that the ducks can be kept flying from one set of decoys to another by proper posting of the shooters; for if a flock fails to draw to one, it is quite sure to take to another. Before daybreak each man has shoved his boat in the sedge in a favorable

THE GOOSE POND.

AN OLD CURMUDGEON.

spot, and built his screen or blind in such a manner that he can push his skiff in and out as it becomes necessary in picking up ducks and chasing cripples.

With the first gleam of light on the eastern horizon comes the dash, and oftentimes while engaged in setting the decoys in darkness the quiver of many wings can be heard overhead; and sometimes a splash, followed by a dozen or more in close quarters, denotes that the birds have discovered our decoys before we are prepared to receive them. The decoys being set in such a way that they will swing to leeward, and ride free from each other, leaving space enough between us and them to secure the pitch of the ducks in front rather than behind, we get behind our blind, and are ready. The flight has commenced, and the booming of guns is heard all over the marsh. The sight of a dozen decoys riding apparently undisturbed is an inducement to join company. The passing flock detects them, and the birds set their wings for the stools. Down they come, rocking and swinging, until close to the tops of the rice, when they swing around to scrutinize their irresponsible companions. One moment

more and the cheat may be discovered by the older heads, and away will go the flock. But we are quick to take our chances, and our harvest is an abundant one.

We always make it a rule to secure blue-winged teal for our table. We can roast them, broil them, toast them, or fry them in butter. Stuffed with mushrooms, and toasted, they leave a canvas-back in the shade, in my opinion. Early

in the season we find loads of mushrooms on the old pastures here, and there is nothing finer than a fat blue-winged teal stuffed with fresh mushrooms.

We proceed to draw the birds preparatory to shipping. This is done very neatly. The large mallard duck livers are always preserved, washed and slightly salted, for our breakfast, and a more delicate morsel can seldom be found. This done, the birds are sponged, tied in pairs, and hung up to dry. Afterward we put them in bunches of six, label, and ship them the next morning by the cook when he goes over for the

THE DRAW—DUCKS SETTling TO DECOYS.

DUCK-SHOOTING IN A PRAIRIE SLOUGH.

mail. The express company deliver them, and we draw against them, the proceeds covering our expenses. On our last trip we sent to the Chicago market some fourteen hundred head of mallard ducks, widgeon, blue-bills, and geese, which were our surplus after giving away, consuming in camp, and sending to our friends East a fair share.

After dinner we take a smoke, and about three o'clock we sally out for the evening flight, which though shorter, is often stronger and more exciting, especially if on the eve of an approaching storm. This is a privilege not enjoyed in South Carolina. There you have no evening shooting, as the ducks leave the bays, where they congregate during the day, rising about dusk almost in a body for the rice fields ten to twelve miles up the river. But in the gray of the morning they return to the creeks and bays, affording fine sport for a time.

Other methods of securing these birds in the prairie sloughs of the West are somewhat different from that we have attempted to delineate. Our method is that practiced by the scientific sportsmen who pursue the sport for the love of the pastime—a method in which strategy, calculation, and study are concerned, and in which patience and perseverance secure success. Go down on the Calumet and you will see shooting practiced in all its modes. There you will find the true sportsman who has left his place of business for a day's recreation and relief. He does his work thoroughly. He has not come to cripple and to maim, but to kill. But paddle down the creek, and on every projecting point you will find posted some pot-hunter, who blazes away at every passing flock, frightening far more birds than his shot reaches, and crippling more than he kills. He never shoots at a single bird, but bangs into a flock pell-mell as it passes, to be treated in like manner by the next pot-hunter.

In the spring, when the prairie sloughs are full of water, the birds as they pass north remain for some time. Here is no cover at all—no means by which an approach can be made without discovery. The tempting sight of a thousand ducks in a mere pond or slough, almost at your door, gives occasion to a vast deal of strategy. Generally speaking, the birds in this situation are safe. Many times we have been perplexed to find some means by which we could secure our game. There they sat—elegant birds, all ready for an invitation to be bagged, but far beyond the effectual reach of flying shot. What is to be done? We get a team and drive to town, procure a cask and a spade, also a lot of stones—for you might as well look for a needle in a hay-stack as a stone on the prairie. We select a spot on the edge of the slough commanding the whole area. We dig a large hole and dam up around it to keep out the water. After the hole is large enough to admit the cask to within six inches of the rim, we bale it out and put it in, then throw in the stone until we have settled it fairly, and tramp the clay well around it. When the cask is firmly set, we throw out the stone and cover it with some old bleached prairie hay. Then we get inside, and, with a few decoys, our cover is complete. We have shot mallards in this way, to the utter astonishment of the farmers, who never were able to get near enough to touch a feather. The next season we go up to the old spot, and the cask is full of water. We bail it out, put some hay in the bottom, and are then again ready for work.

In the fall these birds resort to the vast corn fields to feed, and when they once come to understand the business, they soon fatten, and are in elegant condition. The best method of working a corn field which the ducks have been in the habit of visiting is to go in a party of three or four, take your

positions commanding the whole field, pull up the standing corn by the roots, and stack it up as you would stack muskets—enough to make a secure blind; get under cover and wait. About three o'clock in the afternoon the ducks begin to come, just over the tops of the corn, hundreds and thousands of them, according to the locality. We have seen them sally forth from the sloughs and marshes near Peoria Lake in a direct line for the corn fields in numbers that would surprise the novice.

Here is a fine chance to secure every bird. Cripples stand no chance of escape. A

broken wing is just as effectual as a broken head; for when they strike the soil you can pick them up. Quite different is it if they fall in a marsh; there they hide in a trice, and when the opportunity offers, at once make for the margin of the pond or the shores—eventually to die, to be eaten up by minks, musk-rats, foxes, or hawks, or to become the prizes of some fortunate poacher or bush-whacker. The cleanly picked bones often mark the spot in the lonely marsh where the wild-cat or fox has made "a square meal" from what was once a plump corn-fed mallard.

RAPE OF THE GAMP.

CHAPTER IX.

PROUD AS LUCIFER AND DARK AS EREBUS.

WHEN gentle Mrs. Browne plaintively remarked that she was doubtful as to what papa might think of "these new doings," she used the plural number advisedly, alluding not only to the monstrous innovation of walking before breakfast, but more obscurely to another change of doubtful tendency, which had crept almost imperceptibly into the practice of this well-regulated family. Mr. Browne, attended by the ladies of his family, worshiped in a district church which had been built in his part of the town. This edifice was of the Georgio-Palladian era, built of bricks, disguised inside and out with stucco, and lighted by means of tall sash-windows of the usual domestic pattern. Its interior was rendered at once elegant and commodious by a gallery which ran round three sides of the structure, like the dress circle at a theatre; and a handsome three-storied pulpit formed the grand centre of attraction. Walter Browne, Esq., was a very regular attendant at this place of worship, and expected his women-folk to be the same; but for many months past his expectations had been imperfectly fulfilled.

The old parish church, dedicated to the Holy Apostles, has been described as standing prominently on the brow of the cliff. It is a massive Gothic structure, and, having been designed for grand functions and pompous ecclesiastical processions, has a vast chancel and choir, extensive nave of seven spans, and broad aisles. The fourth seat in the northern aisle was facultied to Mr. Browne's house, which, before the other church was built, of course depended on the old one for spiritual ministrations. In this seat Albert, Frank, and Hubert Browne were wont to worship still, accompanied by Robert when on a visit to his family, and of late by Janet, who now affected to despise the rectangular "temple" (as Frank called it), and had been observed making efforts to pe-

ruse a hand-book of Gothic architecture and other works of a retrogressive character. It happened that the three front seats in this aisle were facultied to the Grammar School, and that Mr. Lane sat in the left-hand corner of the front seat.

A habit prevailed at Pedlington of entering the parish church by a door in the north wall of the choir, where, during the infrequent week-day services, the scanty congregation was easily accommodated in the stalls. But on Sunday the body of the church was filled; so those who went early sat in rows confronting those who came late. Every Sunday, just as the service was commencing, Albert, Frank, and Hubert would march down the choir steps, sweep to the right in front of the school seats, wheel to the left round Mr. Lane's corner, and so reach their own place in what seemed to them a quiet, unostentatious manner. After service they returned by the same way, again filing past Mr. Lane.

It must be said for this out-of-the-way angle of the church that those who worshiped there sat or knelt in the glow of a magnificent painted window which filled the wall at the eastern end of the aisle. Of late—at first occasionally, latterly more regularly—Mr. Lane had become aware of a graceful figure and a wave of delicately perfumed air attending his friends' arrival; and when he looked round from time to time at the boys behind him, the fair face of Janet, lit with tinted rays, closed the vista. At least he saw no further. Beauty such as hers, even with him, had power to arrest the eye, and say, "Thus far shalt thou come." But he averted his look, and went on with his prayer and praise. A poet-artist might have imagined this wayward girl unbonneted and seated under the gilded organ-pipes in full blaze of all the chancel windows, and so, crowning her golden hair with white roses, might have made a St. Cecilia of her, as many a Madonna has been made. But Mr. Lane put such foolish ideas away from him, and pursued his devout exercises. Yet was

he growing accustomed to feel that she was near him in church, greeting him with happy smiles on the way to his daily task, and always present, though seldom speaking, in that house which was his favorite resort in all the town.

The Brownes dined early on Sundays, as most good people do in Pedlington, and as no member of that family attended evening service at church, they were not sorry to see Mr. Lane drop in to their frugal supper, which he had now acquired quite a habit of doing. If there was any difference in his manner to Janet and to the others, it was merely that, as being younger, and therefore farther removed from him even than sister Joan, he made less attempts to converse with her. He used frankly to admit that, while he could understand and sympathize with, and generally win the confidence of, boys of all ages, young ladies from twelve to twenty-four years of age were a complete mystery to him, and that therefore they must pardon him if he seemed stiff or harsh or silent with the young ladies present. Then Nelly would laugh, and say he was always very agreeable to her, and papa would rally her, and say perhaps she was the exception to Mr. Lane's rule. Of course every rule had one exception. But Janet would be quite silent on such an occasion, her eyelids would be lowered, and the dark curling lashes motionless. Really Mr. Lane did often try to draw her into the common conversation, but it seldom availed. He talked too much upon abstract subjects, very often making almost all the talk himself, and only drawn out by affectionate appeals from the mother, or by half-sarcastic questions and inductions on the part of the eldest daughter. And when an abstract question was not on the *tapis*, the talk was seldom about individuals, and never degenerated into that harmless though personal gossip which is dear to women of all ages. On Sunday evening the conversation was often religious, and whatever Janet may have *thought* of Mr. Lane's theories and opinions, she *felt* they answered doubts and difficulties of her own, and that they were singularly unlike the rigid unreasonableness of her father's code. Mr. Browne, when he listened, which was not often, for he preferred his book, looked upon it all as harmless theorizing, very well for a single solitary man, who might range over the whole world of ideas and yet live an honest, upright life, but quite unsuited to the decorum and stability of family economy. Perhaps occasionally he was rather astonished and alarmed at a startling novelty; but knowing as he did that his children must sooner or later take wing from the paternal nest, and become more or less inoculated with other opinions than his, he thought it well that their first introduction to outlandish sentiments should be in com-

pany with a man whom he both liked and esteemed. Mr. Lane always treated the mother with more respect and consideration than her daughters. He never paid the girls any marked or conspicuous attention, never exchanged glances or smiles with them on any subject which was not spoken of openly *coram magistro*, and, above all, Mr. Browne felt quite sure that Lane was a man who had his way to win in the world, and that he had no idea of encumbering himself with a wife in that toilsome ascent. He also united with his wife in thinking that Mr. Lane's friendship had been of inestimable service to Hubert, and might have the indirect effect of infusing into Frank a dash of his energy and more vigorous habits of mind.

One Sunday evening Frank was absent. He had gone from home on the Friday, and was not to return till the following Monday morning. A great storm had been raging throughout the whole Sunday, but at about eight o'clock in the evening Mr. Lane appeared as usual. It happened that no one but Janet was in the drawing-room when he was shown in, and she was sitting on a footstool by the side of the fire, leaning her back and head against the white marble mullion.

"I *won't* get up for you, Mr. Lane," she said, putting out her warm little hand to him, "because I know you think me only a little girl who ought to behave properly."

"That's right," he said, quietly; "you know I sympathize with all rebels and disaffected people all over the world. It's a part of my creed to do so."

"Ah!" she thought to herself, but of course did not utter the thought, "with people all over the world; but if *I* were breaking my heart, he wouldn't think about *me*."

"What a dreadful storm it is!" she said, presently. "And how long it *has* lasted! It made me so sad last night to hear the wind howling in that terrible manner."

"Well it might," he replied. "And they tell me that last night or this morning early a large steamer from Bremen ran ashore at the mouth of the Peddle. She went to pieces, and all hands were lost before an effort to save them could be made."

Janet expressed her sympathy for the "poor things," and wondered whether there was a Dutch Jonah on board, and whether they could have saved the ship by throwing him overboard to the white-bait. But she was thinking inwardly, "He does not care whether *I* was sad or not. He does not like me the *least bit*."

Then she resolved desperately to *make* him ask her for his umbrella. "It doesn't matter what he thinks of me *now*," she thought; then said, looking at him pointedly, "I can see you are quite wet, Mr. Lane. How very shocking! Had you not got an umbrella?"

In the mean while this big strong man had been quite dreading some allusion to his *umbra*. Since that morning on the cliff he had never seen it. He was attached to it from long service and many pleasing associations, and would not buy another. Consequently when it rained he allowed himself or his coat to get wet. To this arrangement he had little or no objection. And if Janet had mislaid and so lost his *umbra*, thinking it had been returned to him, or having forgotten all about it, she would be vexed to find out the state of the case; and he could not bear to inflict the least annoyance on her. But if, as he suspected, she was keeping it in sweet durance, he could do nothing honorably (he thought) but ignore the fact.

Now he was in presence of the enemy—actually under fire. The question was fired at him point-blank. His courage, as that of a true hero always does, rose to the occasion; but his chivalrous, watchful care of this lovely foe did not flag for an instant.

"I think I had a common old parachute once," he answered, looking at her, or rather into her, with such calm, forbearing eyes that her purpose nearly quailed. But his indifference had made her desperate. She would *make* him treat her like a human being, with at least gratitude and regard for one who had dealt kindly with her, and who had deserved so well of her by his services to Hubert.

"Think, Mr. Lane?" she urged. "You know you had. The dearest old nice large one. And you lent it to me."

Poor little Janet! She said those last words in a voice ringing with joy, and with triumph dancing in her eyes. But the knight of green gamp was not so easily overthrown.

"So I did," he said, still fixing upon her that calm, unwavering glance. "What a long time ago that was! You really were a little girl then. I don't think you were sixteen. You and Nelly couldn't have held it between you if you had not rested the end of the handle on the seat of the boat. But I shall never be so gallant again. You are quite a woman now, as you say; and if I were to lend you an umbrella, the gossips would gossip about you. Besides which, *I have lost it, and don't intend to buy another.*"

Janet might have made another effort to retrieve the day if Mrs. Browne had not come in at that moment. But it is doubtful whether she would or no. Mr. Lane was so stern and yet so tender. He was thinking of her all the time, and fighting with her to secure the privilege of not seeming to think of her, and to secure her from the imputation of thinking about him, and still more of being thought a flirt. How noble he was! yet how invincible in his nobility! "Is it only possible, then," she thought, "to vanquish the weak—to have

those at one's feet at whose feet one could not lie?"

"I assure you we were not flirting, Mrs. Browne," said the gentleman.

"No need of assurance," she replied, smiling.

"But what do you think we were doing? Quarreling?"

"Quarreling? No," replied Mrs. Browne, incredulously shaking her head.

Then Janet, with her eyes full of tears, said, "Mr. Lane was scolding me for being sancy and bold, mamma. I am too self-willed; I know I am. But he is not as kind to me as he is to Hubert. He doesn't care for what I think or feel."

Then a little pause of utter astonishment on the mother's part and a deep wonder on Mr. Lane's part ensued, after which Janet brushed the tears away, rose up smiling like Hebe, and said, "I know papa is down stairs waiting for us to come to supper. Mr. Lane will give you his arm, mamma."

And off she ran, but turned at the head of the stairs with an arch smile, which alone would have slain any champion but this one, and said, "It was very kind of poor Mr. Lane to have come to-night, mamma, as it is so wet, and he has *no umbrella!* I was afraid he would not come to-night, as Frank is not at home."

That was Janet's Parthian arrow, shot as she retreated from the field. When they sat down to supper, conversation became general, and hostilities were not renewed. But added now to Mr. Lane's admiration for Janet, a profound and not at all unpleasant wonder at her strange behavior to him settled on his mind. Yet he was resolved to be even less kind to her than usual, and to show her as plainly as any negative course could do that her conduct was imprudent, and that he was displeased at it. "Poor little pet!" he thought to himself. "She is too playful, and too guileless of wrong. Some fellows would have taken advantage of her. I must give her a silent lesson in propriety." Accordingly, for many weeks he slighted her so pointedly that her mother noticed it, and said to her one evening, after Mr. Lane had left, "I fear you really have offended him, Janet." And Frank, overhearing this, and having himself noticed a want of his usual gentleness in Mr. Lane's manner to Janet, observed that he should have thought Lane too generous a fellow to be angry with a girl; at which Janet could restrain herself no longer, but burst into tears and left the room. When she reached the solitude of her own chamber, and had turned the key in the lock, she opened a cupboard door and peeped in ruefully at the *umbra*, which stood gravely in a corner, and, although carefully mended and patched by her hands, seemed to reproach her for levity and waywardness. "I don't care," she said to the inanimate ob-

ject, shaking her head at it as if it were a sentient being—"I don't care. I sha'n't give you back until he asks for you. So he may get wet, and be as cross as he likes."

On the Sunday afternoon before Mrs. Browne's party, as Frank passed Mr. Lane after the service, he slipped a piece of paper into the latter's hand. "I am coming," the note said, "up to your rooms this evening, but don't stay at home if you have any engagement. F. B." In the evening, accordingly, Frank came, and found his friend writing.

"Ah!" he said; "I see. Writing letters. Don't let me interrupt you, but I hate writing letters; often have sixty or seventy to write in a week."

"I don't write as many in a year," said Mr. Lane. "No wonder you hate it. But I was not doing so just now. I was preparing a Greek Testament paper for my class."

They sat without talking for a while, and Frank fell to wondering, as he often did, what the secret of Lane's life could be. To a man of his sagacity and penetration the idea of some entanglement with a woman would have occurred in the case of almost any other man. But Lane's character and habits seemed to repel the supposition. Among all his acquaintances Frank had seen no man who treated women with such courtly respect as Lane did; and yet in this was no tinge of what is commonly called gallantry. Even the old Ada, his housekeeper, was a member of a privileged sex, and treated as such. But that in some way, or for some reason, Lane had severed himself from his early friends, Frank was pretty sure. The Pedlingtonians had gradually arrived at a belief that Dr. Phelps and Mr. Lane were friends of old standing; and as to Captain Fuller, he had broken out one day with an assertion that he had known Lane for twenty years, and that he was "a devilish good fellow, and highly connected." When pressed for further information, he said that Mr. Lane was born in India, and early left an orphan; that he had been educated abroad, and had not cultivated his connections and acquaintances in England. In this latter statement the soldier did not adhere rigidly to the truth; for, though the subject of the conversation had completed his education in Germany, he and Captain Fuller had been school-fellows at Harrow, and being both powerful and impetuous youths, had kicked each other's shins and struggled together furiously over the foot-ball, and the armies on either side had paused, as in Homeric combats, to see the champions fight. Moreover, Mr. Lane's father and the captain's father having been brother officers and friends, the orphan school-boy was frequently invited to spend a part of his holidays at Rivermead, the Fullers' house, and these invitations had been most urgently renewed since Mr. Lane's

return to England. "But he never went any where now," as the dragoon concisely expressed it.

Still, as Frank was forced to believe, Lane must have had some friends and connections in his youth as well as the Fullers; and if not, his cutting *them* was all the more strange. Who was the guardian who had brought him up? Oh, *he* was dead, was he, and his wife, and every one belonging to him! In short, Lane had been born and bred in the household of the man in the moon, and sent to Pedlington in a balloon, which had then returned, and so cut off his means of communication with his relatives. "No, Captain F., that won't do for yours truly, F. B. The truth is, Lane has quarreled with his family; and whichever is in the wrong, *he* will never give way. It would be easier to drag the old church off the cliff than to make *him* knuckle under. Don't you notice, Fuller, that religious men are always either pusillanimous or proud? If they're soft-hearted fellows, they get soft-headed too; if they're made of tougher stuff, like our solitary friend, they get as proud as Lucifer and as dark as Erebus."

This dialogue and these reflections will throw some light upon Frank's view of Mr. Lane's position. We shall leave them sitting together over Lane's fire, because their conversation is too interesting for the end of a chapter.

CHAPTER X.

BEATING ABOUT THE BUSH.

WHEN Frank Browne felt any curiosity upon a subject, his habit was to talk all round it, casually as it were, and without apparent interest in it, yet hovering about it, so that an unwary interlocutor was sure to expose some of its secret places, especially as Frank's languid eyes, with their drooping lids, never looked more drowsy than as the critical moment was approaching. He was, however, too wary to sound a vigilant and susceptible man like Lane in this way, although some curiosity concerning such a mysterious friend was inevitable. Frank certainly might have cunningly extracted rather more from Captain Fuller than the plain-spoken warrior had already divulged, but thought it ungentlemanlike to "pump" a man about his friend's affairs. He had gone as far as to ask Fuller directly whether Lane had no private property, and Fuller answered without any restraint that he might have some little trifle saved out of his education fund, but that he was heir to a snug little property on the death of a relative who had passed middle life.

After the two strangely assorted friends had sat silently over Mr. Lane's fire for several minutes, Frank said again, as if he had

been thinking of nothing else since last saying it:

"Yes, I hate writing letters. I'm sick of it. And, now I come to think of it, how you must hate boys!"

"No, I do not," replied the other, laughing at the idea, though somewhat gravely. "Boys are not like letters, written and never seen again."

"And then they pay so badly," continued Frank, "considering the labor you have with them. But in that respect you and I fare pretty much alike."

"But I assure you," Mr. Lane urged, "that it's a great thing to watch a boy's character growing and expanding, and to help him to become honest and brave and generous. It more than requites the trouble."

"I dare say," replied Frank. "But that's a luxury to which I'm a stranger. And it's a new idea in Pedlington. The only rivalry between the master and me was which should hate the other worst."

"Now Hubert," continued Mr. Lane, "would blush at the thought of doing many things that he might have considered venial if no one had watched over his moral growth; and his mind is at any rate more receptive than it was a year or two ago."

"Yes," Frank replied, heartily, "he's getting on, and coming out too, is Hubert." Then, after a pause, "But you won't stay here long, I suppose?"

"Don't you think," asked the usher, "that the corporation would give me the Doctor's berth if he were to get promotion?"

"No," said Frank. "Much as they respect and as every one likes you, they couldn't do that unless you were in orders. We find they exceeded their powers last time. The trust-deed directs that the candidate selected must be a priest of the English Church, and must act as chaplain to the mayor and corporation. But they were resolved to have a good master, and broke the statute; and as it's a life appointment, Phelps can stay as long as he likes. But I'll tell you what, Lane; no doubt the archbishop would give you a title to orders, and you could qualify yourself for the head-mastership."

But Mr. Lane shook his head. "No, no," he said; "no climbing over the wall for me. But, seriously, I did not think of stepping into Phelps's shoes. My intention has been to complete three years of service here, and then go up and keep terms at Cambridge."

F. B. "What can you want of another degree?"

MR. LANE. "It is not exactly the degree which I want, but the opportunity of taking up a new course of study thoroughly for one thing, and a fellowship, if I can get it, for another."

F. B. "We could put a brief in your way on the home circuit, if you went to the bar."

MR. LANE. "Which promise I shall remind you of if I don't get a fellowship."

F. B. "Then you don't look forward to matrimony?"

MR. LANE. "No."

F. B. "Not if a nice girl with money fell in your way?"

MR. LANE. "Every man to his taste. My stomach would rebel at the poor girl's money, and it would be a bone of contention between us."

F. B. "I confess it would suit me. I should like to find just such a girl as Janet, with just such a snug little nest-egg."

"Now," Mr. Lane thought to himself, "this is a feeler," so he answered, very gravely: "I wish that young lady would find it in her heart to see Fuller with the eyes of half the other girls in Pedlington, to whom he appears a demi-god. If he were to marry, he would sell out and go and live at Rivermead, the most charming spot in Oxfordshire. You know his father is dead, and though his mother and sisters are there now, the place is his own."

F. B. "Would he propose?"

MR. LANE. "If he thought there was a chance."

F. B. "I know you wouldn't say so unless you were sure."

MR. LANE. "I am sure."

F. B. "I will sound her delicately, but I fear it's no go. I like Fuller too, very much, and think his wife will be a lucky girl. But no one can do any thing with Janet."

MR. LANE. "Fuller is the most generous and gentle man in the world. I believe he would treat his wife like a duchess."

"Evidently," thought Frank to himself, "Lane does not want Janet for himself. He is quite in earnest about Fuller; but I know nothing is to be done in that quarter."

In the mean time Mr. Lane, though he had spoken seriously and with deep interest about Fuller's regard for Janet, had been sorry to miss the opportunity of asking Frank (apropos of Phelps's name) why such an absence of all cordiality prevailed between his family and the Doctor. Phelps had refused to tell him, merely saying that no affinity existed between Mr. Browne and himself, and that they had had the good fortune to discover the want at their first meeting. Nevertheless he professed to respect Mr. Browne, and to think him "an honest, pig-headed Englishman."

Now Mr. Lane returned to the subject abruptly, and asked Frank why the acquaintance had dropped so suddenly.

"The truth is, my dear fellow," replied Frank, "that Phelps is interested in an infernal scoundrel who seduced and deserted a young lady closely connected with us. He doubts the facts, but we know them to be facts. And this fellow, not contented with such an outrage, threatens (at least so we

hear) to come back to England, and try to rob Blanche and Janet of their fortunes. Of course he can't do it. But he might give us a great deal of trouble. The governor had an attack of paralysis once, and we fear that any publicity about this affair would bring on another. However, Phelps was incautious enough to mention the fellow's name to my father, hoping, I suppose, to effect a reconciliation. The result was that the governor told my mother he never wished for Dr. Phelps's presence in his house again; and he never goes back from his word. You understand that we quite exonerate Phelps from any intention to hurt our feelings. And while I am on this painful subject, let me tell you that I fancy Janet's dislike to Captain Fuller is based on her belief that Fuller and this scoundrel were friends at Harrow, and that Fuller still has a sneaking regard for him. This is only a guess of mine, but I think it is so."

"What a dreadful story!" said Mr. Lane. "But what claim has the man to your sisters' fortune?"

"None, either in common law or equity; but he was Captain Lyte's nephew, and expected to be his heir. And there are black-guard solicitors, you know, Lane, who would contest the legality of the will."

"Thank you for explaining it all to me," said Mr. Lane. "I trust you will find the latter apprehension to be without foundation, at any rate."

"I hope so, I am sure," rejoined Frank. "It would kill the governor. And that would be a serious disaster to all of us just now. And I should be very sorry, though he has not used me well."

After another pause Frank turned to his host and said, "By-the-way, Lane, are you going to your friends at Christmas?"

And again it occurred to Mr. Lane that Frank was curious about him, and perhaps considered that confidence deserved confidence in return. He detested the secrecy which circumstances, or a mistaken view of his own position, had forced upon him, and was determined not to simulate a candor which he could not exercise. So he said, "Let you and me understand each other, Browne. I have no friends in England, except in Pedlington, whose friendship I can claim or avail myself of. My life here for two years and a half has been an open page which any one may read. But there is a barrier between me and the past which I can not surmount. I tell you this plainly, because I feel it due to you. And now that you know it from my own lips, would you like me to withdraw from the acquaintance of your family?"

Frank was standing before a little old cracked pier-glass which stood on the mantel-shelf, curling his handsome brown whisker on his forefinger. Even this abrupt as-

sault found him imperturbable. Looking at Lane with amused astonishment, he said, "Not at all, my dear fellow. Excuse me for seeming to pry into your affairs. I rather like a man to talk to me about my own sometimes. But what I was going to say was, my mother thought you might like to drop in as one of ourselves on Christmas-day, only I didn't know whether you would be here. We always have a grand feed on Christmas-day; and Robert is coming, and my sister Blanche, though I'm sorry to say her husband can not come."

Whatever Mr. Lane suffered, he was free from those coward qualms and eternally recurring suspicions of being suspected which haunt the timid wrong-doer. It was clear that Frank meant what he said, and that only. And under this sense of unmerited generosity two pictures rose before Mr. Lane's mental vision: one, the happy united family seated round their Christmas board; another, a solitary conscience-haunted man standing under a gaunt crucifix by a rain-beaten window, through which he dimly saw the old sexton half-buried in a re-opened grave on the opposite slope of the churchyard.

Another long pause occurred; then remembering that Frank would expect an answer, Mr. Lane said, "You are all very good, and Mrs. Browne is kindness itself, but I shall not be able to come."

As far as any emotion was visible in Frank's face or manner, he seemed utterly indifferent whether Lane would come or not, and, indeed, whether he cared to come or not.

"But we shall see you on Tuesday night," he said. "Fuller is coming to dinner, and Key. A curious coincidence, is it not? They were both school-fellows and contemporaries of Phelps at Harrow."

"Very curious. I will certainly drop in about nine o'clock. I have already made Key's acquaintance."

"There is a smack of crypts and confessions about our new rector," added Frank, "which is apt to give one a cold chill in a dark room. But he is organizing a choir, and introducing what he calls reforms right and left. We shall soon have 'a grand function,' as he calls it, instead of the old humdrum service at the parish church. And, what is more, he is a splendid pianist, and great in glees and madrigals. Haven't the girls been wiring into our poor old Collard for the last few days? That's all."

"I admire Key very much," said Mr. Lane, shortly. In truth, he did not care much to discuss the new rector with Frank, because Key was one of those ecclesiastics who, even when partaking of secular amusements, seem to be inseparable from their sacred functions. Frank took rather a secular view of all such duties, whereas Lane held them in such high veneration, and was so

"WOULD YOU LIKE ME TO WITHDRAW FROM THE ACQUAINTANCE OF YOUR FAMILY?"

much impressed by the devout earnestness with which Key discharged them, that he longed to have the young divine for a friend and counselor, and was casting about in his mind to see whether he could achieve this with safety.

Presently Frank reverted to the dinner question.

"Who do you think," he asked, "is to have your chair at dinner on Tuesday?"

Mr. Lane happening at that moment to be thinking about Mr. Key, and recalling certain associations which his advent to Pedlington revived, had forgotten poor Frank's

existence, and had to be roused like one out of a dream.

"Upon my word, Lane, you are a thorough hermit," said Frank, good-naturedly. "You live and brood so much alone that I do believe you look upon shadows and airy nothings as realities, and upon live men and women as the very ghosts of nonentity. With you, women have no sentiment and no passions; men are so refined and idealized that you couldn't take their photograph."

"I beg your pardon, Frank," said the hermit, calling the man of the world for the

first time by his Christian name. "Perhaps I am a fool; but I have sinned and suffered; and, as you see, I have striven hard to purge and purify myself."

Frank was really moved by this outburst. He spoke more earnestly and with more feeling than Mr. Lane had ever heard from his lips before. "Lane," he said, "how can you talk like that, man? Do you take Pedlington for Paradise, and me for a 'spirit of a just man made perfect'? What have you done that I haven't done—I mean of wrong? If your life and mine and that of any other three men in Pedlington were written in columns, I doubt whether yours would not be the cleanest story of the five. But now, who do you think is to represent you? I want you to guess, because it is such a joke. We all thought he was sweet upon Nelly. But that little gay deceiver Janet seems to have bagged this Plumstead partridge too."

"Then of course you mean Martin?"

"The same. The truth is that the governor is looking up the J. P.'s just now, and when he heard that I had failed with you, he expressed a wish that Martin should be asked."

Mr. Lane merely said, "I am sure he will be delighted to come."

And Frank went on: "He finds that young Delavine has been making interest with the Great Unpaid for the reversion of their clerkship, and wants to secure it for me at his death. But between you and me, Lane, I would rather be without it. There is only one clerkship worth having, and that is the Peace. The governor let old Delavine slip into that, and the rest may go begging for aught I care."

"Martin is a gentlemanly, amiable young fellow," said Mr. Lane, trying to throw cold water on Frank's candor.

"Doesn't his laugh," Frank rejoined, "remind you of a young donkey braying? How will he do at Oxford? Have to avail himself of the pitchfork, I suppose. But of course you don't like to talk about pupils. It would be like our talking about clients. My brother Alfred, who died at the Cape, and who knew Phelps at Oxford, used to say that the dunces were pitchforked through the schools."

"Martin's mother is a very superior woman," Mr. Lane remarked. "And his father, though rather pompous, is a kind and honorable gentleman."

"Ye-es," drawled Frank. "You know how his father came in for that property. The grandfather was a corn dealer, or something of that kind, in Mark Lane, and used to buy hops of Squire Everington, whose son wanted to marry Blanche. The estate had been mortgaged time out of mind; and two or three years of glut in the hop market ruined the old squire. He and the son cut

off the entail, and old Martin, who had bought up all the mortgages, stepped in."

"I suppose you see a good many estates changing hands?" Mr. Lane said.

And Frank replied: "Yes. Conveyancing is our legitimate business. Are you going to the ball to-morrow night?"

Surprised at the sudden change of subject, Mr. Lane merely said that he never went to balls, and should feel like a fish out of water at one.

Some further talk on this subject ensued, but it will be referred to in another chapter.

"Well, good-night, Lane," said Frank, rising.

"Good-night," said the other. "I'm sorry you can't smoke, as tobacco is my only incense offering."

And the lawyer went, leaving his mysterious friend under a heavy cloud.

As he went, Mr. Lane thought: "That man is more generous than I am, with all his worldliness. He talks without reserve, and freely admits me to his family, knowing there is a mystery about me. But surely there can be no danger in gazing on flowers."

What could Mr. Lane have meant? Of course there can be no danger in gazing on flowers, unless the blossom of the upas lurks among them. But the school-master shrunk from following out this line of thought, and turning to his table, completed that Greek Testament paper upon which he was engaged when Frank came in.

CHAPTER XI.

DE GUSTIBUS NON EST DISPUTANDUM.

As became the future head of a firm of old and fair repute, and also of a family whose respectability was a gem of the purest water, Frank Browne kept a watchful eye upon himself and his acquaintances. His regard for Mr. Lane, though as sincere as yours or mine might have been, was nevertheless subject to the surveillance of this orb. That Hubert was making rapid progress under Mr. Lane's tuition, and becoming manful under the influence of his friendship, Frank saw. Nor did he fail to observe that by these means his youngest brother would be able better to advance his own interests in life, and would avoid any serious risk of becoming a charge upon the firm. That Mr. Lane, without any vulgar egotism or self-assertion, caused himself to be respected wherever he went, Frank also saw, and felt that the acquaintance redounded to his own credit. The old saw, "Noscitur a sociis," never wears out. Mr. Lane, admired and desired by ladies and men, poor and rich, clerical and military, young and old, led Frank by the arm into a current of pop-

"OH! AH! BY-THE-WAY, SHALL YOU LOOK PARTICULARLY NICE TO-NIGHT, JANET?"—[SEE PAGE 813.]

ular air. "We always thought *that young man had nothing in him*," the old ladies of Pedlington would remark, figuratively; "but Mr. Lane could never put up with his society if it were so. Evidently he was not appreciated in his own family, and rejoices at the opportunity of intercourse with a kindred spirit." "A master spirit, *I should say*, my dear Mrs. Joy," suggested another matron. "The spirit of a master, at any rate," facetiously rejoined the first speaker.

Moreover, even in the charmed circle of the Maison Browne, where the blind little god fluttered with felonious intent in the

gauzy curtains, as they rippled like a silvery water-fall in the summer breeze, or lurked (in winter) about and among the substantial comforts of well-carpeted rooms, darkened by the heavy folds of crimson drapery, but lit with that joyous homely blaze which makes an English home a temple and an English hearth an altar to the gods—even here Mr. Lane was never suspected of a suspicion of flirtation. Wherefore Frank reckoned him a safe friend for a man with good-looking sisters in a scandalous radical borough like Pedlington. And then the fact was not to be hastily rejected by a prudent

calculator that men who do not flirt usually do marry sooner or later. Janet, beyond a doubt, with her face and fortune, might do better than marry Mr. Lane. Indeed, there was no marriage so high in the social scale as to be absolutely inaccessible to Janet, though for his part Frank thought Nelly a very living and breathing impersonation of Psyche, and far superior in mere beauty to her more fortunate sister. Yet, on the other hand, Janet, with her romantic, willful disposition, might form some preposterous attachment, and do much worse, both for herself and for Frank, than to marry his honest friend. Fuller evidently knew the secret of Lane's parentage, and declared him to be "well connected." This talismanic phrase counted for much with Frank. Captain Fuller himself belonging to a county family in Oxfordshire, and speaking of a man as "well connected," gave that man, so to speak, a patent of nobility. Frank knew too well that the same expression would not have been applied to him in the same quarter, and never would be, unless he should marry into an aristocratic circle; and even in such a case the term would strictly only apply to his children, and revert to him incidentally. And yet his father's brother was a squire, a small squire of a small parish, and less than his ancestors, the race in its descent having become "small by degrees and gradually less." But the blot on the escutcheon was that the uncle who intervened between Uncle Robert, the squire, and Walter Browne, Esq., solicitor, had become a tradesman; and Theodore Browne, Junior, the presumptive heir to the — estate, actually kept a tea warehouse somewhere in those regions delicately intimated in polite circles by the initial letters E. C. Frank Browne's vigilant eye grew dim with vain regret as he reflected upon this wrong done to his house. "Why can't that fellow Lane," he thought, indignantly, "utilize his connections? What is the use of a man really having a clean 'scutcheon, and money in the background too, as Fuller says, unless he makes use of it? Why not make his sublime relations fork out? I would, in double-quick time. And why can not he enter at one of the Inns at once, and keep his terms, without muddling away time over another university degree? Surely he has foreign degrees (*and things*) enough. What is the good of all those degrees? I can't see that Alfred was any the better for his, except that he assumed a kind of superiority to all of us, and would scarcely open his mouth for fear we should not understand what he said. If Lane goes on at this rate, he will be forty before he ever sees a brief. Why, he must be hard upon thirty now. I am eight-and-twenty, and he seems much older than I am; while Janet is only eighteen. Oh yes, she is nineteen, though, and

Nelly eighteen. These religious men are always as proud as Lucifer. Either his people have offended him, or he has offended them; and neither he nor they will give in (if they're pious too) till the crack of doom, and not then. I hate such folly. Why can't he be a sensible fellow, and avail himself of his opportunities? Splendid chances! I would back him through thick and thin. I can tell you what, B. (what does B. stand for?)—B. Lane, Esq., of Bohn and Gottingen, B.L., D.C.L., and Ph.D. (whatever that may be), it is not every ugly, grim, red-headed fellow who gets such a chance as I more than suspect you have got."

These calculations and musings of Frank were the burden of similar musings and calculations which passed through his mind at various times on the subject of his new friend. With Frank, feeling and calculation always went hand in hand, or rather, we should say, that from long habit feeling had become subservient to interest, and that he never allowed free scope to the former without carefully considering its relation to the latter. For example, it is incumbent upon this chronicler, with an eye to veracity, to admit that Frank Browne hated his brother Albert, yet not with that malignant hatred which would prompt a Mexican to use his stiletto, but with a genteel and even domestic kind of hatred, knowing that Albert would be, if absent, a permanent charge of two hundred a year on the profits of the firm. But Albert having the privilege of drawing two hundred net, or drawing one hundred and living at home, was counseled by Frank to adopt the latter course, which saved nearly seventy pounds a year, adding the value of Albert's services to the difference between the actual cost of his maintenance and the hundred pounds which he annually resigned, for what he facetiously termed "the amenities of home." Again, Mr. Browne had insured his life heavily in favor of Mrs. Browne, thus securing to her an annuity for life, in which he directed that Joan (if still unmarried) should participate. But as this latter provision would, in any case, terminate with Mrs. Browne's life, it was still probable that sister Joan would be returned upon the hands of the firm. Pretty Nelly was a charge upon the same devoted enterprise of eighty pounds a year till married, and of fifty pounds a year for life after marriage. For tying up all which charges securely Frank entertained a hearty detestation of his respectable papa. To persons of a more excitable temperament it must remain a mystery how the father and son could abide together under the same roof. Yet they did so, had done so, and intended to do so until death should them part. Frank, however, took some credit to himself for not wishing to hasten that consummation. Talking to Mr. Lane

one evening about the old parish church, and the changes which the new rector had introduced, he said, "One comfort is that now the choir will make such a row it will be immaterial whether any one miserable sinner responds or not. Some fellows think it necessary to repeat all the responses, like a parish clerk; I don't."

"I do," briefly rejoined Mr. Lane.

"Well," continued Frank, "there's no accounting for tastes. But how, my dear fellow, can I say that 'the burden of my sins is intolerable,' when they don't bother me half as much as one new act? Or how can I honestly call myself a 'miserable sinner,' when I never even wish to brain the governor?—and he has used me shamefully."

Mr. Lane gently suggested that the value of these phrases was relative, and that a lofty ideal of virtue induced a somewhat depreciatory view of one's own merits.

"I never did advocate crying 'Stinking fish!'" said Frank; "and if I had my own way with the liturgy, I should adopt some expressions a little more consistent with self-respect."

But Frank would scarcely have hated his father so cordially had it not been for that sore about his work. Mr. Browne had thought proper to bind Frank to certain payments after his death, in part because he chose not to curtail his establishment while his daughters were of marriageable age, and partly because, as the price of his admission to the firm, Frank was duly called upon to make such payments. But Frank knew that his father had no wish to impoverish him by these charges, nor to reduce the firm to a lower rank in the rising generation. On the contrary, this very prospect soured the old Tory against the young Tory, the latter declaring that the Board of Guardians and the Turnpike Trust and the commissioners of all sorts of local institutions were a parcel of unblest radicals, and that he would chuck their clerkships into the gutter. It further leaked out that an aspiring young solicitor of contraband proclivities had been making interest among the justices of the peace for the reversion of their clerkship, which office Mr. Browne senior considered the crowning glory of his professional career, and was naturally anxious to secure for his son after him. Frank had heard of this mine, and had neglected to countermine, the truth being that he disliked all these clerkships, and thought that he saw his way so to increase the office-work as to be independent of them. But why should he exert himself to do so during his father's lifetime? "I am only to have two hundred pounds a year till he dies," Frank would say to a particular friend who was expostulating with him on this subject. "And what would be the use of my making money for him to put by for Albert, who will

end by eloping with a scullery-maid and marrying her, and having nineteen children with harelips and no roofs to their mouths?"

But Frank extended his animosities no further. Perhaps he thought Joan a fool not to have married and got off his hands (prospectively) when she had her chance, and perhaps he despised her accordingly. He also thought his mother weak for conspiring with his father against him. But, for that matter, his opinion was that a wife should side with her husband in all things (his wrong being right for her), and Frank resolved that whenever he took a wife, that devoted lady should perform such a duty to him.

Robert, the soldier, was already comfortably provided for, Mr. Browne's elder brother, the territorial head of the family, having charged his paternal acres with an annuity of two hundred pounds a year for his military nephew. And though Hubert was an expense and a present burden on the finances of the house, yet Frank more than suspected that his father had a private purse laid aside for starting that young gentleman in life, so careful had the good man always proved himself to leave his house in order if he should be called away. Moreover, Frank was proud of the boy, and liked him; for Hubert was bashful, ingenuous, and brave, and excelled in all the athletic sports of youth. To what extent Frank's generosity might have endowed his younger brother is doubtful, but, if necessary, he certainly would have played the elder brother's part with beneficence and conscious pride.

Nelly, too, was a permanent entry in Frank's good books. When he could spare the time, he was *almost* always pleased to take her where she would; for was she not both lady-like and beautiful? And was he not in some measure her patron and guardian? Yet he would caution her sagely, after one of her innocent skirmishes with the ruder sex, in which she invariably fought single-handed against odds.

"You shouldn't have too many fellows about you, my Nelly," he would say to her. "It keeps the best sort of fellows at a distance, and will make all the women mad if you don't drop it. That sort of thing is very well for a *débutante* for the first few months, as long as it's the fashion for every one to pet her. But you must pitch half of them overboard now. Depend upon it, a girl who goes about like a comet, with a ridiculous long tail of idiots, will never get a berth among the stars."

"Pray interpret, Mr. Oracle," says Nelly, demurely.

"I mean, dear, that a woman without birth or fortune who encourages more than one admirer at a time has very little chance of being *bien vue* in good society."

Perhaps Frank's pronunciation of the *cue*

is not strictly Parisian. Perhaps his sister desires a little reprisal.

"*Bien* who?" she asks, innocently. "*Bien* rous? What does it mean, *M'sieu' Mentor*?"

"Oh, if you want lessons in colloquial French, you had better send for our linguist," Frank retorts.

"I will tell Mr. Lane what you say. See if I don't," Nelly rejoins. "I am sure *he* does not regard me in the light of a comet."

"If all the men were like Lane, my dear," Frank adds, "it would not matter so much. But some fellows have no dignity or reticence. If a pretty girl smiles upon them, they fancy they have made a conquest, and go and prattle about it. Then other girls get hold of the story. Then a lot of old cats (and pottering old men who are no better) take up the cry, until the poor girl's name and fame are caterwauled over half the house-tops in the town."

But taking all things into consideration, Frank's fraternal affections inclined most toward Janet. She would never cost him a shilling; that was clear. Again, she would probably marry, and might happen to have no children, and to leave her money to him. At some future time she would probably take Joan off his hands, or even Nelly, if that little luminary should come to grief among the pitiless stars. A hundred things might happen. And in that other respect Janet was no comet. If she was a little too reserved with women, at least she held her own among men. No jackass could boast of *her* favor. Indeed, Frank had been much puzzled at her *poco curante* social airs, and at the absolute indifference with which she met the advances of her admirers, until he began to suspect her covert preference for his saturnine friend. At first, too, he only reckoned that a girlish freak, and thought, shrewdly enough, that her wish to be admired or noticed by Mr. Lane was provoked by his apparent unconsciousness of her charms. However that might be, Janet's manner was very nice, and quite up to Frank's ideal. Some persons objected to her silent habit, and set it down variously to pride, shyness, or stupidity. But Frank liked it. He objected to a woman who was "all jaw, like a sheep's head," and declared with emphasis that the highest gift the gods could bestow on a girl already endowed with beauty was the art of saying little gracefully. And then Janet made a rule of only dancing once with the same man at a ball. In any social difficulty she always appealed to Frank, and never disputed his sentence. She respected his opinion and enjoyed his little jokes, often slyly inventing an occasion for him to repeat the latter. At any moment she would pop on her tiny thimble and deftly mend his gloves. Jouvin hadn't a girl in his factory who could touch her. Every Monday she attended to the buttons on his shirts, which

services seemed rather to be a pleasure than a burden to her. On one occasion she actually proposed to darn his socks; but that he forbade. He wouldn't have her delicacy of touch and handling degraded to such mechanic drudgery. Happy Frank! Here and there a husband would exchange his wife for such a sister. "A gem of sisters you are, my Janet," he would say to her. "I wonder what sort of wife you'll make!" And once only she answered (and Frank, passing languidly to another subject, still pondered on the answer), "That depends upon whether I get *my husband* or no."

Après le bal. The Tuesday morning has arrived, the languid, washed-out, limp, pallid November morning, when (as the Reverend Melanchthon Marmaduke elegantly expresses his dolorous sentiments on this subject)—when "the jaded votaries of Terpsichore silently regret those nocturnal excesses amid which they have pandered to the World, the Flesh, and the Devil." These penitent votaries have indeed submitted to the filial penance, and eaten a more or less hearty breakfast at 8.45 A.M. They have apologized to their guest, Miss Philadelphia Lyte, for that pandering to three Powers of Evil on the very evening of her arrival. They have explained to her that it was the first of the three great "Hunt Balls" of the season, from which no fair Pedlingtonian dares to absent herself, under penalty of omission from the future list. She has graciously condoned their offense, with a sly remark that the Pedlingtonian hunters used in her day to understand the conditions of a successful ball far too well to strike out such pretty names as those of Janet and Nelly Browne. And poor Frank is now—for business must be attended to—making his office toilet in his room, when he sees the reflection of Janet's face, somewhat sad, beside his own in the mirror. But this Adonis imperceptibly continues the disposition of his neck-tie. If the reflection were (supposing such a thing possible) that of a spectre, his languid utterance would neither fail nor falter.

"Dropped a shilling and picked up sixpence, Janet?" he calmly inquires.

A little fleeting smile passes over the reflection of Janet's face, leaving gloom as before.

"Ee—aw!" cries Frank, playfully drawing the first note in a shrill falsetto from the recesses of his stomach, and bawling out the second in a bronchial bass, at the same time beginning to operate on his scanty locks with a pair of ivory-backed hair-brushes.

"I wish you wouldn't," pleads a voice behind him, in a tone half of petulant anger, half amusement.

"Ah, but, my dear," urges Frank, willfully misunderstanding her—"ah, but, my dear, if my hair were in the smallest degree

disheveled, we should lose the only client we have left. And then what would become of Sister and Nelly and Berty?"

"Don't be redic'lous," retorts Janet, with difficulty suppressing a laugh.

"Stoopid ball, was it not?" Frank asks.

"Odious!" she replies, with energy. "Odious! What did you try to make Mr. Martin tipsy for?"

"I!" exclaims Frank, in a tone of grievous injury. "It was Fuller. The ruffian! And then made me ashamed to be seen with him by laughing in that uproarious manner."

"I didn't see any thing to laugh at," says Janet.

"Nor did I," Frank quietly adds, still plying the elegant hair-brushes.

"Then why did you go on like that?" Janet inquires.

By way of answer Frank throws up his chin in a most asinine manner, and again cries, "Ee—aw!" so irresistibly that Janet fairly laughs against her will, and blushing delightfully. She knows that this bray is understood to be an imitation of Martin's laugh. And Martin, though only nineteen years of age, is an elegant young man, an only son, and is devoted to Janet.

Frank now turns his chair half round, and devotes considerable attention to his finger-nails, which he trims with an instrument of ivory. Looking up at Janet for a moment, quite casually, he adds, "No one you care about was there, I think?"

"I like Mr. Martin very much," says Janet. "And if his voice is breaking, I see nothing to laugh at in that."

"And Fuller?" Frank inquires.

"Can't bear him," is the decided answer.

"Very distinguished officer," urges Frank. "Man of good family. Nice little estate of his own down in Oxfordshire."

"Be quiet—do," is the strange remonstrance.

"Well," Frank replies, with resignation—"well. *De gustibus non*. I can only say he admires you extravagantly, and is one of the few honest, straightforward, gentleman-like men in this nasty radical town."

"I don't know any thing about *gustibus*," says the young lady, with conspicuous veracity; "but I know I do *not* like Captain Fuller. And I wonder at your taste, Frank."

"I suppose you know that our mysterious friend Lane has known Fuller all his life, and has the very highest regard for him." As Frank says this, still in his drawling, careless way, he looks up from a favorite finger-nail, and sees Janet blushing crimson. So he returns to the nail, giving her a minute's grace, then resumes, "Don't you wonder why Lane never shows himself at a ball?"

No answer.

"I fancied he thought it worldly, or un-

converted, or some humbug of that kind," Frank continues.

"Is that it?" Janet asks, thoughtfully.

"Oh no. He says the girls get themselves up for admiration, and go there expressly to be admired, and to have things said to them which they don't believe, and wouldn't listen to elsewhere."

"I don't see any harm in looking nice now and then," Janet urges vaguely on behalf of her sex.

"No," Frank rejoins. "But going about admiring girls, and talking egregious nonsense to them, and hopping about like a pea on a hot shovel, is not in his line. It's all very well for me, as it is my duty to take care of you and Nelly. And it suits those fellows at the dépôt. But Lane has something else to think about."

"Does he dance?" the young lady inquires.

"I expect not," her brother says. "I hinted to him that you don't waltz badly, which you really do not, with a good partner."

"How redic'lous you are, Frank!"

"I don't mean any thing, of course, you know," says Frank, languidly rising and apparently dropping the subject, now that his toilet was completed. But Janet, closing with him, and giving him a little affectionate pinch on the tender part of his arm, asks, "When you said that nonsense about me, what did Mr. Lane say?"

"He made a very striking observation."

"What was it?"

"One which proved to me what I have always thought, that Lane is a man of refined taste, and with a high appreciation of the beautiful and the graceful."

"Oh, *what* was it?"

"He stared at me point-blank, and said, 'In-deed!'"

At first Janet's high-pitched curiosity refuses to sink to this level. But gradually the cold, blank indifference of that dreamy word reveals itself to her mind. She sees in phantasy a vivid representation of the scene: Mr. Lane abstractedly gazing into space; Frank gracefully *pose*, introducing the subject (as it were) casually, speaking first about balls generally, then about dancing generally, then about waltzing in particular, then of partners, good, bad, and indifferent, then of his own sisters as partners, lastly of her, Janet, as a good partner in the waltz. She sees Mr. Lane still gazing into space, thinking, or musing, on higher topics, but catching Frank's words and their import as in a dream, and supposing that courtesy demanded an answer, dreamily responding, "In-deed!" then continuing to muse on those higher topics, far away and above, out of Janet's reach, beyond her ken. "In-deed!"

She throws away Frank's arm, which a moment before she was tenderly clinging to. "You provoking creature!" she cries.

Frank feels for his pretty *protégée*, but is resolved to warn her of impending danger. "Now that we are talking about Lane," he continues, as if the merest accident had brought that gentleman's name on the tapis, "I will tell you something else about him. He is not quite such a poor devil as people think. He will be well off some day. And, what is more to the purpose, he is well connected—a Devonshire Lane, I believe (Earl of Sandilands, you know, is the head of the family). And our friend is much too proud to jump down your throat. Depend upon it, he will never marry a girl with money till he comes into his own, which may be a hundred years hence."

"Would he marry one *without*?" Janet asks, pensively.

"Doubtful," is the laconic answer. But the important ceremony of dressing for the office being now concluded to the lawyer's satisfaction, he lounges elegantly away, leaving Janet disconsolate, pouting, leaning back against his chest of drawers with a finger to her lip.

Turning at the head of the stairs, he just looks into his own room again, saying, languidly, "Oh! ah! By-the-way, shall you look particularly nice to-night, Janet?"

Starting into sudden emphasis, she replies, "No; I shall not."

A subtle smile flickers about Frank's countenance.

"I would, if I were you," he draws. "The Old Bird" (by which term he designated their guest, Miss Lyte) likes to see every one spry and spruce. And, now I think of it, Lane is coming in for an hour this evening, if he's not stifled in the Ragged School first, or garroted on his way down here."

Was that "music from the spheres?" Janet's face is illuminated with joy.

"What did you say about being stifled?" she asks, running up to Frank, and again embracing the fraternal biceps.

"Oh, don't you know?" Frank explains. "Every Tuesday and Friday evening he slaves in a stinking school which some crack-brained radicals have established up by the barracks for all the scum of the town. I went there with him one evening to *smell* it. You couldn't see for the reek and steam of the damp ragamuffins. But I was obliged to send that suit of clothes to Westphalia to be fumigated. We occasionally favor some of Lane's aromatic pupils with an interview at Petty Sessions, you know. I thought Lane might have put them off for once. But, as I said before, there is no accounting for tastes. *De gustibus non.*"

The sagacious reader will have divined the lurking motive which brought Janet to her brother's room for a private interview, and will doubtless have noticed how warily that cold-blooded counselor had suffered her to approach the central topic, picking up her

coveted scraps of information, and meanwhile revealing her secret heart to his vigilant eye.

Frank may go now. He has at length parted with his treasure, and left Janet passing rich in anticipation. Will she "look particularly nice to-night," as her brother advised? If we peruse the next chapter, we shall see.

Going straight to her maiden bower, Janet helps, or hinders, in "making the bed." Then she bustles the laughing house-maids out, locks the door, litters the chamber with drapery, gets her mind into a similar state of confusion, and sitting down in the midst of it, muses. She was wont to call such a mental process "thinking;" now she has adopted Mr. Lane's more accurate term, and calls it "musing."

First, of the Ragged School, as Frank calls it, though she has previously been given to understand that the "crack-brained radicals" in question call it a "night-school," and estimate that the work of the J. P.'s, and consequently of their clerk, Walter Browne, Esq., is diminished at Petty Sessions in a corresponding ratio to the increase of their demented labors. "How delightful," is Janet's reflection, "to go and teach poor dirty creatures for nothing!" Why is she not a man, that she too may do such noble things? Papa and Frank may sneer if they like. Will not those drops of knowledge fill the "cup of cold water" which Mr. Lane is giving to more than "one of these little ones," these poor sinners, in the name of One who himself was poor and unlearned? Janet's loving instinct is better than her father's and her brother's "fine old English" conservatism, wiser than their self-satisfied "worldly wisdom." But is there nothing which Janet can do? How trumpery her life must seem to Mr. Lane, with nothing to do but to "look nice" and be smiling and good-tempered, and not always succeeding even in that! The five intellectual Misses Delavine, daughters of the Clerk of the Peace, teach in the Sunday-school, and two of them visit a district. "But papa says it is only to gossip and play with the curates. Rose and Clara Ormsby help to decorate their church. But Frank used to sneer at all that sort of thing before he began to like Clara. He used to say it was unbecoming for girls to do curates' and sextons' work, and ask if they would take to grave-digging next. I should like to help to decorate *our* church for Christmas. But Mr. Key has formed his committee now, and they would only laugh at me. Besides which, papa wouldn't let me go."

Then, in despair, Janet's mind gives up the desire for work, as if such a luxury were wholly out of reach in this world of compulsory idleness. Next she recalls what Frank said about Mr. Lane not marrying a

girl with money, about his not dancing, about his indifference to her dancing well, his objection to going where girls go in search of admiration, to paying vapid compliments. And for each of these peculiarities peculiar Janet Browne respects Mr. Lane more than other men, but above all for his

devotion to "the damp ragamuffins" of "the Ragged School."

At length she winds up her contemplation with a glance of coming triumph in her eye and a fixed resolve upon her lip.

"He *shall* admire me, though," she says to herself.

THE REPUBLICAN MOVEMENT IN EUROPE.

By EMILIO CASTELAR.

[Fifteenth Paper.]

III.—THE GERMANIC PEOPLES.—(Continued.) RELIGIOUS IDEAS.—IV.

BUT as the eighteenth century is a revolutionary age, it necessarily has all the passion and all the injustice of revolutions. And its criticism—revolutionary and not historical, because the eighteenth century ignores every thing outside of its aspiration to emancipate intelligence, and with it mankind—its criticism is aimed principally at religions. In the opinion of a large majority of its thinkers they are all impostures, and more than all that one founded by Christ, the nearest and most immediate oppressor of reason. It is an age which neglects logic, the dialectic of the development of the idea and its sequence. It therefore detests revelation. It can not understand that the conscience should ever have declared its independence of itself. And in fact it was necessary to this end to break the harmony between man and nature, which was so beautifully manifested in the ancient Greeks and their marvelous statues; to combat not merely sensualism, but matter also, and the vivid universe; to create by pain, penitence, and maceration, in a terrible struggle with the senses, a human soul within itself, isolated, separated from the world as a being entire, independent, infinite. The philosophers of the past century saw nothing in Christianity but the present oppression, and declared against it with a genuine revolutionary fury which the nineteenth century, essentially human, serene, impartial, the century which has really created history, and which has done justice to all the manifestations of the human spirit, can not comprehend. But these exclusive passions of each age have been valuable to the education of the human race and the progressive development of its luminous ideal; because if these exaggerations have for a time been tyrannical, they have at the same time been destructive of error, and society has concluded by returning to its calm impartiality, and distributing in due proportion through all its organism the current of ideas, and entering into its indispensable equilibrium.

The eighteenth century was full of exalted ideas and noisy contradictions in the question of religion. Wolff, with great fidelity

to his philosophic ministry, opposed the supernatural, and maintained that every thing which is supposed to have come to us by the way of miracle could have arrived as well by means of natural reason. Philosophy thus prepared the way for a religious transformation, just as the religious transformation prepared the political. The writers who bore the new rationalist idea into all the spheres of practical life, into all the furries of controversy and all the passions of the schools, were writers of scanty reading, poor in science, passionate in their judgments, of a style deplorable in its mediocrity, and in moments of excitement more deplorable still for its violence and vulgarity. Edelman began as apologist for religion, and ended as skeptic. His doubts were singular in a Protestant so pious and a rationalist so recent. He questioned if dumb animals were not happier than men or angels, not having in their minds these religious problems filled with ideas, but swelled also with griefs and troubles. He asked how man, regenerated through Christ, could continue sinning, and, if he continued to sin, how he could have been regenerated. He asked if baptism was efficacious when it did not extinguish sin. He next attacked all dogmas, all beliefs, and declared that the whole of the Old Testament was written in the time of Esdras, and the New Testament in the time of Constantine, the first having been prepared in obedience to the prejudices of race, and the second in obedience to the necessities of politics.

Nicolai was an associate of Edelman in the criticism of historical religion. Dr. Strauss complains, in one of his most profound works on religious problems, of the contempt in which the German conservatives hold the eighteenth century, calling it the age of Nicolai, the worst of writers. Nevertheless this worst of writers was known by all the great geniuses of his time in a different way from Tacitus, who boasted that he did not know the emperors either through benefits or injuries (*nec beneficio nec injuria cogniti*). Nicolai was either the enthusiastic friend or the bitter enemy of all his literary or scientific contemporaries. His reckless criticism, his tone of buffoonery, his superficial acquire-

ments, his brusque sallies, his brutal insults, gained him a detestable reputation and inextinguishable enmities. He revenged himself noisily, classifying all writers in three categories—orthodox roundheads, æsthetic impostors, philosophic numskulls. He afterward published a novel against the morals of Protestant priests; and in his travels in Switzerland rudely and coarsely attacked the most illustrious professors, preachers, and poets of his time, accusing them of belonging to an immense Jesuitical society devoted to the subversion of character and the vitiation of ideas. Naturally all these men of genius, insulted and abused by a man of such vulgar mind and commonplace style, avenged themselves in phrases which, by their energy and cleverness, were long remembered. His reputation, therefore, is unmerited. It is true he dealt in exaggeration; but he fought with the same ardor as the Encyclopedists, although without their genius or their grace, a Protestant clergy in reality as ignorant and intolerant as the Catholic priesthood. His work greatly resembles that of the philosophers of the past century, who, avoiding theologic ideas, and placing above them common-sense, thought to accomplish a philosophic revolution, and in reality brought about a democratic one.

Bahrdt closes the cycle of these writers midway between religion and philosophy. Born in Protestantism, and destined to undermine the Protestant Church; nervous, impressionable, changeable, fickle; more attentive to his passions than to his studies; a preacher from his seventeenth year, and, like all precocious youths, without true development or maturity; a theologian by profession, philosopher by inclination, and, in addition, cook, barber, and tavern-keeper; always miserably poor, always in pursuit of money; the lover of one woman, the unhappy husband of another, the cudged suitor of still another; servant and lord at once; now surrounded by respect, and the next hour abandoned to general scorn and insult—his life, he said, appeared like one of those picturesque novels, his character like one of those odd types, which our writers copied from nature, and which the facile pen and the brilliant imitative talent of *Le Sage* made known to all Europe. Born and brought up in Protestantism, a preacher who might almost be called pietist, he went from one eccentricity to another so far as to construct a novel upon the life of Christ, and to say that, as Confucius and Moses were extraordinary men who preceded Christ, Christ was merely another extraordinary man who had learned his lesson in a secret society whose followers were ancient Masons, and who was destined by Providence to serve in turn as the predecessor of Bahrdt.

In reality the man who founded liberty of thought in Germany is Frederick II. In the

history of his race there is no character more attractive, because there is none more human. His idea is not that narrow one of Herrmann, nor is his passion the national passion of Luther: it is the idea and the passion of humanity. Those who survey history, with its rudenesses and obliquities, as if they were viewing the serene and tranquil region of philosophy, are in the habit of reproaching him with the fact that he wrote an ardent book against Machiavel, and made use of Machiavelian practices; that he sang the advantages of peace like a Virgil, and scattered war like a Cæsar; that he execrated conquest like the Abbé St. Pierre, and was a conqueror like Cyrus and Alexander. But those who examine men and their acts, having in view the difficulties which they encounter, the obstacles they overcome, the evils which they abolish, and the progress they accomplish, will never sufficiently admire the crowned philosopher, who, alone in the world, persecuted by all sovereigns, worried by Russians, Tartars, Croats, Hungarians, and French, abandoned by his friends and allies, with his motley little army strong only in its rigorous discipline, and without other motive power than the great soul of its general, impelled in turn by another greater idea, creates in the centre of Germany the power destined to be, in respect to the liberty of thought, what the house of Orange and England were in respect to political liberty. No doubt the instrument which he used was a bad one, the absolute monarchy; the stains which disfigure his reign are serious ones, like the dismemberment of Poland; his conscience rarely rises to the ideal of justice; his lips utter epigrams which bring on wars; his skepticism degenerates into thoughtless sarcasm; but with all these defects, with others still greater, it may be, there is no personality of his time in which shines forth with such strength and brilliancy the immortal spirit of his age, that essentially humanitarian century. If he had no other glory, the king who received a dominion of barely two thousand square leagues and three millions of inhabitants destroyed to its foundations the formidable Holy Empire, the representative of tradition, the Goliath of absolutism, the jailer of nations, the enemy of William Tell, the executioner of John Huss, the assassin of Padilla, the poisoner of the Latin races, which, if it had triumphed, would have consumed the very marrow of our bones, reduced our consciences to ashes, and made of all Europe what, with its fatal authority and its terrible policy, it made of our haughty Spain, a desolate desert.

The conquest of Silesia, which has been so harshly criticised, was a conquest of liberty of conscience, for the inhabitants, being in large majority Catholics, all received the consecration of their rights from the hands

of a king educated in Protestantism and nurtured in philosophy. After the battle of Striegan, in 1749, two thousand peasants wished to cut the throats of all the Catholics of the border. The king was indignant. The humane spirit of tolerance beat in his heart; the spirit of the age took possession of his mind; the Eternal Divine Word rose to his lips, and invoking the theme of "Love your enemies," he pronounced a discourse, a worthy echo of the Sermon on the Mount, which caused the crazy fanatics to drop their murderous weapons. With a great memory, as befits a statesman; with scanty fancy, like his age; with ideas rather clear than profound, a fine and delicate irony, more brain than heart; a character sometimes served and sometimes commanded by a great intelligence; haughty with the powerful, simple with the humble; passionately devoted to genius and science; unconditional admirer of merit; commonplace in his verses, incorrect in his prose, vulgar in his philosophy, but worthy of comparison with Cæsar when narrating his own exploits, not only in the sobriety of the narrative, but in its simple and natural modesty; gay, like the antique heroes; the most moral of administrators; eminent as a lawyer; zealous that justice should reach the lowest social classes; tolerant of the opinion of his people, whom he allowed to say what they pleased, reserving for himself the right to do as he pleased; firm in adversity, serene in danger, thoughtful in his plans, tenacious in his purposes—above all his qualities shines out that effusion with which he opened the frontiers of his kingdom, the gates of his palace, the arms of his friendship, to all those who thought, believed, or worked for any idea; to the philosophers of the Encyclopedia, persecuted by prejudice, and burned in effigy by hangmen; to the Moravian Brothers, with their Utopias; to the Freemasons, excommunicated by the popes; to the Jesuits, cursed by the kings; to all those who suffered for any faith. His brow rises above all others and shines, reflecting the light of the future, the thought of ages to come, because his soul embraced with ardent enthusiasm universal tolerance.

V.

The two men who really personify in Germany the climax of the religious revolution in the eighteenth century are Cimaros and Lessing. The first rose above pious traditions and universal revelation to seek, not in the skies which were deaf to his prayers, but in the depths of conscience, the law of the spirit, the natural religion derived from our inmost being, and in harmony with the principles and the rights of reason. And it is well to note this historic phenomenon; for from the moment when reason seeks outside of religious traditions the natural law

of conscience through a logical movement superior to the individual will, through a dialectic force self-imposed, it will seek also outside of political traditions the natural law of society. To-day the fundamental principle of Cimaros has become an ordinary principle of common-sense. Every man of ordinary instruction knows that religion should be sought not so much in revelations as in nature and conscience, just as every man of ordinary intelligence seeks in turn the basis of society not in traditions, but in fundamental human rights. But in ages different from ours, in times of obscurity, it costs a superhuman effort to rise to a new ideal, and grievous martyrdom to communicate to the blind and obstinate the splendor of that light.

But Cimaros did not restrict himself to the expression of new ideas; he attacked as well the old traditions. In his exaltation he showed little respect to ancient beliefs, and attracted implacable enmities. He understood as soon as he had begun to raise the veil from his thought that a great tumult was imminent. Therefore, after having written whole reams to interpret the Bible and the Gospel, he guarded with restless jealousy the product of his ideas, as a robber guards his spoils. The rigid education of the Lutheran schools, their narrow historic spirit, their fanatical dogmatism on the subjects of sin and pardon, their invincible repugnance to all the inspirations of human reason, had made of the philosopher who breathed all the vital air of his century a most ardent, intense, and at times reckless enemy of the ancient religious faith. Thus in his fragments he maintains that baptism imposed by force upon children was a usurpation of human rights and of Divine authority and of the ministry of reason; that the Trinity and its dogmas the more they are investigated appear not superior but contrary to human reason; that eternal punishments inflicted upon finite, weak, and ignorant beings are devoid of moral sense, mercy, and justice; that Christ and John the Baptist were two mere Jews, devoted to the Jewish ideal, worshipers of a material and tangible kingdom of their race, rebellious to the Roman yoke, conspirators against the authority of the Cæsars, enemies of a priestly aristocracy more politic and wiser than they, and whose privileges, preserved through the tolerance of the prætors, our Saviour attacked on the day of His triumphal entry into Jerusalem, thus bringing Himself under the law and rendering Himself legally liable to death by crucifixion. All that Christianity has of more ample, more spiritual, more human, the kingdom of God as opposed to that narrow kingdom of the worldly Jews, its exaltation over the fragile crowns and the low ambitions of the world, was due principally to after-times, to the ac-

quisition of more philosophic ideas, and the natural progress of conscience.

As it is seen, the criticism of Cimarus was in the sense of irreconcilable opposition to Christianity, that is to say, the sentiment of his age. The dialectic development of ideas in history is like this. The generation which has to realize a certain term in the series of human progress is unjust, passionate, and even cruel toward preceding generations. When we gaze with rapture upon the perfect beauty of the Venus of Milo, and bless the benefactors who have saved from the wrath of men and the deluge of ages this rare prodigy of loveliness, the incarnation of the human ideal in marble, we can scarcely comprehend that the early Christians saw clearly in that grace, that serenity, that harmony in the incomparable beauty of the goddess, the deformed face of the devil and his angels. But perhaps there was need of this horror of nature, of the taste and of the art of the ancients, to create, with a formidable reaction of the human conscience, the saving Christian spiritualism. And as the business of the eighteenth century was to create the free man in the plenitude of his right, every bond which attached the spirit to the past, if it was not unfastened, was broken—was cut with fury and violence. How many beliefs, sweet and consolatory, fell like dry leaves! how many sources of consolation were dried up, after having satisfied for ages the devouring thirst of the infinite! how many cheering images, shining like stars in the night of the soul, were blotted out, and vanished from the horizon of our hopes! how many orphaned spirits lay naked, hungry, and cold at the feet of the altars, without God, in the midst of a society without faith! But the human spirit burst its fetters, overleaped its barriers, and plunged boldly among the tempests into the conquest, which was often a bloody one, of its inprescriptible rights.

The publisher of Cimarus's criticisms upon Christianity was to attain an immortal name in science, in the arts, in literature, in criticism and religious philosophy, as precursor of the great geniuses of Germany. His name was Lessing. We may call him the critic *par excellence*, as we may call his age the critical age of history. The thought which Frederick II. realized in politics Lessing sustained with enormous force in letters—universal tolerance; the human spirit rising purely above the discords of men; the eternal revelation of God by means of the various religions; the right of every conscience, of every being, to communicate freely and intimately with its religious ideal, which, in whatever form, always embodies the infinite. These ideas gained him bitter opponents, proceeding principally from the bosom of the Protestant orthodoxy. And his opponents, like all those who assume to pos-

sess absolute truth with their religious faith, far from consenting merely to refute the ideas contrary to their own, insult, defame, and persecute those who maintain such ideas, seeing a crime where perhaps there may be an error, in the case of beliefs, almost always independent of the human will, and imposed upon the understanding by forces superior to our own. To spread his ideas among the masses, to enlighten consciences and persuade minds, Lessing chose the sphere intermediate between the real and the ideal, the sphere of Art; and in art that manifestation which is most nearly related to life, which partakes most of its emotions and its incidents, the Theatre. Drawing his inspiration, like the great English dramatist, from the luminous narratives of Italian literature, from which dramatic subjects have been drawn, like the fine marbles from the rich quarries of Italy, Lessing took the foundation of his drama, a genuine defense of toleration, from the famous tales of the *Decamerone* of Boccaccio. It is the time of the Crusaders. Jews, Christians, and Mussulmans meet about Jerusalem, the Holy City, where all have imbibed the idea of the unity of God, and whence all have departed from rivalries of race more than from motives of dogma and belief. And nevertheless that close communication between races, though it be made by means of so destructive and inhuman an element as war, teaches a truth which it is hard to hide from natural reason—that all those enemies, rivals, warriors, who hate, persecute, and kill each other, have the same affections and needs; live in common griefs and hopes; are all weak or strong in the same conditions; all hungering for the ideal, and needing the light and air of nature; subject to death; forced to join in mother earth those mortal frames which in life have kept apart their hostile creeds and religions; to wake perhaps in another life, and to discover there that one God illuminates and vivifies and nourishes with his uncreated light not only all worlds and suns, but all souls and consciences.

The Patriarch of Jerusalem is the type of the intolerant ecclesiastic materialist—avaricious, sensual; loaded with jewels and diamonds, dressed in costly brocades; more careful that the faithful should fear, venerate, and maintain himself than his God. Saladin is the Sultan, who has risen above the intolerance of his religion to a more intimate and profound worship of humanity and its rights. The young Templar, born in the feudal castles of Germany, a child of royal blood, who has sought beneath the palm-trees of Jerusalem the sepulchre of his God, represents the middle term between the intolerance of the Patriarch and the humane and generous spirit of Saladin. He is, without knowing it, the son of an Arab prince, the brother of the Sultan, and of a German gentlewoman

belonging to a noble family. The hero of the drama is the wise and prudent Jew named Nathan. Religious hatreds, intolerant fanaticism, have led the Christians to burn his home, and with it his children. He is at first filled with implacable horror of Christianity; but he afterward sees that these passions should give way to pure and intelligent tolerance, and receives in his home as his own child a daughter of his persecutors, the fair and pious Rachel, educated by her protector in sentiments more humane than those of selfish sectarianism. Saladin being in want of money, intends to extort it from this Jew by proposing to him a delicate question—which of the three monotheistic religions he prefers. The Jew tells this story: A certain lord possessed a beautiful ring, to which were attached all the advantages of life and fortune, and he ordained that the one of his sons who should receive the ring should be his sole heir, with the right to transmit it to his successors. It was traditional in the family that the best among the sons of these heirs should inherit the ring; but in the course of time it happened to one of these lords that his three sons were equally good and worthy, and he ordered to be made two rings identical with the ring of marvelous prestige, and gave them to his sons. The father having died, each one of them believed he had the true ring, and demanded the inheritance. A suit was begun, and when all the three rings were brought to the tribunal they were so identical that no distinction could be made; and the judge decided that he whose life should be most blameless should be held the possessor of the true ring. Saladin, who believed that he had left the Jew no escape, because if he declared in favor of Judaism or Christianity he would have to give up all his treasures as a blasphemer, and if he declared in favor of Mohammedanism he would have to give them up as a convert, was astounded with this dexterity and prudence. Such considerations persuaded him more and more toward tolerance; and it is afterward seen that the Jew's daughter Rachel and the Templar were niece and nephew of the Sultan, children of his brother, who, captivated by the beauty of a noble Christian woman, had listened to the voice of his affections more than to that of his creed: showing how nature brings together beings divided by the discords of men and their religions.

Lessing was not contented with defending toleration in the theatre; he raised it to a creed in his theory of the education of the human race. In the opinion of the great thinker, the glory of humanity does not lie in the quiet possession of truth, but in the contests and struggles which the truth has cost. He says that if God should call him and say, "In this hand I hold the truth, and in this other the rough and painful road

which leads to the truth—choose!" he would choose the road, although at the risk of moistening it with his sweat and his blood. Yes, sanctifying virtue of struggle, of labor, of pain, thou appearest to destroy, and thou createst! thou appearest to abase, and thou exaltest! thou appearest to be the sign of our inferiority, and thou art the splendid proof of our greatness and glory!

Lessing accepted the struggle for the truth to strengthen his spirit, as the ancient athlete entered the gymnasium to strengthen his body. And in these exercises of thought he found the truth that all religions are different grades, scattered fragments, varied shades, of one religion, which has progressively educated the human race. The religious ideal is not found contained in a single book, but in all the books which have sustained and consoled humanity on its rough and sorrowful road toward the realization of its ideal. As the labor of the East was not lost, nor the labor of Greece and its philosophers, nor of Rome and its lawyers, so also the work of the different churches will serve to clear and enlighten the human conscience. From the peaks of the Himalayas, to which the fathers of the earliest gods raised their supplicating arms; from the summit of Sinai, from which the Jehovah of Moses still speaks in lightning and thunder; from the sombre hill of Calvary, where flows the blood of the Son of Man; from Hybla, which saw the cradle of the Greek gods and heard the dialogues of the divine Plato; from the Coliseum, over whose arches shone the protecting genius of Rome, and in whose centre to-day the cross spreads out its arms, appearing to be nourished by the ashes of martyrs, as a tree by the sap of the soil; from the domes of St. Peter of Rome and of St. Paul of London; from the towers of the church of Worms which heard the protest of the monk Luther, and the towers of the Cathedral of Cologne, which still shelters the Catholic reaction—there comes no final discovery of the ultimate limits or signs of revelation. We can not see in the past the beginnings of religious tradition, nor in the future the limits of religious hopes. For as the book of the Vedas has been the book of nature, the book of the Persians the book of light, the book of the Old Testament that of God the Father, the New Testament of God the Son, and the Reformation that of the Holy Spirit; as the human understanding can never count the stars nor measure the infinite, so it can never know how many religious books full of disclosure and light may come hereafter in progressive ascension to continue the work which the others have begun, to embellish and sanctify the human spirit, for which are reserved in the depths of the heavens eternal and incessant revelations.

The fundamental idea of Lessing is that

all religions have powerfully contributed, although in different degrees, to the totality of human education. The spirit of progress entered, therefore, even in those secluded and sacred spots which appeared to be excepted from the movement and the renovation of all beings and ideas. The saints saw the fluttering of the leaves of their inert books of stone before the breath of the wind of their age; they saw the germs of new ideas taking life in progressive transformations in the very warmth of their sanctuaries. These agitations of conscience gave birth to high conceptions of human dignity; and whenever knowledge gives prominence to human dignity there follows of necessity an outburst of the conscience, freighted with ideas, and with this outburst comes perforce another victory of liberty.

WOODED BY AN ATTACHÉ.

I

MR. BRENTON entered the ball-room at ten o'clock, with his wife on his arm, and followed by his four daughters, who resembled a flock of doves.

It was their first ball. The daughters were in a flutter of anticipation; Mr. Brenton found his cravat stiff; and Mrs. Brenton gave her rich gown a stealthy adjustment as she prepared to confront one thousand pairs of eyes. All this agony came of being sent to Congress by appreciative fellow-townsmen. The entertainment was given in honor of an Oriental prince, who sat in a stage-box. He carried a fan in one slender brown hand, with the pointed nails; and he wore an embroidered petticoat.

"He looks just like the figures on grandmother's best china tea-pot," whispered Fanny Brenton.

"Or an Eastern idol," added Kitty, saucily.

May Brenton scarcely heard these comments; she seemed to have entered an enchanted realm. Music floated down from some concealed height; the atmosphere was sweet with the breath of flowers; light glittered from gilded chandeliers; the eye was dazzled by a moving sea of color.

Ah, lovely, delicate May Brenton! soft violet eyes looking out shyly yet eagerly on this new life, yourself a gracious vision in cloudy white, with ivory shoulders and slender throat upholding a small head crowned with golden hair! Better to perish like one of those tropical insects which serve as the living gem of a night than never to have sipped the cup of revelry at all.

Every one was at the ball—foreigners of many classes, and free-born citizens innumerable; all with nuts to crack beneath the great central hammer. The city was a Christmas-tree hung with golden favors by

capricious fortune, and the flocking crowds hoped to find their individual names inscribed thereon. Along the stream of pilgrims ambition had hurried the Brenton family. It can not be said that they expected to find the fathers of their country draped in classical mantles while making laws; but still less were they prepared to discover them in easy lounging attitudes, bandying words and probing each other's weaknesses unmercifully.

Adelaide Brenton, a young woman whose audacity filled her relatives with pride at this critical juncture, coolly scanned the multitude with her fine black eyes, and received back the coin of masculine admiration. Mademoiselle, in shimmering raiment like the sunset, veiled in black lace, made an appearance not to be despised.

"I intend to set my cap for the minister from Patagonia," she remarked. "Aud, pa, mind that you get us presented to the French minister's wife: a vicomte has just joined the embassy."

"I don't see how it is to be managed, my dear," pleaded Mr. Brenton, with a furrowed brow.

Then little Mrs. Bird, who knew every body, and liked to consider her tiny self a female diplomatist, introduced a grave gentleman to May, who led her away for the Lancers. May was pleased with her partner, and with every one. Was it not her first ball? Mr. Cobb was a gentleman from New Jersey, proverbially supposed to carry specimen cranberries and oyster-shells in his pocket; but he made no allusion to these articles while dancing with May.

The next lady in the set rustled and sparkled; her diamonds would have graced a princess. She said,

"There's going to be a right smart of people at supper, I reckon."

Why was it that May became abstracted, confused, replying to her partner's remarks at random? Because her glance had met that of her vis-à-vis, a thrill has passed from one to the other, communicated by the contact of finger-tips; and although May curved her neck like a swan in assumed unconsciousness, she was aware, with a delicious sense of undefinable happiness, that his eyes continually reverted to her face. This vis-à-vis was Captain Charles Frederick Chevenix, attaché. He was a man in the prime of a grand type of beauty, superb physical development united with youthful grace, and regular features redeemed from effeminacy by a massive chin. He wore a diplomatic uniform, and evinced military training in every movement.

"A new girl from Yankeedom," said Miss Longford, in reply to a question of the captain's. "Do you think her pretty?"

But Captain Chevenix was far too wily a bird to be caught in any such feminine net.

"Rather pretty," he returned, indifferently.

"Her father represents the manufacturing interest; he makes pins, I believe," continued his partner, toying with her bracelet.

Miss Longford was *passée*, with haggard lines of fatigue beneath her eyes, a high Roman nose, a slim, elegant form. Perhaps she had the greatest prestige of celebrity of any woman at the ball. "How does she achieve it?" cried her indignant sisters, powerless to compete with her, however young and pretty. She was not especially accomplished, and yet she had never been a wall-flower during ten years of society life. The solution was simple: she had been well placed on the stage at the outset, had a small fortune, and belonged to an old family. It was not by means of nature's scale of real worth that she was appraised, but the fictitious value set on human jewels by the world. Her toilets were exquisite and original, her coiffure imitated the severe simplicity of a Grecian knot at the crown of the head. May Brenton was conscious of entire collapse to the balloon of satisfied vanity when she noted Miss Longford's creamy robe, which clung to the supple form like a glove, and terminated in a long, sinuous train. The belle understood very well how to carry herself with a calm hauteur. She need not dread old maidenhood, since she could marry. Was there not a vulnerable spot in the polished cuirass when she contemplated a peachy new face like May's? Captain Chevenix mentally inquired wherein lay the difference, in a republic, between making pins and raising tobacco. Indeed, the pin interest, as a disadvantage, made such a slight impression on his mind that he forthwith obtained an introduction. Captain Chevenix was fond of searching out novelties. May Brenton would be elected a beauty, and he enjoy the vantage-ground, in first recognizing her claim, from which to keep other men at a distance.

The next moment she was whirling away in his arms, he clasping her firmly and lightly, the crown of golden hair brushing his cheek, the very buoyancy of motion seeming a dreamy response to the enchanting Strauss music. Miss Longford experienced one of those stabs beneath the polished cuirass as they passed, although the bland general who fanned her was not aware of the pang. That waltz was an era. When it ended the young people found themselves in a gallery, screened by flowering plants, a delightful retreat from which to observe the moving throng below. It is possible that Captain Chevenix's varied experience has brought him in contact with more brilliant conversationists than our May, but she is fresh, and he adapts himself with ready tact to her mood. Then there is that glamour of beauty and appealing grace about the girl. His fine gray eyes, in-

dolent and tender in expression, watch the changing color in the soft cheek, note the delicate curves of the sensitive lips.

Here Dame Nature has played the aristocrat a trick. May has the small fine ear, the taper fingers, and arched feet, denoting high blood, so often found among American women of humble origin. Her grandfather began life a tin peddler, and how do you account for it, Charles Frederick Chevenix, lineal descendant of the Earl of R——? So the night wears on; the Eastern prince sits in the stage-box, blinking impassively; Miss Longford sweeps away on the devoted general's arm; Mr. Brenton has made it up with the Representative who rudely interrupted his speech of the morning in the House, and they are amicably discussing Pacific Railroad stock; Adelaide is flirting with Mr. Cobb; and Fanny giggles in a corner with a midshipman. Captain Chevenix, after leading May to her carriage, presses a small white glove to his lips.

An unbidden guest has entered the ball-room, changing the splendor to a sickly glow: it is the pure, unwelcome dawn.

II.

Such dissipation as the ball brought lassitude and weariness to the Brentons. In the afternoon of the following day May sat in the bow-window overlooking the street, pale and languid. John Pendleton was ushered in, his advent imparting electrical animation to the ladies.

"Oh, John, how did you come? We are so glad to see you!"

May's greeting was a shade cooler. It was irksome to meet John. Her conscience smote her. Had they not been almost lovers at home? Would they not have been engaged if Mr. Brenton had consented instead of bidding them wait? She had become years older, in experience, during the month which had since elapsed. John was no longer a hero. She went back to the window, and leaned her chin on her hand. The world was before her, and she could afford to spin her garment of folly of any bright hues that pleased her fancy.

John was an apple-faced young man, his habiliments of an unmistakably rustic cut. Not a hero, by any means; only with a broad brow and clear eye that promised future ability. Mrs. Brenton was delighted to see him, for he represented home. She called him Johnny, unmindful of the flush this appellation occasioned. The good lady was more interested in the ways of the new minister, the behavior of the mill hands, the ravages committed by rats on Aunt 'Liza's chickens, than in the most finished effort of oratory in the Senate-chamber. She was Lady Bountiful at Milltown. Here she was ill at ease, afraid of doing something to disgrace her husband, crushed by her own insignifi-

cance. Of a shy and irresolute disposition, she took refuge in the martyrdom that the girls wished to come; and when once they were launched in society, she intended to elude all obligations in a chronic condition of nervous headache. She viewed the courage of her offspring, in their present position, with mild wonder.

The coolness of May's greeting stung John Pendleton's pride. He glanced furtively at the window while answering questions. What ailed May? He was slow to appreciate that she might have outgrown him so soon; slow to realize that this meeting was not as much to her as to himself, when he had worked early and late to earn the brief vacation. The Brenton mill had many slaves; indeed, Mr. Brenton was a sallow, care-worn man, while young John was chained to Labor's chariot wheel.

"Where is Madge?" inquired May, with averted face.

"She is in Paris with Mrs. Ward," replied John. "They return soon."

The girl at the window started perceptibly, a deep blush succeeding her previous pallor. Captain Chevenix had just dismounted beneath the bow-window and given his horse to his groom. The ensuing peal of the door-bell rang on May's heart with a quick vibration of alarm. Her first impulse was to run away and hide; her next to smooth the folds of her lavender dress.

"Must I see him?" asked Mrs. Brenton, querulously, taking the attaché's card.

"Do not bother your dear head," said Adelaide.

Then the Misses Brenton went down stairs. John Pendleton was utterly forgotten.

III.

A July morning in Milltown. Industry turned wheels and spun webs just the same as if the sun did not steep all the adjacent hills in blue haze. Milltown was a thriving place, aspiring soon to become a city. The village street was shaded by lofty elms, and on this thoroughfare was located the Brenton mansion, not without pretension in the way of conservatory, cupola, and plate-glass windows.

On this July morning two strangers arrived by the train, evidently master and man. The master glanced about him with some curiosity, the man maintained that stolid, wooden aspect peculiar to grooms of the highest breeding. All Milltown saw them in a trice; the factory girls became enthusiastic; John Pendleton, glancing down through the dusty window of his office, felt a sudden coldness at heart; two of the Brenton girls, in *négligé*, were hanging new curtains in the parlor; May was transplanting in the conservatory; the industrious Kitty assisting mother to make currant jelly.

Captain Chevenix, having deposited serv-

ant and portmanteau at the Milltown House, walked up the gravel-path.

"Why do they not have parks instead of court-yards? Surely the country is large enough," he soliloquized.

Fanny's arm dropped the curtain; May overturned a flower-pot; mother and Kitty came swiftly and stealthily from the kitchen, still imbrued in the blood of the currant. Who should answer the bell? Their faithful servitor, Bridget, had been summoned home by illness. May's face glowed with a sweet content. The constant companion of every pleasure during the winter had not forgotten her, then! Adelaide was equal to the emergency. She metamorphosed herself like the fairy in the pantomime, and came tripping down stairs in white raiment, in the act of tying a blue sash, her hair floating over her shoulders, negligently confined with a band of ribbon. Then who so smiling when she threw wide the portal to the distinguished stranger as the young woman lately poised on a step-ladder, hammer in hand?

"We didn't think much of the redcoats in my day," said grandmother.

The captain's greeting was eager; he had been at Newport hoping to meet them there, and now he had ventured to search them out. These remarks were addressed to the serene Adelaide, who listened as if she had not a care in the world, while his gaze sought the classical profile of her sister. They were left alone one moment, and drew nearer instinctively.

"Are you glad to see me, dear?" How caressing the tone! how tender the light in the gray eyes!

"Very glad," whispered May, confidently. Never was knight of romance like this one. His image had entered in and taken possession of her imaginative soul. Captain Chevenix murmured, softly,

"Sleep was no sweeter than her face to me,
Sleep of cold sea-bloom under the cold sea."

In the mean while the feminine element sat in judgment in the dining-room. The crisis was grave. Pa must invite the attaché to move over, bag and baggage; he could not be permitted to stop at the Milltown House, which was a large, barren hotel, with swinging sign, and pervading odor of bar-room.

"We must get Hepsibah to help; and for Heaven's sake, ma, don't have dinner at half past twelve," said Adelaide.

"At what hour would you dine?" inquired grandmother.

"Lunch at two and dinner at half past six o'clock. I wish we had a morning-room; and, ma, that servant will consume more beef in a day than we do in a week."

"Lord bless us!" ejaculated grandmother. "No one can keep their health who takes tea later than six."

"We must make an effort. He has come to propose to May, and I guess the match will be a feather in our cap," continued the ambitious Adelaide, seizing a broom and leading the way to the guest-chamber.

Ignorant of the consternation he had occasioned, the captain became a guest; Hepsibah, grim of aspect and stiff in her ways, was pressed into the service; the late dinner was served, Mrs. Brenton nervously presiding, Mr. Brenton striving to be facetious, the girls with many misgivings as to the salad. Grandmother persisted in sitting by the dining-room window, during the meal, with her knitting, and conveyed as much disapproval of the entire proceedings as a very rigid old lady in her best cap may do by a frozen silence. Aunt 'Liza had come to the rescue by rushing in the front-door, with an ice-cream freezer in her hand, just as May was strolling forth with Captain Chevenix.

"I've made you some cream, seeing's the day's so hot," panted the good woman. "I thought your company might relish it. How do you do, Sir?"

Thomas, the servant, made himself at home in the kitchen, treating Hepsibah with a mocking deference, while Job, awkward, simple-hearted man-of-all-work, who took care of the young ladies' ponies, became slave at once to his superior sway.

John Pendleton sat at his desk with knitted brow, lost in painful thought. Before him was spread a sheet covered with mysterious characters—hieroglyphics that meant future fame to John as an inventor. This man of the world, brilliant, accomplished, and handsome, had come to rob him of May. This conviction smote on him with a throb of pain and fear, and he acknowledged, nay magnified, every advantage of the rival, shrinking into undeserved self-abasement. The other was clever, proud, rich. How impossible to imitate the quiet ease of manner, the perfect breeding evinced in unobtrusive adaptation to the circumstance of the moment, like fitting on a glove, the entire absence of all personality in conversation! Captain Chevenix never spoke of himself or his family, read poetry to the girls, was interested in Milltown politics, and was altogether so affable that even grandmother thawed. John, keenly aware of his own constrained shyness, the size of his boots, the difficulty in disposing of his hands, perceived these things, and for one terrible moment, full of anguish, longed to hurl the stranger into the gulf of grinding machinery, as he stood talking with Mr. Brenton.

If the master was unassuming, the man was not. Thomas was obliged to resort to the Milltown House for his beer, whither he lured the guileless Job, to the manifest detriment of the latter's morals. Hepsibah, mem-

ber of a temperance society, sipped her cup of tea in silence. Why dwell upon the trials of the week, how Mrs. Brenton was stretched on the rack of housekeeping cares; how Thomas insisted on filling his master's portable bath-tub in the middle of the velvet carpet of the guest-chamber; how grandmother sat on the stairs to watch that the captain did not fire the house by late reading; how May frequently retired in tears of mortification! The captain was very much in love, and the hours devoted to simple pleasures flew by on wings. The soft twilight of the best parlor knew not of the noisy clamor of the kitchen. Nevertheless one can not live on bonbons alone; there were suppressed yawns of a morning when an hour at the club would have been welcome. May was sent on long drives in the pretty pony carriage, in order that her sisters might dust and re-arrange the visitor's costly toilet apparatus, in deadly fear of being caught by Thomas serving as chamber-maids.

"A grandson of the Earl of R——!" exclaimed Mrs. Ward. "Let us have afternoon tea on the lawn, my dears, and croquet."

Mrs. Ward lived in an old brick house surrounded by spacious grounds. Milltown never understood her, and now that she had returned from Europe, she was more incomprehensible than ever. In years gone by she had issued cards with "At home Thursdays" in the corner, and Milltown had exclaimed, "Supposin' she is to hum, she needn't print it." All that could be clearly appreciated was that her husband had left her a large fortune, which her adopted daughter, Madge Pendleton, would inherit.

So the Brentons took their lion up there, blessing Mrs. Ward in their hearts, and were entertained in faultless style. Madge Pendleton, a fair girl, best described as harmonious to any position in which she was placed, looked wistfully at radiant May, in her delicate green draperies and Mand Muller hat, whose side the captain seldom quitted.

"Chère maman," she said, when the others had departed, "that would be a man to worship."

A summer night on the lake, where a boat floated idly on the calm surface. This lake, embosomed among the hills, fed the mills in the valley below. Moonlight silvered the foliage, spread a broad track of liquid splendor for the boat, and glorified the youthful faces of the occupants. May Brenton, with a white shawl over her head, was changed by the moon's wand to a pure Madonna. Her mood was gay; she sang little snatches of song which alone spoke of her increased confidence—how readily she was assimilating her own happiness to the daily uses of life! John Pendleton wielded the oars, occasionally making gruff comments, or indulging in mirthless laughter, which betrayed his own unhappiness. From the height to

which she had attained May looked back at John with tender pity. He would yet marry, the wound be healed, while she went forth into the world. Midsummer evenings remain in the memory a dream of perfumed stillness, of dusky banks fringing the water, of a calm expanse of heaven spanning a universe. As they landed on the island Madge took her brother's arm. When their parents died Mrs. Ward adopted the girl, and John was placed in the factory.

"I am sure that May will be punished yet," said the sister.

"Hush!" returned John, humbly; "she can not help it."

Beside the glistening waters, with the trees forming a shadowy dome of darkness above, Captain Chevenix had taken May's hands.

"I am going away to-morrow, dearest. Do you divine my reason for coming at all?"

Yes, she knew it. With her head on his breast, and the handsome face bending over her, realized all in the silent pressure of eloquent lips. "Thou, and no other," is the lover's creed.

John was sharp and rude going home. Captain Chevenix turned his aggressive hostility so quietly and coolly that it was impossible to tell if he perceived the animosity. This galling composure well-nigh drove John frantic.

Thomas celebrated the eve of his departure by imbibing more stimulant than usual, in company with the unhappy Job, and attempted gallantly to salute the prim Hepsibah in consequence. A violent scuffle ensued, and was succeeded by the appearance of that indignant woman in the parlor.

"I can't stand such actions no longer, marin," she said. "I'm goin' hum." And she went.

Captain Chevenix behaved with discretion, only requesting to be allowed to correspond with May. Mr. Brenton consented in some perplexity. He was an indulgent father, and he was in no haste to give away the lily of his garden to a stranger. The affair with John had blown over, then? Fate brought her gifts to the Brenton door with a lavish hand. Lo! as May watched her lover depart, Mr. Cobb, of New Jersey, dawned on Milltown. Adelaide blushed vividly.

"I don't care," she said, vehemently; "he may take us as we are, or not at all."

May twined her arm about her sister's neck. "Let me work for you as you did for me, dear."

"It might be nice to have fresh cake for supper," assented Adelaide, revealing a dimple of satisfaction.

IV.

A year elapsed, bringing many changes. John Pendleton had gone to England in the interest of Milltown manufactories; Ade-

laide had married Mr. Cobb, and become queen of one of those prospective cities chiefly indebted to enthusiastic advertisements for an existence. May Brenton leaned her arm on the mantel-piece, watching the clock dial absently, almost wearily. Her costume of black lace, strewn with gilt stars, denoted that she was again decked for a ball, but how different from the first one! Here was only blasé indifference; her movements were no longer impulsive. Her beauty was undimmed, yet she had gained in dignity what was lost in soft, rounded outline.

"Are you ready, my dear?"

"I thought you would remain at home in peace, papa."

"Why should I be banished? Am I too old for an escort?"

This assumed gayety nearly proved too much for the girl's cold composure; she bit her lip hard to force back the tears.

"Good old father; always the same! Charles was to have been here at ten. I suppose he will meet us instead."

"May," said Mr. Brenton, in the carriage, "Captain Chevenix has been talking over settlements with me. He seemed surprised at the smallness of your portion. I can not endow one child at the expense of the others. I have four girls."

"What did he say?" Her voice was sharp and strained.

"Oh, he is a gentleman, my dear. He only regretted that the condition of his own fortune necessitated an ample provision for his wife. I wish—" and here Mr. Brenton's wish ended in a profound sigh.

May slipped her hand into that of her father; her eyes were very bright and hard. She would not weep; indeed she could not; and there was an intense nerve tension about her mood which strung her to apparent composure. The secret of this excitement was jealousy. Miss Longford at the ball said to the still attentive general:

"I never thought the engagement between the attaché and Miss Brenton would come to any thing. There is no *dot*."

"*On dit* that he has a penchant for the heiress instead."

An abrupt pause in the music wafted these words to the recently arrived Brentons. The father flushed angrily; the daughter shuddered. Here was May's perfect fruit of happiness crumbling to ashes. She had been the subject of polite gossip for a year, identified on every public occasion with one cavalier. Half an hour later Captain Chevenix entered the room, escorting Mrs. Ward and Madge Pendleton. They had spent the winter at the capital, where Madge was a favorite in diplomatic circles, not only as an heiress, but as an accomplished linguist. Captain Chevenix hastened to May's side. Mrs. Ward had asked his advice about some

engravings; in fact, he had dined there. May listened coldly, her gaze distraught, then accepted her partner's arm. She had filled her tablet of engagements with feverish eagerness. Captain Chevenix frowned slightly, and danced with Madge, whose unfeigned pleasure was balm to wounded vanity. How May's beauty blazed into richer splendor under that sting of anger! Once she detained Fanny to ask, "How do I look?"

"Splendidly," returned sisterly pride.

May smiled. She dreaded that hollow-eyed despair should look out on all those cruel people, who would rejoice in her downfall. How she wished that the polished floor would yawn at her feet, and receive her into welcome darkness of oblivion, away from the hateful noise and glitter of the scene!

"Perhaps you will allow me to escort you to the supper-room," said Captain Chevenix, in an injured tone. He found her an alcove, where May daintily sipped her ice.

"I waited for you until ten o'clock."

"I am sorry that I detained you. We must add it to my list of faults. I do not seem to be fortunate in pleasing you."

When reproach steps in, love flies out the window. She played with her bouquet in obstinate silence; he looked at her furtively, pulling his mustache.

"I may have to run over home next mail," he finally said.

He was dissatisfied with himself, and still more so with May. She took this to be the chance of dismissal desired.

"We have made a mistake from the first, I fear. Consider yourself free." She did not dare to trust herself to speak of friendship: her grief might overpower her at any time.

"You know best what is for your own happiness," was the dignified response, as he bowed over her hand. The wide river now rolled between them, but months before they had stepped on either side of the tiny rivulet. After that May was crouching in the carriage, wildly imploring her father to take her away, to hide her from the scrutiny of those innumerable eyes. All was over!

Captain Chevenix went home, wrapped himself in a Delhi dressing-gown, lighted a cheroot, and surveyed the field. He was reluctant to give up his pretty May, but he had on the previous day received a letter from his brother, Lord H——, bluntly declining to assist him further, and concluding with a suggestion that he should marry and settle in America. The attaché set his white teeth, and looked at a ring on which was engraved his family crest—a couchant leopard.

"We shall see, my lord," he muttered.

What a mere bagatelle May's portion would be! Why could not Mr. Brenton make a sacrifice to endow his daughter handsomely? The lover was very fond of

her. He took out her photograph, and kissed it; he twined a silky tress about his finger. On the whole, he pitied himself very much for being curbed by stern necessity in his choice.

A week later Miss Longford said, in the name of society,

"Of course she is finished for this market. He never allowed another man to admire her, and nobody wishes a discarded plaything for a wife."

V.

A night in March five years later. Milltown was asleep, and it was midnight when May Brenton closed her book. She was alone—a stern, grave woman, old beyond her years, with lines of repressed pain about the mouth, a pathetic sorrow in the large eyes; for May had cherished her grief, brooded over it, until every happiness had suffered eclipse. Shunning the sympathy of friends, she had lived the life of a recluse until her mother died, and then she had taken her place as head of the household. Milltown had ceased to wonder at her ways; only one pair of eyes followed her regretfully—those of prosperous John Pendleton, who owned the mill on the hill, and had returned from Europe enlarged in mind, as he was improved in appearance. He made no secret of his preference, and he was Mr. Brenton's confidant, but May took no heed of a devotion which was none the less noble because undeserved. Once he had spoken, and been rejected. A less patient man would have turned to Kitty, ready to smile at his lightest word, yet John waited, in his heart deep compassion for the sensitive plant blighted by his own sister. Madge had married Captain Chevenix, attaché, four years ago, and letters came to Milltown from the young matron more English by adoption than a native-born Briton, which caused May's wounds to bleed afresh. Madge wrote about the London season, Ascot races, and Cowes regattas, for her husband had not followed his brother's advice to settle in America, as a *dernier ressort* for penniless younger sons.

May closed her book, and gazed into space. Kitty was falling in love with John Pendleton. The thought gave her pain. Why? She arose and went to the window. The rain had ceased, the wind lulled, and just then the moon rifted the clouds. She saw a stream of water flowing down the steep hill opposite. Her heart stood still. In that awful moment the bond of apathy which had held her so long was broken. Sleeping Milltown was at her mercy. May knew very well what the rivulet meant—the lake above the town, swollen by recent storms, was forcing a passage through the embankment. A cry rang out through the street: "Save yourselves! The lake has overflowed."

Then the church-bell pealed forth an alarm. That was all she could do; the bell was an iron voice. She pulled the rope until the waters poured in a window above her head; escape was impossible; she climbed to the belfry where the bell hung. Thank God that father and Kitty were absent. If she died she need not be missed. She had often longed to die.

And now! The record of five years rose before her in stern rebuke. What had she done? Wrecked her own life and clouded those of others for the sake of a man to whom she had been as the idle wave on a shore left far behind. She bowed her head on her knees, and waited. The loneliness was awful. Below, the waters surged and lapped. John's mill was hurled into the valley. Would the church stand? Was it indeed founded on a rock? The voiceless prayers of dead generations seemed to rise from the venerable walls, and shield her with unseen wings. Oh, the prolonged agony of suspense! She had saved Milltown only to be forgotten. She seemed to read her whole life traced in fiery characters on an unfolding scroll. For recreant Charles Chevenix the idle boat drifting on the calm lake surface; for her the devastating overflow of an angry flood.

At last she put out her hand in the dark-

ness, and drew back shuddering. The water was creeping slowly up to the belfry: already the church was submerged. This was the end; death awaited her in the gloomy abyss below. A despairing cry broke from her lips.

"May, where are you?" shouted an agonized voice on the hill above. What hope the voice inspired!

"Oh, John, I am here. Do not risk any thing for me."

"I am coming. Courage, poor love!"

Darkness and silence succeeded. May clung to a beam; a wave swept through the belfry. The next moment might decide her fate. A warm, human hand grasped her own, and she was led, step by step, over a swaying plank to the next building, and thence to the hill above. Saved! Day dawned cold and gray; the wreck of Milltown lay at their feet.

"We must begin the world over again," said John, gravely.

May looked at him beseechingly.

"If you can forgive me, John, let it be together."

Not in the least like the wooing of Captain Chevenix; but in that cold dawn, with stained garments, and consecrated by the solemnity of a great sorrow, they prepared to begin the world.

SOME TALKS OF AN ASTRONOMER.

VI.—MEASURING THE HEAVENS.

AS I have said before, by observations with an instrument of any kind, made at one place, we can only determine directions, and not distances. But by making observations at two places very far apart, they can be arranged in such a way as to determine distances also. It is not always necessary to actually travel to another part of the earth for this determination, because in the evening we are, in consequence of the earth's rotation, eight thousand miles from where we started in the morning, and it is therefore possible to use this change of place produced by the motion of the earth instead of using observations made at two distant places. But as the latter will be more readily understood, we shall explain the method of determining distances on the supposition that we have two instruments and observers at different points of the earth's surface making simultaneous observations on the same heavenly body. I think I can explain at least a principle on which such observations are employed to determine distances in a very simple way. Suppose that at night, looking down a street, you see two gas-lamps, one of which is much further than the other. Suppose the one nearest to be so much fainter that they both appear to you of the same brightness;

then stand still, and by looking at them you will not be able to state which is the more distant; but you can decide the question very easily by walking a short distance at right angles to the direction of the lights. The nearest light will seem to move in an opposite direction to that in which you walk.

In Fig. 1, if you see two lights to the north, and stand east of the line joining them, the nearest light will seem to be west of the more distant one. Now walk toward the west, and when you reach the line joining them, the two lights will be seen together; pass still further to the west, and the nearest light will seem to cross over to the east. You see that in consequence of your motion the lights have changed their direction, and the change is greater the nearer the light is to you. Now this change of direction is called *parallax*. Parallax may be defined as the difference in the direction of a body as seen from two different points. Given this difference of direction, and the distance and direction of the two

FIG. 1.

COMPARATIVE SIZE OF MOON AND EARTH.

The distance between the two bodies is thirty diameters of the earth.

points from each other, and we can, by a simple trigonometrical calculation, determine the distance of a body from each of the points without making any actual measurements. If, then, two observers, one in Australia and one in America, can determine separately, by such an instrument as I have described, the exact direction of a heavenly body at the same moment, we have at once the means of calculating its distance from the difference between the two directions.

You naturally inquire how can two such distant observers be sure they make their observations at the same moment, and what common point of reference can they use to be sure that their directions are measured in the same way? In regard to the former, I observe that it is not necessary that the observations should be made at the same absolute moment, if we only know the real moments at which they were made, and are able to calculate the motion of the body during the interval. To furnish all the data we do not depend upon a single pair of observations, but always employ a long series, the combination of which enables us to calculate the motion of the body during the interval between one set of observations and another. As points of reference we may use either fixed stars, which are so immensely distant that they seem to be in the same direction from all points of the earth, or we may use the direction of the earth's axis. The stars near the pole, in their apparent diurnal revolution, cross the meridian twice, once above the pole, and once below it. If we determine the point on the circle when the telescope points to a star crossing above the pole, and again determine it when the telescope points to it when it crosses below the pole, the average of the two determinations will be the position of the circle when the telescope points exactly at the pole. Subtract this from the position of the circle under the microscopes when another star

crosses the meridian, and the difference of the two will give the difference of direction between the pole of the earth and the body observed. On this principle vast numbers of observations have been made, at the observatories at Greenwich and at the Cape of Good Hope, to determine the zenith distance on which the moon crosses the meridian on various days. The combination of these shows that the difference of the direction of the moon as seen from the earth's surface and from its centre is nearly a degree. And from these observations the distance of the moon has been determined within a few miles. This distance varies in different points of the moon's orbit, and amounts, on the average, to a little less than 240,000 miles.

The distance of the planets outside of the moon, or those which revolve around the sun, is so great that their parallax is very small, and the accurate determination of their distance is a very difficult problem. The planets coming nearest the earth are Venus and Mars, and even their parallaxes never become so great as the smallest object visible to the naked eye. The parallaxes of the outer planets are yet smaller, and scarcely admit of exact measurement. In consequence of this extreme smallness of the angle to be measured, all our estimates of distances in the solar system were twenty years ago erroneous by about one-thirtieth of their entire amount. For instance, the distance of the sun was supposed to be ninety-five millions of miles, and it is now known to be only about ninety-two millions. Notwithstanding this, the proportions between the distances of the planets are known very accurately. For example, we know that Neptune, the outer planet, is almost exactly thirty times as far from the sun as the earth is, and once knowing the distance of the sun, we can find the distance of Neptune with great accuracy by multiplying it by this number.

At the beginning of this paper I called your attention to the fact that five of the stars which we see change their places in the heavens from time to time. These are the five planets which, with the sun, earth, and moon, constitute the solar system as it was known before the invention of the telescope. The

EXPLANATION OF PARALLAX.

RELATIVE PROPORTIONS OF THE SUN AND PLANETS.

furthest known planet is Neptune. This object is entirely invisible to the naked eye. It is, as I have just said, thirty times as far as the sun. By the principle of parallaxes, which has just been explained, all these bodies will be seen in different directions as the earth changes its position while moving around the sun, just as a street lamp seems to change its direction as an observer walks past it. In the case of Neptune this change of direction amounts to two degrees, a quantity which can be seen and measured without the aid of any astronomical instrument. It is in consequence of the great extent of this angle that we are enabled to determine the proportion between the distances of the planets and the distance of the sun.

Now let us turn our attention to the thousands of millions of fixed stars which do not seem to change their places in the heavens from year to year. Evidently these bodies must be much further off than the planets, because if they were not, we would see them in slightly different directions as the earth moved in its annual course around the sun. We know there must be some such change in their direction, but how great a change

we can not tell until we measure it. By measuring it we shall be enabled to find the proportion between the distance of the earth from the sun and the distance of the star we measure. And this measurement of change of direction in different times of the year is the only method yet known for determining the distance of the fixed stars. Hence astronomers have for two hundred years or more been engaged in attempts to determine the annual parallax of the fixed stars; but so small is this parallax that until quite recently it evaded every attempt to see it. The effect of heat and cold in changing the instruments used by the astronomers and in altering the rates of their clocks was far greater than the parallax which they had to measure. At length, about forty years ago, it was found by Bessel, the great astronomer of Königsberg, that a small star in the constellation Cygnus had a parallax of one-third of a second. Let me give you an idea how small an angle one-third of a second is. Suppose you were to put three hundred stars in a row, the distance between every two consecutive stars being one-third of a second, so that the whole three hundred extend over a line one hundred seconds

long, the three hundred stars would, to the keenest eye, appear as only a single round bright star in the firmament. It is only by using powerful instruments, and employing every artifice which human ingenuity can invent to guard against innumerable small sources of error, that it is possible to measure a quantity so small.

The star just mentioned is so small as to be barely visible to the naked eye. It was selected for this measurement because it changed its position in the heavens about five seconds a year. From this change it was concluded that it was probably nearer than many brighter stars. The fact that it was within a distance admitting of measurement being once settled, it became of interest to learn whether the parallaxes of other stars could not also be determined. Measurements have since been made from time to time of every star of the first magnitude in the heavens, and on a great many smaller ones which it was suspected might be near our system; but not in a single case has a parallax greater than one second been found. The star α Centauri, in the southern hemisphere, is found to have a parallax of about one second, but no other star in the celestial vault has been found to have a parallax of more than half a second. In quite a number of stars the parallax ranges from two-tenths to half a second. Let us see now what these measures give us for the distance of the stars. When a star has a parallax of one second, it shows its distance to be a little more than two hundred thousand times the distance of the earth from the sun; with a parallax of half a second, the distance is twice as great; with one of a third of a second, three times as great, and so on, the distance being inversely proportional to the parallax. As there are only

two stars of which the parallax exceeds half a second, it follows that with the exception of these the stars are all more than four hundred thousand times as far as the sun. The sun being nearly a hundred millions of miles, this distance amounts to about forty millions of millions of miles. Hence the nearest known star is distant twenty millions of millions of miles; there are about a dozen others of which the distance ranges from two to five times this amount, while all the remaining ones are situated at distances yet farther. You see that bright star, α Lyra, now (October 1) a little west of the zenith? Dr. Brunnow has recently determined the parallax of that star to be almost one-fifth of a second, consequently, by the rule we have just given, its distance is more than a million times that of the sun, i. e., it is just about one hundred millions of millions of miles.

I can not leave this subject without saying that the distance of the sun has been found by yet other methods, one of which is too wonderful to be omitted. Suppose we had a messenger whom we could send to and fro between the earth and the sun, and who could tell us exactly how long it took him to perform the journey; suppose we could also find by trial exactly how fast he could travel; then multiply his speed by the time occupied in coming from the sun, and we shall have the distance of that body, just as we would get the distance of two cities when we knew that a train running forty miles an hour took seven hours to run between them.

Such a messenger is light. Let us find how long it takes light to come from the sun and how fast it flies, and we have the distance required. How hopeless a task it seems to find either the time or the velocity! But both have been found by methods which admit of being understood without any great amount of scientific knowledge. The time of the journey has been found by two entirely independent methods. The first is by the eclipses of Jupiter's satellites. The inner of these satellites revolves around Jupiter very regularly in less than two days. He passes through the shadow of Jupiter in every revolution, and thus becomes eclipsed. These eclipses can be observed with a small telescope, and the time noted within a few seconds. The time of revolution and the form of the orbit being precisely determined, the moments at which future eclipses are to occur can be exactly predicted. The first astronomer who accurately investigated this subject found that when the earth was between the sun and Jupiter the eclipses were seen several minutes sooner than they should have occurred; as the earth moved away, they were seen later, and finally, when the earth got to the opposite side

THE EARTH, SEEN FROM THE SUN (SUMMER SOLSTICE, NOON AT LONDON).

of the sun, they were as much too late as they had been too early. As the earth returned, the eclipses again came earlier, and the irregularity continued in the same order year after year. The variation was found to be about eight minutes in time on each side of the mean. Persuaded that no such irregularity in the motions of those bodies could really exist, he attributed the appearance to the progressive motion of light, and hence concluded that this agent was about eight minutes in passing over the space which separated the sun from the earth. The most exact determination of this time was made about seventy years ago from an examination of all the eclipses of Jupiter's satellites, observations of which were to be found in the Paris Observatory. The result was 8 minutes 13.2 seconds.

The other method of finding the time light requires to pass from the sun to the earth is due to Bradley, who was Astronomer Royal of England in 1750. In making observations to determine the parallax of the fixed stars he was surprised to find an apparent annual motion of the stars of about 20 seconds, which did not correspond to the parallax at all. After long study on the subject it occurred to him that, owing to the rapid motion of the earth in its orbit, no star would be seen in its true direction unless it was in the line of direction of the motion; but the motion of the light itself would be combined with that of the earth. The angle being 20 seconds showed that the velocity of the light coming from the star was 10,000 times that of the earth in its orbit. Since the velocity of the earth would carry it to the sun in about 57 days, light would, by this theory, require about $\frac{1}{10000}$ of 57 days to reach the sun. Calculate this time, and it will give 8 minutes 12 seconds. The most exact observations of recent times give 8 minutes 18 seconds. There is therefore an outstanding discrepancy of five seconds only between the results of the two methods, and this is accounted for by the uncertainty of the old observations of Jupiter's satellites.*

The terrestrial velocity of light is also obtained by two different methods. The mechanical difficulties involved in them may

THE CIRCUMFERENCE OF THE SOLAR GLOBE COMPARED TO THE ORBIT OF THE MOON.

be judged by the fact that it has been necessary to measure a space of time less than a millionth of a second. The most accurate method is that of Foucault, in which a beam of light is made to fall on a rapidly revolving mirror, from which it is reflected to a second mirror, which throws it back to the revolving mirror. If the light required no time whatever to pass between the two mirrors, the stationary mirror would reflect it back to the same point from which it came in the first place, for, however fast the other mirror might turn, it would be in the same position when the light was first reflected and when it came back after the second reflection. But if the light takes any time to go and come, the mirror will have moved a little between the two reflections, and the rays will be thrown back to a different point from that from which it came. By giving the mirror a velocity of a thousand turns per second the deviation of the second reflection was sufficient to be measured by the aid of a telescope, and the results of the measurements indicated that the velocity of light was 185,000 miles per second. Multiply this by the 498 seconds it takes light to come from the sun to the earth, and we find the distance passed over to be 92,130,000 miles, a result remarkably accordant with the other recent determinations of the sun's distance.

VII.—WEIGHING THE HEAVENLY BODIES.

I have thus tried to give you a general idea of the methods by which the celestial distances are measured. You now wish to know how the planets are weighed. The only way by which we determine the weight

* Since this was written all the eclipses of Jupiter's first satellite observed during the past twenty-five years have been investigated by Mr. S. Von Glase-napp. His result is that the time in question is eight minutes twenty seconds—only two seconds different from that given by the aberration of the fixed stars.

of a celestial body is by the measurement of its attractive force on some other body. Attractive power, mass, and weight, as understood in common language, amount to the same thing, the weight of a body being simply the attraction between it and the earth. It is found by experiment at the surface of the earth that the inertia of all bodies is proportioned to their attractive power, and there is a certain regularity in the movements of the planets which shows that they are subject to the same law. I must remark, however, that the weights we get are not pounds or tons, but fractions of the mass or weight of the sun. If a planet has a satellite revolving around it, the determination of its mass from the movements of the satellite is very easy. You know the earth has one satellite (our moon), Jupiter has four, Saturn eight, Uranus four, and Neptune one. So, to determine the relative weights of either of the five planets I have mentioned, we find by careful observation the distance of every one satellite from a planet around which it moves, and the time of one revolution about it. We then take the cube of the mean distance, and divide by the square of the time of revolution; the result gives the mass or weight of the planet. We can apply this rule equally to determining the mass of the sun by the distance and times of revolution of the planets around it. Taking the cubes of all the distances, and dividing by the squares of the times of revolution, we obtain a series of numbers showing the proportions between the weights of the several central bodies. Where different satellites revolve around the same primary, we shall get the same result for the mass of the primary, no matter which satellite we take. So, also, whatever planet we take to get the mass of the sun, we shall get the same mass for the sun. In fact, one of the great laws of planetary motion discovered by Kepler was that the cubes of the distances were proportional to the squares of the times of revolution. He found the law solely by observation. It was reserved for Sir Isaac Newton to discover that the proportion in question depended upon the weight of the sun. By the rule thus explained it is found that the mass of the earth is $\frac{1}{320000}$ that of the sun; the mass of Jupiter is $\frac{1}{1045}$; that of the planet Saturn is $\frac{1}{3200}$; that of Uranus, $\frac{1}{43000}$; that of Neptune $\frac{1}{40000}$.

The planets Mercury, Venus, and Mars have no satellites; hence this method can not be applied to them. But in speaking of universal gravitation it was stated that every heavenly body exerts an attractive force on every other heavenly body, and thus causes it to deviate slightly from the orbit it would otherwise follow. By measuring this deviation we can determine the force that produces it, and thus learn the mass of the planet which exerts that force. The attrac-

tion of Mercury produces some small irregularities in the motions of Venus, from which its mass is found to be $\frac{1}{300000}$ that of the sun. The attraction of Venus and Mars produces certain deviations in the course of the earth around the sun. They cause the position of the ecliptic to change very slightly from year to year. By a study of these changes it is found that the mass of Venus is about $\frac{1}{400000}$ and that of Mars about $\frac{1}{300000}$ that of the sun. Of course the same method can be applied to the planets which have satellites. You know that between the orbits of Mars and Jupiter there lies an immense group of very small planets, sometimes called asteroids. More than one hundred and thirty planets of this group are now known, and several new ones are found every year. The planet Jupiter exerts a very powerful attraction on these bodies, and a number of mathematicians have calculated its mass in this way. Different calculators get results varying from $\frac{1}{1047}$ to $\frac{1}{1033}$. You see how wonderful the agreement between the results found by methods so different.

The determination of the mass of the planets by this second method requires the most profound mathematical knowledge, and the calculations are so complicated that very few can undertake them. Every thing must be computed with the greatest precision, for a single mistake in whole volumes of calculations might spoil the result. Where there are so many sources of error it might seem hopeless to attain certainty; but the discovery of the planet Neptune must make it plain to all who are disposed to doubt how great a degree of certainty has thus been attained. The planet Uranus was discovered by Sir William Herschel in 1781; it was then the outermost known planet. During the sixty years which followed this discovery it was found that its motions could not

JUPITER, AS SEEN BY THE GREAT WASHINGTON TELESCOPE, MAY 7, 1874.

be satisfactorily accounted for by the attractions of the known planets. Many astronomers judged that these deviations were due to the attraction of some planet not yet discovered; but as they did not know where to look for the attracting body, their speculations led to no result. About 1843 two young mathematicians, Adams in England and Leverrier in France, undertook to calculate where a planet must be in order to produce the observed deviations. The telescope of the Berlin Observatory was pointed in the direction which they indicated, and there was a new planet within one degree of the computed place.

VIII.—THE SUN AND SPECTROSCOPY.

It seems surprising enough that men should have been able to weigh the heavenly bodies and measure their distances; but within the last fifteen years they have succeeded in doing what is yet more wonderful—being nothing less than determining, to a limited extent, the chemical constitution of such of them as are self-luminous. This is done by spectrum analysis. Although this has become quite an extended subject, its first principles are so simple that I think they can easily be rendered clear. Let us begin with an experiment with which all are familiar. You know that common white light is really compounded of light of many colors, and that when we pass it through a glass prism these colors are spread out over a certain scale, red appearing at one end, and gradually changing from yellow, green, and blue up to a faint purple or violet. This spreading out of the different colors to view is called the solar spectrum, or simply the spectrum. It is produced by the bending of the light out of its course as it passes from the air into the prism, and again as it passes out of the prism into the air. This bending is called refraction, and the property which produces it is called refrangibility. The separation of the light into the different colors shows that these different colors possess different degrees of refrangibility, that is to say, that some are bent out of their course by the prism more than others. It is found that common sunlight is a mixture of light of every degree of refrangibility, just as in a pile of sand we may have a mixture of grains of every size between the largest and the smallest. If we could arrange our prism so that the light of only one degree of refrangibility should fall in one point, and the light of another degree of refrangibility

in another point, we should have what is called a pure spectrum; but in the manner in which this experiment is made we can not get such a spectrum, because the light which comes from the top of the sun, and has one degree of refrangibility, will fall on our screen in the same place with the light which comes from the bottom or lower edge, and has a different degree; and in the same way light of the same degree of refrangibility passing through the upper part or the lower part of the prism will fall on different parts of our screen. If we should admit the sunlight through an extremely narrow slit, and also cover up all of our prism except an equally narrow slit, we might have nearly a pure spectrum; but then it would be too faint to be seen. To avoid this, a slightly different arrangement is made. The light is admitted through a very narrow slit, as at A; it is then suffered to fall on the whole side of the prism. Immediately beyond the prism a lens is placed which has the property of bringing to one point on the screen all the light which passes from the prism in any one direction, and of taking to a different point every ray which passes in any different direction. In order that the slit may be made extremely narrow without having any waste of light, the observer looks into this lens, placing his eye beyond the point or focus toward which the rays converge. To assist his vision, he looks into it with a small magnifying-glass. He thus has a little telescope with which he is looking through his prism. The spectrum which before was formed on the screen is now formed on the retina of the observer's eye, and he can examine its different parts by direct vision with far more accuracy than he can observe it on the screen. This arrangement, consisting of a narrow slit, a prism, and a small telescope, forms the spectroscope. When he adjusts his prism and telescope in such a way as to get a pure spectrum, he finds that this spectrum is crossed by a great number of dark lines parallel to the slit. These lines indicate that in the light which we receive from the sun certain particular degrees of refrangibility are missing.

THE SOLAR SPECTRUM.

SPECTRA OF VARIOUS BODIES.

To refer to our illustration by grains of sand of all sizes, the principle is the same as if, on accurately weighing every grain, and separating the sand according to the size of the grains, we found that grains of some special size or weight were missing from the whole. These lines, hundreds or even thousands in number, thus spread over the spectrum, are the open book in which we read something of the chemical constitution of the bodies from which the light has emanated, or by the gases through which it has passed.

If instead of sunlight we take candle-light, or light from a red-hot iron or from a glowing body of any kind, we see none of these dark lines. This shows that these bodies send out light of all degrees of refrangibility. Since we know the sun to be a glowing body, we conclude that he is of the same nature, and that the missing light indicated by the dark lines arises from those particular kinds of light having been culled out by the gases through which the light has passed. This culling out of light of particular degrees of refrangibility by a medium is called selective absorption. Now it is found by experiment that each gas, such as hydrogen or nitrogen, exerts this act of selective absorption on light of particular degrees of refrangibility in a peculiar manner. Different gases select light of different degrees of refrangibility, and therefore show lines in different parts of the spectrum. When light passes through the vapor of iron we see a great number of dark lines, but every one in a definite position. Learning what sorts of light any gas thus calls out or selects, we can always recognize light which has passed through this gas by seeing this sort of light missing—in other words, by seeing dark lines in the corre-

sponding part of the spectrum, as is shown in the accompanying illustration.

The three rules of spectral analysis are these:

1. A glowing solid or liquid body sends out light of all degrees of refrangibility; therefore when we examine its light by the spectroscope, we see a continuous spectrum, without any dark lines. Hence the spectroscope can give us no definite information respecting the constitution of such a body.

2. A glowing gas sends out light of special degrees of refrangibility; therefore when we examine its light by the spectroscope, we see a greater or less number of bright lines separated by dark spaces. Each gas has its own system of lines; therefore by looking at the spectrum of the gases and measuring the lines the spectroscopist can tell at once what gas it is which produces those lines.

3. When light from a glowing solid or liquid body, as in rule 1, passes through a gas, that gas absorbs light of the same degrees of refrangibility with that which it sends out when it is itself glowing; therefore by examining this light with a spectroscope the observer can decide from the dark lines which he sees what gases the light has passed through.

It appears, then, that the information given us by the spectroscope is, after all, practically limited to bodies in a gaseous state. When we find a spectrum without either dark or bright lines, we know that it comes from a solid or liquid glowing body, but we can not tell any thing of the chemical constitution

A SUN SPOT.

of that body. To obtain this information we must have the substance we wish to examine in a state of vapor, and then we detect its composition either by examining this vapor in a state of glowing heat, and noting the position of the bright lines, or by passing ordinary light through it, and noting the position of the dark lines.

The question may arise, How do we know that the same lines which we observe in the spectrum may not be produced by different chemical substances? Is it not quite possible that some other substance than hydrogen should give rise to the same lines

which we see in the spectrum of that gas? It is, of course, impossible to prove that no other substance should give rise to them. The evidence in the case is much of the same nature as that by which we recognize the picture of a friend, and conclude that it is not the picture of any body else. For any thing we can prove to the contrary another person might have the very same features in all respects, and might therefore make the very same picture. But as a matter of fact we know that practically no two men whom we have ever seen do look exactly alike, and it is exceedingly improbable that they should look so. The case is just the same in spectrum analysis. Among all the numerous simple substances which have been examined with the spectroscope no two give the same system of bright lines. It is therefore exceedingly improbable that a given system of bright lines should be produced by more than one substance. From what has been said you will perceive that spectral analysis can tell us only of bodies which exist as vapor in the atmosphere of the sun or planets. A great many known substances are thus recognizable in the sun's atmosphere by the dark lines in the solar spectrum. Iron, for instance, magnesia, and hydrogen are always strongly indicated.

The spectroscope has also, within the past six years, shown that the sun is at all times shooting up immense volumes of fiery vapor.

THE ECLIPSED SUN, AUGUST, 1869.

The corona and prominences are shown at *a, b, c, d, e, f, g*, as observed at Des Moines.

These masses of vapor have for several centuries been seen during total eclipses of the sun, but their nature remained entirely unknown until the spectroscope was applied to them. This instrument shows that they consist chiefly of hydrogen gas. With a powerful spectroscope, aided by a small telescope, they can be observed at all times when the air is quite clear. A number of eminent spectroscopists are constantly engaged in these observations, and we may hope to learn from them something more than we yet know of the nature and destiny of the globe from which we derive our light and heat.

The spectroscope can be applied to the stars with as much success as to the sun. It is thus found that the physical constitution of the stars is, for the most part, of the same general nature with that of the sun; in fact, that the stars are themselves suns. They consist of immense masses of solid or liquid matter in a state of glowing heat, surrounded by vapors which exercise a selective absorption upon the light of the star as it passes through them.

IX.—COMETS AND METEORS.

The celestial movements, as I have already described them, take place with a majestic regularity which has in all ages impressed the minds of men with a sense of the unchangeableness of the heavens. But this

regularity is from time to time broken by the apparition of bodies of an extraordinary aspect, which hover in the heavens for a few days or weeks, and then disappear, to be never again heard from. Comets have appeared, at intervals of a few years, from the period of the earliest historical records, the last one having been seen by nearly every body in the northwestern horizon only a few months ago. In days when men thought that the heavens were only a little larger than the earth, that the celestial movements were under the control of beings like the kings and warriors of the world, and that the latter was the only world in space, these bodies were looked upon as portending great calamities here below—war, pestilence, the death of kings, and the fall of empires. Indeed, as late as the fifteenth century we are informed that Pope Calixtus ordered prayers to be offered up for protection against the Turks and the comet—a circumstance which has given rise to the popular myth of the pope's bull against the comet. Accordingly, in a great many cases, we find the account of a comet connected with the death of some emperor, or the occurrence of some great event. Perhaps in the simple fact that we of the present day look on these bodies without terror or foreboding, we have a fair compensation for all the labor the world has spent in acquiring a knowledge of the heavens.

As to the frequency of comets, we may say that from fifteen to thirty, plainly visible to the naked eye, generally appear in the course of a century; so that if any person grows to mature age without seeing one, it is because he does not make proper use of his eyes. The appearance of a bright comet is so peculiar that it is impossible to mistake it. It consists of three portions, known as the nucleus, the coma, and the tail. The first is a bright central point, looking exactly like a star, from which it would be impossible to tell it but for the foggy appearance of its light. This arises from the "coma," which is an envelope of white nebulous light surrounding the nucleus, and gradually shading off in every direction. Lastly, we have the tail, a long stream of milky light, growing wider and fainter as it recedes from the comet, until the eye can no longer trace it. A curious feature, noticed from the earliest time, is that the tail is always turned from the sun. The length of the tail is very various. Sometimes it can scarcely be seen, while that of the great comet of 1861 extended more than half-way across the heavens. The absolute length nearly always amounts to many millions of miles.

When it was found by Kepler and Newton that all the planets revolved about the sun in conic sections in exact obedience to the law of gravitation, the question naturally

arose whether comets did not move in the same way, and subject to the same law. It was found by Newton that the great comet of 1680 did move in an orbit so near a parabola having the sun in its focus that the deviation from that curve could not be detected by observation, and that it was therefore subject to the gravitation of the sun just as the planets were. But in the case of a body moving in a parabola, the velocity is so great that after making part of a turn around the sun, it will go back nearly in the direction from which it came, never to return. The actual portion of the orbit in which the comet could be observed was so small that it was impossible to distinguish between a parabola and a very long ellipse; and if the latter were the orbit, the comet would ultimately return, though it might be only after the lapse of hundreds or even thousands of years. As a matter of fact, this comet has not returned yet, and, for aught we know, may be flying away from the sun to this day; if so, it is now far outside the orbit of the most distant planet.

It was Halley, the friend and co-worker of Newton, to whom was reserved the honor of first showing that at least one comet revolved around the sun in a regular period. A great comet appeared in 1682, and in calculating the position of its orbit Halley found that it coincided almost exactly with that of a comet which had been observed by Kepler in 1607. If I were to draw the two orbits on this page the lines would be so close together they would almost run into one throughout their entire length. It was almost certain that the two comets were really the same body, which had returned to its perihelion after the lapse of seventy-five years. If this were so, it ought to have returned every seventy-five years during past centuries. So, searching the records of observations, Halley found that a comet had been observed in 1531 moving in almost exactly the same orbit. There could no longer be any doubt that this was really a comet moving around the sun in a very

ORBIT OF HALLEY'S COMET, SHOWING ITS PLACE IN 1874.

elongated orbit, for although the length of the intervals between its several apparitions was not always the same, the difference was no greater than would result from the effect of the attraction of the planets. Halley therefore ventured to predict that the comet would appear again about the end of 1758 or the beginning of 1759. Meanwhile mathematicians found out how to calculate the effects of planetary attraction, and making the necessary allowances, Clairaut of France computed that the comet would return in the middle of April, 1759, but announced also that the imperfections of his calculations might lead to an error of thirty days. Actually the comet returned to its perihelion on the 12th of March of that year.

The next return was in 1835. Mathematical science had made such great advances that the time was predicted within three days. The next return of this most interesting of all comets will take place about the year 1910; I can hardly tell you the exact year now, but no doubt before it appears astronomers will be able to announce the very day when it will pass perihelion.

When the heavens came to be swept with telescopes, it was found that comets so small as to be invisible to the naked eye appeared with great frequency. The more careful the search, the more frequently they were found; and now hardly a year passes without one or two new ones, and sometimes five or six. A large majority of these seem to move in parabolic orbits, and if they ever return at all, it will be only after the lapse of centuries. But a couple of dozen or so have been found to be periodic, returning at intervals varying from four or five years all the way up to seventy or eighty. For any thing we know, all the comets may be destined to return some time. There is little doubt that the great comet of 1858, the most brilliant that has appeared this century, returns in about 1900 years, but there is none of more than eighty years which has certainly been seen at more than one return to the sun.

To the question, What is a comet? science is still unable to return a defi-

nite answer. When examined with the spectroscope, the most of the light of all comets seems to be separated into three bright bands. By the rules of spectrum analysis already given, this would indicate that the comet is a gaseous body shining by its own light. The position of these bands also seems to indicate that the gas is some combination of carbon. But this opens two very difficult questions—first, why does not this gas at once expand in space, as we know every gas does when relieved from pressure? and secondly, how can it remain hot enough to shine by its own light? It seems pretty certain that the brighter comets can not be wholly gaseous. The first such comet which has appeared since the introduction of the spectroscope is that of last summer, and the nucleus of this one gave a continuous spectrum, but the coma showed bright lines, as other comets had done.

To the telescope the nucleus of a comet looks quite solid, and it is probably either a large solid or liquid body, or an immense cloud of such bodies of small size individually, but so great in number that we can not see through them. The most plausible theory that can be formed respecting the coma and tail is that the nucleus is composed of some substance which is evaporated by the heat of the solar rays, and thus forms a cloud of vapor round it. This cloud of vapor is the coma. Now comes the most mysterious operation of all. The material composing the coma, or at least some portion of it, is repelled by the sun, and driven off into space

DONATI'S COMET OF 1858, AS SEEN IN SEPTEMBER FROM THE EAST BANK OF THE HUDSON.

in a continuous stream, just as smoke rises from a chimney. It is this stream of vapor which constitutes the tail. The great problem of comets is, Why does the sun repel the vapor which rises from the comet instead of attracting it, as he does every other known form of matter? The only theory of this action which has any thing worthy of consideration is that of Zöllner, a young German physicist of much eminence, now a professor in the University of Leipsic. He assumes that the sun is an electrified body, and that the vapor which rises from the comet becomes electrified in the same way with the sun, and is thus repelled. He also maintains that the light of telescopic comets is mostly produced by discharges of electricity through the vapors which compose it, which accounts for the spectrum consisting of bright bands. The principal drawback to this theory is that we have no independent evidence that either the sun or the comet is electrified. Could this be proved, no serious doubt of the correctness of the theory would remain, and we might consider the problem of the constitution of comets as satisfactorily solved.

Within the past few years a relation of a remarkable character has been found between comets and shooting-stars. The nature of the latter is perfectly understood. The earth, in its passage around the sun, is continually encountering vast numbers of minute bodies, each revolving in its own orbit around the sun. These bodies probably weigh only a few grains each. Striking the atmosphere with the enormous velocity of the heavenly bodies produces a degree of heat which instantly burns them up, with the production of a most brilliant light. This light it is which produces the appearance of the shooting-star. These bodies have never been seen except by the light of their own destruction; it is therefore impossible to determine the orbit in which any isolated one revolves. But when there is a meteoric shower this orbit may be determined with considerable accuracy by a comparison of all the meteor paths, and it was thus found that the meteors which produced the great showers of 1866 and 1867 traveled in the identical orbit with a comet seen in the former year. We can not avoid the con-

COGGIA'S COMET, EARLY IN JULY, 1874.

viction that these bodies are simply fragments of the comet which it has gradually been throwing off and leaving behind in its journey. Since that time other meteoric showers have been found associated with comets in the same way. Very curious in this connection is the association of the shower of meteors on the evening of October 27, 1872, with the lost comet of Biela, of which you have probably heard. This comet was formerly bright enough to be seen by the naked eye, but grew fainter at every return, and at last disappeared from view in even the most powerful telescopes. On October 27 of every year the earth passes very near the orbit of this comet, and in 1872, although the comet itself could not be seen, some of its fragments showed themselves in the air as a meteoric shower.

X.—THE STELLAR UNIVERSE.

We have in these talks passed in review a number of the more prominent and interesting features of the heavens. We have been mainly concerning ourselves with the solar system, comprising those bodies which

are, astronomically speaking, right around us. But what are these thousands of stars we can see with the naked eye, and those millions we see with the telescope? What is this "universal frame" in which our earth and all its kingdoms and peoples, our sun and our planets, with all their attendants, are but an insignificant speck of star dust? This is one of the sublimest questions we can ask of astronomy, but it is one to which she is not yet able to give a definite answer. What we wish to know is, first, how the individual stars are constituted—what a star is, in fact. Then we should know their distances, their motions, their distribution through space, and the magnitude of the space which they fill. Finally, we should know the bond of connection among them, and in what respect they constitute a whole. I shall briefly indicate what is known or supposed of these various questions.

Of what a star is the telescope can hardly tell us more than the naked eye. To the latter the star is nothing more than a lucid point, and in the most powerful telescope it is only a brighter point. Until starlight was analyzed with the spectroscope we could only judge from analogy that the stars, being suns, were probably constituted like our sun. But this instrument shows that this conjecture is well founded, though we do not yet know enough of what our sun itself is to tell from this alone what a star is.

Until the present century was well on its way we were as much in the dark respecting the distances of the stars as we were with respect to their nature. The only way of measuring these distances is by the method of parallaxes, already explained. The earth in its annual course around the sun sweeps around a circle of 185,000,000 of miles in diameter, so that we have a base-line of this enormous length with which to triangulate out to the stars. Determine the exact direction of a star properly situated now, and again after the lapse of six months, and the change of direction not otherwise accounted for may be attributed to parallax, and will afford an index to the star's distance. For the three centuries which have elapsed since Copernicus promulgated the theory of the earth's motion, astronomers have sought to detect and measure this change. Before the invention of the telescope Tycho Brahe made the most careful observations of the altitudes of stars without being able to find any change whatever. When the telescope was applied to astronomical measurements a vast step forward in accuracy was made, and in the seventeenth century we find Picard, the Cassinis, Flamsteed, Roemer, and a number of others working at the same problem, in every way their ingenuity could suggest, without success. In the early part of the eighteenth century the problem was taken up by Bradley, with an

instrument much more delicate than any before applied, and it was in the course of his researches that he discovered the phenomenon of "aberration," already described. But this apparent change of direction of the stars could not be attributed to parallax, because the direction was the same at the two ends of the base-line, and it was in the middle of it that the greatest deviation took place. The efforts were continued by a great number of astronomers in the early part of the present century without any better result. Apparent changes like those which would result from parallax were sometimes found, but critical examination showed that they were really due to changes in the instruments produced by temperature and other causes.

It was now seen pretty certainly that the parallax of even the brighter stars must be less than a second, and that to determine it some instrument must be found which could be at all times relied on to give results correct to a small fraction of a second. Such was the state of things when the question was taken up by one who, though little known to the general public, may fairly rank as the greatest practical astronomer of the century. Bessel had at Königsberg only what would now be considered a very small and insufficiently equipped observatory, but he inaugurated a system of carefully investigating the errors to which all his instruments were subject, as well as every other cause which could influence the results of observations, which has almost revolutionized instrumental astronomy, and has enabled the astronomers of the present time to attain a degree of accuracy in their results which would have been thought impossible a century ago. The instrument with which he succeeded in determining the parallax of a star was the heliometer. This instrument is essentially a telescope, of which the object-glass is sawed in two across the centre. If the two pieces are put together as they were in the first place, an image of a star will be formed in the focus just as if the glass were in one piece. But if the two pieces are slid along past each other, each half having its own focus, there will be two images of a star, one formed by each piece, the distance apart of which will be equal to the distance the pieces have slid. If there are two stars near each other, and the glasses be slid till the easternmost image of one star comes exactly over the westernmost image of the other, the distance of the images of the two stars, as it would be were there but one glass, is proportional to the distance the two glass halves have been slid. The latter distance can be regulated and measured with great exactness by having the motion made by a fine screw, and thus the angular distance of the two stars can be determined when the focal length of the telescope is known.

The method employed by Bessel and most of his successors in determining the parallax of a fixed star is this: Some star is selected which either from its brilliancy or its proper motion is supposed to be comparatively near our system. One or two very small stars are then sought for as nearly as possible in the same direction with the bright one. The former, from their smallness, are supposed to be immensely more distant than the latter, though, as seen in the telescope, they may seem right alongside of it. The annual motion of the earth must then produce a change in the relative positions of the stars as seen in the telescope on the same principle as the lights already illustrated. It was this change in the case of the star 61 Cygni that Bessel sought to determine by his measures with the heliometer. Continuing his observations for some years, he found that as the earth swung from one side of its orbit to the other the star seemed to swing one-third of a second on each side of its position. The great problem was solved. Bessel's determination was followed by a number of others, as I have already said, and there are perhaps a dozen stars within a million times the distance of the earth from the sun. Immense as are the distances of the few stars which we have described, nearly all the others, even those visible to the naked eye, are situated at distances immensely greater. We have every reason to believe that these fainter stars are really as bright, on the average, as larger ones, and that their faintness arises entirely from the immense distance at which we see them. But the stars visible to the naked eye form only a very small fraction of those which are seen with great telescopes. I believe that the great Washington telescope already mentioned will show from thirty to fifty millions of stars. The smallest stars we can see through it are probably more than a thousand times as far as the brightest that we see in the heavens, such as Sirius and α Lyrae. You see that our sun with his whole retinue of planets is hardly more than a point in the stellar universe. Taking the distances which I have already given, you perceive that the nearest star is more than six thousand times as far as the farthest planet. The distance of the farthest the telescope will show can not be accurately estimated, but it is probably so great that light would take ten thousand years to pass over it. Even then we have no certainty that this is the utmost extent of the universe. But the stars beyond this are probably more thinly scattered than they are inside this limit; in other words, if we do not see the limit of the universe itself, we probably see the limit of its densest portion. It is of course beyond human power to say how far the stars may be scattered through those portions of space which our telescopes can not reach.

Our next question is, according to what law,

if any, are the stars distributed throughout space? It needs only a glance at the heavens with the naked eye to show that this distribution is by no means uniform, but that in certain regions many of the stars are aggregated in clusters, while in other regions there are very few to be seen. But the most remarkable feature of the distribution is brought out with the telescope. Pointing this instrument on any part of the Milky Way, we find it to be formed by the scattered light of uncounted millions of stars too faint to be individually seen with the unaided vision. If we could see the whole Milky Way at once, we should find it to extend like a girdle round the whole heavens. With the most powerful telescopes the number of small stars visible in this girdle is greater than in all the rest of the heavens. We thus have the singular fact that a large portion of the suns which make up the invisible universe are condensed into a vast girdle or irregular and broken ring, and that our sun is situated somewhere in the plane of this ring, and not far from its centre. We can hardly even guess at the dimensions of this ring, but light itself would probably require hundreds or even thousands of years to fly across it.

Our last and greatest question is, whether these stars are entirely separate and independent of each other, each one moving on in its own infinite orbit, or whether they form a system, every member of which revolves around the same centre, like our sun and planets do. The latter has been a favorite idea. You are all familiar with the celebrated theory of Mädler, that Alcyone is the central sun of our universe. But truth compels me to say that this theory, sublime though it is, has not the slightest evidence to sustain it. It is true, as I remarked in our first conversation, that very slow motions among the stars are known to exist; but they do not follow any regular law, as they would if they all took place around some centre. So far as yet observed each star moves forward in its own straight line, and these lines cross each other in all sorts of ways.

The most singular fact connected with the proper motions of the stars is that one or two stars are flying through space with such enormous rapidity that the combined attraction of all the stars visible with the telescope could never stop them. This seems to be especially the case with a small star, invisible to the naked eye, designated in astronomical literature as "Groombridge, 1830," from the name of the astronomer who first recorded its position. The rate of motion of this star is about seven seconds per year—the greatest known. It was hence concluded that it must be very near us, and a number of astronomers have sought to determine its parallax, but have found it to be only about

GREAT NEBULAR GROUPS.

a tenth of a second. Its apparent motion in a year being seventy times its parallax, it moves at least seventy times the distance from the earth to the sun in a year, or eighteen millions of miles every day, and more than 200 miles every second. From what we know of the distribution, masses, and num-

ber of the stars, it seems probable that the attraction of all the bodies in the universe can never stop this headlong speed, nor bring this star into any orbit, and that consequently it will pass through our universe, and leave it entirely in its passage through infinite space. If we had accurate observa-

tions of the star's position three or four thousand years ago, we could speak with more certainty of its destiny. We may expect that our posterity of a few thousand years hence will, by the aid of the observations and tables we shall transmit to them, be able to come to a definite conclusion respecting the age and the structure of the universe. But at present we have no conclusive evidence of any connection at all between the several stars, such as exists among the planets and satellites of our system, excepting in the case of double stars. In the first place, there is no direct evidence that gravitation itself extends to distances so enormous as those which separate the stars from each other. It is true that few, if any, astronomers would doubt that it does so extend; but it is equally true that its action must then be exceedingly small. In the next place, if we grant this, there is no proof that the mutual gravitation of the stars is sufficient to prevent them from all flying away from each other in virtue of the proper motions which they are seen to possess. It would, however, take millions of years for this to occur; so that the universe, as we see it, is fitted to endure unchanged through periods of time far beyond those of which man can form any conception.

XI.—THE PRESENT WORK OF ASTRONOMERS.

No doubt you think the business of an astronomer is to gaze through his telescope at the stars. As there are several hundred people in the world who are now employed as astronomers, being either students of the science or astronomers by profession, you wonder what they can all find to look at that has not been fully observed since the time of Herschel, and why they do not get tired of looking. But you are mistaken in supposing that simple star-gazing forms any important part of the work of an astronomer. The principal problem of the astronomy of the present day is the determination of the motions of all the heavenly bodies. To find how such a body is moving we must know its position in the heavens at two or more times—the more the better. I have before tried to give you an idea how positions in the heavens are determined. Any one observation of position is liable to many errors, small and great, arising from the imperfections of the instrument, and accidental mistakes in pointing the instrument or recording the numerous numbers on which a position depends. Hence two or three observations must be made and calculated before we can be sure of the exact position of the star. And an hour's calculation may be required to reduce one observation. Then, as the position must be determined a number of times in the course of years before the motion of a star can be decided on, you see how much time and labor are required to de-

termine the motion of a single star. Consider that a million or two of stars are visible with an ordinary telescope, and you will see that the work of determining the positions of them all would occupy all the astronomers of the world for generations. As I have already indicated, owing to the immense distances of the stars, their apparent motions are so slow that it will require centuries of observation to determine them with accuracy. Among the millions of visible stars there are not a hundred thousand the positions of which have yet been exactly determined.

Now look at the solar system. We have, besides the sun, eight large planets, nearly a hundred and forty small ones between the orbits of Mars and Jupiter, and eighteen moons. Tables of the movements of the earth and the brighter planets must be kept up with such precision and certainty that the captain of a ship years hence shall be able to learn from his nautical almanac the exact altitude of sun or planet at any required day, hour, and minute. On the accuracy of this information he must often risk his ship and all on board. To determine the motions of a single planet or satellite under the influence of the attraction of all the other bodies which affect it involves an amount of labor of which no one not acquainted with the subject can form any conception. Several mathematicians have spent ten years or more of unremitting labor in working out the algebraic formulæ which express the motions of the moon, and enable them to be calculated. As time advances, the number of observations increases, and greater accuracy of results is required. The labor increases enormously, so that future corrections to the tables must be the combined work of several. The French Academy of Sciences has for eight years past been offering a prize for new tables of the satellites of Jupiter without securing a single competitor. You will not now be surprised to learn that in investigating the laws of the celestial motions there would be work to keep all the observatories of the world actively employed for many years to come.

There are a great many other subjects to be investigated besides the motions of the heavenly bodies, and nearly all such investigations require the co-operation of many observers. Take, for instance, the physical constitution of the sun. Observations of the solar spots seem to show that they run in a period of between ten and twelve years. The source of this period is still an entire mystery. In fact, there are more mysteries in the constitution of the sun now than there were before the spectroscope was known, and before we can hope to penetrate them we must have a long series of observations of solar phenomena both with the telescope and the spectroscope.

Another class of interesting objects which occupy the attention of many astronomers are the variable stars. There are perhaps a hundred stars the light of which is known to vary in intensity. One conclusion which the observations of these changes has led to is that the so-called "new stars" which on several occasions have suddenly blazed out in the heavens are really only variable stars, and were in the same place before, only too faint to be noticed by the eye. We should like to know what sometimes causes a star thus to blaze out and increase its light and heat a hundred or a thousand times. Because if such a thing should happen to our sun, every living thing on the surface of the earth would be destroyed, and the elements would literally melt with fervent heat. But he has shone so long without any change in his light and heat that we need not feel in any danger of such a catastrophe.

The physical constitution of the planets is another subject of astronomical investiga-

tion. Jupiter is an object of especial interest to the astronomers engaged in these researches. It now seems probable that most of the planets are covered with layers of clouds and vapor so thick that the rays of the sun can not penetrate to their surfaces. In the case of Jupiter these layers of vapor assume various colors, the cause of which has not yet been made out.

You now see that if we know a great deal about the heavens compared with what was known in past ages, we know very little compared with what there is to learn, and that there is no lack of work for all the astronomical investigators in the world.

I have been able to give you only a very short and summary survey of the work of astronomers in exploring the heavens. The subject is altogether too vast to be disposed of in so simple a way. I shall be satisfied if I have given you some general idea of the manner in which the great discoveries of astronomy have been made.

THE TRAGIC STORY OF EMILIA DARÀNO.

TRANSLATED BY AN EXILE.

[The letters and papers of the following narrative were accidentally found in a rusty metal casket among a heap of ruins and ashes beneath the ground-floor of one of the houses on the outskirts of Naples destroyed by the recent eruption of Vesuvius. The house had been too humble even to have been the residence of any of the Neapolitan nobles, though it may have belonged to one of their retainers; but how this small metal box with the faded manuscript came there, where it seems to have been secreted in the walls of a vault or cellar, probably during the last hundred and twenty years, those who have transmitted the papers have no means of ascertaining. At any rate, this is all the account they think it prudent to give, being apparently in fear (and they more than hint this) of causing offense to some of the descendants of a once powerful noble.]

The extraordinary and, it is to be feared, too truthful recital of some of the deeds that were enacted under a despotic rule (when private atrocities could even surpass such public vengeance as were remorselessly practiced down to the days of Pellico and Baron Puerio) has obviously been written first in English, for greater safety, and then translated by the lady herself into Italian. No complete copy of either is said to exist, and the present narrative is made up from fragments of the two copies. The Italian portions carry with them their own evidence of having been written by one who *thought* in English, as they continually seek to render the English idiom and phraseology.

The asterisks and other signs of omitted passages do not always denote the suppression of portions, which (as in the case of the documents relating to the tragedy in the Cenci family) were too shocking realities to be recorded, but also actual gaps caused by the writing having become quite illegible from mildew and rust, while here and there portions have been lost, or purposely torn off and destroyed.

These letters and papers were evidently addressed to some dear female friend of early years, though not a relative; but they could never have been received, and were no doubt seized upon and secreted for some sinister purpose on the death of the ill-starred lady.

It scarcely becomes the humble position of an editor and translator under the present circumstances to offer any critical or other remarks. All that he will venture will be in half a dozen words. Certain cruel atrocities, both in public and in private, well known

to have been practiced in various parts of Italy—and nowhere worse than in Naples—are never likely to be repeated, thanks to such patriots as Mazzini and Garibaldi. With regard to the character of the unfortunate Lady Emilia Daràno, it is a curious problem, presenting, as it does, something extraordinary in the alternations of miserable weakness with an unconquerable fortitude—the apparent lack of volition with a determined and unshaken continuity of affection for her lover, even while death is constantly imminent—an alternate prostration by suffering from fiend-like provocations with reactions of heroic energy. Her closing scene is profoundly pathetic. She says of herself that she has no faculty for describing things, but she certainly tells her dreadful story with remarkable clearness. The only exceptions are when she is in a state bordering on delirium from the intensity with which her memory revivifies the events of her unparalleled trials.

AN EXILE.]

THE LETTERS AND FRAGMENTS.

FORGIVE me, dear, dear Otty, the length of time that is sure to elapse before I am able to keep the promise made to you before I was taken away from home as the wife of the Marchese di Albarozzi. You said you were sure I should have a thousand strange things to tell you, dear; but, alas! you could little imagine the scenes would be painted in distemper and encaustic. You will wonder how such technical words come into my head, dear Otty, but you will understand all about that very soon. Soon, do I say?—well, soon or late, but most probably much later than I wish, because neither my head nor my hand is very often in the best condition for writing; and when it is done, or a certain portion is done, I shall then have to wait till means can be found to transmit it to you. Am I a prisoner, then? Am I watched? Ah! dear, sweet Otty, when we used to play at having a feast, with primroses and poli-

anthuses set out in paper trays and scallop shells in the garden of your uncle's house by the sea, what philosopher, what genius, nay, what angel, could have foreseen the terrible contents of that cloud which in a few years was to burst over the little golden head you remember, now so prematurely gray, and besides so thin, dear, that the lightest breath of wind scatters it all over my eyes!

You, so happily married and encircled, not only with all the luxuries of India, but with tender and loving hearts, will deeply feel my..... In English it will have a better chance of getting safe out of this country; my Italian translation is intended for the nearest relation of my dear one, in case we should both be suddenly cut off. What I have to tell you has all transpired within a very brief space—in fact, since I was carried away the victim of family misfortunes, pride, and blindness. Often I have taken up a pen when thinking of you, Otty, intending to lay bare the secret of my secluded, my worse than withered life; but the pain and the loathing disgust at some things, far more than a sense of shame or remorse concerning acts entirely induced as well as done by others, have continually rendered me unable to write a single word. Still from time to time I shall force myself to do it, especially as there is always great relief in such communications to those we love.

That I am the only daughter of an Irish nobleman, who disappeared abruptly from fashionable circles, is about as much as you know of us, unless your uncle has communicated the rest. And this, I fancy, he would not be likely to do, as he was aware that some of our family history was a tender subject. My mother was the daughter of an Italian lady of rank, the widow of Count C——, whose estates had been confiscated by Austria after he had been shot as a leader in one of the patriotic rebellions. Having nothing to support herself and her daughter, she went on the stage as a cantatrice. She was well received, chiefly on account of her misfortunes, but also because she was regarded as possessed of a peculiar beauty, having brilliant light golden hair, and dark eyebrows, with long black eyelashes. My mother's hair was quite black, you know; and so was that of my father. Curious, wasn't it, that I should so take after *her* mother, and be so unlike my own. But these odd things do happen now and then, I have heard. Well, my father, Lord A——, at that time a dashing young man on a tour through Italy, seeing that golden head one night at the opera, fell in love with it more than with the singing, and obtained an introduction. But directly he set eyes on my mother, then a girl of little more than sixteen, he was struck with the difference between the real beauty of youth, unadorned and not made up (*senza ornamenti e non composto*), and a

pale, care-worn face that needed rouge and stage-lights to give all the beauty that had enchanted him, poor man. So he married my future mother (the phrase, dear, has a smack of my Irish blood, don't you think?), and took her straight to his house in London. In a few weeks more my mother would have been on the Italian stage; but they both agreed to keep all silent on that matter.

Lord and Lady A—— were equally proud of their descent, and were equally without any ideas on economy. Whenever they saw any thing or heard of any thing they fancied, it was at once ordered without the slightest thought of what it might cost. They were comparatively poor, this youthful couple, yet they lived quite up to their position in society, and therefore greatly beyond their real means, so that by the time my education, such as it was, was completed, and I should have been introduced into society, my father found himself quite ruined. They both seemed as much astonished at this as if it had happened to somebody else. The wrecks of his property being gathered up, Lord A—— saw that there was barely sufficient for a respectable existence. We therefore were obliged to quit London, and giving up all society, we retired to an old dilapidated castle on the coast of Clare, there to live as best we might, and at any rate avoid the endless humiliations that attend the poverty of a family of rank in England.

I had just attained my nineteenth year, when a rich Italian nobleman, bearing the title of the Marchese di Albarozzi, arrived one morning at the castle with letters of introduction from a Neapolitan nobleman who was not aware of our present condition. He had been very intimate with my father, Lord A——, during the short-lived period of his imprudent splendor. But now concealment was impossible. The fallen turret, the cracked walls, the weed-grown wilderness, once a fine garden, our broken and faded furniture, not to speak of our defaced china-ware (*porcellana scagliosa*), as well as our habiliments, all displayed our ruin at a glance. My mother was still more shocked at the state of the bedding in the only spare room that was habitable. One of the windows also was half boarded up, and the others had several cracked panes pasted over with paper. The pride of an Irish nobleman, who had been accustomed to all the attentions and homage which they so commonly receive on the Continent, writhed under this; but Lord A—— had no alternative, and was compelled at once to state frankly his altered circumstances, and the impossibility of his receiving the marchese with that hospitality which his letters of introduction would otherwise have insured. In fine, he could only accommodate the marchese for the night; and Lady A—— would

never have consented even to that had there been any hotel within reasonable distance. As for me, I was very glad he was not to remain, as I had conceived the utmost antipathy to our distinguished visitor at first sight, and this was greatly enhanced by his first look at me.

But, to the utter discomfiture and vexation of us all, the marchese made very light of our difficulties and scruples, assured Lord and Lady A—— that he had been a great traveler, and was a man of the world. He then flattered and softened them by great respect and courtly compliments, reminding them of their fine equipage and position among his friends in Naples; gracefully lauded my beauty (my grandmother's, you know, dear), and finally, in a not very round-about way, actually threw out hints of his wish to ally himself some day to a family of rank in Great Britain or Ireland. As for fortune, he had enough and to spare; and with a few more such remarks, he proposed to send away his servants, and remain a day or so at our dilapidated abode. Lord and Lady A—— seemed to carefully avoid exchanging looks, and with faint apologies, but evidently changed minds, they consented.

The horses, carriage, and servants of the marchese were all sent away to the nearest town, except his valet, a very old man, named Andrego. This valet was decrepit, or else deformed—I never knew which—and with a complexion so freckled and dark that at first I took him for a Malay or Eastern slave of some kind. His crouching, abject demeanor aided this impression. He was very like a toad. As there was no room to be had with us, a bed was found for him at the cottage of a road-side blacksmith not far distant.

Day after day passed, and the marchese did not depart, nor even allude to leaving us, but constantly paid me the most marked, and all the more odious, attentions. My distress at this was much increased on perceiving that Lord and Lady A—— evidently favored his suit. It is not in my power as to internal character, but easy enough as to all externals, to give my impressions of the Marchese di Albarozzi. He was very tall, and of most elegant carriage and courtly manners. He had a fine symmetrical figure and limbs, except that his arms were too long, and his hands and feet very bony and large. His face would have been considered by every body as handsome but for the mouth, which was coarse and gross. He had a small retreating chin, a large heavy throat, and ears that stood erect, with a fringe of hair at the edges almost as black as his eyebrows. His voice, like his manners, was very subdued and deferential, and gave the effect of one accustomed to the highest court circles. He seldom looked at me in a direct way, though very often by indirect means,

such as a mirror or side window; but when he did look pointedly at me the eyes almost paralyzed me with their cold glitter, notwithstanding the smile on the rest of the features. His movements were singularly easy and graceful, and he bowed and swerved as he walked with a noiseless elasticity quite remarkable. When he offered me his hand to lead me here or there, any one might have supposed that I was a princess. He wore very choice and costly jewels, and had various accomplishments. Nevertheless, I had made up my mind not to accept his proposals.

As to accomplishments, he spoke several languages with fluency, was a fine musician, and intimated that he was a proficient on the viola and the bass-viol (*viola di gamba*); and he was not only a connoisseur of painting, but had himself studied the art in Florence. Twice he induced me, or, rather, it was by the express wish of my father, to accompany him on a little sketching excursion. He certainly had much skill and taste. But on the second occasion he suddenly lost all his habitual courtliness, and made advances to me, both by words and actions, that caused, on my part, a precipitate retreat, not, however, without my observing an expression upon his countenance as though he could have struck me dead at his feet, or worse. The marchese returned not long after, and he met me in the evening with more than his usual respect, as in humble apology for his recent conduct, and my mother, to whom I had indignantly complained, desired me to think no more about it, as the intentions of the marchese were perfectly honorable. His proposals had, in fact, been accepted by Lord A——.

When I heard this my heart seemed to die within me. I hastened to my own room, and wrote a few lines to my father, declaring that I could never become the wife of the marchese, and, moreover, that I entertained an unconquerable antipathy with respect to him. Not content with this, in an evil moment, and with rude indiscretion, I made a copy of this note, and had it handed to the marchese the same night, declining to leave my room the whole evening.

Next morning the marchese saluted me as usual, and without the slightest appearance of constraint, so that I thought the servant had never delivered my note. But on inquiry I found that it had been duly received. To my surprise, not the least notice was taken of it either by him or by Lord and Lady A——. Meantime the marchese manifested no signs of taking his departure, but often strolled out for long walks in the neighborhood with my father, and it appeared that they often sat up late at night together. Our table also was far better served than we had known since our arrival in this seclusion, and hampers often came containing

game, wine, and *drogheria* (drugs or groceries, probably the latter). How did this happen?

One morning early, after a sleepless night, I dressed anyhow, not feeling to care for myself, and went down before any of the rooms had been put in order. Walking from room to room, without any object, I chanced to go into my father's library, so called, and found the furniture as if it had been pushed about, half-filled wine-glasses on a side-table, and a dice-box and loose cards flung under the fire-place. What could all this mean? I wandered round the garden and shrubberies in a maze of perplexed thoughts. At breakfast the marchese was grave and thoughtful, while Lord A—— was far more cheerful than he had been for a long time, more attentive to the marchese—indeed, more attentive to all of us—than usual. Did this bode any good to me? I scarcely thought so.

The very next day there was a bustle in the castle, old Andrengo being very busy in packing up all that remained of my father's library, which the marchese had purchased, and also in packing up for his master's departure. But before I had time to realize and enjoy the thought of this, I was startled at finding Lord and Lady A—— equally busy in packing things as for a long journey, and giving directions about shutting up the castle during a period, they said, of perhaps several years. My mother now took me aside, and informed me that through some secret political influence the marchese had in London my father had obtained the governorship of a distant settlement, and that his kindness and generosity had in various ways helped them out of their ruined position. She was sure I could not, after this explanation, do otherwise than accept the honor of the marchese's hand, who professed himself quite ready to forgive the insult of my previous behavior. Lord A——, she said, commanded my obedience as the highest duty of a daughter, and at the same time, as my father, he most earnestly entreated it. Otherwise—and here my mother's firmness was evidently failing, but she took her breath, and went through with it—otherwise there was nothing before me but some low marriage, or to become a pensioner in a poor-establishment, unless, indeed, I preferred a convent. What else was there? They could not take me with them, my mother was sorry to say, and I could not live alone in the castle.

I was dismayed and overcome by all this, and yet more confused in my thoughts when Lady A—— hinted vaguely, but not without emphasis, at certain gambling transactions rendering our position with the marchese one of most peculiar delicacy and sense of honor. Our position!—delicacy—honor—what had occurred? It seemed as if I had scarcely understood half that my mother had been saying. What was it that

I was called upon to pay for, with my revolting mind thrown into the bargain? Lord A——, then, had lost heavily to the marchese in a gambling transaction. Were the dice loaded—or was the wine drugged? But had the marchese really won? If not, what was the meaning of such expressions as his "kindness," his "generosity," our position of "delicacy" and "honor?" To my thinking there had been foul play of one kind or another; but on whose side was the advantage? Some things in life are never cleared up, and very often they are not worth the trouble of clearing. In any case I was to be the victim. These conflicting thoughts rushed through my brain while my mother stood silently bending over me. I was sinking backward, and had covered my face with both hands; indeed, I believe I did sink down upon..... [The MS. is here illegible, and a leaf or two are missing.]

"Yes," said I to my mother next day, "and I can give a reason for it. Mere prejudice, girlish innocence, morbid fancies! Something more than these causes my refusal. All his professions of love for me I disregard; they are without one spark of pure affection. Strong passion? Yes, indeed; but of what kind? A wolf and a tiger, however quietly they may lurk restrained in ambush, have strong passions, none the less for their savage patience; and so has the serpent that crushes you slowly before he devours. What has been the secret life of the marchese? None of us know. I can not even imagine it, but I feel as if it had been far worse than I am able to imagine. If, as you say, the reading of some horrid characters in romances must have put such things into my head, then what but some knowledge could have put such things into the heads of those who wrote the romances? I hate his demonstrations of passion, and I hate still more his savage patience. And all the while so courtly and graceful!" My mother left me with anger.

That night was very stormy; and as we were near the sea-coast, the weather always told heavily upon our old walls. The marchese slept in a chamber of the north wing of the castle, beneath a tower so ruinous as to have become little more than a shell; and every time I heard the wind come rushing from the sea, I devoutly wished that it would strike that tower with all its force. This may appear very wicked in me; for what harm had the marchese ever done me? you will say. Still, I felt this wish. It was from my foreboding heart—a true instinct of nature with some people, I do believe.

In a day or two more every thing was to be settled, and the castle was to be vacated and locked up. Andrengo had completed his packing, and was sitting crouched down with his back against a wall. He looked

more like a reptile than ever, it seemed to me. No doubt he resented my refusal of his lord's overtures; and as I passed by he gave me a steady, impassive look, and I saw a lambent golden light in his eye, just like what one often sees in the eyes of a toad. Surely no good and amiable man would ever have had a servant of that sort!

....."If I would but give my consent!"

And Lord A—— added, in a tone of paternal solicitude, that "there was always a blessing of some kind in a wealthy marriage." And yet, I argued, there might be curses that overbalanced it. But this he would not listen to, and even hinted that I had had bad thoughts beyond my years. This was unjust; they were not properly thoughts; they were only strong impressions and misgivings....."Would but give my consent!" Consent! I never *did* consent; but at last, in utter exhaustion of energy and prostration of mind, they saw that I would let it happen. What manner of man must he be who would marry a girl under such circumstances? I did not then know. One thing would have saved me—a deep love for another. This I had not, never having really been in society, and having seen no one who inspired such a feeling.

The marriage was to be private, and to be kept secret during a few months, the marchese explaining to Lord and Lady A—— that he had important diplomatic business to settle in London before his departure, and that his reception in fashionable circles would be greatly promoted if he was supposed to be unmarried. However indignant Lord and Lady A—— might have felt at this, it evidently did not prevent their consent.....*My consent!* No, they never obtained that, but I sank, like a drowning wretch, through the various formalities of a marriage. It was strictly private, nobody but Lord and Lady A—— and our old house-keeper being witnesses of the dreadful ceremony.

It was in the morning, and earlier than usual on such occasions. I had been quite unable to take any breakfast beyond half a cup of tea. As we drove off from the poor old castle I looked out of the carriage window, and saw my mother's pale face suffused with tears, as she stood in the entrance porch, trying to wave her handkerchief; and Lord A—— standing in the court-yard without his hat, and the wind blowing his hair about his temples, trying to bid us farewell cheerfully. It was all like some cruel mistake that occurs in a dream, and we feel intensely but do not understand. I turned to the marchese—I know not what prompted me—and observed a sardonic smile on his swarthy features, that lighted up more palpably as our eyes met. I turned my head aside. My heart sickened to death. Not a word was exchanged during the first hour.

The marchese then drew down the dark green silk blinds of the carriage.

I have previously alluded to his savage patience. He now uttered some shocking imprecations in Italian, and suddenly, as if awaking from a trance, threw aside all delicate consideration and restraint, taunted me with the ruin and poverty of my family, reproached me in terms and in a tone of the haughtiest scorn for my persevering refusal of his hand, and told me he would ever resent and revenge the insult. He then seized me in his arms, calling me his slave, and the creature of his purchase! No words can record his deliberate fury and my dismay. I entreated his forbearance in vain, and he instantly stifled my cries with his large bony fingers. I felt suffocated, and fainted. When I recovered my senses, I seemed to myself to present the miserable appearance of some poor bird that had been unable to find shelter from a storm of rain and wind. The marchese was leaning back in the other corner of the carriage, with his arms folded, and as quiet as an image.

We drove straight to London, where an obscure lodging in the suburbs had been taken. I found we were to live here under an assumed name. The servants of the house attended upon us, except that Andrengo waited at dinner, and also cooked the foreign dishes, none of which I ever would touch. As for the marchese, my worst apprehensions were realized. I was united to a man who had gone through the whole round of an utterly licentious and unbridled course, using his wealth as the familiar demon to obtain every difficult or forbidden thing he fancied; and he had chosen me merely as the last novelty that crossed his path of vice, my resistance adding fuel to his abnormal will. As for love, he entertained for me no single feeling that did not make me shudder. I had often heard my father and mother declare that personal beauty and personal attractions of every kind were the greatest blessings with which a girl could be endowed, and that I possessed them in an eminent degree. Alas! if this was so, how certainly had they proved an unutterable curse to me!

I have said that my worst apprehensions were realized, but they were poor representations of the reality. For how could a delicate girl, the only daughter of a noble family, brought up with the most scrupulous exclusion from the sight or the knowledge of the great vices and contaminations of the world—how could such a girl ever imagine a character in which the cruel anomalies recorded, as I have since found, of a Nero or a Caligula, had attained a similar possession of the blood and the volition? I feel convinced that the marchese, if he had been in a similar position, would have rioted in similar abominations. A strange fever was con-

tinually burning in his veins. My torment, my dismay, my loathing, seemed to be his relief and pastime. He once crushed my fingers so tightly in his powerful hand, because I was pushing him from me, that the blood gushed from nearly all my nails. On another similar occasion he held me by both ears till I fainted; and when I had recovered he handed me a tumbler of water with all the grace of a courtier. The water revived me, and I instantly dashed the remainder in his face.

He stood still a minute, carefully drying his face and beard with his handkerchief, and then, when I was expecting some brutal assault, and not knowing what form of violence it would assume, he advanced in his most elegant manner, and softly took my hand. "Madam," said he, in the mildest voice, "would you like to have a divorce?" Before I could reply he continued, in an altered tone, "To return to the sea-coast, and unlock the ruins of your beggarly castle, there to reside alone upon nothing, or perhaps, for a time, upon the meagre charity and laughing contempt of all who heard your very equivocal story?" I was about to exclaim that I would most gladly leave him, come what might, when he interrupted me at the first word, "No, no; a few years will do for that. Remember, you refused me—yes, refused me—always remember it; and you must have time to repent the insult. But see! the evening draws on. Now, madam, to your bed! I am going out to sup with some friends. Perhaps I shall first come up stairs to see how you look, and to pardon you for throwing that water in my face; but I expect a penitent and submissive air. However, I am, as I said, going out afterward to supper, and at some miles distant. I shall return about midnight most probably, or by two or three in the morning, so you need not sit up to watch the stars for me."

.....To escape; but there was never any opportunity. No refuge, no relief, no hope for me. It was but too obvious that the marchese did not regard me as his wife, but only a slave, and one of the most degraded sort. When I once asked him how much longer I was to remain in these obscure, murky-windowed lodgings, and under an assumed name, he told me with a humiliating smile that I ought to be glad to hide myself in darkness, feeling to what condition my beauty and pride had sunk. And he again taunted me with having been sold to him, and made some remarks about gambling transactions between Lord A—— and himself, when they had *both* pretended to be intoxicated. This I did not well understand, but quite sufficiently to make me feel ready to creep into my grave. I often thought of Lord A——'s worldly-wise remark about the "blessings" of a wealthy marriage—in opposition to a daughter's feelings!

I was frequently left alone, yet never safely alone. I was always watched secretly or openly by old Andrengo. My mother must certainly have sent letters to me, but none ever came to my hand. Where to address a letter to my parents I did not know; but having written several at a venture, marked to be forwarded, I am sure they were all intercepted. The landlady of the house always turned a deaf ear whenever I sought to make any appeals to her kindness or womanly feelings. She said she made it a rule never to interfere between husband and wife. It was neither prudent nor proper. No doubt she was very prudent toward her own interests. She had the purchasing of all the provisions, and robbed us to her heart's content. In all money transactions the marchese was profuse and careless. He once asked to look at a bill sent in by the landlady, and remarked, to my no small surprise, that her charge for cauliflowers was ridiculous, but ordered me to discharge the bill without comment. By these means he held her indirectly in his pay. Whenever I went out to take any exercise, Andrengo always followed me, "to prevent my being insulted." Escape! no, there was no chance of such a thing. I began to sink into an abnormal state. The marchese had said that I ought to court obscurity, considering the abject state to which he had reduced me, and that I ought rather to wish to shun the countenances of my fellow-creatures. I was beginning to feel that it was so, and could not look people in the face. The first stages of madness were no doubt.....

He was insatiate in his modes of vengeance for what he called my insult in having refused his hand so long, and with such declarations of aversion. But just as madness really was settling upon my brain, Heaven granted me a change—a respite. The marchese informed me that he was about to return to Naples, and that I should set out before him, under the care of Andrengo. He himself would follow when he had completed certain affairs. The prospect of being carried out of England would have appeared like the last seal to my doom, but the feeling that I should for a time be relieved from the loathed marital bondage, the fiend-like elegance, the cruel courtliness, the abhorred passion and cruelties of the marchese, at once reconciled me to this sudden departure. I accepted such a change with the feelings of one who has been half suffocated by executioners on a bed of torture, when the dungeon grating has been suddenly opened to the fresh air of heaven.

Every thing was arranged, and even my clothing was packed, without consulting me, during the absence of the marchese for a few days. But he sent word that he should come to take leave of me. It was a very short note, in which there was an expression

of sardonic devotion that made me shudder. He arrived late at night. I had been in bed two or three hours, and was fast asleep. A frightful dream was tormenting me, when I was awake by the reality of his fierce carresses, and perceived that he was intoxicated—a very unusual thing with him. He suddenly sprang into the middle of the room, threw off his clothes, and then commenced reciting some verses in Italian from one of the tragedies, the purport of which appeared to bear some reference to a diabolical and unnatural vengeance not unlike that of old Count Cenci, though he mentioned other names. Presently he stopped, drank a glass of water, and then came sidling and bowing toward me in his most elegant and courtly manner. But I had seen this before, and if ever a foul fiend..... No, he was not mad, or only for a time.....

My departure was not long delayed; and though I was still too weak to travel, often having fainting fits, and a singing in my head, Andrengo, at less than an hour's notice, announced that the carriage—a dirty old hired thing—was at the door, and I partly walked and partly was carried down stairs, and was put into it. Andrengo sat on the box with the coachman.

Arrived in Naples, I was taken to a house on the outskirts of the city, apparently the least picturesque locality that could be found, except that Vesuvius was constantly before my vision. Andrengo and two women, who were equally creatures of the marchese, took up their abode with me. I found that I was to be called the Signora Emilia Daràno, and was not to be known as the wife of the marchese, but only a poor relation. It may be well supposed how indignant this might have made me; but I was past all that, and scarcely felt it except now and then when the thought of my family crossed my mind. I did not even much speculate as to what were the ultimate intentions of the marchese with regard to me. My predominant feeling was a sense of relief and free breathing, and existing in quiet without any immediate expectation of his detested presence. I once or twice even found myself singing, or at least humming, a few bars of a song.

To my surprise, I now discovered that my liberty was comparatively restored. I walked about the gardens not only of the house, but the gardens and vineyards, and even the orange groves, of the neighborhood, quite alone. No doubt I was watched by some means, but the watching was not apparent. It was merely intimated to me by Andrengo that the marchese had strictly forbidden that I should enter, or approach near, the city of Naples. This I cared little about. What were the gayeties and brightness of life to me? The period of his arrival was quite uncertain.

Weeks elapsed. The brilliancy of the climate and scenery charmed me, and my naturally fine health began to return. Blessing my temporary release, though looking forward with horror to the arrival of the marchese at no distant day, I wandered among the delicious gardens and orange groves in the neighborhood, enjoying the air and the odors, and, above all, the wonderful luminous indigo blue of the bay, the colors and lights of the sky above, and the peaceful-looking Vesuvius. The city, at no great distance, certainly caused some vague wish and curiosity at times, but the prohibition did not much trouble me. To be alone seemed the greatest blessing, but a far greater was at hand.

Oh, tremble young heart, tremble young soul, when out of too deep a misery there suddenly springs up too much happiness! Enjoy it to the utmost in your power; speak of it only in whispers of adoration; clasp the present moment to your bosom even as I clasped and was clasped by *Mim*, my first, my only love!

* * * * *

During one of my rambles I found myself entering a lovely wood full of trees of exquisite foliage, and among which there were many flowers and fruit trees that seemed to have planted themselves, and were growing as wild as they were beautiful. Seating myself at the foot of one of the most umbrageous trees, and opening a book, I tried for a long time to read, but in vain. Vague apprehensions, and thoughts as vague, and an inward fluttering, prevented me. Misgivings I had, and knew not about what. Presentiments, yet without form or sense of their purport and direction. The same page was read and read again and again, so unable was I to fix my attention upon the meaning of the words. Still I persevered, with many sighs at my own strange foolishness, when gradually the page became obscured by a moving shade. I looked up, and a young man, evidently an Italian, passed close by me with a noiseless tread. He had a sweet and earnest countenance, and when our eyes met he lingered on his way. I could not, I had no power to withdraw my eyes, and after he had loitered onward a few paces, he slowly returned, and paused before me. Ah, what tears!—what tears I am shedding, dear, dear Otty, while my hand writes of this! Flow on, sweet fountain! for while anguish mingles with your waters, sweet emotions of love's divine passion predominate over all. And yet I can not continue to write this—to describe—indeed, it is not possible, much as I wish to linger, even as he lingered—and to relate, or to.....

He could not speak English, but my Italian seemed better than usual, and, indeed, he evidently understood what I was about to say almost at the first word; nor was I slow

to apprehend his meaning. We sat on a green bank side by side looking into each other's eyes I know not how long. No expression, no one word of love passed our lips, but there was little need of words. When he gently took my hand at parting, the touch ran through my veins. No agreement was made as to our meeting again. He murmured something to that effect, but my voice was lost to me. By what means I got home I have no idea, as I neither saw my way nor felt the ground beneath me. As for my dinner or my supper, not one morsel could I touch. Remember, my dear Octavia, and whoever may read this narrative when I am no more, that I was not yet in my twentieth year, and this was my first affection. Not that I was conscious at this moment of the state of my heart, though its constant heaving and fluttering might have told me, one would think. Andrengo and the woman of the house seemed to scrutinize my face more closely than usual, it seemed to me, but perhaps this was fancy.

Next day I dressed myself with more than usual care in order to take a long walk; but the looks of these people alarmed me, and I went no further than the garden boundaries. It was the same next day and the day after. Something of what was going on within me must have been written on my face. I began to feel that it was so, and shrank from their gaze.

On the fourth day, when I had made up my mind to go out at all hazards, a letter arrived from the marchese, informing me that his return to Naples was indefinitely protracted, and that in the mean time he desired to have my portrait. This much surprised me, but I subsequently discovered that it was to pacify Lord and Lady A—, who were astonished at receiving no letters from me. Moreover, I was instructed that the marchese desired to have me painted in a classical character, and chose for his subject a full-length figure of Venus, on first seeing Adonis, who was to be in the background. He gave a sort of description of how he wished the figure of Adonis to be painted, which showed that he was thinking of himself; and yet there was an under-tone of irony in his expressions that both disgusted and puzzled me. He mentioned a young painter in Naples who had been highly recommended to him, named Sebastiano—, a descendant from the celebrated Sebastiano del Piombo. I was to go to his studio forthwith, being always accompanied by a daughter of the woman of the house. I was very little disposed to the sort of painting indicated, but glad of the opportunity of seeing Naples.

Accordingly I went next morning, attended by Simona, to the studio of Sebastiano. The recognition—need I say it was immediate?—made the whole floor shake beneath

my feet, as it seemed, though no doubt it was my shaking knees. He at once saw my dilemma, and hastened to relieve my embarrassment by informing me that he had expected my arrival, having received a visit from a noble friend of the marchese, who had fully explained his wishes. I was quite unable to reply, and excused myself on the ground of my imperfect knowledge of the Italian language. With regard to the composition and general treatment of the picture, I left it entirely to so accomplished an artist. Something to that effect I stammered out. Ah, my dear —, I had no wish to be flattered into a Venus, even though I saw a living Adonis stand before me!

We had a preliminary difficulty about the arrangement of the drapery, and I refused to listen to the girl Simona, who assured me that whatever might be thought of such matters in England, it was common enough in Italy, and that she herself had been several times painted as an unchristian goddess without injuring her religion (*sbattiezzi*), and was once modeled in terra cotta and exhibited. This girl was of a far more amiable nature than her mother, and seemed to have taken a kind of regard for me. She was a curious mixture of innocence and immodesty. She would laugh at the most improper things.

As for the number of visits the picture required, they could not be calculated beforehand, any more than they could easily be counted afterward. How happy I was!

After the third or fourth visit, Simona asked my permission to go out for a while to see some friends who resided at no great distance. I was so astonished, delighted, and confused at the request that in my agitation I ordered her never to think of doing so; and in a few minutes, when she renewed her request with easy effrontery, I consented, with a foolish air, murmuring something about her speedy return. How happy, how speechlessly happy I was!

What is the wisdom or the use of being reminded, or of reminding yourself, that nothing lasts? Of course it does not; the grand question of life is what state we are in while something lasts. Again and again I visited Sebastiano's studio, and on almost every occasion Simona left us alone for an hour or more; latterly, indeed, she dispensed with the formality of asking my permission, and spared me the awkward position of acquiescence. I was too happy. Yet I was delighted and terrified by turn. Often I as completely forgot the marchese—his very existence—as though he had long been dead. Then I started with horror, as if just awaking, when the revolting recollection of him suddenly rose up in my imagination, coupled with the intolerable thought of his return—his return to me—a wife, and no wife; and,

besides, no longer his. Thus was my heart uplifted and cast down alternately. Sebastiano fully comprehended the danger of my position, as also of his own; but his chief apprehension was on my account. Still we lived our life—lived in our present hour of bliss, like the butterfly and the convolvulus. How *could* we expect it to continue? how *was* it to end? And even if the appalling end could have been foreseen, I can scarcely now perceive by what means it could have been altered.

Month after month thus passed. During the first four months of my arrival—the third of my visits to Sebastiano's studio—a few lines from the marchese now and then reached me; but during the last five months not a word. Andrengo hinted that his lordship was seeking to obtain some very high post. I devoutly hoped the difficulty would continue. Only one month had I resided with the marchese in London for our "wedding tour," and yet it had seemed like years, to such a pitch of utter detestation and disgust he had brought me.

I was now beginning to persuade myself that he would never come to Naples. Why should he? What did he really care for me? What was there in me that he could not readily find elsewhere? What self-delusion! One morning a thunder-clap fell upon my brain! A letter arrived from the marchese, announcing his speedy return, though he could not be certain to a day.

.....So ill—so lost—so continually fainting. I was often prostrated in a kind of conscious, apprehensive delirium. As soon as I was able, and in deafness to the remonstrances of the nurse, as I was really not well enough to go out, I hurried to Sebastiano. The conference and the decision were the agitated work of less than five minutes, and we agreed to fly to France or Spain, and thence to England.

Returning home, I determined at once to write to my mother, addressed to our old castle, with directions to be forwarded, as in all probability the post-office people there would know where to send. The thought struck me that for greater secrecy no letter should be written till we escaped from Italy, but having recently come across a volume of the tragedies of Alfieri, a passage in the opening scene of *Mirra* had greatly affected me, and I determined to copy this. My mother would at once recognize my hand, and could not fail to apply the lines to her wretched daughter:

"*Mirra infelice strascina una vita
Peggio assai d'ogni morte....non oso
Pinger suo stato orribile: mal puote
Un padre intender di donzella il pianto;
Tu madre, il puoi. Quindi a te vengo.*"

Having copied these lines and carefully sealed the letter, without writing another word, it was taken to the post-house by Se-

bastiano. Every moment was now occupied in preparing for flight, or rather in thinking in a most confused manner as to preparations. I packed and unpacked and repacked, and then threw every thing aside as too bulky. My dear infant, of course, greatly enhanced my difficulties. My nurse I could not trust; but Simona's attachment to me had increased. She had greatly taken to my little one, and I resolved to propose to her that she should take the place of the nurse, and fly with us; but I reserved this communication for the last moment.

The morning of the day arrived when we were to fly from Naples, starting from Sebastiano's studio. It was now my usual hour for going out, when a man from the post-house, with two letters in his hand, met me at the door. One was from the marchese to Andrengo; the other was addressed to me in a strange hand. It was only a cover, but it inclosed the letter I had addressed to Lady A—, which was now returned to me! I reeled back to my room, and was unable to leave my bed for the rest of the day. With a secret influence like this, it was obvious that escape from Naples was scarcely possible. You are no longer surprised, dear Otty, at being so long without any news of me up to this date. What else may be in store, heaven—or the other place—only can know. But I will proceed with these letters whenever I am able.

Early next morning Andrengo sent up word to me by Simona that the marchese was on his way to Naples, and might shortly be expected. I instantly dropped off into a stupor, in which I was conscious of all manner of anguish, but understood nothing.

When I came to myself I found I was still lying in bed, and presently I heard the step of the marchese. My temples throbbed violently, and I felt myself staring wildly. He entered my chamber in his most courtly and graceful manner, and in a kinder tone than I had ever heard him use since our wretched marriage, inquired after my health. I was amazed even to speechlessness; and judge how this must have been augmented when he smilingly informed me that he had been to Sebastiano's atelier to look at the picture, which he much admired; and he added, carelessly waving his perfumed handkerchief, that he had also been to the nurse's apartment to see the child, and thought it was very like me—with some exceptions. He glanced toward a mirror while making this last remark, as if to intimate a resemblance to himself. And yet I fancied he was looking toward my face in the glass. I almost made an inward vow never to rise again from my bed, but to die there. That night I carefully fastened my chamber door.

I was in some sort obliged to get up in a day or so, but always fastened myself in at night, pleading pains in the head and side.

I might have added the heart-burn, for I'm sure my heart burned day and night. The marchese bore all this with apparent unconcern. But one night, after a day of intense heat, and during a storm of thunder and very vivid lightning, my door was suddenly burst open, and the lightning streamed into the room as though it had caused the fracture, and in the midst of the broad gleam I saw the marchese.....as I had certainly become insensible, and blessed the tempest and the horror that had made me so.

I was again rapidly sinking into a state, as in London, of not caring what became of me, when the marchese abruptly informed me that he wished to have the picture taken to his palazzo in the city, and as Sebastiano had told him that a final sitting would be necessary, I had better go directly to his studio for this one sitting—more, if it was necessary. Had I heard rightly? No doubt I must have looked deaf or stupefied, for the marchese repeated his commands. I could not help thinking there was a latent gleam of sardonic pleasure in his countenance at the mental torture and confusion in which I was placed. Amidst all this I was still only too glad of an opportunity of a few private words with Sebastiano, as it was clear this state of things could not and should not continue, and that we must at once settle upon some plan of ending it. For my part, I was quite ready to die.

Simona, as usual, accompanied me. Directly we arrived at Sebastiano's door the girl startled me by asking leave to go at once to see a dear friend. It was obvious that she had a lover, and, indeed, she sometimes forgot that it was Edoardo, and called him Batti.

The instant I entered the studio, where Sebastiano was sitting with his head resting on both hands, he leaped up in surprise, and could scarcely hear me explain why I came, so great was his excitement on the necessity of our immediate flight. But when I told him of my inclosure to Lady A.—having been returned to me, and which he had himself taken to the post-house, he stood the picture of dismay and hopelessness. As soon as he had sufficiently recovered, he sat down by me, and we both talked hurriedly of all sorts of things and at the same time, both devising impracticable schemes, all ending in sighs and tears, till it was time for me to depart. Simona was waiting for me below.

Arrived at home, I had to be carried up stairs from exhaustion. The marchese remarked that he was not surprised at it; sitting to painters was always very fatiguing. Next day I was too unwell to go out; but on the day following the marchese ordered a carriage for me, and again I went to Sebastiano, the girl leaving me as before.

Remembering the depressed figure presented by Sebastiano at my last visit, my

breath was taken away on entering by finding him with a drawn sword, practicing, now at a large looking-glass, and now at a small black spot on the wall! I sat down and actually laughed, just as some hysterical people will laugh during a funeral, or when taken unawares by the announcement of a strangely shocking accident. Sebastiano looked half offended. He was to write a few lines to the marchese, inform him of our mutual devotion, and call him to a mortal contest. As soon as he would listen I represented to him that the marchese, besides his height, lithe movements, and unusual length of arms, was practiced in all sorts of unfair sleights, by means of all which advantages he had killed several antagonists in duels. I had heard him coolly boast of it. Sebastiano said he did not believe the marchese was a man of high courage. I replied that I thought he was a strange mixture of most cautious apprehensiveness and desperate courage, like a cat, and that he was equally skillful, cool, cruel, and remorseless.

"Then," exclaimed Sebastiano, "I will lay myself open to his wounding, in order that I may make one mortal thrust."

"Ah, my dear Sebastiano," said I, weeping bitterly, "and what would then become of me? You would certainly die of such wounds."

He stood lost a moment, and presently seized the sword again, and made lunges in the air in a paroxysm of abortive passion. I wept the more to see it.

All on a sudden a new thought flashed across me. I hurriedly left Sebastiano, saying I would very quickly return. The recollection of the marchese having once tauntingly asked me if I would like a divorce had occurred to me. I made my way to the doctor who had always attended me, and whom I much liked, and had a confidential interview with him. He expressed the greatest distress and perplexity at what I told him of the marchese, whose abominations and brutalities under so courtly an exterior not a little surprised him. In England, he said, I should have a strong case, but the laws were not the same in Italy. He gave me a private note to a great lawyer who resided in the next street, desiring me to explain every thing to him, and after that they might confer, and perhaps act in concert. With this most kind advice I immediately made my way to the great lawyer. He listened imperturbably, as it seemed, even to things most abnormal in the marchese, and then confined himself to questions with reference to my position with Sebastiano, which, in strict confidence, I was obliged to confide to him. He then shook his head with a straight kind of smile, and said that my case proved too much against myself. Of course it did, if the marchese had been suing for a divorce. However, he said he

would carefully study and consider the question in all its bearings, and then communicate with Dr. Maurizzio. And I might implicitly rely upon his legal honor (*giurisprudenza*). I besought him to do all he could for me, and we parted. I found Simona had been waiting some time for me below stairs, and I was obliged to hurry home instantly.

The picture being still unfinished, the marchese went the next day to the studio to complain of the delay. Nevertheless he appeared much pleased with the painting, and went again the day after, and sat some hours, as he informed me, by the side of Sebastiano while he was at work upon it, greatly admiring his skill, though regretting to observe that he often had an unsteady hand. Such talent ought not to be so over-anxious.

The morning for the final sitting arrived, and the marchese took me in a carriage to Sebastiano's atelier. He complimented the artist, and in the most elegant manner insisted upon aiding Simona to undress me behind a screen, and adjust the draperies, after which he handed me a glass of water, and then led me to my position as if it were to a dance. He remained with us while the finishing touches were given. Simona had been sent to his palazzo with a message. If the thoughts and feelings of we three could have been..... [The remainder of the sentence is illegible.]

We returned homeward, but not by a direct route, as the marchese wanted to purchase something in one of the neighboring streets. While we slowly drove along, a strange and intense presentiment—or whatever it was—made me inwardly ejaculate, "Divorce! Yes, indeed! Why should there be this difficulty? When will the world, with all its civilization and wisdom, see the humanity and morality, as well as the reason and justice, of a divorce in cases where"..... The marchese was reclining on a back cushion, with a half-audible inward sort of whistling and careless beating of time with the fingers of his left hand. We drove past the house of Dr. Maurizzio. The door was blocked up by a loose heap of building stones; the windows were all closed, and the balcony full of rubbish. The house was evidently uninhabited. The carriage presently stopped, and the marchese, humming part of an air in a new opera, alighted and left me. Words fail me. Surely if I had been one of the most wicked women in the world, some persons besides a dear friend like you, Otty, will pity me. The marchese returned with a basket of fruit or something. I don't know how we got home.

The Detestable dressed himself with more than usual care for dinner, and assumed toward me all the fine manners of his first courtship, and something more—profound respect, superfluous attentions, ardors, and

sometimes what he intended for loving leers, of a kind that made my flesh creep and the room swim. Then he checked himself, with a courtly bow presenting me fruits, sweetmeats, flowers, as if inspired with the most delicate admiration. This to me, whom he had treated with every remorseless insult, offense, grossness, contumely, in undisguised resentment and vengeance, on account of my persistent refusal of him when he made his proposals for me! this to me, when he so well knew that I ever groaned within at being the slave and victim of his abhorred.....

I do not think the wine was drugged, but instead of giving me strength, or acting as a restorative, it rather prolonged the fainting fits to which I was now subject. The marchese must surely have thought me dead sometimes. The wonder is that one so wretched should ever have recovered consciousness.

The painting was sent to the marchese's palazzo, and he gave a grand *festa*, being in celebration of his return to the higher circles of Naples. As he had never acknowledged me publicly as his wife, of course I was not present. But he invited Sebastiano, and would accept no excuses. Moreover, he praised the young painter before his guests, and specially presented him to several noblemen of wealth as one highly meriting their patronage and friendship. Could I, can any one, understand all this? and after the sudden disappearance of my kind friend Dr. Maurizzio? But very soon it will be clear enough. The marchese, however, had not yet carried out his scheme of entertainments and hospitalities. He must certainly have considered me to be a worm that was unable to turn (*ritorcere*).

Nothing but my terror of the danger to which I should expose my dear Sebastiano would now have prevented my telling the marchese every thing, for he had actually invited him to come and dine with us at our obscure suburb villa, *en famille*! A few hours after hearing of this, Simona secretly placed a note in my hand from Sebastiano, in which he expressed the very same feeling, declaring that only his alarm at what might happen to me prevented him from making the marchese fully aware of all that had passed, and of the unalterable love we bore each other. He came. What else could he do? He did not know what to do or think till he had seen me. And then how could we exchange a word? Our very exchange of looks must be avoided. This insuperable difficulty was, however, easily swept away, as the marchese politely excused himself to us after dinner by saying that he had a slight headache, and wished to take a few turns round the neighboring gardens.

Left alone with Sebastiano, it will readily be supposed that we rushed into each other's arms, with a torrent of hurried words; but

we sat speechless, looking at each other. The confounded (*confonduto*) state of mind and feeling to which the Abhorred had reduced us could not possibly be endured any longer. Sebastiano rose from his seat, and approaching me with measured steps, took my hand very gently in his, and said, "My dear, my adored Emilia, *say* what you wish to be done—something must immediately be done—only say *what* you wish, and I place my life, even as I have already placed my heart, at your feet." These words caused me a burst of tears, so that I was quite unable to speak or think. Finding me quite unable to reply, Sebastiano's face lost all its fine, softly curving outlines, and seemed to have hardened into a kind of metallic visor as he declared that he would kill the marchese directly he re-entered the room. Two or three ornamental stilettos were lying about, and he at once selected the longest. This roused me from my stupor. I could not agree to it. I suppose a woman always flinches at blood when the moment comes. Besides, to be quite honest, I was afraid the marchese, who was as lithe and agile as a tiger, would be more likely to kill Sebastiano. He allowed me to replace the stiletto with a deep sigh of despair. Now we found our tongues, fearing the return of the fiend, and proposed first one thing and then another. We agreed to try and escape from Naples at the very first chance. But when we called to mind the prompt return of my letter, and next the sudden disappearance of Dr. Maurizzio, we saw how futile the attempt was almost sure to be. Then we simultaneously proposed to die together, and I suggested that we should throw ourselves in the bay infolded in each other's embrace. To this Sebastiano objected, as he could not endure the thought of my being devoured by the sharks, which were so numerous at that season. Poison was then decided upon; but it then struck me that, as we had fixed to die, we might at least try the bare chance of escape together with that of being able to pass a few days together in concealment. Having the means in our hands, we could die directly the necessity arrived. This was final. The attempt needed money, and Sebastiano had plenty. I had none, not even a jewel.

The marchese returned, saying he was much better, and apologizing for having left us so long. He spoke much about the painting, and the copy he wished to be painted for Lord and Lady A——, which he intended to send to England, and thence onward to where they resided. But it was only the head and bust that he wished to have copied. As he said this he laughed in a strange sort of under-tone, at which I should have felt scorn and disgust enough had I not been too agitated within. He then spoke casually, and with a careless air of friendly interest, of the important com-

missions for pictures which would shortly be given. When Sebastiano bade us adieu for the night, the marchese gracefully embraced him as he left the room.

This completed the business of the mental rack so far. No more in this way could be done and suffered. The elegant fiend listened at one window till the last sound of Sebastiano's footsteps had died away; he then came and stood in front of me for some time in a menacing attitude without word or motion.

"Wretch!" cried I, aloud, unable to endure this a moment longer; "wretch! monster! what is in your mind? Speak it at once! Murder me at once! I defy and spit at you!" Saying this, I made an effort really to spit upon him, but my parched lips and mouth refused any thing beyond a husky sound.

His eyes flashed with a light far worse than the eyes of any wild beast of nature as he sprang upon me without uttering a word, flung his arms round me, bore me off to my apartment, dashed me anyhow upon the bed, and commenced tearing off my clothes as if I had been carried into a jungle.....My cries and screams brought no one to my assistance. It seemed I was not yet to be murdered. The ferocious sensualism and the devil-like spirit of revenge held equal sway. He wound and rewound me in his long arms, and I heard the half-articulated words, "Me! to refuse *me!* to dare to insult one like me by persistent refusals! But you have found your reward!" I heard no more until the monster could retain his secret no longer; yet he chose his moment. He whispered like fire in my ear; he hissed it through his lips; he knew all; had known it ever since his return! My deluded paramour, the favored rival, the fool of my choice, who had helped me to dishonor the noble house of Albarozzi, should assuredly die, and my hand should be the instrument.....

On coming to myself I found I was alone, and I lay tossing about in a fever of confusion of thoughts and apprehensions. A slumber of exhaustion ensued, and probably lasted for several hours. I awoke with a start, and saw the marchese standing at the foot of my bed. He had dressed himself for a supper-party in Naples. He said it would be pretty well over before he got there, but that he needed a little relaxation and amusement. Before he went, however, he commanded me to take an oath, the terms of which he dictated. They were of the most impious and awful kind, invoking my soul's eternal perdition, and calling upon my Maker to record the same if I ever broke the oath. It was to the effect "that I would not, directly, indirectly, or in any manner, inform, or endeavor to inform, Sebastiano that all was known, that he was to die, and by my hand."

I sat up in bed, and looking the marchese full in the face, refused to take any such oath. I said, calmly, notwithstanding my involuntary shudders, "I know you intend to have us both assassinated in some secret manner; and that it would be delightful to you to inform me, after I had assisted in the death of one I love, that my own turn was then come. I at last know what you are in all respects. You are not the sort of cruel monster one reads of in some romances, but one so much worse in several respects that nobody ever reads of them, because nobody dare paint them. This is my answer. I repeat that I will not take that oath. I see the unsheathed stiletto under your vest. Kill me without more words."

Saying this, I laid myself back upon the pillow, closed my eyelids firmly, and awaited the blow. Some minutes—for minutes they seemed—now elapsed. The marchese then said, in quite an altered voice of polite composure, "Would you do me the favor to open your eyes for a moment?" I did so. He slowly drew forth the stiletto. It was the one that Sebastiano had taken up. "You have seen this before?" I closed my eyes again, and awaited death. The last malignant pleasure of revenge and the last pang of my wretched and defeated life had transpired. But the expected blow did not come. "Ah!" murmured the marchese; "I see by my watch that I shall not arrive at my fair friend's supper-table till daybreak. I must therefore hurry away. As for the oath, I shall find means to bring you to your senses. All that I have willed to be done shall be done, and perhaps something more. I have the honor, madam, to wish you a very good night."

Days passed away, partly occupied, no doubt, in maturing his scheme. Was he not, if it were only in his savage and remorseless patience and self-command, unlike all we ever..... Poor Dr. Maurizzio, what had become of him? He often occurred to my thoughts. In the conversation I had which proved so ruinous to him what had most surprised me was that he did not appear much surprised at all I told him. He said that not only Italy, but Paris, Vienna, and some other places, contained men like the marchese.* They were the greatest possible examples of the abuses of the power given by wealth. He regarded

* The editor is aware that in the writings of an admired psychological and great dramatic poet (Mr. R. Browning) there may be found a certain duke who speaks of his murdered wife's portrait in a manner worthy of the marchese. And in Count Stendhall's work, *De l'Amour*, there is a similar character. A certain Italian nobleman, having reason to suspect the fidelity of his wife (Madonna Pia) in consequence of finding a gentleman's watch on her toilet-table, carried her off to reside on pestilent marshes. Every day he paid her a visit, and showed her the watch, without uttering a word, and continued to do this till she took the malaria and died.

them as monomaniacs, who ought to be put under surveillance, if not in confinement, instead of moving at large in society, and misleading, seducing, or marrying innocent young ladies, whose parents were deluded, as the young girls themselves were often dazzled, by their riches. Besides, who could predicate an incarnation of vicious extremes under an elegant person and the most courtly manners? Alas! alas!.....to think of the divinely human face which Raphael might have been inspired to dream of, and to paint—even that of my Sebastiano—and then to think of the inhuman, abnormal, gloating calm of the Abhorred (*abborrito*), by whom I had been insidiously purchased for a slave, and treated worse than a slave! And yet, again, to think that the worst—yes, though nothing beyond could be thought possible—was still to come!

Where had they dragged me? Was it a dungeon, or a vault for the dead? Or was it one of the cellars under the house? And I in my night-dress, torn and split, and my hair all flying about! The three men wore no masks, but their faces were blackened with broad perpendicular bars, like a horrid kind of helmet. The black skull-cap of one of them fell off, and I was sure that I recognized the head of Andregno. The cellar was lighted by a lamp with a shade over it. Beneath it the marchese was seated upon a stone ledge, as in judgment, with his back against the wall. I found myself lying upon the damp flooring, with three men standing round me, like torturers or executioners. Two of them had rods in their hands, of osiers or other dried water-plant, bound together.

"Will you take the oath?" said the marchese, in a low tone. What I replied I do not know, but it was to the effect that I dared not, would not, could not take such an oath!

The marchese then, placing one leg slowly over the other, began to relate how a certain Russian noble of former years, but not very remote (to whom the parents of an unwilling daughter had given her in marriage), had discovered that the young lady had actually committed the insulting crime of loving another. That private meetings took place. That the princely husband discovered the dishonor, and that his wife even admitted her criminal preference. That the insulted noble caused her to be stripped and thrown among his ruffian soldier serfs (*heyduks*), and that he then ordered the insufferable culprit to be flogged with long whips all the way to her native town; and that when, covered with blood, she sank down upon the road, being unable to fly a step further, he directed.....

There is a blessed law in nature that sensations can only be wrought up to a certain

degree, so that tortures are often defeated either by the sense becoming deadened, the victim becoming quite insensible, or dying very quickly. No doubt it became apparent that I should die without taking the oath. This was not the marchese's intention, as it would destroy his fine scheme of revenge. But if pain had failed by being self-defeated, he thought that horror and apprehension might be successful.

.....Andrengo soon returned, bringing in something heavy, which he placed before the marchese, a little distance from his feet. It was an iron brazier full of live coals. He then fanned the fire with a large and richly ornamented Indian fan which the marchese had leisurely opened and handed to him. Andrengo—for I was certain it was he—again went out, and very soon came back with what appeared to be a large copper bolt taken from the outer door of the cellars. This he thrust into the brazier, and turning toward me significantly, put one finger into his mouth. What could the wretch mean? Looking up at the other two ruffians, with interrogatory dismay, they both raised a forefinger and pointed the tip toward one ear. Andrengo now knelt down and fanned the fire.

"As you are resolved to die," said the marchese, after a long pause—"as you prefer to die rather than take the oath I have dictated and ordained, it shall not be in any way you may fancy, but in the way I think most appropriate. When that bolt, which at present has scarcely attained redness, arrives at a white heat, it shall be applied to the orifice of an obdurate ear; and then it shall be thrust into an obstinate, husband-hating mouth—you must pardon so harsh an expression—till the tongue becomes a hard cinder, and the adulterous palate ashes."

* * * * *

"Whose child is it? Confess, or expect far worse than I have threatened!.....Kill you? Not I; there are several things to be done before that. Torture? Yes; be sure of it.....Is the *chiavistello* white hot yet? Once more—whose child is it? It is not mine. The eyes, the mouth, the shape of the head, besides the fact that.....And now not a moment more. Confess, I say, and give the name!".....I confessed. After a little he said, "It was not at all necessary to my knowledge, but your confession was my will and pleasure. And now the oath!"

* * * * *

My entreaties, my prayers, my screams for mercy, for some human consideration, my cries for death to come—death to come at once—at once—all were disregarded; and at last I cried out in my agony, "I consent!" Water and restoratives were then given me by one of the torturers; time was allowed; more water was given me; a napkin steeped in cold water was bound round my head;

and calling upon God to forgive me, I took the required oath.

Weeks intervened. What were weeks, months, any time, to a fiend of patience, and deadly, cold, yet ever-burning inward continuity like the marchese? So he pretty well left me alone, though constantly watched closely by his creatures, till I had sufficiently recovered. Tortured and outraged as I had been, it would have defeated his designs to kill me. I was to be the medium of his revenge upon Sebastiano. What was to be done with me afterward I knew not, and did not much care to think. I had been forced and horrified by preliminary barbarities, with others more monstrous threatened, into taking an oath of the most awful nature not to endeavor by any means to forewarn my beloved Sebastiano of his impending fate, and I was to assist in bringing it about. How I should ever be able, how my impassioned affection could possibly allow me, to do the latter remained to be proved. But I had certainly taken the oath, and saw no means of evading it. "Unless," mused I—"unless I could kill the monster, or get him killed in any way." Ah! there was little chance for that with one of his wary brain and rapid hand. With my thoughts and emotions constantly enveloping my lover, I only wished we could once more meet, and die together, and be at rest and peaceful blessedness in heaven.

The day was at hand. I felt like what I supposed any woman would feel who was about to be tried for her life, and certain to be condemned and executed. The marchese had been frequently giving dinner and supper parties at his palazzo, and now and then water parties on the bay, to most of which Sebastiano had been invited, and by one means or other compelled, in a manner, to be present.

One morning the marchese entered the room where I was seated, trying to read, and taking a chair, bowed to me in his most elegant style, and seated himself by my side. He took my hand very softly, pressed it gently, looked at it, and then said, in what he intended for a sympathetic tone, "Ah, 'tis a pity, really it is a pity, that so fair a hand will shortly have to execute so fatal a deed." I snatched back my hand, and looked at him. "Yes," he proceeded—"yes, Emilia, this is the day I have fixed, and every thing is prepared. If I remarked that it was a pity so fair a hand as yours should have to do so foul and yet so very just an act of vengeance, how much more is it to be regretted that the hand of a fine and still more promising artist should be finally suspended in its work—cut short midway in a brilliant career! However, I shall possess the last and the best of his productions, and shall often look at it with much pleasure and satisfaction when you are both no more.

This was one of my reasons for ordering it to be painted. But the other and less obvious reason was in consequence of the perverse and insulting aversion you presumed to manifest toward myself—one who had conferred upon you the wasted honor of his hand. I was curious—I may say desirous—of ascertaining if you were capable of very different emotions toward another object, and I therefore determined to place you in circumstances of some degree of temptation. The result, signora, has fully justified my anticipations."

I sat speechless. The marchese awaited my reply, but reply or comment was impossible. He had actually plotted—for how else can it be regarded?—plotted that I should fall in love with a most lovable object, in the secret hope of finding food for his devilish appetites for varied torments and revenge because I had mortally wounded his gross self-love!

He left the room, bending gracefully toward me as he was passing out. I was not left long on the present occasion. Every thing was now to be brought speedily to a crisis. Andrengo entered, and bowing low informed me that his lordship had invited a number of his noble friends, including the Signor Sebastiano, to a water excursion in his yacht on the bay; that the party was intended to be rather numerous; that they would have musicians and feasting; that the excursion was for two or three days if the present fine, hot, and calm weather on the bay continued; and that I was to make preparations accordingly, and at once. The yacht would put out in the course of an hour or so that same morning, and within half an hour a carriage would be at the door, into which he, Andrengo, had been ordered to see me seated, and to attend me with respectful homage.

I wonder if it is at all common for extreme circumstances to cause an absolute change in the nature, or at least in the natural character, of a person? If the extreme circumstances do not crush, surely this may sometimes take place. And I think such a change must at last have been wrought in me. Instead of sinking prostrate upon the floor at this announcement, I heard it with so unmoved an air that Andrengo did not know what to make of me, and thinking that I had not clearly heard or not understood all he had said, he repeated it. I told him I would be ready. It was only to throw a few things into a leather bag (*tasca di pelle*) for myself. He would attend to the marchese's requirements. No doubt it would be a delightful excursion. He looked a little puzzled, I thought, as he retired. Certainly the last remark was hardly a sane one.

Directly the wretch withdrew I rose and paced about the room, feeling inwardly called upon to do something, but not knowing

what. As for preparations, I made none beyond collecting a few articles of clothing. A number of persons of rank were to be of the party, Andrengo had informed me. Was I for the first time to be presented as the Marchesa di Albarozzi? and then was I to be denounced before them all? I could not think it. That would be much too open a plan for the feline character of the Abhorred. He could not take Sebastiano's life or order any body to do so, with my assistance, before his friends; and he would be almost as unlikely to make any public talk of what had occurred and what he intended to do. I did not feel much care about solving his foul problem. I was prepared for every thing by being unprepared for any thing, if you can make sense out of such a thing, and I seemed to have got into a strange state between firmness and stupidity.

The carriage soon arrived, and was not kept waiting beyond a minute or two. Andrengo bowed with abject servility, and addressed me as "la marchesa" as I stepped in. This was the first time I had ever been so addressed; and from the wretch who had acted as my chief torturer in the cellar, though he fancied I had not recognized him under his disguise! What did this mean, and what was it to lead to? Not that I cared. We drove direct to the bay.

A small boat rowed us off to the yacht, which was at a little distance. Before arriving alongside I saw that the marchese was already on board; and presently Sebastiano appeared, and bent over the rudder end of the yacht as he gazed at my advancing boat. On getting into the yacht I found the marchese in a state of angry exclamation, very unusual with him, in consequence of a blunder made by his secretary in the wording of the invitations. None of his noble friends had arrived, that day week having been specified by mistake. However, the marchese was determined not to be disappointed in his intended amusement—neither, he added, should I or his friend the Signor Sebastiano; he therefore ordered the sailors to put out into the bay without loss of time.

The invitation, then, of several noble friends had been a subterfuge. No such witnesses were to be near. Still there were five or six sailors and two servants, besides Andrengo; how were all these to be blinded? Meanwhile, how pathetic was the unsuspecting face of my lover! What he was suffering was from the anomalous pain of our relative positions, little dreaming of its approaching end. As the day wore on, while we sat or walked upon the deck, he tried now and then to obtain an exchange of glances; but I would not notice this, as I perceived that we were closely watched every instant. I seemed to have lost the sense of fear and apprehension for myself, chiefly

no doubt because my feelings were absorbed by Sebastiano. How to break my oath I did not know, even had I dared to think of that; and how I should be able to keep it, I knew still less.

The marchese was very talkative and fluent, and quite exerted himself to be "enter-taining." We had supper at an early period of the night, after which the marchese arranged that we should fish for an hour to enjoy the cool night breezes after so hot a day, as it was too early for bed-time.

Something peculiar had been constructed for this occasion. As the deck would have been too narrow for the number of visitors who had been invited, as we were informed, two platforms, each of about four feet width, had been attached by iron hinges to one side of the upper edge of the deck. These lay flat at the side of the yacht, like leaves of an English table, but could be raised to the level of the deck by means of cords at each end. These cords were solely for this purpose, but would instantly break with a man's weight if he stepped upon the platforms. Two long iron brackets were therefore fixed flatly underneath each platform, and these being drawn outward by little ropes, strongly and securely sustained these additions to the width of the deck. I am not good at describing things, and can only narrate what happens or appears to me, and what I may have felt and thought, so you must try and understand these two platforms. As for me, the marchese took care to instruct me all about them well enough.

Both the platforms were now raised, and the long iron brackets drawn outward beneath them, all the hinge parts being well oiled to make them work easily. "So, so," thought I, as this was being done; "I have been made the wife-and-no-wife of a cunning artificer, and am beginning more fully to appreciate his genius." The lurid dawn of his plan began to break fitfully upon me.

The marchese called for two chairs, and bowing courteously to Sebastiano, pointed to one of them, and then to the foremost platform, as he said their fishing lines ought not to be too close together. He then placed his chair upon the platform, and seated himself with his fishing fooleries (*frascherias*) beside him. Sebastiano did the same. I was left to look on, and admire and expect, or feel quite sick of the thing, as usual on such occasions. I have said that the Detestable, like Nero, was highly accomplished in various ways, and among others he was a fine swimmer, and used to boast that no sea could drown him. I wondered if he was aware that Sebastiano was also a swimmer? It seemed as if that thought had not occurred to him. Murderers generally forget something or other. My oath—that now flashed across my mind; but the moment of trial had not arrived.

There they sat. I felt sick at soul, yet gradually fell into a dull, wandering sort of reverie. How foolish people look who sit fishing so gravely and catch nothing! The marchese must be a rich man. Though I always detested his face, yet I once thought he was handsome. But this was a mistake. His nose is too long, and the want of chin is ill compensated by his long upper lip—all of which are characteristic of the baboon's ugly and ferocious disposition. What a contrast to the Raphaelesque face of Sebastiano! Could the same creative hand have made this—and that? I wished I was not so religious. I was only half an Italian, or I should have killed the Abhorred long since—and with good cause. But my English blood had never enabled me to contemplate such an act. And so he had triumphed, and had got us both in a deadly net. Were fish plentiful in Naples? Our bills were no criterion of the cost of any thing, as we were always robbed by the housekeeper. She had certainly been my keeper, and watched me like an evil spirit—a familiar of the one who sat there! Was I calm—and with death hovering in the air, round and round? Yes, I was calm, except a constant fluttering at the heart, and sometimes a throbbing of the temples. But all would soon be over now.

There they sat, pulling up their lines now and then—sometimes with nothing—sometimes with a poor shining little victim, who was thrown to bounce and flap about upon the deck in the melancholy silver moonlight. I took several of them up, unobserved, and dropped them over the other side of the deck into the water. The dismal occupation continued nearly an hour (to think of this, with what was passing in the minds of all three!), the monotony being only varied by the sinister appearance once or twice of the dark dorsal fin of a shark. But they did not wish for any thing so large as that, even if they could have dealt with it in the water or on the deck. Eventually the "sport" was concluded, and we went below to retire for the night.

The sleeping places were small, and the partitions so thin that I fancied a whisper could be heard from one to the other. The cabin appropriated to Sebastiano was next to mine. The marchese had returned to the deck to say a few words to the sailors, and the thought of exchanging some sign or token, I knew not what, with my lover, instantly occurred to me. Speak above my breath I dared not; and if I could make him hear a faint whisper, then what could I say to him? In this dilemma, and every instant so precious, my fingers involuntarily gave a light tap on the partition next to Sebastiano's cabin. It was not answered, and in my excitement I tapped again a very little louder. An interval of silence occurred, and then a soft tap responded. But it was at

the door of my cabin. I was in dismay at Sebastiano's rashness; and yet he was not aware that all was known, and might have fancied that I had called him in order to exchange a hasty word or two. I very softly opened my cabin door, and there stood Andrengo! "Did la signora la marchesa call for any thing?" said the wretch, in a tone of abject servility. I choked at the sight of him, and shutting the door in his face, threw myself upon the bed, clasping my forehead with both hands. After a time I began to pull off and throw my dress on this side and that, like a despairing creature, or one in a state of fever. Presently the marchese opened my cabin door by some means he had for unfastening the lock from without, and entered. He closed the door after him. I begged of him not to remain, the cabin was so small, the night so hot, and I overheated, and wanting to be alone. He replied in a grave and rather loud tone that it would be highly unbecoming to leave me alone in the very next cabin to a gentleman, however punctilious that gentleman might be, and no doubt *was*, in the present instance. I was, of course, too young and innocent to see the force of this, but it was proper that he should watch over my fair fame, and his own honor—with more in the same vein, the abhorred, sardonic fiend, who was watching over me and some tortures of the mind are no more endurable than the tortures of the body.....but I was much stronger than he had imagined, though I left a handful of my hair in his grasp.

It was some time before daybreak that I made my way up to the deck, less than half dressed, and all in disorder. Only one of the sailors was there, standing dreamily by the helm. He looked at me with great surprise, and still greater pity, but said nothing. I sat down near him. After a while he said, softly, as if to himself, "The stars look bright and peaceful; and the world below often looks bright too, but seldom peaceful." This made me burst into tears, and that was a blessed relief to me, as I had been in a state of madness or fever. I then rose, and went to the fore part of the deck, to be quite alone. Leaning over the side, I looked down into the water as if I were looking into my grave, for I felt something dreadful was soon to be done. Who was to do it? According to my oath, I was to do it. But I did not feel that it could be so. Let me examine this oath, thought I, and let me well consider my religious and conscientious obligations. I had taken an oath, of the most appalling kind, to God, with God's perfect knowledge that while my lips were forced by tortures to repeat certain words, my soul and heart were directly opposed to all the purposes of that oath. Could that be really binding in its true spirit? Did not the voice of God within me denounce such an

unnatural oath, and absolve me? Was I bound most to our Father in heaven or to a fiend incarnate below? And yet—and yet—the terms of that oath made it a terrific thing to break. It was a frightful invocation.

Before sunrise I roused myself from my torpor, and making my way down to one of the unoccupied cabins of the guests who were never intended to be present, I dropped off into a dead sleep.

The day was far advanced before I made my appearance again upon the deck. The great heat of the weather, and some carelessness or other, had caused a part of the rigging to take fire. The flames had just been extinguished. Andrengo was throwing something overboard, first on one side, then on the other. He ceased doing this directly he saw me look in that direction. Sebastiano made some sketches of Vesuvius, under different effects of color from the clouds, while seated upon the foremost platform. We never exchanged a word or a look. Nothing could exceed the elegant and superfluous attentions of the marchese toward me during the whole of the day, not merely in presence of Sebastiano, but even when we chanced to be alone for a few minutes below. "Ah," you will say, "this man—this detestable spirit of outwardly restrained revenge—must have been a lunatic." Alas! no; he had no such excuse. I fear what poor Dr. Maurizzio said about him as one of a class—though the marchese must surely have been one of its very worst incarnations—was perhaps too true. I think it must have been the great jurisprudencalist to whom I applied in the vain hope of obtaining a divorce who betrayed us.

As the sun went down I again noticed Andrengo throwing things over the side of the yacht, which fell with a heavy splash into the sea. They looked like large bones and pieces of raw meat.

Supper was announced, and the marchese, intimating to Sebastiano that they would again try their fortune with the fishing lines before going to bed, took my hand and led me down to the cabin with all the finest airs of his diabolical refinement. He kept up an animated disquisition on the different merits of the Roman, Venetian, and Florentine schools of painting, and thence diverged into remarks on the wild ecstasies and capricious beauties of the Neapolitan national songs and dance music. Glancing with a sickly eye out of the cabin window, while he was thus displaying his misapplied acquirements and disgusting eloquence, I observed the black, sinister fin of a large shark pass along the surface of the water in the fading light. Soon afterward I saw another, almost as large; and then a third, if not a fourth. My throat became choked, as if the fingers of the marchese had clasped it. I rose from my

seat. "Where are you going, Emilia?" said he, in a bland voice. "On the deck; the heat here suffocates." "As you please, marchesa; we will take a few glasses more wine, and then follow you."

On reaching the deck I found Andrengo pouring out wine from a great jug for the sailors, all of whom were already intoxicated. Two of them were lying upon the deck fast asleep. Andrengo, seeing me, made some remark about the fishing lines having got into disorder. Without knowing exactly why, I returned to the cabin below, and saw that the marchese had just poured out two large glasses of wine for himself and Sebastiano. "The fishing lines are all in disorder," said I. The marchese stepped out just to the foot of the ladder, and called for Andrengo. I emptied the wine in the glass of the marchese under the table, placed it in front of Sebastiano, and then placed his full glass where the other had stood. My lover stared at me with provoking surprise. The Detestable re-entered the cabin, and glancing at Sebastiano's empty glass, he drank the full one before him, and proposed that we should all go up to the deck. We went. Perhaps there had been no stupefying drug employed. I did not believe it to be poison. Something more fiendish than that was evidently intended. "Save him somehow! save him somehow!" was rapidly repeated within myself, as you often hear persons who have lost their wits keep on repeating, whether sense or gibberish, the same thing; so "Save him somehow! save him somehow!" was rapidly repeated within me.

The fishing trickeries were not yet in order, so we walked up and down the deck. The two platforms were now raised by Andrengo and one of the sailors, and were lifted up to a level with the deck, and the cords made fast. The two long iron brackets were then carefully drawn outward by their cords. Andrengo placed a chair upon each platform, and the marchese himself went upon the foremost platform, and laid the fishing lines ready for Sebastiano. His own were not yet disentangled. "We will go down again for a few minutes," said he, "and take another glass of wine." So we slowly descended. The marchese watched Sebastiano, and I watched the marchese. The only effect the wine had taken upon him was a degree of dizzy excitement, causing volubility of speech. Meanwhile my dear Sebastiano, not at all aware of the dreadful death so systematically prepared for him, looked now at the marchese and now at me with an innocent though troubled perplexity that was most pathetic to witness. He declined, however, to take any more wine; but I recklessly drank some, feeling a wish to be uplifted beyond myself. Andrengo now came to say that all the fishing tackles were ready. "Very well," said the marchese,

with a sprightly air; "tell the men they may retire for the night." He then turned to me. "Emilia," said he, "we shall return to Naples to-morrow, and I wish, immediately we land, to send off a few words to one or two of my intended guests to arrange another excursion for next week. Will you do me the favor to be my amanuensis, and write what I wish to say? Signor Sebastiano, be pleased to remain here; we shall finish in a very few minutes." He took me by the hand with ceremonious grace—the detestable, the maddening torturer—and led me to the remotest of the little cabins. Closing the door, he said, with a hideous smile, "The time has come." I looked him full in the face. "Could you not," said I, in a tone between a last pleading and a last reproach—"could you not effect your murderous revenge by a far more simple process?" He smiled horribly as before. "Of course I could," said he, "but your oath was to the purport that he is to die by your hand or agency. Go now"—and he lowered his voice to a grating whisper—"go now up to the deck, and draw back the iron brackets from the foremost platform—the *foremost* one, remember!" I stood still and took a long breath. Again I looked with anguish into his face, but it was utterly, utterly beyond mercy or humanity; and I went.

Upon the deck there was not a soul. No, not even my own soul, for that was below with my dear, my beloved, my doomed life-of-life! There was not a breath of wind, and the night was very sultry. Looking over into the sea, a horrible dorsal fin moved along the surface, and passed downward under the yacht! I started, and drew back the brackets from the foremost platform. Without pausing to think, I then, in passing, hastily drew back the brackets from the aftermost platform also, and descended. The two platforms were left in their places, exactly on a level with the deck as before, but supported only by the thin ropes by which they had been drawn up to their level position.

The marchese was awaiting me, just like a wild beast in his lair. I saw the glitter of his eyes directly I had arrived at the bottom of the cabin stairs. He closed the door. His whole face was livid with exulting anticipation, and gleamed as if it had been lighted by a lamp from within. "Well," said he, "have you?" "Yes, I have done it." "The foremost platform, as I directed?" "Yes." "Completely done?" "Completely." "*Traditoraccia!*" ejaculated he between his teeth, "you have *not* done it; you are lying!" Confronting him, I said, firmly, "I tell you that I have done it completely;" and I stamped my foot upon the floor. He paused an instant, looking at me, and then steadied himself with one hand on the door. Perhaps the wine had begun to affect him.

"Come, now!" said he; and repeating the words in a loud and quite an altered tone, he walked with hasty strides to the larger cabin, where my doomed lover was awaiting us. "Now for half an hour's fishing before we go to bed!" said he; and we all three ascended to the deck.

None of the sailors were visible, and the helm seemed to be fastened steadily by a rope. There was scarcely a breath of air, so that the yacht lay asleep like a water-bird upon the surface. We took a preliminary turn up and down, the marchese talking all the time, rather loudly and almost incoherently, about the stars and the clouds, so as to keep Sebastiano's attention directed upward. A splash of something falling into the sea, like what I had noticed before, was now heard. Sebastiano paused, looked at me, then listened, whereupon the marchese redoubled his volubility in order to call off his attention. All this time the inward gabbling of "Save him somehow! save him somehow!" was going on within me, not only in my brain, but the gabbling and tingling seemed to be all over me. I was conscious also of some strange effect from the glass of wine I had last taken; but though I was dizzy and overexcited, I felt exalted above despair.

The marchese's rodomontade now diverged into fishing and into remarks on the beautifully magical appearance of the phosphoric colors and brilliant sparks and flashes seen at fitful intervals in the sea during calm and sultry nights like this. "Can these wonderful lights," said he—"lights and colors which I do not believe you, my young friend, could paint—can they be attributed to merely chemical causes?" and he approached the aftermost platform. My heart seemed beating almost through my side. "Or can they," proceeded he, "be the effect, as some naturalists have fancied, of the lively ecstasies of a sort of animalculæ? No more of this; now for our fishing!" Saying which the marchese stepped forward upon the platform and seated himself.

To my utter dismay and confusion, the light cords proved strong enough to bear his weight—and there he sat! Yes, with the air of a senator, and without any external sign of the demoniac triumph of revenge now at full work within his expectant mind. As for me, I was transfixed. I must have made some mistake! Beyond remedy now—and I approached near to my beloved Sebastiano with the feeling that we would die together. The marchese noticed the action, saw that not a moment more was to be lost, and loudly demanded why Sebastiano did not take his place upon the foremost platform.

Sebastiano, who had at last awoke to apprehensions of a danger of some kind or other, had instinctively hesitated; but on this loud call he advanced toward the fore-

most platform, and had one foot upon it when an involuntary cry burst from me, and I clasped my arms around him! With an infuriate look the marchese started up from his chair. But the sudden jerk caused the two cords to snap asunder, the platform instantly fell, and he was precipitated into the sea!

Calling loudly for help, Sebastiano was about to spring into the water. I had scarcely relaxed my hold, but now I infolded him with renewed energy, crying out, "No, no, no! You are not aware! you are not aware!" The marchese quickly re-appeared, and striking out, with piercing cries of terror, he reached the side of the yacht. Seeing this, Sebastiano, notwithstanding my clinging, made his way to the place beneath which the marchese was struggling to gain a hold. And a hold he did gain with his strong fingers upon the upper ridge of the fallen platform, still crying out for help with a terrified voice. In vain Sebastiano endeavored to stoop down and seize his hands, as I defeated the intention by whirling wildly round. The head of the marchese, nevertheless, rose nearly to a level with the deck by his own violent efforts, and Sebastiano, in his turn, now forcing me round, I gave a frantic spurn downward with one foot in passing. Sebastiano now threw himself flat upon the deck with his arms over the side—but my destroyer had disappeared!

A confusion was raging over the deck, drunken sailors, nearly naked, staggering about, only half awake, Andrengo wringing his hands—I know not what went on. Suddenly the most frightful, piercing shrieks were heard from the sea at no great distance. They ceased abruptly. In a few seconds they were renewed near to the yacht; and then, two crimson stumps, whether of legs or arms, appeared above the surface, were swung over backward, and went down! We saw no more, heard no more; but we knew enough.

Falling heavily upon my knees, I returned thanks with loud-uplifted voice to God for giving to me—the slave and victim of the worst passions and vices of the worst of men—spirit and strength at this one supreme moment to save my dear, my only beloved.

You are very kind, my girl, whoever you are, to tell me these things. It is not usual, I suppose, under my sad circumstances..... And so this is a prison? It is not half so bad as people say, only it wants air—fresh air. Perhaps I have been favored a little on account of all I have gone through; and, besides, you tell me I am very likely to be liberated. Ah! liberty comes too late for me. Every thing is now too late for me—even death. Cruel old Death! he should have come before.....

What a moment that was, down in the

little close-shut cabin, when I said I *had* done what he told me, and I stamped upon the floor! The action made him pause an instant, but there was no time. I have observed in life that when an action or gesticulation is totally at variance with the character of the speaker, or with the declaration made, the speaker is telling an untruth, directly or indirectly. Have you also noticed that, my girl? I stamped upon the floor in declaring I had done something to kill my lover, and my subtle-minded tyrant accepted it as a firm declaration of obedience. What a fool he must have been!.....But as to stamping down, I was inspired at the moment. He would have got out but for that!.....

Acquitted as being of unsound mind! My mind was sound enough, my girl, or the sharks would have chopped up my dear, dear lost lover instead of the Abhorred. Let me look closer at you! Are you not Simona? And you tell me that three of the sailors jumped or tumbled overboard to try and save the devil from hell? Two of them were drunk, and one sober, who was drowned, while the drunken men got safely back. Acquitted, too, you say, in consequence of some of the confessions extorted from Andrengo by the rack. Ha! ha! I'm glad he was put on the rack. I hope they brought a white-hot copper bolt for his mouth, so that he might remember what was done to force me to take a lying oath. But they got some truth out of him.

Unsound mind! Poor dear Dr. Maurizzio never considered me in that light; but I fancy that much learning had made him a little mad, when he said the Detestable was only one of a class. Laws, too! and the great lawyer who betrayed us! Suppose the cases had been in some degree reversed, and that I had been much less than half as wicked as the marchese, how certainly and how easily he could have obtained a divorce from me! But those who make these laws either have no sense or foresight, or they care nothing for justice and real morality. My head begins to go round, but my heart is in the middle of the world.

It can not be that men and women are all of the same species. Apart from mere varieties, some bipeds evidently come from a different source. When I think of the tenderness and delicacy of Sebastiano, the pure and steady-burning ardor of his passion for me, his constant self-abnegation, and refined considerateness for one whose enslaved and degraded position might have generated disgust and scorn—when I think of his true nobility of soul, the angelic fire of man's best nature, and then contrast all this with the abnormal.....

Don't tell me any more about the confiscation of all his dear paintings, all his dear, beautiful sketches, by the Neapolitan government; it consoles me to know they will

be preserved, admired, and honored, though I resent the unjust and totally unfounded accusations against him. He never knew of the plot against his life till after my victorious struggles had prevented him from saving the Abhorred. Say no more, poor silly girl, about his dying wish that I should have his best paintings. How would they have looked upon prison walls, or upon these walls? If this is not a prison, it has all the eye-watched, stifling air of one.

No wonder he had a fever, after what his mind had to endure for weeks, besides the events of those last hours on board the yacht, and the final scene. Here are the dear fragments—the torn pieces of his letter from San Pietro's Hospital. I have talked to them, as I do to myself now, and kissed them, and wept over them, till the letter has become mere damp, illegible rags, and all I can now read are the words, "My adored! my adored!" But in my brain all he wrote is forever written—yes, forever, as foolish loving people say, when they are likely to die in a few weeks or days.....

Simona came to me one evening, with an expression of which I had never thought her happy, careless face was capable. As soon as we were quite alone, she came and sat down close by me.

"Ah, dear, sweet Lady Emilia," said she, in an under-tone, "you little know the concluding trial his lordship had prepared for you when you returned next morning to the dismal house in the suburbs after the sharks had done what he intended. One of the cellars—you remember the cellars" (I nodded and smiled)—"was hung all down the walls with dark red cloth, and lighted by two or three tapers. In the middle of the cellar stood a little bier, and upon the bier was a little, little coffin of a black-red color, like the color of a Tuscany rose, and in this coffin there lay a little white image with a red silk cord—a sort of very tight necklace....."

"Away! away! away with your accursed secrets! Do not utter another word, lest a mad heart should kill you! I knew it—I dreamed it—I was sure it would be done one way or the other—and now you have put the finishing light to our picture! Ha! ha! ha!" laughed I, "poor silly chattering bird, that little knows what it says, look down from your idle perch—look at this little foot! What are the white camellias, the intolerant poppies, the brilliancy of the cactus flowers that make their stony mother-beds blaze in the noontide—what are the stocks and wall-flowers that hide the rocks on the sea-shore, or the anemones that crowd the young green rye of the open fields with dazzling purple and scarlet stars—what are they all to this one foot! Vanity, my dear, blossoms up to the edge of the grave, and peeps over. Thus do we forestall our epitaphs. Still, believe me, it really used to be considered as beauti-

ful when I lived in the natural world like other young ladies of my station; but *now* look at it! look at it *now*, and think of the Bay of Naples by starlight, and the life, the spirit, the exalted soul of that one moment!"

I shall write no more. Enough of all things. Farewell, my Otty. "Now," said I, "put me to bed, my good girl. Don't steal any of the fragments of his letter out of my

bosom when I am asleep; and if I never awake again, be sure to take care they are all buried with me. Now, my dear, kiss me—kiss me once more, as if it came from *him*! Ah, that was from heaven! Happy, happy death! And now good-night to you, dear—and to all else on earth. Lay me out gently—place flowers upon my faded bosom—and put white slippers upon my feet. Good-night, my love!"

THE FIRST CENTURY OF THE REPUBLIC.

[First Paper.]

INTRODUCTION.—OUR COLONIAL PROGRESS.

FIFTY-ONE doubtful and divided men, of infinite variety in opinions, education, and character, met in the hot days of July, 1776, in that plain room at Philadelphia where was decided the chief event of modern history, to found a republic. They were about to reverse all the inculcations of recent experience, and to enter at once upon a new era of uncertainty. From all the models of the past they could borrow little, and they overleaped barriers that had affrighted all former legislators. Not Cromwell and Hampden, not the plebeians of Rome and the Demos of Athens, not the republicans of Venice nor the Calvinists of Holland and Geneva, had ventured upon that tremendous stride in human progress that would alone satisfy the reformers of America. Educated in the strict conceptions of rank and caste which even Massachusetts had cultivated and Virginia carried to a ludicrous extreme, they threw aside the artificial distinction forever, and declared all men equal. One sad exception they made, but only by implication. Rousseau had said that men born to be free were every where enslaved; but Adams and Jefferson demanded for all mankind freedom and perfect self-control. Yet still the same dark shade rested upon their conception of independence. But in all other matters they were uniformly consistent. In all other lands, in all other ages, the church had been united to the state. The American reformers claimed a perfect freedom for every creed. Men trained in the rigid prelatical rule of Virginia and the rigorous Calvinism of Massachusetts joined in discarding from their new republic every trace of sectarianism. Religion and the state were severed for the first time since Constantine. Of the many important and radical changes that must take place in human affairs from the prevalence of the principles they enunciated a large part of the assembly were probably unconscious. Yet upon one point in their new political creed all seemed to be unanimous. The people were in future to be the only sovereigns. The most heterodox

of all theories to European reasoners, the plainest contradiction to all the experience of human history, they set forth distinctly, and never wavered in its defense. The English Commons had been content to derive all their privileges from the condescension of the crown. The people of France were the abject slaves of a corrupt despotism. Two or three democratic cantons in Switzerland alone relieved the prevalence of a rigid aristocracy. All over Germany, Italy, and Scandinavia the people were so contemned, derided, and oppressed as scarcely to deserve the notice of the ruling classes. The few ruled over the many, and slavery was the common lot of man. Nor when the reformers of America proclaimed the sovereignty of the despised people, torn and dismembered by the tyranny of ages, could they hope to escape the reproach of wild enthusiasm, or to be looked upon as more than idle dreamers.

Yet the chiefs of the republican party were men so resolute, pure, sagacious, as to deserve the esteem of the most eminent of the Europeans. Touched by a secret pang of admiration for an integrity which he did not share, the historian Gibbon, in the midst of a stately review of the miseries and the joys of all mankind, confessed the sentiment while he clung to his salary and his place. Robertson and Hume, bound to the scheme of royalty by pensions, honors, and official station, dropped a sigh for that independence which they were never to know. Adam Smith lent the Americans a full and generous sympathy. Fox, Burke, and Barré, Wilkes, and even Chatham, joined the brilliant but narrow circle of the friends of America. On the Continent philosophers and poets, princes and statesmen, watched with a singular attention the revolt of the New World against the traditions of the Old. Voltaire from his Swiss retreat, or in the assemblies of Paris, rejoiced over "Franklin's republic." Vergennes was amazed at the blindness of the English ministry, and the folly of their king. And when the story of Bunker Hill and of the rising fame of Washington came like a sudden illumination

over the Atlantic, all Europe began to study with critical interest the characters and the histories of the men who had already shown a consciousness of their natural rights and a power to defend them. The congress of deputies at Philadelphia was no longer an obscure and isolated assemblage; it was plainly laboring upon a grand political problem under the scrutiny of all mankind.

In the following sketch of the progress of the colonies up to the period of freedom I shall endeavor to describe the country as it appeared to Adams and Jefferson, Chatham and Burke, its poor resources, its savage territory, its isolated and divided people. Nothing, indeed, gives us a clearer view of the mental vigor of our ancestors than that they should have foreseen and secured the union of so many distant settlements into one grand nation,¹ and should have predicted with John Adams that the day of independence was the opening of a new era of hope for millions yet to come. A notion had prevailed among Europeans that America could only be the parent of degenerate and feeble races. Buffon had suggested and Raynal confirmed the theory. No man of intellectual ability, no poet, philosopher, or statesman, Raynal said, has yet appeared in the New World. Franklin, Washington, the two Adamses, Jefferson, rose up before mankind almost while he spoke. Yet whoever surveyed the slow advance of civilization in the wilderness under the restraints and discouragements of the English control might scarcely wonder at the doubts of the French philosophers, or hardly see in the long chain of feeble settlements the future homes of civilization.

At the founding of the republic the colonists were accustomed to boast that their territory extended fifteen hundred miles in length, and was already the seat of a powerful nation. But of this vast expanse the larger part even along the sea-coast was still an uninhabited wilderness.² Although more than a century and a half had passed since the first settlements in Massachusetts and Virginia, only a thin line of insignificant towns and villages reached from Maine to Georgia. In the century since the Declaration of Independence a whole continent has been seamed with railroads and filled with people, but the slow growth of the preceding century had scarcely disturbed the reign of the savage on his native plains. On the coast the province of Maine possessed only a few towns, and an unbroken solitude spread from Port-

land to the St. Lawrence. A few hardy settlers were just founding a State among the Green Mountains destined to be the home of a spotless freedom. In New York, still inferior to several of its fellow-colonies in population, the cultivated portions were confined to the bay and shores of the Hudson. The rich fields of the Genesee Valley and the Mohawk were famous already, but the savages had checked the course of settlement. It was not until many years after the war of independence that the fairest part of New York was despoiled of its wealth by a careless agriculture. Schenectady was a frontier town, noted for a mournful doom, and even Albany and Kingston were not wholly secure from the stealthy invasions of the Indian. Pennsylvania, a frontier State, comparatively populous and wealthy, protected New Jersey and Delaware from their assaults; but Pittsburg was still only a military post, and the larger part of the population of the colony was gathered in the neighborhood of the capital.³ Woods, mountains, and morasses filled up that fair region where now the immense wealth of coal and iron has produced the Birmingham of America.⁴

The southern colonies had grown with more rapidity in population and wealth than New York and Pennsylvania. Virginia and the Carolinas had extended their settlements westward far into the interior. Some emigrants had even wandered to Western Tennessee. Daniel Boone had led the way to Kentucky. A few English or Americans had colonized Natchez, on the Mississippi. But the settlers in Kentucky and Tennessee lived with rifle in hand, seldom safe from the attacks of the natives, and were to form in the war of independence that admirable corps of riflemen and sharpshooters who were noted for their courage and skill from the siege of Boston to the fall of Cornwallis. The Virginians were settled in the Tennessee mountains long before the people of New York had ventured to build a village on the shores of Lake Erie or the Pennsylvanians crossed the Alleghanies. But still even Virginia is represented to us about this period as in great part a wilderness.⁵ Its own lands were yet uncultivated, and its territory nearly clothed in forests. And in general we may conclude that the true boundary of the well-settled portions of the allied colonies did not in any degree approach the interior of the continent. In the North the line of cultivated country must be drawn along the shores of the Hudson River, omitting the dispersed settlements in two or three inland districts. The Delaware and a distance of

¹ "A voluntary association or coalition of the colonies, at least a permanent one, is almost as difficult to be supposed; for fire and water are not more heterogeneous than the different colonies," says Burnaby, Pinkert., vol. xiii. p. 751. Yet in 1742 Kalm saw the coldness of the people toward England. Pinkert., vol. xiii. p. 461. He was even told that in thirty or forty years they would form a separate, independent state.

² Holmes, *Annals*. Bancroft. Gordon. Ramsay.

³ Before 1796 there were few settlements north of the Ohio. Cincinnati had then only ninety-four cabins, and five hundred inhabitants.

⁴ Hist. Col. Penn., Day, p. 59.

⁵ Winterbotham, U. S., i. Great part of Virginia is a wilderness, says Burnaby, Pinkert., xiii., p. 716.

perhaps fifty miles to the westward included all the wealth and population of Pennsylvania. The Alleghenies infolded the civilized portions of Virginia, and North and South Carolina can not be said to have reached beyond their mountains. So slowly had the people of North America made their way from the sea-coast.

But little was known¹ of the nature of the country spreading from the borders of Pennsylvania and Virginia to the Mississippi. It was called the Wilderness. It was usually painted in the fairest colors by those who had explored it. The table-land near the Ohio was supposed to be one of the fairest and most fertile portions of the world;² the rich plains of Kentucky might support a nation; and the forests, the meadows, and the valleys lay waiting to be possessed. But the fear of the savage still guarded the tempting region. The dark and bloody ground had no charm for the pacific settler; the wilderness was pathless, and it was a journey of twelve days in wagons from Baltimore to Pittsburg. But of the immense and impenetrable regions beyond the Mississippi our ancestors had scarcely formed a conception.³ It was a land of fable, where countless hosts of savages were believed to rule over endless plains, and to engage in ceaseless battles. Long afterward it was thought that the vast tide of the Missouri might in some way mingle with the waters of the Pacific.⁴ The great Northwest, now the granary of the world, the peaks of the Rocky Mountains, and the rivers of Columbia were all unknown; nor could the most acute observer, shut up in the narrow limits of the Hudson and the Delaware, suppose that within a hundred years the Atlantic would be joined to the Pacific by frequent highways, or that the frightful solitude beyond the great river would be the centre of a throng of vigorous republics.

Within the cultivated districts a population usually, but probably erroneously, estimated at three millions were thinly scattered over a narrow strip of land. The number can scarcely be maintained. The New England colonies could have had not more than 800,000 inhabitants; the middle colonies as many more; the southern a little over a million. New York had a population of 248,000, and was surpassed by Virginia, Pennsylvania, Massachusetts, Maryland, and

was at least equaled if not exceeded by North Carolina. Its growth had been singularly slow. The small population of the union was composed of different races and of almost hostile communities. There was a lasting feud between the Dutch at Albany and the people of New England, for it was believed that the former had held a correspondence with the Indians during the recent war, and purchased the spoil taken from the New England villages. The Germans settled in Pennsylvania retained their national customs and language, and were almost an alien race. Huguenot colonies existed in several portions of the country. The north of Ireland had poured forth a stream of emigrants. Swedish settlements attracted the notice of Kalm along the Delaware. In North Carolina a clan of Highlanders had brought to the New World an intense loyalty and an extreme ignorance. The divisions of race and language offered a strong obstacle to any perfect union of the different colonies. But a still more striking opposition existed in the political institutions of the various sections. In the South royalty, aristocracy, and the worst form of human slavery had grown up together. In no part of the world were the distinctions of rank more closely observed, or mechanical and agricultural industry more perfectly contemned. In New England the institutions were democratic, and honest labor was thought no shame. In the South episcopacy was rigorously established by law; in New England a tolerant Puritanism had succeeded the persecuting spirit of Cotton Mather and Winthrop.

In the period before the Revolution it was the custom to look upon the southern colonies as the land of wealth and material splendor. Their soil produced the chief exports of the New World; their system of agriculture, however abhorrent to the feelings of the more cultivated Northerner, was attended by a remarkable success; their population grew rapidly; they held a ruling position among the colonies in the eyes of all strangers. Virginia had so far surpassed all the other colonies as to seem almost the mother and mistress of the whole. Her own people had named her the "ancient dominion," and her progress was so rapid as to suffer no hope that New York or Massachusetts could ever rival her wealth and power. The population of Virginia alone was half a million—more than twice that of New York.¹ Her exports of tobacco, corn, and other productions reached a value of nearly three millions of dollars. Her ample territory was

¹ Holmes. Bancroft. The French Jesuits had explored the country, and hoped to rule it. Parkman, *Pioneers*.

² "The Ohio," says Winterbotham, l. 189—twenty years later—"is the most beautiful river on earth;" but as late as 1819 Michigan was thought to be a worthless waste, and Cass first explored its rich fields. *Life of Cass*, p. 79.

³ St. Louis was settled in 1763, but was still a small frontier town, scarcely known to the colonists.

⁴ New York Hist. Magazine, August, 1871. "The Missouri has been navigated for 2500 miles; there appears a probability of a communication by this channel with the western ocean." This was said in 1803.

¹ Holmes, 1732, *Annals and Note*. The population of Virginia was estimated very differently by different observers; but Holmes inclines to the largest number. The census of 1790 seems conclusive. It gives Virginia 876,000, while New York had but 340,120, Pennsylvania 434,373. See Ramsay.

penetrated by navigable rivers, and it was supposed that the James and the Potomac must at some time form the outlets for the commerce of the West—a hope from which the Hudson seemed forever cut off by the difficulties of transport from Albany to the lakes.¹ But, with all its advantages, Virginia was weighed down by influences that careful observers saw must lead to a speedy decay. No colony, indeed, was apparently less likely to become the founder of a republic and the patron of human equality. Through all its earlier history Virginia had been noted for its intense loyalty to the Stuarts and its hatred of every element of reform. The planters of Virginia ruled over their abject commonalty with a severity that the English aristocracy had never for many generations equaled. All those feudal restrictions and abuses which the Massachusetts colonists had come to the New World to avoid had been brought over to Virginia by its earlier settlers, and fostered into more than European strength. The church establishment was supported by the colony, and all religious toleration was unknown, at least to the constitution. Nowhere had ecclesiastical tyranny been so fostered by the government. The industrial classes of Virginia had been kept by law in stolid ignorance, when Connecticut had enforced the education of all its citizens. Governor Berkeley had boasted, in 1671, that the colony had neither printing-presses, colleges, nor schools, and had prayed there might be none there for at least a hundred years. His wish had nearly been fulfilled. In 1771 the commonalty of Virginia were noted for their ignorance and brutality; the gentry alone controlled the politics and managed the finances of the colony. Virginia, too, had been the first of all the colonies to import slaves,² and had set an example that had been too eagerly followed. She had practiced both white and colored slavery. The English government had early made her borders a convict colony, and the records bear frequent accounts of highway robbers who had been reprieved that they might go to Virginia; and on one occasion London sends “one hundred of its worst disposed children, of whom it was desirous of being disburdened,” to be apprenticed in the colony.³

The ruling class in Virginia were the planters. They were often cultivated and intelligent men, who had been educated in English universities or in the best schools of their native land. Their possessions were immense, and had usually come to them

from their ancestors. Entails prevented any division of the family property, and it was a common complaint at the time that all the land of Virginia was held by a few hands. Mechanical, agricultural, or commercial pursuits were forbidden by custom to the planting class. It was thought beneath a member of the great families to engage in trade, and Scotch emigrants and foreign adventurers pursued a gainful traffic, engrossing the wealth of the country, while the land-owner slumbered in indolence and fell into poverty on his ancestral estate. The towns of Virginia were small and wretched, fever-stricken and neglected. The wealth of the ruling families was wasted in building immense mansions in the solitude of their plantations, where they emulated the splendors of the English country-seats, and exercised a liberal hospitality. One of the wealthiest of the landed proprietors was Lord Fairfax, the early patron of Washington. In his youth he had cultivated letters, and it was even rumored that he had written for the *Spectator*. His estate in Virginia contained more than five millions of acres.⁴ The fine mansion, Belvoir, seated among the fairest scenery of the Potomac, where he lived with his brother, and Greenway Court, which he built in the Shenandoah Valley, where he died, in 1782, were scenes of frequent festivity. But the accomplished lord was ardently loyal; his property, valued at £98,000, was confiscated at his death, and the land he had selfishly withheld was divided among the people. The fair widow whom Washington had wooed and won with stately assiduity was also a large landed proprietor. But the Revolution broke up the system of entails, and gave a new impulse to the prosperity of the colony.

Notwithstanding the establishment of episcopacy, the growth of dissent had been rapid in Virginia, and at the opening of the colonial struggle the Dissenters were more numerous than Churchmen. That valuable race, the Scotch-Irish, had settled in large numbers within its borders. Education, too, had made some progress. William and Mary's College, sluggish as had been its advance, had sent out many cultivated men. Liberal principles and a love of freedom had never been wanting to the people. Eminent Virginians had already become shocked at the fatal results of slavery, and there were no stronger advocates of abolition than Jefferson and Lee. Throughout the whole colony there was a plain desire for enlarged political progress, and, happily for Massachusetts, her wrongs were felt nowhere more deeply than among the Virginia reformers. Nor was the project of independence any where more favorably received than by that large

¹ Winterbotham discusses the question, and decides in favor of the Potomac.

⁴ Sabine, Am. Royalists. Fairfax and Sparks. Life of Washington.

class of the population who had felt in their own lives the evils of a tyrannical government. Her immense territory, which reached, at least in theory, over the mountains to the Mississippi, and through the whole valley of the Ohio, her wealth and commerce, her population, greater than that of any other colony, and, above all, the rare abilities and patriotism of her citizens, made Virginia the centre of reform, and perhaps the most effective instrument in binding the whole country into a perfect union. Happy had she followed the teachings of Jefferson¹ and the example of Carter, and destroyed slavery when she cast aside feudalism.

Less corrupted by European traditions than Virginia—a land where the English and the German, the Swiss, the Scotch-Irish, Quakers, the children of Skye, and the sad hosts of Africa were mingled strangely together—North Carolina had early shown a wider liberality of thought than her powerful neighbor. Caste and rank had less prevalence; her people were industrious, and her prosperity great. North Carolina was already the fifth colony in importance; the population reached nearly two hundred and fifty thousand.² South Carolina, less populous, but with nearly twice as many slaves as whites, was noted for the haughty manners of its planters, the ignorance of its people, the high education of some of its leading men, their open dislike for slavery. No South Carolinian of any intelligence at this period but lamented that so dark a stain rested upon his native colony. Maryland, too, possessed a weight in the country in 1775 that must seem strange to the modern politician. It possessed a larger population than either New York or the Carolinas. Its Roman Catholic planters were sometimes intelligent and liberal. Maryland still belonged to the heir of the Calvert family, but its people cared little for a degenerate race whose early excellence had faded away. A colony of Scots from the north of Ireland had settled at Baltimore, and were probably of greater value to the rising State than most of its planters and all its proprietors. But slavery, an established church,³ a proprietary government, a rigid division of rank and caste, had apparently linked Maryland so closely to Virginia and the South in politics as to give little room for the progress of freedom. It was, indeed, the first colony to express a wish to withdraw the declaration of independence when sudden reverses fell upon the republican armies.

The four New England colonies, separated from the South by an immense distance,

and a journey of many days, and sometimes weeks, by sea or land, were altogether different from their neighbors in politics.¹ Two of them, Connecticut and Rhode Island, were free from all internal control from England, elected their own governors, and practiced a democratic republicanism.² In Connecticut, at least, all men were already equal, all were educated, and slavery was abolished practically. In Massachusetts the governor was appointed by the English king, but his salary was regulated by the province; yet the Massachusetts people had been rapidly advancing in political knowledge; mental cultivation had always marked their chief men. Their Puritan clergy had produced many of the early authors of America; they were usually wise, austere, and patriotic. Liberty, even in that imperfect form in which it existed under a colonial rule, had shown its fairest results in New England. The people were prosperous, the government well administered, the courts pure, the clergy respected, the general morality above that of any other community. The sentiment of human equality had already prevailed over the influence of English caste and Puritan theocracy; a bold, free nation had arisen, not quite so numerous as the Dutch, who had defied the arms of Philip II., or the Swiss, who had overthrown the Hapsburgs, yet capable even alone of founding a republic that not all the powers of the Old World could overthrow. Its population was purely English, its manners republican and plain, its people accustomed to labor and to reflect.

The middle colonies were less democratic than New England. New York, like Virginia, had been weighed down by a system of entails and by immense landed estates that limited immigration. It is stated that the German colonists were so badly treated by its land-owners that they imbibed a lasting hostility for its people, moved away in large bodies to Pennsylvania, and prevailed upon all their countrymen to follow them. They hoped to make Pennsylvania a new Germany.³ A kind of colonial aristocracy had grown up in New York. Its Dutch population were, however, attached to freedom, and the presence of a royal governor and council had not tended to increase the respect for English institutions. Strong religious differences had already agitated the people. The Episcopal Church was opposed to the Presbyterian, and Calvinism

¹ Dwight, *New England*, paints some years later the virtues of his countrymen. In Connecticut, he says, "there is a school-house sufficiently near every man's door," i. 178. See Hildreth, i. 508.

² Palfrey, *New England*, ii. 567, 568, notices the unexampled liberality of the two charters.

³ Large numbers of Scotch-Irish also came to Pennsylvania about 1773. Holmes, *Ann.*, ii. 187. They came from Belfast, Galway, Newry, Cork, 3500, with no love for England.

¹ Jefferson proposed the abolition of slavery in Virginia, but found it expedient to withdraw his project.

² I have usually adopted Ramsay's numbers, which seem confirmed by the first census, i. 146.

³ Episcopacy was rigorously established in Maryland after 1668.

led on the way to independence. In Pennsylvania the proprietary government was conservative, and opposed to violent measures. New Jersey, rich, highly cultivated, and prosperous, was strongly affected by its Presbyterian college at Princeton, and was naturally opposed to prelatical England. It is indeed curious to notice how largely the religious element entered into the dispute between the king and the colonies.¹ The English revolution of 1688 was re-enacted in America, and King George dethroned because it was feared that he meant to assail the consciences of the people. Men felt that should the king succeed in conquering them, he would have a prelate in every colony, and a rigid rule against progressive dissent. In the middle colonies the Presbyterians led the way to freedom; in the southern the liberal Churchmen, Huguenots, and Scotch Presbyterians. Thomas Paine, in his famous argument for separation, relied much upon the fact that the people of America were in no sense English, but rather a union of different races met for a common purpose in the New World, and resolute chiefly to be free. It was this common aim that produced that harmony which was so seldom interrupted between the various inhabitants of the different colonies, and which formed them at last into one nation.

In the course of a century within their narrow fringe of country the colonists had transformed the wilderness into a fertile and productive territory.² Agriculture was their favorite pursuit. Travelers from Europe were struck with the skill with which they cultivated the rich and abundant soil, the fine farm-houses that filled the landscape, the barns overflowing with harvests, the cattle, the sheep.³ The northern and middle colonies were famous for wheat and corn. Pennsylvania was the granary of the nation. In New Jersey the fine farms that spread from Trenton to Elizabethtown excited the admiration of the scientific Kalm.⁴ Long Island was the garden of America, and all along the valleys opening upon the Hudson the Dutch and Huguenot colonists had acquired ease and opulence by a careful agriculture. The farm-houses, usually built of stone, with tall roofs and narrow windows, were scenes of intelligent industry. While the young men labored in the fields, the mothers and daughters spun wool and flax, and prepared a large part of the clothing of

the family. The farm-house was a manufactory for all the articles of daily use. Even nails were hammered out in the winter, and the farmer was his own mechanic. A school and a church were provided for almost every village. Few children were left untaught by the Dutch dominie, who was sometimes paid in wampum, or the New England student, who lived among his patrons, and was not always fed upon the daintiest fare. On Sunday labor ceased, the church-bell tolled in the distance, a happy calm settled upon the rural region, and the farmer and his family, in their neatest dress, rode or walked to the village church. The farming class, usually intelligent and rational, formed in the northern colonies the sure reliance of freedom, and when the invasion came the Hessians were driven out of New Jersey by the general rising of its laboring farmers, and Burgoyne was captured by the resolution of the people rather than by the timid generalship of Gates.

The progress of agriculture at the South was even more rapid and remarkable than at the North. The wilderness was swiftly converted into a productive region. The coast, from St. Mary's to the Delaware, with its inland country, became within a century the most valuable portion of the earth. Its products were eagerly sought for in all the capitals of Europe, and one noxious plant of Virginia had supplied mankind with a new vice and a new pleasure. It would be useless to relate again the story of the growth of the tobacco trade. Its cultivation in Virginia was an epoch in the history of man. Tobacco was to Virginia the life of trade and intercourse; prices were estimated in it; the salaries of the clergy were fixed at so many pounds of tobacco. All other products of the soil were neglected in order to raise the savage plant. Ships from England came over annually to gather in the great crops of the large planters, and Washington, one of the most successful of the Virginia land-owners and agriculturists, was accustomed to watch keenly over the vessels and their captains who sailed up the Potomac to his very dock.¹ The English traders seem to have been often anxious to depreciate his cargoes and lower his prices. Virginia grew enormously rich from the sudden rise of an artificial taste. From 1624, when the production of tobacco was first made a royal monopoly, until the close of the colonial period the production and the consumption rose with equal rapidity, and in 1775, 85,000 hogsheads were exported annually, and the sale of tobacco brought in nearly \$4,000,000 to the southern colonies.² This was equal to about one-third of the whole export of the

colonies. Happily since that period the proportion has rapidly decreased, and more useful articles have formed the larger part of the export from the New World to the Old.

One of these was rice. A Governor of South Carolina, it is related, had been in Madagascar, and seen the plant cultivated in its hot swamps.¹ He lived in Charleston, on the bay, and it struck him that a marshy spot in his garden might well serve for a plantation of rice. Just then (1694) a vessel put in from Madagascar in distress, whose commander the Governor had formerly known. Her wants were liberally relieved. In gratitude for the kindness he received the master gave the Governor a bag of rice. It was sown, and produced abundantly. The soil proved singularly favorable for its culture. The marshes of Georgia and South Carolina were soon covered with rice plantations. A large part of the crop was exported to England. In 1724, 100,000 barrels were sent out from South Carolina alone. In 1761, the value of its rice crop was more than \$1,500,000. Its white population could not then have been more than 45,000, and it is easy to conceive the tide of wealth that was distributed annually among its small band of planters. They built costly mansions on the coasts and bays, lived in fatal luxury, were noted for their wild excesses, and often fell speedy victims to the fevers of the malarious soil. Indigo, sugar, molasses, tar, pitch, and a great variety of valuable productions added to the wealth of the South. But cotton, which has grown through many vicissitudes to be the chief staple of British and American trade, was, at this period, only cultivated in small quantities for the use of the farmers. It was spun into coarse cloths. But it was not until Whitney's invention, in 1793, that it could be readily prepared for commerce, and to the inventive genius of Connecticut the Southern States owe the larger part of their wealth and political importance.

Extensive as had been the results of the labors of the American farmer at this period, he had achieved the conquest of the wilderness in the face of dangers and obstacles that seemed almost overwhelming. None of the appliances of modern agriculture lay at his command. His tools were rude yet costly, his plow a heavy mass of iron, his cattle expensive, and at first scarcely to be obtained. The fevers and malaria of the new climate, the sharp frosts, the unknown changes, even the not infrequent earthquakes and celestial phenomena, must have covered him with alarm. Before him lay the dark and pathless wilderness, behind him the raging seas. A whole ocean separated him from his kind. In front the savage hovered

over the advancing settlements, and not seldom filled the thin line of cultivated country from Albany to Savannah with the tidings of fearful massacres. Often the frontier families came flying from their blazing homes, scarred and decimated, to seek shelter from the unsparing foe. Yet more cruel or more unfriendly than the terrors of the wilderness, the climate, or even the savage, seemed to the colonists the conduct of their royal government in England. Instead of aiding the struggling settlers in their contest for life, it had treated them as objects of suspicion and dislike. A fear that they might plan at some future time a separation from the mother country governed all the English legislation.² Hence laws were early imposed upon them that might well have checked the whole progress of their agriculture. They were forced to purchase all their supplies from England. They were scarcely permitted to have any commercial intercourse with any foreign country, or even with each other.³ They were obliged to send all their tobacco, sugar, indigo, rice, furs, ores, pitch, and tar directly to England, and there accept the price the English traders were willing to give. It was forbidden them even to send their produce to Ireland. These jealous restrictions must have kept many an acre from being planted, and prevented that rapid progress which free trade could alone incite. Franklin showed clearly that in this way the colonies had always paid a heavy tax to England, of far greater value than any stamp act could ever give, and that the English merchants and traders had already grown rich by the onerous burdens they had laid on America.³ Had the colonial ports been opened to foreign traffic, every article must have risen in price, or the demand for it increased beyond conception. But the English had always treated the colonists with a severity like that which Spain once practiced in South America, and which she now exercises over the creoles of Cuba. Corrupt and worthless Englishmen were sent out as governors, councilors, judges, and even clergymen. They looked with disdain on the colonists they plundered, and hastened back to England to defame the reputation of the abject race. It is plain that most Englishmen looked upon the Americans as serfs. They had no rights that Parliament could not abrogate, and no security even for their own earnings. England plundered the American farmer almost at will, and robbed of his just profits the sturdy laborer in the

¹ England now treats her colonies with the gentleness advised by Burke and Franklin, and her authors condemn the old tyranny as strongly as Americans. Mr. Doyle, of Oxford, has produced a careful essay on the progress of the colonies, 1869.

² Ships might sail for wines to Madeira and some Spanish ports, under certain restrictions.

³ Franklin to Shirley, December, 1754.

¹ The legend is told by Pitkin, 101, and Ramsay.

valleys of Vermont, and the wealthy rice planter in the swamps of South Carolina.

The commerce of the colonies flourished equally with their agriculture. It was chiefly in the northern colonies that ships were built, and that hardy race of sailors formed whose courage became renowned in every sea. But the English navigation laws weighed heavily upon American trade. Its ships were, with a few exceptions, only allowed to sail to the ports of Great Britain. No foreign ship was suffered to enter the American harbors. The people of England were resolved to prevent all foreign interference in the trade of the colonies, and the American ports were rigidly shut out from the commerce of the world. Isolated from the great centres of traffic, and even from exchanging many articles with each other, bound by a most oppressive monopoly, restrained by a selfish policy, the colonists yet contrived to build large numbers of ships, and even to sell yearly more than a hundred of them in England. The ship-yards of New England were already renowned. Boston, New York, and Philadelphia were seats of an important trade. On the island of Nantucket the whale-fishery had been established that was to prove for a brief period the source of great profit, and a school of accomplished seamen. The spermaceti-whale was still seen along the American coast, but the New England whaler had already penetrated Hudson Bay, and even pierced the antarctic. The Revolutionary War broke up the trade, and the English captured two hundred of its ships, besides burning the oil stored on the island.¹ In consequence of the rigid navigation laws, smuggling prevailed along all the American coast, and swift vessels and daring sailors made their way to the ports of France and Spain to bring back valuable cargoes of wine and silks. Boston was the chief seat of ship-building, and its fast-sailing vessels were sent to the West Indies to be exchanged for rum and sugar. In 1743² it was estimated that New England employed one thousand ships in its trade, besides its fishing barks. But when the laws were more strictly enforced, the shipping trade of Boston declined. British war vessels watched the colonial ports, and cut off that large source of wealth which the colonists had found in an illicit commerce with Spain and the West India Islands, and it was with no kindly feeling that New England and New York saw the gainful traffic destroyed which had brought them in a stream of French and Spanish gold.³ The rude English officials not seldom made illegal seizures. Every custom-house officer was turned into an informer, and no cargo seemed altogether secure.

There was no redress except in an appeal to England. Yet the American commerce still flourished, even within the narrow limit to which it was confined, and the colonists bore with admirable patience the exactions and restrictions to which they were subjected in order that New York and Boston might not compete with London and Bristol. In fact, the navigation laws had prevented altogether that natural and healthy growth which might have made the colonial sea-ports even in 1775 considerable cities. But twenty-four thousand tons of shipping were built in the colonies in 1771, and the whole exports were in 1770 three millions of pounds sterling, and the imports about two and a half millions. It was noticed that the value of the tobacco exported was one-fourth larger than that of the wheat and rye.¹ The rise of American commerce had seemed wonderful to Burke, Barré, and all those Englishmen who were capable of looking beyond the politics of their own narrow island; but no sooner had America become free than its trade doubled, trebled, and soon rose to what in 1775 would have seemed incredible proportions. New York, Boston, and Philadelphia became at once large cities, and England was enriched by American freedom.

One gainful source of traffic to the colonial and British merchants had been the slave-trade. Immense numbers of these unwilling emigrants were forced upon the colonial markets, chiefly by the inhuman policy of England. A strong feeling of disapprobation for this species of merchandise had early grown up in the minds of the Americans, and Pennsylvania, New England, and even South Carolina were anxious to discourage it by imposing a heavy tax on slaves. But the English Parliament abrogated all their humane legislation. No sentiment of Christian mercy seems to have moved the bishops, lords, and accomplished statesmen who held the control of the American trade. The English merchants insisted upon their monstrous traffic. In one year six thousand slaves were brought to South Carolina; fifteen thousand were forced upon all the colonies. It is at least an indication of the higher degree of civilization to which the inhabitants of the New World had attained that they were the first to exclaim against the horrors of slavery, and that they taught the English intellect one of the most striking principles of modern progress. If in any particular men have risen beyond the cruel selfishness of the earlier ages, it is in the recognition of the principle that human slavery shall no more be tolerated. The Pennsylvanians as early as 1713 protested against the barbarous traffic.² One of the chief grievances of New England was that

the English were resolute to force slaves upon them; and when the colonies became free, they proceeded at once to indicate a period after which no more Africans should be imported into America. They were the first to fix the ban of civilization upon an infamous traffic, which had been sanctioned by the usages of all ages. If they did not abolish slavery itself, it was because the cruel legislation of English statesmen had implanted the evil so deeply in the midst of the new nation that nothing but a fearful civil convulsion could eliminate and destroy it.

In manufactures the colonists can be said to have made but little progress. The English government had rigorously forbidden them to attempt to make their own wares. A keen watch had been kept over them, and it was resolved that they should never be suffered to compete with the artisans of England. The governors of the different colonies were directed to make a careful report to the home government of the condition of the colonial manufactures, in order that they might be effectually destroyed.¹ From their authentic but perhaps not always accurate survey it is possible to form a general conception of the slow advance of this branch of labor. South of Connecticut, we are told, there were scarcely any manufactures. The people imported every thing that they required from Great Britain. Kalm, indeed, found leather made at Bethlehem, in Pennsylvania, as good as the English, and much cheaper. He praises the American mechanics; but, in general, we may accept the report of the governors that all manufactured articles employed in the family or in trade were made abroad. Linens and fine cloths, silks, implements of iron and steel, furniture, arms, powder, were purchased of the London merchants. But this was not always the case in busy New England. Here the jealous London traders discovered that iron foundries and even slitting-mills were already in operation; that fur hats were manufactured for exportation in Connecticut and Boston; that the people were beginning to supply their own wants, and even to threaten the factories of England with a dangerous rivalry. The English traders petitioned the government for relief from this colonial insubordination, and Parliament hastened to suppress the poor slitting-mills and hat manufactories of our ancestors by an express law.² The hatters, who seem to have especially excited the jealousy of their London brethren, were forbidden to export hats even to the next colony, and were allowed to take only two apprentices at a time. Iron and steel works were also prohibited. Wool and flax manufactures were suppressed by stringent provisions. American factories were

declared "nuisances." No wool or manufacture of wool could be carried from one colony to another; and, what was a more extraordinary instance of oppression, no Bible was suffered to be printed in America.¹

Under this rigid tyranny American manufactures had sunk into neglect. Massachusetts had ventured to offer a bounty on paper-making, and some Scottish-Irish had introduced the manufacture of linen; iron furnaces had been erected in various parts of the country, and its immense mineral wealth was not altogether unknown. But it is safe to conclude that from Maine to Georgia no species of artistic manufactures existed within the colonial limits. The farm-house and the spinning-wheel were the only centres of a native industry which the British Parliament could not suppress. Of those two great sources of American progress, coal and iron, the latter had assumed some importance. Pennsylvania, New Jersey, and Virginia had begun to produce pig-iron in an imperfect state. The ore might be exported to England, and even Ireland, and it was already known that the colonies could produce such large quantities of the metal as would supply their own wants, and perhaps those of Europe.³ As they were not suffered to manufacture even a nail or a pin, a wheel or a plow, England made immense profits by returning the raw iron to America in various articles of trade. Coal was known to exist within the colonies, and was mined in Virginia.² Speculative observers foresaw the day when furnaces and factories might spring up along the banks of the Delaware and the Potomac, and the mineral wealth of the country be made to contribute to the prosperity of the colonies. But of that immense and inexhaustible store-house of the finest coal the world possesses which lies in the Lehigh Valley and upon Mauch Chunk Mountain our ancestors could have had no conception. No one supposed that beneath the rude and pathless forest, on lands that seemed destined to perpetual sterility, covered with savages, and terrible even to the hunter, there lay mines richer than Golconda, and stores of wealth beyond that of Ormuz and the Ind. Or had any statesman of 1775 ventured to predict that on the site of Fort Pitt, in the heart of a terrible wilderness, at the junction of two impetuous streams, was to spring up, within a century, a city where coal and iron, lying together in its midst, should be the source of a boundless opulence, he would have lost forever all

¹ Bancroft, v. 266.

² Kalm, Pinkert., xiii., p. 473. Pennsylvania, he thought, can supply all the globe with iron, so easily was it procured. "But coals have not yet been found in Pennsylvania (p. 406), though people pretend to have seen them higher up," he says.

reputation for discretion. The journey from the Delaware to Pittsburg was long the terror of the Western settler.

It was long after the Revolution that a hunter who had been out all day on Mauch Chunk Mountain, and had found no game, and who was returning weary and disheartened to his cabin, with no means to purchase food for his family, struck with his foot as he passed along a black crystal. He stooped and examined it.¹ The first specimen of that priceless mineral which has transformed the wilderness into a populous nation, and contributed to the comfort of millions, lay before him. The rain fell fast. The hunter was tired and hungry. Yet he took up the apparently worthless stone and carried it with him to his cabin. Mauch Chunk then lay bare and bleak, the haunt of wild beasts and savage men, and had not the hunter preserved his shining mineral, might still have hidden its secret stores for another decade. He showed the specimen to a friend; it was taken to Philadelphia. The mountain was explored, and a company formed to work the mine. But it was at first unsuccessful, and many years elapsed before Pennsylvania became conscious of its hidden treasures, and discovered that it possessed mines richer than those of the Incas and perennial fountains of industrial progress. The unlucky discoverer, it seems, reaped little profit from his good fortune. His land was taken from him by a prior claim. He died in poverty. Great companies, possessed of enormous capital, and spanning with their combined railroads half the continent, now encircle the Mauch Chunk Mountain with their avenues of trade. Coal has been found heaped upon the sides of the hills, and compressed in huge masses in the valleys. The richest and almost the only bed of anthracite in the world has been discovered beneath the path of the solitary hunter.

The wild men of the woods and marshes were to our ancestors objects of interest as well as terror.² In the earlier period of the colonial history their numbers had been exaggerated, and it was believed that a hundred thousand painted savages might at some moment throw themselves on the white settlements. But it was found at length that one nation was alone formidable, and that an Indian empire had risen beneath the shadows of the forest that resembled in its extent, its cruelty, and its love of glory the most renowned of European sovereignties and conquerors. In the seventeenth century the Six Nations had their seat in that fair and fertile portion of New York that reaches from Albany to Lake Erie. Onondaga was their capital. A single sachem ruled with un-

disputed authority over the obedient league.³ A passion for conquest and a love of martial fame had led this singular confederacy to exploits of daring that seem almost incredible. They held in a kind of subjection all the territory from Connecticut to the Mississippi. The wild tribes of Long Island obeyed the commands of Onondaga; and even the feeble Canarsie, on its distant shore, trembled at the name of the Mohawk. Under the shade of the endless forests, over the trackless mountains, and across rapid rivers, the war parties of the Six Nations had pressed on to the conquest of Pennsylvania and New Jersey, and all Virginia yielded to their arms.⁴ They fought with the Cherokees on the dark and bloody ground of Kentucky. The Illinois fled before them on the fair prairies, now the granary of the continent. The savages seem to have resembled the extinct races whose bones are found in the prehistoric caves of Kent and Dordogne. They were cruel, and rejoiced in the tortures of their captives. Their wigwams were filthy and smeared with smoke, adorned with scalps, and hung with weapons of war. Cunning and deceit formed a large part of their tactics. They rejoiced to fall upon their enemies by night and massacre the flying inhabitants of the blazing wigwams. Yet in their rude society the savages manifested the elements of all those impulses and passions that mark the civilization of Europe.⁵ They were fond of fine dress, and their women produced rich leather robes, glittering with decorations in colored grasses and beads, head coverings, adorned with feathers, and moccasins of singular beauty. They danced, they sang, with a skill, vigor, and precision that Taglioni might have envied or a Patti approved. The Iroquois boasted that they had themselves invented twenty-six different dances. They exchanged visits from wigwam to wigwam, and practiced a courtesy that might have instructed Paris. They had their orators, who polished their sentences with the accuracy of Cicero. With a simple faith they worshiped the Supreme Spirit; and yearly, in February, when the germs of life were opening, met to return thanks to their Maker that he had preserved their lives for another year. A white dog was sacrificed, prayers were offered, hymns of thanksgiving sung,⁶ and on the wild shores of the Seneca or Cayuga lake a natural worship hallowed the savage scene.

⁵ Mem. Penn. Hist. Soc., i. part ii. p. 317.

⁶ The Indians had the vanity of all feeble intellects, and thought themselves the superiors of all mankind. Colden, i. 8.

Of the numbers of the Indian tribes it is of course impossible to form any exact estimate. But it is believed that in the height of their power the Six Nations never possessed more than seventeen thousand warriors, and that in the year 1774 they had scarcely two thousand. Their whole number was then estimated at ten thousand souls.¹ Their wars with the French and with the native races had rapidly reduced their strength. It was stated by Tryon at this time that the wilderness from Lake Erie to the Mississippi could furnish twenty-five thousand warriors, and was inhabited by one hundred and thirty thousand Indians. In the South the Cherokees were the ruling race, and might, with their allies, produce several thousand men. It was with these fierce and relentless warriors that the English hoped to devastate the long line of frontier settlements from Lake Ontario to the Savannah. Twenty thousand Indians, it was thought, would fall upon the unprotected colonists, and with the scalping knife and the musket force them to submit to the British king. Nothing more incited the colonies to independence than this unheard-of barbarity. It was when all the distant settlements were threatened by an Indian invasion that they resolved upon perfect freedom; and even the patient Washington when he heard the news could not restrain his malediction upon the cruel tyrant, and urged an instant separation.² In periods of peace the Indians had afforded the colonies an important branch of trade. Furs and skins were exported in large quantities to Europe, and the most successful trappers were the Six Nations, who brought their wares to Albany, and the less warlike tribes who dealt with the merchants of Fort Pitt. Gold and silver were of no value to the savages. They would only receive their payment in wampum or strings of shells³—a currency that passed freely over all the continent—or in powder, shot, and muskets, rum, and sometimes articles of dress. A fine uniform or a glittering coat was sometimes exchanged for large tracts of land. A string of periwinkle shells, purple or white, was valued at a dollar; and the first church in New Jersey, it is related, was built and paid for from contributions in wampum.⁴ New York and Albany in the early Dutch period had almost adopted the currency of the savage. There are, indeed, marked traces of the influence of Indian customs and superstitions among the whites. Their omens, dreams, and intense belief in witchcraft, their incantations and spells, seem to have convinced Cotton Mather

and the New England divines of their close connection with the spirit of evil,¹ and helped to increase the sense of a present Satan in the neighboring forests. To the wild hunters of the border the savages taught their keen study of nature, their caution, and their impassiveness. The frontiers-men borrowed their moccasins, hunting shirts of leather, and caps, their patience of cold and hunger, and rivaled them at last in the pursuit of game. At the close of the Revolution the power of the Six Nations was broken forever. They had taken the side of the English, except only the friendly Oneidas, and the last of the Mohawks found a refuge in Canada.² The other tribes sold their possessions, and nearly all moved away. Canandaigua, Cayuga, Oneida, Onondaga, gave names to flourishing white colonies from New England, and with the destruction of the Indian rule New York rose rapidly to the first place in population and power among its sister States.

Next to the Indians, along that wide fringe of border land that skirted the banks of the Hudson, the declivities of the Alleghanies, and the western counties of the Carolinas on the brink of the Wilderness, lived the hardy race of the pioneers. The home of the woodsman was usually a log-cabin; his chief wealth his musket and a family of healthy children. Far away from the centres of civilization, more familiar with the manners of the wigwam than of the city, generous, fanciful, fond of nature, and of the trees and rivers, mountains and plains, around him, always ready for change and new adventure, the pioneer lived in ceaseless excitement, and sank at last to rest under the green sod of some untried land. His life was, indeed, never secure from the treacherous assaults of the wild men of the woods. The Indians were as fickle as they were mobile and active. The pioneers, trained in constant watchfulness, produced some of the most noted and possibly the most eminent of the men of the Revolution. Washington himself was in his early youth educated in the arts of frontier life. Poor, self-instructed, accurate,³ truthful, at nineteen he had as a surveyor studied the wilderness west of the Alleghanies, and learned the life of the woods. At a later period he traveled on foot with a pack on his shoulders from Winchester to the Ohio, through the heart of the forest. Later still he led the provincial troops through the woods and mountains, and became famous as a commander; and when the fate of freedom rested on him alone, his experience in the forest and the wilderness

³ The careful drawings of the self-taught Washington show the methodical nature of his mind. See Sparks, Life.

guided him to the victories of Trenton and Princeton. Daniel Boone, the founder of a State, was a more accurate example of this wayward class. From his cottage on the Yadkin, where, surrounded by wife, children, and comparative ease, he might well have lived content, an irresistible desire to explore the mysterious wilderness drew him away. He climbed the tall Cumberland Mountains, and saw with a kind of rapture, he relates, the lovely plains of Kentucky, the buffaloes cropping the rich meadows, the flowers blooming in the waste.¹ He descended into the paradise, was captured by some Indians, who came upon him and his companion from a cane-brake, escaped, was found by his brother in the wilderness, to his unspeakable joy; and when his brother left him, built a hut, and lived alone, he declares, in inexpressible happiness. From the summit of some commanding hill he delighted to trace the windings of the Kentucky through its ample plains, or hunted for his daily food through the teeming woods. "Through an uninterrupted scene of sylvan pleasures," he writes, "I spent my time."² He resolved to return to North Carolina for his family, and found a settlement in the smiling waste. He sold his farm. With wife and children and a small band of settlers, he climbed again the wild Cumberland Mountains. The Indians attacked the small party, his son fell in battle, but the ardent pioneer persisted in his vision, and founded Boonesborough, on the banks of the Kentucky, in the wilderness he loved so well. A small stockade was built. It was attacked by the Indians. Boone was taken prisoner in a warlike expedition, but instead of torturing him, the Shawanese adopted him into their tribe and treated him as a brother. Again he escaped, and in his wooden fort at Boonesborough sustained a siege that had nearly proved successful. The savages were repulsed, peace and liberty came together, and the bold pioneer died in the scene he had looked upon with rapture, the founder of a new nation, and surrounded by a grateful people.³

Such were the men who led the way to the frontier settlements, who first crossed the Alleghanies, who penetrated beneath the shadow of Lookout Mountain, or ventured into Cherry Valley, when the Six Nations still ruled over Western New York. They formed a long line of isolated colonies, and disputed with the savages the possession of the wilderness. Behind them, protected by their necessary vigilance, the more peaceful settlers cultivated their ample farms and lived in prosperous ease. Yet the border land was never safe from a hostile invasion.

¹ Filson's Kentucky. Boone's Narrative.

² Narrative, p. 36.

³ Filson, p. 49. "He lived at last," it is said, "in peace, delighted by the love and gratitude of his countrymen."

When the English first incited the savage tribes to a general rising the whole frontier was penetrated by a series of murderous attacks. The settlers on the outskirts of North and South Carolina fled from their blazing homes or perished in an unsparing massacre. The Indians who followed Burgoyne filled New York with slaughter. Vermont and New Hampshire trembled before their threats. Cherry Valley armed in its defense.¹ The fate of Wyoming has been told in immortal song. The shores of the Hudson were no longer safe. Brandt and his band of savages penetrated into Orange County, and the massacre of Minisink alarmed the Huguenot farmers in the rich valleys of the Shawangunk and the Dutch in the hill country around Goshen. As the savages pressed on into Orange County they came to a school-house which was yet filled with its children. They took the school-master into the woods and killed him. They clove the skulls of several of the boys with their tomahawks; but the little girls, who stood looking on horror-struck and waiting for an instant death, were spared. A tall savage—it was Brandt—dashed a mark of black paint upon their aprons, and when the other savages saw it they left them unharmed. Swift as an inspiration the little girls resolved to save their brothers.² They flung over them their aprons, and when the next Indians passed by they were spared for the mark they bore. The school-master's wife hid in a ditch and escaped. It was amidst such dangers that our ancestors founded their new republic, and forced on the course of progress.

Within the more cultivated portions of the country the most influential person in every town was usually the clergyman. In New England the authority of the ministers was no longer what it had been in the days of Cotton and the Mathers. A revolt had taken place against the spiritual hierarchy which had opened the way for intellectual freedom. But the New England pastor was distinguished always for virtues and attainments that gave him a lasting prominence. In his youth he had passed through a spiritual exercise which had fixed him in the path of virtue. He examined his own nature with the accuracy of a Pythagorean. He had laid down rules to himself that formed the guiding principles of his life. Sloth he abhorred; he resolved to lose no moment of time; to do nothing that he should be afraid to do in his last hour; to consecrate himself to the service of his Maker.³ The image of ideal virtue had dawned upon him in its surpassing loveliness, and he wandered away into the still woods and pleasant fields filled

¹ Campbell, Tryon County, is full of the trials of frontier life.

² Eager, Orange County, p. 391. It was July, 1779.

³ Edwards, Diary and Life.

with sweet visions of the divine Messiah. Yet he knew that the world was full of trouble and vexation, and that it would never be another kind of a world. It was thus that Jonathan Edwards meditated in the dawn of his intellectual youth, and many another ardent follower of Calvin. The New England minister was fond of scholastic theology. He keenly pursued the delicate and refined distinctions of election and grace, of free-will and predestination, but seldom wandered far from the decisions of the Geneva school. Yet he had learned self-control, and was well fitted to direct the conduct of others. Elected by the voice of the people to the ministry of a town or city congregation, his scholarship and his decision gave him a political and personal influence that he was not afraid to use.¹ The clerical families were often connected by the closest ties of relationship, and the pastorate descended from generation to generation. The Cottons and Mathers ruled over Boston for nearly sixty years. Edwards was the grandson of a clergyman, succeeded to his charge, married a clergyman's daughter, and married his own daughter to the Rev. Aaron Burr. Yet the people of Northampton, where he was settled, with the largest salary in New England, rebelled against his authority. He removed to Stockbridge, and became at last president of the College of New Jersey on the death of his son-in-law, Burr.

These cultivated men were usually ardent patriots. But their patriotism was no doubt stimulated by the dread of a religious rather than political tyranny. A fear prevailed in all New England that Parliament and the king were resolved to impose bishops upon each of the colonies, and to enforce by law the ritual of the Church of England. Whitefield had warned the colonies of a coming woe. The imprudent conversation of young Episcopal ministers in Connecticut and Boston added to the apprehension. Archbishop Secker had suggested the idea of an American episcopate,² and the project was already entertained in England of reducing New England to a subjection to the national Church by lavish bribes to its independent clergy, and by the reform or suppression of all the colonial charters. Cambridge had even been suggested as the seat of a colonial bishop, and an Episcopal church had already sprung up beneath the shadow of Harvard College under the auspices of the Society for Propagating the Gospel in America. Then Mayhew of Boston began a series of publica-

tions that sounded an alarm throughout the country. He felt the danger; he saw the unscrupulous nature of the men who ruled in England. The "overbearing spirit of the Episcopalians" he brooded over, until he almost felt once more the clerical tyranny from which the gentle Robinson had fled, and which had impelled the *Mayflower* over the stormy sea. "Will they never let us rest in peace," he cried, "except where all the weary are at rest?" Is it not enough that they persecuted us out of the Old World?" Yet Mayhew was still sufficiently loyal to hope that King George was "too good and noble" to suffer it. When the controversy with England began, Mayhew was ever ready to support the liberties of his country, and his pulpit resounded with patriotic exhortations. Almost every Congregational minister was equally faithful. Like the Huguenot and the Covenanter, they even fought in the ranks, and sometimes led their townsmen to battle, and fell among the first.

The clergy of the middle and southern colonies were persons less distinctly the leaders of the people than in New England. The Episcopalian ministers were often mild and amiable men who cared nothing for politics. They were inclined to the English rule, but were not unwilling to share the fortunes of a new nation. Some, however, were bitter and relentless in their Toryism; their violence helped to bring discredit on their cause, and their religious intolerance led them to their ruin. In New York the Dutch and Presbyterian clergy were often eminent for their virtues and their scholarship; their churches in the city were to the eyes of our ancestors splendid, their salaries high, their congregations numerous and attentive. The Presbyterian church in Wall Street, the new Dutch church, and even the old, were scarcely surpassed by Trinity and St. Paul's. Meantime a new religious influence had been impressed upon the nation by the preaching of Whitefield, and in 1742 a revival had swept over the country that never lost its effect. Villages and cities had been stirred by the impulse of reform. Many strange and some not attractive scenes had followed it. Children held their meetings for prayer apart.³ Women had been roused to unreflecting fanaticism, and imposture and hypocrisy had flourished in the general excitement. Yet it was acknowledged that every where morality had received a real impulse at the hands of faith. The clergy themselves profited by the general movement, and became better fitted to guide the people. The Roman Catholic clergy at this period had lost much of their early intolerance. The Society of the Jesuits had been abolished, a series of

¹ The minister was sometimes obliged to rule his people with no tender hand, and violent controversy often arose, which sometimes "came to hard blows." Life of Edwards, i. 464. The people of Northampton were of "a difficult and turbulent temper," etc.

² Gordon, i. 143, gives the general apprehension and the plan.

² *Observations*, p. 156.

³ Edwards, *Life*.

moderate and reputable popes had ruled at Rome, and reform seemed about to invade the councils of the Vatican. The fanatical reaction of the nineteenth century had not yet begun.

In the towns and villages the lawyers shared with the clergy the intellectual influence of the time. Many of them were well-read and accomplished men, who joined to their technical knowledge a considerable acquaintance with letters, or were noted for their natural eloquence. John Adams had prepared himself by a careful study of his profession to defend with legal accuracy the rights of his countrymen. William Smith, of New York, was known as a faithful historian as well as jurist, and formed the intellect of John Jay. Colden wrote well. In Virginia Patrick Henry had won his first renown by an impassioned appeal against the avarice and the ambition of the Established Church. Jefferson had trained himself by practice in the courts before he essayed to condense in a brief memorial the rights of man. Nothing indeed is more remarkable at this period than the nicety and clearness with which the various points in dispute between the colonies and England were discussed in every part of the country, and the superiority in argument which the legal writers of America showed over their opponents in London when they treated of the professional elements of the controversy. Otis and Adams reasoned with calmness and force, while Johnson raved and Mansfield blundered. In the grand argument which the American lawyers addressed to the suffrages of the civilized world there was a depth of reflection and a wide acquaintance with the principles of the common and international law that proved to acute observers their just claim to freedom. No one could think such men unworthy to found a state.

The chief cities of our ancestors were all scattered along the sea-coast. There were no large towns in the interior. Albany was still a small village, Schenectady a cluster of houses. To those vast inland capitals which have sprung up on the lakes and great rivers of the West our country offered no parallel. Chicago and St. Louis, the centres of enormous wealth and unlimited commerce, had yet no predecessors. Pleasant villages had sprung up in New England, New Jersey, and on the banks of the Hudson, but they could pretend to no rivalry with those flourishing cities which lined the sea-coast or its estuaries, and seemed to our ancestors the abodes of luxury and splendor. Yet even New York, Philadelphia, and Boston,¹ extensive as they appeared to the colonists, were insignificant towns compared to

the European capitals, and gave no promise of ever approaching that grandeur which seemed to be reserved especially for London and Paris. In 1774 the population of New York was perhaps 20,000; that of London 600,000. The latter was thirty times larger than the former, and in wealth and political importance was so infinitely its superior that a comparison between them would have been absurd. Boston, which has crowned Beacon Hill, pressed over the Neck, and even covered with a magnificent quarter a large surface that was once the bed of the Charles River, was in 1774 a town of 15,000 or 18,000 inhabitants, closely confined to the neighborhood of the bay. The Long Wharf may still be seen on the ancient maps; the Common was used as a public resort;² the Hancock House was illuminated at the repeal of the Stamp Act, and the Sons of Liberty raised on the Common a pyramid of lamps, from the top of which fire-works lighted up the neighboring fields. But Beacon Hill was still used by its owner as a gravel-pit, and it was feared by the citizens that he might level it altogether. The Boston of 1774, which proclaimed freedom and defied the power of England, would scarcely rank to-day among the more important country towns. New York was more populous, but it was still confined to the narrow point of land below the Park. The thickly built part of the town lay in the neighborhood of Whitehall. Some fine houses lined Broadway and Broad Street,³ but to the west of Broadway green lawns stretched down from Trinity and St. Paul's to the water. Trees were planted thickly before the houses; on the roofs railings or balconies were placed,⁴ and in the summer evenings the people gathered on the house-top to catch the cool air. Lamps had already been placed on the streets.⁵ Fair villas covered the environs, and even the Baroness Riedesel, who had visited in the royal palaces of Europe, was charmed with the scenery and homes of the citizens. Extravagance had already corrupted the plainer habits of the earlier period. The examples of London and Paris had already affected the American cities. The people of New York drank fiery Madeira, and were noted for their luxury. Broadway was thought the most splendid of avenues, although it ended at Chambers Street. And twenty years later, when the City Hall was built, it was called by Dwight (a good scholar) the finest building in America.⁶ The streets of New York and Boston were usual-

¹ Burnaby describes Boston as the most cultivated of the American cities. Dwight thinks New York "magnificent" at a later period.

ly crooked and narrow, but the foresight of Penn had made Philadelphia a model of regularity. Market and Broad streets were ample and stately. The city was as populous as New York, and perhaps the possessor of more wealth. It was the first city on the continent, and the fame of Franklin had already given it a European renown.¹ Yet Philadelphia when it rebelled against George III. was only an insignificant town, clinging to the banks of the river; and New York invited the attack of the chief naval power of the world with its harbor undefended and its whole population exposed to the guns of the enemy's ships. The southern cities were yet of little importance. Baltimore was a small village. Virginia had no large town. Charleston had a few thousand inhabitants. Along that immense line of sea-coast now covered with populous cities the smallest of which would have made the New York and Boston of our ancestors seem insignificant, only these few and isolated centres of commerce had sprung up. The wilderness still covered the shores of Long Island, New Jersey, Delaware, and the Carolinas almost as in the days of Raleigh.

To pass from one city to another along this desolate shore was, in 1775, a long and difficult journey. Roads had been early built in most of the colonies. In Massachusetts they were good, except where they passed over the hills. In New York a good road ran through Orange and Ulster counties to Albany. That between New York and Philadelphia was probably tolerable. In the southern colonies but little attention was paid to road-building, and even those in the neighborhood of Philadelphia were often almost impassable. A stage-coach ran in two days from New York to Philadelphia, but the passengers were requested to cross over the evening before to Powle's Hook, that they might set out early in the morning.² Sloops sailed to Albany in seven or eight days.³ From Boston to New York was a week's journey. In fair weather the roads of the time were tolerable; but in winter and spring they became little better than quagmires. There was therefore but little intercourse between the people of the distant colonies, and in winter all communication by land and water must have been nearly cut off. Had it been told to our ancestors that within a century men would ride from New York to Philadelphia within three hours, or pass from the Atlantic to the Pacific in seven days, that the passage from Boston to Charleston would be made within three days, or from Liverpool to New York within ten, they would have placed no more confidence in the prediction than in the

speculations of Laputa. Nor did they dream that Franklin's discoveries had made the closer union of the human race still more certain. The northern cities were usually built of brick or of stone, and many of the farm-houses were of the latter material.¹ The former had been imported from Holland for the first New York buildings; and even Schenectady, a frontier town, was so purely Dutch as to have been early decorated with Holland brick. In the country stone was easily gathered from the abundant quarries on the Hudson or along the New England hills. Many large, low, stone houses, with lofty roofs and massive windows, may still be seen in the rich valleys opening upon the Hudson, almost in the same condition in which they were left by their Huguenot or Dutch builders, and apparently capable of enduring the storms of another century.² Brick-making was soon introduced into the colonies, and the abundant forests supplied all the materials for the mechanic. Fortunately no palaces were built, no royal parks required, no Versailles nor Marly indispensable to our ancestors, no monasteries, no cathedrals. A general equality in condition was nearly reached. Not five men, we are told, in New York and Philadelphia expended ten thousand dollars a year on their families. The manners of the people were simple; their expenses moderate. Yet nowhere was labor so well rewarded nor poverty so rare. Franklin, who had seen the terrible destitution of England and of France, pronounced his own country the most prosperous part of the globe, and was only anxious to protect it from that tyranny which had reduced Europe to starvation, and snatched their honest earnings from the hands of the working classes. He saw that those who labored were the best fitted to govern. The wages of the farm laborer in the northern colonies was probably three times that of the English peasant, and the general abundance of food rendered his condition easier. Fuel, however, before the discovery of coal, seems to have been sometimes scarce and dear. Kalm notices that complaints of its dearth were frequent in Philadelphia—now the seat of the chief coal market of the world.³ Wines and liquors were freely consumed by our ancestors, and even New England had as yet no high repute for temperance. Rum was taken as a common restorative. The liquor shops of New York had long been a public annoyance. In the farther southern colonies, we are told, the planter began his day with a strong glass of spirits, and closed it by carousing, gam-

bling, or talking politics in the village tavern. Our ancestors were extraordinarily fond of money, if we may trust the judgment of Washington, who seems to have found too many of them willing to improve their fortunes from the resources of the impoverished community.¹ But in general it must be inferred that the standard of public morals was not low. In comparison with the corrupt statesmen of England and France, or with the members of the English Parliament, who were nearly all willing to accept and to give bribes, the American politicians seemed to the European thinkers the most admirable of men. Washington rose above his species, and Franklin, Samuel and John Adams, Jefferson, Gadsden, and Lee were wise and prudent beyond example. Our generals and soldiers, when compared to those England sent over to conquer them, were evidently of a higher and purer race. Burgoyne,² Howe, and the greater part of their associates shocked the rising refinement of colonial society by their gross vices and shameless profligacy as much as by their inhumanity. Gates, Arnold, and Lee, who imitated them, were exceptions to the general purity of the American officers, and of these two were English-born and one a traitor.

The desire for a higher and purer life was indeed the finest trait of American politics and society. The Declaration of Independence embodied the real feeling of the people. They were anxious to promote human equality, to enforce the common brotherhood of man, to cultivate refinement, to escape from the gross vices of mediæval barbarism which still covered all Europe. They had learned the necessity of religious and political toleration by the slow course of experience. In the opening of their history religious toleration had been unknown. New England had persecuted Episcopalians, Quakers, Dissenters. Stuyvesant, in New York, had sent Quakers in chains to Holland, and been reproved by his superiors at the Hague. Virginia was bitterly intolerant, and by the boasted constitution of Maryland in 1649 the Socinian was deemed worthy of death, and whoever reproached the Virgin Mary was fined, imprisoned, or banished.³ But these harsh laws were gradually swept away, and in 1775 a practical toleration prevailed in all the colonies. No one of any intelligence any longer desired to propagate his

faith by penal laws. An equal progress had been made in politics. Virginia was willing to abandon its entails and its oligarchy; Massachusetts to assert a democratic equality; New York to break down its colonial aristocracy forever. All the colonies united in throwing aside the restrictions of European prejudice, and by a remarkable revolution provided for the creation of a republic, in which the people should be the only rulers.

I shall conclude this imperfect sketch by a brief review of the intellectual condition of America. It had produced no Shakspeare nor Milton, it possessed no poets and historians; but it is quite probable that the Northern States of America were better educated in the ideas of Milton and Shakspeare than even England or France. Of the people of New England the larger proportion could read and write, while of the two centres of European civilization the great majority of the population were sunk in hopeless ignorance. From the dawn of its history New England had insisted that its people should all be educated; and New York and Pennsylvania had not lingered far behind it.¹ Connecticut imposed a heavy fine upon every father of a family who had neglected to teach his household the elements of knowledge,² Massachusetts had enforced a similar provision, and even South Carolina had directed a school to be planted in every township. It was the aim of the New World to open the minds of all its people to the light of literature, and to cultivate the whole community. It sought mental as well as political equality. But in France and England the royal governments found no leisure and had little inclination to teach their people. It was only in Protestant Holland and Germany that men were yet allowed to learn the "sweet influences" of a rule of letters.

In their eager and resolute desire to make knowledge free to all, our ancestors at once planted in the wilderness the printing-press. Three years had not passed after the landing of the first colony in Pennsylvania when the clank of the machine that had reformed Europe and discovered America resounded under the shade of the primeval forest.³ It was with knowledge rather than arms that the followers of Penn hoped to found their state; and fifty years earlier Massachusetts had erected its first printing-press at Cambridge, and had consecrated New England to literature and thought. Our ancestors were plainly resolved that the New World should be a land of printers. Pamphlets, sermons,

political pieces, resounded through the wilderness, and before the close of the seventeenth century Cotton Mather alone had printed in England and America three hundred and eighty-two of his own productions. In the opening of the eighteenth (1704) a weekly paper, *The News Letter*, was published at Boston.¹ It was then the only newspaper printed in British America. It was a foolscap half sheet, and was thought sufficient to contain all the news of the day. In 1725 William Bradford issued at New York the *New York Gazette*, a foolscap sheet. The two Franklins, James and Benjamin, edited at Boston the *New England Courant*; and suits for libel, imprisonment, and fines were the reward of several of the early editors. James Franklin was in jail for four weeks; Zenger, of the *New York Courant* (1733), was also soon in the grasp of the law. But through all its early trials the printing-press passed successfully. The newspaper became as necessary to the colonists as their daily food. In 1775 five were printed in New York, and as many each in Philadelphia and Boston. The free school proved the best ally of the printer, and popular education laid the foundation of a nation of readers. The power of the press was soon manifested. Reform and revolution followed in its path. Yet the rude machine at which Franklin and Bradford labored seemed to lag behind the wants of even an early age; to print a few hundred copies of a small sheet required incessant toil; and Faust himself² must have looked with amazement and awe upon one of those giant printing-presses that in our day consume their miles of paper, pour forth ten thousand huge sheets of accurate typography every hour, and relate the story of mankind.

Various colleges or schools for the higher education of the people had already been planted in America. Harvard had long held a high renown even in Europe, and had been fostered by liberal donations from English Dissenters. In its earlier history it had been unlucky in its principals: one had proved to be a Jesuit, another a Baptist.³ To preside over Harvard was a favorite aim of Cotton Mather that was never gratified. Many of the eminent men of the colony had been cultivated in its careful course of study. Samuel and John Adams were its graduates, and it had long been the school of Massachusetts and of Boston. Classical learning still formed the foundation of all mental training, and no one was thought capable of professional excellence who was not learn-

ed in the languages of Greece and Rome. Yet it is worthy of notice that Washington had never construed a line of Virgil, and was wholly self-educated, and that Franklin learned his pure style and strong passion for letters and science in the composing-room.

Dartmouth College had been recently founded to teach the Indians, which it failed to do. Yale was more flourishing. Columbia College, in New York, founded in 1756, had but two professors and twenty-five students; but among them were to be numbered John Jay and Alexander Hamilton. In New Jersey Princeton College, under the presidency of Dr. Witherspoon, a cultivated Scotchman, flourished, though with a poor endowment; it had sixty students and fine buildings. In Virginia William and Mary's College had been founded with an ample liberality by the two sovereigns whose names it bore; it was endowed with a large income, and was designed to make Virginia a scene of wide intelligence. But the region of slavery could not be made favorable to mental progress. The college languished;³ its students were few; it is chiefly memorable as having furnished Jefferson with some facilities for study.

In all the American colleges it is doubtful if three hundred students were educated annually. More scholars are now gathered at a single university than in the year 1775 were found in all the famous seats of learning of the country. Yet the colleges, however imperfect, were still of real value to the people. They spread an acquaintance with the chief masters in science and letters, and helped to supply the press with literature, and diffuse knowledge. Yet of the earlier American authors who attained fame, the chief had never passed through a regular course of study. Irving had gathered the charms of his perfect style from nature and practice in the newspapers. Cooper, Halleck, Drake, were self-educated and refined. Pure literature, in fact, is seldom taught in colleges, which have usually been little more than professional schools. The chief aim of education must always be to excite inquiry and awaken the slumbering faculties. A just conception of its purpose our ancestors had formed. They saw that there should be no limit to the spread of knowledge, and hoped that a system of instruction would grow up among the people that would prove a lasting bond of union. Their extravagant vision has been in part fulfilled. The common-school system has flowed from the germs which the Puritans, Huguenots, and Dutch planted in the wilderness, and the college is gradually assuming a more popu-

¹ Mr. Hudson, in his interesting account of American journalism, notices a previous newspaper, in 1690, which had the unusual fate of lasting only one day, p. 44.

² The invention of Hoe's rotary press has made the cheap newspaper possible, and cultivated the minds of millions.

³ Winthrop.

¹ Burnaby, Pinkert., xlii. 783. Princeton College had only "two professors besides the provost."

² Ramsay, i. 263, notices its decay. Burnaby, Pinkert., xlii. p. 714.

lar character.¹ In the period of the Revolution, with one or perhaps two exceptions, the colleges were firmly on the side of progress. Harvard gave its brightest geniuses to the cause of freedom, its transatlantic Hampden to fall at Bunker Hill, its Adams to found a nation. Yale was rigidly patriotic. Princeton College, under Witherspoon, formed a bulwark of independence. Yet the influence of the colleges was only a faint impulse compared to that of the general intelligence of our educated people, and that strong passion for liberty which had grown up from the simpler school-house and the modest library.

Books, which had discovered America and first disturbed the wilderness, were not wanting to our ancestors. The booksellers sold freely the new works of Johnson, Burke, or the famous Dr. Goldsmith, and one Boston house numbered ten thousand volumes on its shelves. Several public and private libraries already existed. Kalm mentions the collection of excellent works, chiefly English, in the public library founded by Franklin in 1742 at Philadelphia. The wealthier people of the town paid forty shillings currency in the beginning, besides ten shillings annually. Several smaller libraries were also founded near it. Boston showed a "more general turn for music, painting, and the fine arts" than either of the more southern towns.² But literature still hesitated to flourish in the New World. Mather, Edwards, sermons, pamphlets, newspapers, were the chief sources of the mental progress of our ancestors. It was idle to look for a Homer or Shakspeare in so wild a land;³ nor is it likely that a fourth epic will be sung for many a cycle. But reading was a characteristic trait of the whole people, and curiosity and inquiry the chief impulses of their civilization. In military affairs the colonists had shown courage and capacity. New England troops had grown famous at the conquest of Louisbourg, the siege of Havana, and the fall of Quebec. While the English ministry were denouncing them as a feeble, abject race, more intelligent observers in England knew that the colonists were only cowards in cruel and inhuman deeds. Virginia's troops had fought bravely in the wilderness, and Washington was the most renowned of the colonial commanders. In military stores, guns, powder, arms, the country was deficient; nor did its people suppose that they would ever be drawn into another great war.

Around the thin line of settlements occu-

¹ In cities, it is said, colleges seldom flourish, yet the eagerness with which students avail themselves of the advantages of the Boston Latin School or the New York Free College, a school of mines or a popular law school, shows that utility must be one trait of the college course.

² Burnaby, Pinkert., xiii. 747.

³ Rameay, i. 275. Its earliest poems were in Latin.

pied by our ancestors a circle of various and almost hostile races hemmed in their progress. Between the austere and Puritanic New Englander and the loose, profligate,¹ yet often courageous clergy and people of Quebec there could be no friendship. Canada refused to join in the cause of independence. Its French population turned with aversion from an alliance with heretics and Saxons. To the westward the Canadian and clerical influence governed all the Indian tribes. The Mississippi was held by the Spaniards and by a few English planters who steadfastly refused to join the colonists.² New Orleans, recently transferred to Spain, was at first unwilling to sell arms and powder to the boats that had sailed down the great river from Pittsburg. The English in West Florida were hostile to the colonies; Spanish Florida was still undecided. It was with no confidence in any exterior aid that the colonists looked out upon their beleaguered territory in the hot days of July, 1776. On every side around them they saw the impending horrors of a war of extirpation. Canada teemed with military preparations; the savages were aroused through all the wilderness; the cities on the coast were threatened with sudden ruin; Howe was already landing on Staten Island; disunion tore the ranks of the reformers. Yet on the 2d of July, 1776, a bell rang cheerfully over Philadelphia that spoke the liberation of America. Samuel Adams had won his cause.³ The 2d of July seemed to John Adams the grandest day of all the ages.

THE BEAKER.

I PLEDGE to thee this golden cup,
Filled with my life's red wine;
Drain if thou wilt the generous draught,
For every drop is thine.

Look down into its sparkling depths,
And watch the bubbles bright
That rise from out its ruby heart
And break in foamy light.

Then take the cup I pledge to thee,
Filled with a draught divine;
My soul lies trembling on the brim,
And every drop is thine:

Is thine to take or to reject;
But if reject thou must,
Toss to the winds the worthless wine,
And crush the cup to dust!

¹ Riedesel, Mem., iii. p. 87. Macgregor, *Progress of Commerce*, i. 141, notices the immorality of the Canadians. One minister of state stole £400,000.

² Gayarré, *Louisiana, Spanish Dominion*, p. 109. Finally the Spaniards attack the English.

³ Samuel Adams, to his disciple and kinsman John, was the "wedge of steel" that split the bond between England and America. J. Adams to William Tudor, June 5, 1817. So Jefferson looked to Samuel Adams as his guide and teacher.

THE PLAINS.—A PROPHECY.

Go ye and look upon that land,
That far vast land that few behold,
And none beholding understand—
That old, old land which men call new—
Go journey with the seasons through
Its wastes, and learn how limitless.
The solemn silence of that plain
Is, oh! so eloquent. The blue
And bended skies seem built for it,
And all else seems a yesterday,
An idle tale but illy told.
Its story is of God alone,
For man has lived and gone away
And left but little heaps of stone.
Lo! here you learn how more than fit
And dignified is silence, when
You hear the petty jeers of men.
Its awful solitudes remain
Thenceforth for aye a part of you,
And you have learned your littleness.

Some silent red men cross your track;
Some sun-tanned trappers come and go;
Some rolling seas of buffalo
Break thunder-like and far away
Against the foot-hills, breaking back
Like breakers of some troubled bay;
Some white-tailed antelope blown by
So airy like; some foxes shy
And shadow-like move to and fro
Like weavers' shuttles as you pass;

And now and then from out the grass
You hear some lone bird cluck, and call
A sharp keen call for her lost brood,
That only makes the solitude
Seem deeper still, and that is all.

That wide domain of mysteries
And signs that men misunderstand;
A land of space and dreams; a land
Of sea-salt lakes and dried-up seas;
A land of caves and caravans
And lonely wells and pools; a land
That hath its purposes and plans,
That seems so like dead Palestine,
Save that its wastes have no confine
Till pushed against the leveled skies;
A land from out whose depths shall rise
The new-time prophets; the domain
From out whose awful depths shall come,
All clad in skins, with dusty feet,
A man fresh from his Maker's hand,
A singer singing oversweet,
A charmer charming very wise;
And then all men shall not be dumb—
Nay, not be dumb, for he shall say,
"Take heed, for I prepare the way
For weary feet;" and from this land
The Christ shall come when next the race
Of man shall look upon his face.

JOAQUIN MILLER.

ROME, 1874.

Editor's Easy Chair.

THE press every where, and very naturally, re-sents a recent law which it believed to menace its freedom. This is instinctive; for the hand of arbitrary power is first laid upon the press, which is the public tongue. Its freedom is the palladium of every truly free government, and its utmost abuse is not an evil as great as the constraint of its liberty. But while we shall all probably agree upon this, and while the chief advocates of the law in question deny that they cherish any hostility to the press, nothing is more notorious than the discontent of many public men with the incessant vituperation and misrepresentation to which they are subjected in the newspapers. The point is well worth considering whether the press, which in its comments constantly presents so lofty an ideal of public life, does all it can to make that ideal practicable. Indeed, the impartial reader—namely, the intelligent and discriminating person who is now perusing these lines—must often ask himself, as he rises from his daily feast of the newspaper, whether it does not seem that the great journal is quite as much intent upon maintaining the consistency of its own expressed opinions upon public men and measures as upon securing that lofty conduct which it so strenuously commends.

This course, indeed, is natural enough, because if its judgment be discredited its influence is im-

periled; and as the press constantly expresses the most positive opinions upon the most inadequate or even inaccurate information, an apparent consistency often requires it to persevere in conscious error. A journal often wishes, undoubtedly, that it had not taken the position which it has taken, but which, having taken, it must maintain. "I am very sorry," said an editor, in effect, "to have called Mr. Smith a liar, a forger, and a thief—very sorry indeed; but, having done so, of course I must stand to it." He had a theory not only that a journal should seem to be infallible, but that he could persuade its readers that it was so. But in the very instance of which he spoke every body knew that he was wrong, for the disproving facts had been published, and his refusal to acknowledge the truth, by showing a want of manly candor, harmed his journal very much more than his persistence in a slander helped its reputation of infallibility.

The simple truth is that if an editor lacks judgment, he can not help showing it; and nothing is a plainer or more ludicrous proof of it than the effort to establish infallibility or to maintain consistency. Yet it is this personal and petty feeling which cripples the press in the work of elevating the tone of public life. Each journal has two or three favorites, whose mouths, according

to its report, never open but pearls and diamonds drop profusely out. They are the greatest of statesmen and most incorruptible of men, while the rest are wretched twaddlers and pettifoggers, imposing themselves upon a good-natured community as great men. Party organs, of course, grind the party tune; but we speak of the press which, whatever party it favors, means to show by the method and tone of its advocacy that it does not serve the party, but the country by the party. The object of such a press certainly should be to co-operate with all good endeavor, and as a powerful means to a loftier and purer politics, to make public life an attractive career for the best men. At the best it has thorns and repulsions enough. But does the press try to remove them?

When Mr. Eugene Hale was appointed Postmaster-General in the early summer there was great speculation upon the motives of the appointment, as if the President's personal knowledge of him and regard for him, and Mr. Hale's character and service, were not to be considered as any reasons whatever. Upon learning that Mr. Creswell could not remain until the autumn, Mr. Hale declined the position on account of his health, which had been impaired by his constant and arduous service in the House during the late session, and there was a general newspaper disposition to smile at the suggestion that so young and rising a man would decline so great an honor for so trivial a reason, and fresh theories were suggested of the real significance of his action by no means, in every case, favorable to Mr. Hale. This is a fair illustration of a prevalent fashion in the treatment of public men. While we are constantly deploring low standards and dishonorable conduct, and justly exposing and condemning the guilty, and while we are regretting that the best men, the most intelligent and the most trained, will not or can not take an active part in public and official life, we persistently do what we can to exclude them, and to perpetuate the evil that we bewail, by a general doubt and censure of all concerned, and by a failure to commend with the same ardor that we condemn.

No honorable man is allured into public life by a wish to make money, and there is no measure more popular than a reduction of salaries. But if public men are poorly paid in money, they have certainly a right to expect to be cheered by the honorable recognition of their services. They ought not surely to be dogged with doubt and clouded with suspicion at every turn. A suitable man is perhaps persuaded to stand for Congress, and is elected. He leaves his business and his home, changes the whole manner of his life, and devotes himself faithfully and intelligently to the duties of his new position. To such a man the position is really arduous. The fate of poor Mr. Mellish showed how sorely the duties may harass a sensitive and conscientious Representative. Yet for all his industry and zeal and actual sacrifice, the chance is that his only reward will be to be classed as one of the Congressional "den of thieves" or nest of jobbers, while his real work passes without the slightest recognition. This method of treatment certainly does not make public life more attractive: and if we think it wise to deny public men both money and repute, to starve them and to snub them,

it is not surprising that good citizens decide that it is as pleasant to stay at home as to go abroad to be kicked.

It was indignation with what they believed to be a fashion of injustice, a resolution not to suffer their names and actions to be the targets of what they hold to be a reckless and wanton crew of Bohemians, who stab and shoot anonymously—the bravoës of the press—that made so many Senators and Representatives willing to try to arrest the mischief by a very questionable law. The power of the press is indeed enormous. No citizen of New York, or of any other city, but would wince if, upon coming out of his house some pleasant morning to walk down town, he should see his name placarded upon all the curbstones in Broadway as a rascal or a cockatoo. It would be disagreeable in one street of one city on one morning. How would he like to be placarded as a fool or a knave all over the country every morning? "Then let him not be so," replies Cato. True: and you, O Cato, Briareus and Argus in one, have you no duty? In proportion to your power must not be the wisdom and generosity of its exercise? If, as you profess, you would cleanse public life, can it be done by a criticism founded in suspicion and hostility, and wanting the inspiration of patriotic co-operation? There are as much patriotism and honorable ambition in this country as in any other, and there are many men in the public service who are inspired by motives and hopes as high as those which have animated any men at any time. For good reasons, also, the salaries of public men are small; such men are necessarily and properly closely scanned, and held to the severest responsibility. No sensible man would abate in the least degree that strict accountability and that relentless vigilance. But it is no less wise that commendation should be as hearty as censure, and that criticism should be as generous as it is just.

At a pleasant dinner of the dominant sex the "Woman" question, as it is technically called, came up, and it was languidly agreed that when wives gravely and thoughtfully urged upon their husbands, and mothers upon sons, and sisters upon brothers, and sweethearts upon lovers, that they felt themselves radically wronged, and insisted upon the suffrage, it would be granted. And the question passed. But one of the guests said to another that the real difficulty was that what may be called the best women—those, that is, who in the minds of the best men stand for the whole sex—are supremely indifferent to the subject, or are positively opposed to the proposition. The women who advocate it, he said, are conspicuously vain, shallow, self-seeking lovers of notoriety, and of an evident coarseness of fibre; not, indeed, in every individual case, but as a class. And what makes the prospect more hopeless, he added, is that the character and method of their arguments are so feeble and inefficient, their logic is so fatally defective, and, indeed, there is such a total want of what we understand by intellectual ability in their presentation of their own case, that the dispassionate spectator is forced to ask himself how the conduct of human affairs could possibly be improved by an infusion of an endless amount of such incapacity.

The smoke of his cigar curled lightly, and he watched it silently.

"Have you got no farther than that?" asked his friend, smiling; "for this is but the most threadbare form of the oldest Tory argument. Have you nothing to suggest to the court or jury upon the merits of the case?"

The guest who had spoken first replied that the senior counsel, Goldwin Smith, Q.C., had made his plea.

"Not exactly Q.C.," answered the other; and he went on to speak of the recent paper of Professor Smith upon the subject.

It is undoubtedly admirable in force and clearness. It is short, for it is only a magazine article, but one of the few rejoinders which have been made to Mr. Mill that deserve attention. He considers Mr. Mill's theory of the historical subjection of women to men to be fundamentally unsound, and asserts that the lot of the woman has not been determined by the will of the man in any considerable degree, but that the condition of both has been determined by circumstances which neither could control. The family was a unit, politically as well as socially, and nothing, he thinks, can be more unfounded than the theory of Mr. Mill that the present relation of wives to their husbands has its origin in slavery. Sarah's lot, he says, was essentially different from Hagar's; and although Hector was absolute over Andromache, her position can in no way be likened to that of her handmaidens. But Mr. Smith forgets that Mr. Mill does not assert nor imply that the relation of the wife to the husband who loves and honors her is not different from that of a mere slave to her master, but that his powers and rights in the law are not essentially different from those of a master, and so far as they are now ameliorated are but modifications of such rights. The father was the head of the family; but of the whole family, which comprised wives and slaves as well as children. He could marry his daughter at his will by the same right that he could sell his slave. Coming from ancient to modern times, Professor Smith, of course, is familiar with Blackstone's dictum that "the very being and existence of the woman is suspended during the marriage," and that of Baron Alderson, that "the wife is only the servant of her husband." The fact that there may have been the tenderest relations of affection between wife and husband did not change the fact that she was subject to his will: and to be subject to another's will is slavery.

This subjection, however, like the ancient inability to hold property, Professor Smith holds to be a relic of feudalism, and in no sense the contrivance of male injustice. But nothing is plainer than that under the feudal system the woman was, upon whatever ground, absolutely subject to the man. This, says Professor Smith, was due to circumstances. But there was certainly some kind of human agency under the feudal system. "Circumstances," applied to that system, is a word expressing conditions largely determined by human character and feeling. If actual force of arms was the tenure by which rights of every kind were held, the want of that force, or weakness, would be regarded with a feeling in which contempt mingled. And this feeling must necessarily extend to the dependent sex. Consequently women in the feudal times

were both toys and slaves. They were truly loved, indeed: they were the mothers of families: they were queens: but they were still subject to the arbitrary will of another.

As fast as a real Christianity and civilization have prevailed, disabilities of every kind have fallen from women. Professor Smith himself admits it, but says that while feudalism lasted the disabilities or anomalies in the laws of property, for instance, were indispensable to both sexes. But as his chief argument is connected with one of the feudal principles, let us look at this more closely. His real and most plausible position is that law rests at last on the actual force of the community. But in case of rebellion women could not execute a law. Men know this; and therefore if any law in the interest of women were passed contrary to the male sense of justice, men would refuse to execute it, law would not be enforced, government would fail, and society would lapse into anarchy. But the anomaly of the law in regard to real property under the feudal system sprang from the same principle of force. The reason of the feudal inability of women to hold property was that they could not bear arms to defend and maintain it. If, then, women should not have the suffrage because they can not bear arms to enforce the laws, ought they to have property which they can not bear arms to protect? But does Mr. Smith accept the logical inference that a return to the feudal system is the true policy of modern society? On the other hand, if the right of women to hold property, although without the force to defend it, has been found upon the whole to be advantageous to society, is there any good reason to suppose that the right to vote without the force to maintain the law would be disastrous? Has not Professor Smith forgotten facts quite as important as those which he mentions? And among these the very vital fact that the interests of women, upon a broad scale, can not be separated, as by his supposition, from those of men? Moreover, the very kind of law that he proposes as that which men would not defend, namely, that punishing some special offense against the sex, would hardly be enacted if women had a real responsibility. So far as this instance is concerned they are like a party out of power, full of the most vehement and uncompromising assertions and pledges. Could they vote as well as speak, they would be like that party suddenly clothed with all the responsibility of government.

But while the inability of women to help to enforce the laws which they might help to make is the strong argument of Mr. Smith, it is evident that under all his plea is a very strong feeling which is even more powerful than argument with him, as with very many generous men and women. In the opening of his article he says, with emphasis, "The very foundations of society are touched when Party tampers with the relations of the sexes." This is a strong way of stating a feeling, not an argument; what is meant is the relations of the sexes as they exist within the writer's experience, not the abstract and ideal relations. For the relations of the sexes have been constantly changing in the sense of larger independence of the woman and an increasing equality, not of function, but of opportunity. That, indeed, is the real substance of the proposition which Professor Smith combats.

It is not the political responsibility of women, as such, but the welfare of society through the co-operation of the sexes: all the aggregate and various forces of society directed to its development. Men and women co-operate in the family and in domestic life. But that is only a part of the life and interests of intelligent men and women. Let the same co-operation extend to their other interests. The greater the liberty, combined with intelligence and conscience, the happier the result.

The error of Mr. Smith and of those who agree with him is the supposition that the political liberty of women would in some manner conflict with the natural feminine charm or function. They must be candidates and officers and orators and ward politicians, it is said, and how can the delicacy of womanhood bear the strain? But is the delicacy of womanhood the creation of law or custom, or is it a part of the nature of things? The great multitude of women in the most highly civilized countries are compelled in the discharge of their family and most natural duties to chaffer and sharpen wits with tradesmen of every kind. They do this with no necessary sacrifice of the charm of womanhood. But if they may thus associate with men in the market without feminine loss, why not in spheres of a nobler interest? Mr. Smith asserts that the women whose public judgment would be most valuable would be generally excluded from public life by conjugal and maternal duty. Does he not, then, so far dispose of his own objection? Such women would still have, as they have now, interest and intelligence in public affairs, and their good judgment would certainly prevent their voting for a woman merely because of her sex.

Mr. Smith evidently has Mrs. Jellaby in constant view as the result of the political liberty of women. But why not Florence Nightingale? And why suppose that women must of necessity wish to be Lord Raglan rather than Florence Nightingale? Larger liberty does not make men meaner, but more manly, and why should it be feared as the ruin of women, however much it may destroy a false ideal of woman? Mrs. Jellaby is a picture of what a foolish woman may become in the absence of political responsibility; and the public women who justly disgust Mr. Smith and his friends, and who seem to them to represent women as they might, could, would, or will be, were they politically enfranchised, are, on the contrary, the very phenomena which the political disability of woman produces. In the amusing little parlor farce of *The Spirit of '76* a female judge is the most ludicrous of figures. Yet the court of women in Siam, of which Mrs. Leonowens tells us, is not a jest; and Portia, although a fair young judge, is not the less "one of Shakespeare's women," the women of the heart's ideal.

Those who appeal so constantly to human nature and the radical differences of sex should at least trust them a little. Political ambition, however strong, is not the master-passion of human nature. How absurd and how revolting, exclaims some shuddering soul, the spectacle of a husband and wife each the candidate of an opposing party for Governor of a State! Yet is a son often an opposing candidate to his father, or a brother to a brother? Not often. It seems hardly worth while to torture the fancy to figure

possible troubles. If such a conflicting candidacy involves grief and confusion to the family, is an affectionate wife likely to countenance it more than the husband? If the right of a wife to a separate property and to her own earnings does not abolish the family, her equal right to an expression of her political preference, with entire liberty of political action, can not harm it. "The only difference between the sexes is sex," says Dr. E. H. Clarke, in his address at Detroit on "the building of a brain;" and he adds, "but this difference is radical and fundamental." Then it should seem that as the liberty of women to acquire and own property has not ended in driving men from the entire management of great corporations, there is no reason to fear that their equal political liberty will lead them to occupations for which the "radical and fundamental" difference of sex unfits them.

THERE is one lady in literature and in life whose acquaintance is most desirable and delightful. She is the one woman, indeed, whom all men are said, not always without some sarcastic feeling, to wish especially to know. She is declared to be the vision that haunts the youth as his heart opens to the soft influences of love, and her figure, trim and debonair, allures the older fancy of the man who sits "alone and merry at forty year," having seen his earlier Gillian and Marian and a score more happily married. She is, in fact, the domestic magician, the good fairy, the genius of home, the thoughtful, tactful, careful, intelligent housekeeper. She is the very she whom Milton had in mind when he wrote,

"Herbs and other country messes
Which the neat-handed Phillis dresses."

Her name is Phillis—not exactly a romantic name, nor, indeed, meant by the poet for a romantic name; for he has just before sketched another kind of woman:

"Towers and battlements it sees
Bosom'd high in tufted trees,
Where perhaps some beauty lies,
The cynosure of neighboring eyes."

Such a cynosure could not possibly have been named Phillis: Artemis, perhaps, or Hildegard; Constance, Edith, Mildred, or Cunigunda, but by no possibility Phillis. That is a pastoral name, a shepherd's sweetheart. Indeed, the two kinds of women are perfectly indicated and distinguished in these lines of *L'Allegro*, which have no detail of description. The impression of womanly difference is nowhere more completely given. One picture is that of the lofty, haughty, "high-born Helen," the superb Lady Clara Vere de Vere; the other is that of the thrifty Baucis, the gardener Adam's wife. And the two are as near in the young man's heart as they are in the poem.

When Mr. William Guppy raised his eyes from the pit of the theatre to Miss Esther Summerson sitting in the boxes, the "image imprinted on his art" was that of the cynosure of neighboring eyes, stately among stately towers and ancestral trees. But doubtless when Mr. William Guppy, as lovers will, abandoned himself to blissful dreams of the possible home that should grow out of his lofty passion, it was another vision that he saw; it was the high-born Helen coming down to

breakfast in a sweet morning-cap, a neat-handed Phillis. For love, which soars and sings, also builds its nest. The one instinct is as deep and sure as the other. The cynosure of worshiping hearts and eyes is but the romantic aspect of Phillis: and because she is so lofty and so lovely will she be the miracle-worker in the household. The secret sorrow of a thousand homes is that the lady of the towers and battlements does not prove in fact to be the neat-handed Phillis.

Indeed, it is a kind of national complaint and lamentation that the neat-handed Phillis is disappearing altogether. This is the significance of the servant-girl question. This is the root of the alarming conviction that Phillis is changing into Biddy, whose fit epithet is not neat-handed. This is the meaning of the cry for bread—light, sweet, well-baked bread, not the clammy dough which is served to a despairing land. This is the reason of the wondering question, What has become of roast meat? and of the melancholy conviction that henceforth baked beef is to replace the juicy sirloin of tradition, history, and elegant literature. Of the accomplished and intelligent young women who honor the Easy Chair at this moment by their attention, of course the immense majority can broil a steak to a turn, or mix the airiest bread, or boil potatoes as new-fallen snow. But there are some unfortunates who can not do it. Let us pity them. They would probably tell us that they have not studied poetry and music, the French language, croquet, and the Boston, to become kitchen drudges: and they will not fail to remind us that Cinderella did not charm the Prince as a kitchen-maid, and that she ceased to be Cinderbreech and emerged from the chimney-corner when she married him. But will they please to curb their wrath for a moment and listen to Dr. Clarke? "Unless men and women both have brains, the nation will go down. As much brain is needed to govern a household as to command a ship; as much to guide a family aright as to guide a Congress aright; as much to do the least and the greatest of woman's work as to do the least and the greatest of man's work." Now the dressing of messes by the neat-handed Phillis is one of the important elements of governing a household; and the Princess Cinderella was the better housewife because she had once been Cinderbreech. Nelson was the better admiral because he had once been cabin-boy. Dickens was the better story-teller because he had once been reporter. The obvious truth is that if Darby can afford to pay a hundred dollars monthly to a *chef*, Joan need know nothing of messes; but how many such Darbys are there?

These remarks, or similar ones, have been often heard by the gentler reader, and are somewhat familiar to her, not to say wearisome. "Oh yes," she says, "I know all this: men want women in the family to be angels and French cooks rolled into one. Heaven save the mark! Suppose that women on their side were to expect men in the family to be heroes and gentlemen as well as 'good providers?'" Well, madame, they ought to expect it and to insist upon it. Perhaps you have played the little game of parlor magic? There are homes in which that game is always played, and they are the happiest

of all. In them the real value of neatness and order, of thrift and taste and temperance, is understood, and the Beauty who once lay lapped in lofty towers knows that the romance which enshrined her amidst those battlements and tufted trees is preserved and forever refreshed by the art of the neat-handed Phillis. And upon *his* side *he* does not reverse the order of the story and of nature, and sink from the Prince into the Beast.

THE general popular conception of Iceland is composed of two parts, Hecla and the geysers, while the more erudite add to this the knowledge contained in the famous chapter "Of Snakes in Iceland." "There are no snakes in Iceland." The island lies as vague in the mind as Bayard Taylor describes the first glimpses of it as caught by travelers, glimmering, indistinct, intermittent. Yet all the Northern lands, as seen in the sagas, with the fierce life of jarls and vikings and seakings—lands lying in chill mists, and overblown with icy winds—leave an impression of profound sadness. The short summer, the bleak earth, the wild tempests, and the incessant elemental warfare waged by the seamen—and all the people seem somehow to be seamen—show human life under the hardest conditions. And yet as the traveler admires the airy architecture of France and England, and loiters in the soft air of Sicily, he remembers that the impulse whose results he sees was given by the Norse, the Northmen, the Normans. Out of strength came forth sweetness.

This romantic melancholy of the North is exquisitely reproduced in William Black's story of the *Princess of Thule*. The opening chapter conveys the very feeling of vague sadness which is the under-tone of the Norse literature; and although the scene is only the Hebrides, it is filled by an imaginative touch with all the weird charm of the sad Northern scenery. How Scott would have delighted in Sheila! None of his own Northern women are more characteristic. She is a new figure in literature, a creation. We hope that the party which sailed in the summer from Aberdeen, in Scotland, for Iceland had copies of the *Princess of Thule* as an introduction to the sentiment of the region which they were to explore. They have told their story, and have given us newer and fresh pictures of that remote and strange and fascinating life. It is peculiarly attractive to us Americans, because we can see in it something of our own political spirit and tendency, the common heritage of our race. If their source is in the Aryan stock, it is peculiarly in "the second swarm," the Teutonic branch, from which we spring, and they give us a sense of kinship to the North which we can never have to the South or the Latin lands.

The first historic settlement of Iceland, of which the millennial anniversary has been celebrated this year, resembles in some points that of Massachusetts Bay. Winthrop and his company were English gentlemen who came to find a home where they could enjoy their faith unmolested. They were self-exiled, and brought with them a certain intelligence and cultivation. The tradition of Iceland is that Ingolf of Norway and Leif of the Sword, with their families, landed near Reikiavik, the present capital, and made a settlement a thousand summers ago.

About ten years afterward the fair-haired Harold, King of Norway, reduced the independent jarls or kings to his supreme authority, and many of them fled beyond sea and settled in Iceland. They were "the best blood of the race," and they founded a kind of republic. After a little more than a hundred years Christianity was established upon the island, and then followed the literary age of Iceland. The monkish influence did not suppress the oral sagas, which were gradually written out, so that, as Bayard Taylor thinks, the manuscript literature of Iceland is the richest in the world. During four centuries the island remained a semi-republic, and then fell through civil wars into the hands of the King of Norway, and so to Denmark by inheritance in 1380.

Mr. Taylor, under the spell of the Hebrides, seems to accept all the traditions of Scandinavian explorations and settlements in America. He says that Leif in the year 1000 made a settlement at the mouth of the Taunton River, and that for twelve years there was intercommunication between this region, or Vinland, as it was called, and Iceland and Greenland. Moreover, he adopts the tale of Dighton Rock, and says that the marks upon it are runes, and that they were made by Thorfinn Karlsefne. And, that our relation to Iceland shall be complete, he adds that in 1356 a vessel went from Greenland to Nova Scotia for timber, and was blown by stress of weather to Iceland on its return. "It is impossible that the knowledge of these voyages should not have been current in Iceland in 1477, when Columbus, sailing in a ship from Bristol, England, visited the island. As he was able to converse with the priests and learned men in Latin, he undoubtedly learned of the existence of another continent to the west and south; and this knowledge, not the mere fanaticism of a vague belief, supported him during many years of disappointment." But Columbus, when he discovered America, was not looking for another continent, but for a western route to India. Had he had "knowledge" of the continent, would he have sought his new route in that direction, or did he suppose the land of which, according to the story, he heard, to be the Cipango that he sought?

The millennial celebration was very simple and characteristic. There was a Lutheran religious service in the cathedral, and a banquet at the university, and dancing on one day, and on another an assembly upon the ground where the

Althing met nearly ten centuries ago. Speeches were made to which the king responded, and there was every where a placid and pleasant festival. The real event was the new constitution, which went into operation on the 1st of August, and which is the first step toward "home rule." Until thirty years ago the government was a simple Danish despotism. But in 1844 Iceland was admitted to a consultative part in its own government. In 1874 the king permits it to levy its own taxes, but only by the law of two Houses of a Legislature one branch of which he controls by the right of appointment. The new constitution is like the French charter of fifty years ago, or the *motu proprio* concessions of the Pope to the Roman States in 1846. But the remoteness of Iceland and its comparative unimportance will secure its political tranquillity. The glimpse that the world has had of the island during the last summer is very pleasing: a simple, industrious, intelligent people; a peaceful, pastoral, lonely landscape; the heavy-outlined Heccla, its snow mantle made golden by the sun; the desolation of extinct volcanic action, and the geysers throwing out jets of water a hundred feet high, in form like a bunch of the pampas grass in blossom.

On the evening of the celebration, when the speeches were made at the university of Reikiavik, in Iceland, there was an illumination at the Cornell University, in the United States. It was in the house of Professor Willard Fiske, one of the few Americans who are familiar with the Scandinavian language and lore, and who first called public attention in this country to the millennial festival of Iceland by proposing that books should be sent by American scholars and publishers to replace the losses which Iceland has innocently suffered, and so to offer the hand of peaceful friendship to our solitary sturdy brethren of the North Sea. At the celebration Professor Fiske's friend and colleague, Bayard Taylor, wrote a little poetical greeting from America to Iceland, which was translated into the Icelandic language, and read to the company amidst great applause:

"Set far apart, neglected, exiled,
Thy children wrote their runes of pride,
With power that brings in this thy triumph
The conquering nations to thy side.

"What though thy native harps be silent,
The chord they struck shall ours prolong;
We claim thee kindred, call thee mother,
O land of saga, steel, and song!"

HISTORY.

MR. PARKMAN has produced another volume, *The Old Régime in Canada* (Little, Brown, and Co.), of his history of the Canadian French. Of the various themes of American history that remain to be thoroughly explored—and there is no country whose annals will demand in the future more careful labor than ours—the exploits of the early French settlers on the St. Lawrence must always seem one of the most interesting. The Jesuits, whose peculiar character Mr. Parkman paints with candor, hoped to found a clerical empire on the banks of the magnificent

river, and convert the savages to the Roman faith. But they were less fortunate than in Paraguay or even Japan. They showed traits of heroic endurance and fanatical courage. They traversed the frightful wilderness, bore cold, hunger, torture, death, without a murmur, lived among the treacherous Iroquois, sustained by omens and visions, converted the gentler Hurons, and taught the Canadian woods to resound with the praises of Mary. But in many particulars the papal missionaries were no less barbarous than the savages they came to convert. The Mohawk was not more exultant over the torture of a captive

than were the Jesuits at the pyre of a Huguenot. They surpassed the Indian in treacherous insincerity; they pursued their rivals, the Sulpitians of Montreal, with relentless hatred. Quebec was torn by the conflicts of the hostile Roman Catholic sects while the Iroquois were screaming their war-songs beneath its walls. The Jesuits condoned the greatest crimes where the Church was benefited by them, and conformed to the worst excesses of the savages in the hope of winning them to a formal Christianity. In their deepest danger they trusted in relics, pictures, and images; in their fierce ambition they spared no one who opposed their imperious rule.

Quebec, under the guidance of the priests, became a scene of political and moral decay. Peculation reigned in all the civil departments. The Jesuits chose the officials, and chose them only for their intense devotion to the Papal Church. They might rob the public treasury at will so long as they obeyed the priests implicitly. Honesty was almost unknown. The children of the colony were left uneducated. A throng of nobles, priests, and nuns consumed the products of the industrious. Beggary awaited most of the settlers (p. 381). The attempt to plant feudalism and priestcraft upon American soil was fatal to the commerce and industry of the colony, and it was a happy exchange for the people of New France when the English banner waved over Quebec. The chief interest, however, of the period of which Mr. Parkman treats lies in the war between the French and the Iroquois, the dangers of the feeble settlement, and the timidity or the weakness with which the colonists met the foe. The Mohawks dragged their victims from beneath the walls of Quebec, and the timid towns-people did not dare to fire upon them. For nearly half a century the Iroquois held the colony in a kind of subjection, and the courage of fanaticism was scarcely equal to that of the wild men of the woods.

Mr. Parkman's volume has many of the elements of a valuable history. His accuracy and careful research are every where apparent. His style is clear, his subject new. He has, indeed, made it his own by his previous studies, and while he may be sometimes drawn into a higher admiration for some of the clerical pioneers than their conduct merits, his research, industry, and care are a good example for all students of American history.

A colder and more critical historian might perhaps have produced a work on the early history of this country more valuable to the student than *The Pioneers and Patriots of America*, by JOHN S. C. ABBOTT (Dodd and Mead), but it would have been less entertaining and less valuable to the ordinary reader. Mr. Abbott writes of a life in which he has participated by a vivid imagination and warm sympathies. He writes of Waterloo as though he were one of the Old Guard; of Kit Carson as though he had tracked a deer with him through a Western wilderness.

This sympathy has a value of its own, which the public recognize, though the critics do not. This value is perhaps more apparent in the series of American pioneers than in any thing else Mr. Abbott has ever written. He is not a pioneer. His life has been spent in civilization. We doubt whether he ever caught a trout, or shot a deer, or bivouacked for a week in the woods.

But we have never read pictorial descriptions so vivid, so realistic, of pioneer life as these afforded by the *Pioneers and Patriots of America*. In *Miles Standish* we see the drama of early New England life; in *Peter Stuyvesant* the quieter course of the early Dutch history of New York; in *Kit Carson* and *David Crockett* the romance of Western pioneering.

BIOGRAPHY.

EVERY literary traveler who has spent a fortnight in Utah feels called upon to write an account of Mormonism. Magazine and newspaper articles and pamphlets and books on Mormonism have accordingly been produced until the reading public has become satiated with a subject which possesses no other attractions than those of a most pathetic tragedy. But it is certain that no "Gentile" could tell the true story of Mormonism; and not until Mr. Stenhouse produced his work on the subject did the American reader possess any thing which deserved to be called a history of this American religious and social monstrosity. His work was comprehensive, calm, conclusive; all that research, personal experience, and candor could do was done to give the American public a trustworthy account of the rise, progress, and present condition of this extraordinary *imperium in imperio*. But one phase, and a most important one, of Mormon life no man could write. Its effect on womanhood could be described only by a woman who had experienced its burdens and its bitterness. Thus the fitting complement of Mr. Stenhouse's volume is *A Woman's Life in Polygamy*, by Mrs. T. B. H. STENHOUSE (A. D. Worthington and Co.). The volume is what its title indicates, not a comprehensive history of the system, but a personal autobiography of one who has suffered the effects of its despotic sway over body and intellect and conscience. In her pages the physical tyranny and brutality of Mormonism are less prominent than in her husband's book, but the degrading effects of this singular superstition on mind and heart, the struggle of the woman's better nature against a perverted conscience, a false religion, a poisonous social influence, all tending irresistibly to her own self-degradation, are far more effectively described. The pitiful feature of Mormonism is that woman is compelled to perform a moral *hari-kari*, to assist in her own moral and social sacrifice. The wife-burning of India is merciful and ennobling when compared with the immolation, the living sacrifice, which Mormonism has required of its victims. The blasphemous travesty of Scripture, the hideous anthropomorphism which it has evolved out of the Bible, is a fitting foundation for such a system. It begins by degrading God; it ends by destroying the family and corrupting both man and woman. According to Mormon theology—not the theology which is preached by the missionaries in Europe, but that which is taught to the people in Utah—Adam was God, who is like a well-to-do farmer; the Virgin Mary was the lawful wife of God, who after the Resurrection will take her again as His wife, and raise up immortal spirits in eternity; the marriage at Cana of Galilee was Christ's own nuptial feast, Mary and Martha were His plural wives, and the women who "ministered unto Him" stood to him in the same relation; and men are the saviors of

their wives, who can not be saved except they are obedient to their husbands and please them. There is nothing in the worst forms of Rabbinical literature, nothing in the most blasphemous assaults of a vulgar and unintelligent infidelity, worse than this. Educated under such a system, the woman is taught to practice a religious asceticism that has no parallel in the history of the world. She is required to crucify not merely her body, not merely her affections, but her womanly self-respect, to her superstition. With a refinement of cruelty that seems well-nigh incredible, the first wife is compelled to join the hands of her own husband and his second wife, and thus to ratify the ceremonial that is the funeral service of her own heart. The bitter struggle between self-respect and a perverted conscience, between a woman's instinct and a superstition that has become a second nature, which in Mrs. Stenhouse's case preceded this act of renunciation, and the heart-sickness which succeeded, she has described as only a woman could who had personally experienced the conflict and the death. The episode of Mary Burton discloses the same inherent tragedy, though from a different point of view. And not the least sorrowful feature in this mis-called religion, the influence exerted by once-degraded wives to seduce all women to their own level, is not concealed.

Yet Mrs. Stenhouse writes without bitterness, without vituperation. The calmness and candor of her narrative render it the more terrible an indictment. To the psychological student, to whom Mormonism is a mental problem insoluble, and the seemingly stolid acquiescence of woman in her own shame an inexplicable mystery, not the least interesting feature of this volume will be the fact that it traces so clearly the process by which superstition gained, first an influence, then an absolute control, over a mind originally intelligent and over a will originally independent. There is of course, incidentally, an interior view of the domestic life of Mormonism; and we believe the chapter on the Mysteries of the Endowment House is the only trustworthy account which has ever been given to the Gentile world of the secret ceremonies which accompany "celestial marriages."

The Life of Napoleon III., by BLANCHARD JERROLD (Longmans, Green, and Co., London), is one of those necessarily occasional and exceptional works which add to our real knowledge of history. In general, the historian can do little else than gather up the information respecting men and events which contemporaneous publications have made known, or which later historians have recorded, and weave them anew in a simpler and a more compact form, or in patterns more graphic and picturesque. But occasionally a historian, by his investigations, really opens to the reading public a new chapter in history, as Motley has done in his histories of the Netherlands and the Dutch Republic. Occasionally a biographer, admitted to the private papers and sacred confidences of a public man, is able to give us a knowledge of his life and work which no one could do who viewed them only from the outside. Mr. Jerrold tells us in his title-page that his work is "derived from state records, from unpublished family correspondence, and from personal testimony;" and in his preface that he had "the benefit of help abundantly be-

stowed by the imperial family," and access to family papers of extreme value; and the pages of this first volume bear out his assertion. We do not remember to have seen before the fragments of autobiography here published. Some of the letters of Louis Napoleon are certainly new. Of his materials Mr. Jerrold does, indeed, make some unnecessary display. Fac-similes are of no particular value except to show the handwriting, and one letter in fac-simile serves this purpose as well as half a dozen. Even the letter written in infancy, with its blot where the sharp nib stuck in the paper and scattered a small shower of ink around, is just such a reminiscence as well-nigh every mother has of her son, and is interesting rather than valuable. If Mr. Jerrold has the advantage of possessing the confidence of the imperial family, this advantage has its drawbacks. He writes as the defender of the dead emperor's memory. His admiration for Napoleon III. is frankly expressed in the opening sentence of his preface. It re-appears in his brief characterization of the man on page 69, and, if possible, still more clearly in his somewhat overanxious defense of the ill-conceived and ill-executed attempt at Strasburg. Mr. Jerrold's prejudices do not materially impair the value of his work thus far; but we shall be agreeably disappointed if he is able to write either dispassionately of the *coup d'état*, or critically of the illusive glories of the reign that followed, and that ended so ingloriously. Mr. Jerrold's very familiarity with his theme detracts from his clearness as a writer. Still the work is of value not only to the scholar, but also to the general reader. The democracy of Louis Napoleon's later life—for he was at once an imperialist and a democrat—appears in some striking phases of his boyhood experiences. The gradual development of his character is not perfectly traced out for us; but the material is all here, and the reader may trace its growth for himself. The descriptions, particularly of domestic life at Malmaison and at Arenenburg, are graphic and realistic. It is impossible to read the story of the life in Italy without a sincere respect, almost a reverence, for Hortense, and a recognition of the source whence Louis Napoleon obtained some of those imperial qualities, and particularly that resolution of purpose and that reserved power, which made him the master of the French people and, for a time, the foremost man in European politics. The present volume leaves the subject of the biography just landed in exile on our American shores; the second volume is promised this fall; the third and fourth in the following spring.

Professor HOPPIN has somewhat impaired the value of his *Life of Admiral Foote* (Harper and Brothers) by his frankly confessed ambition to make a volume which should be a "contribution to the material of future history." In literature as in religion no man can serve two masters; and it is rarely if ever the case that the volume which is a contribution to the material of future history is also an important contribution to present popular knowledge. The fashion, introduced of late years, of composing history by copying out *in extenso* the original documents on which it is founded, of which Mr. Froude affords an illustrious example, adds less to our knowledge than to our means of knowl-

edge, and in lieu of a historian gives us a scribe. We want a judge, clear-minded, acute, impartial, who shall examine and sift the evidence for us, and embody his findings in a clear and concise statement. We get instead a stenographer's report of all the evidence, which we are left to sift for ourselves, that we may make our own findings. Professor Hoppin has been apparently assiduous in his collection of materials; but those which he has gathered he has embodied in his volume, according to the modern method of historical and biographical writing. In many instances a brief statement of their substance would have been every way better for the general reader. The extracts from Admiral Foote's journals and private letters are of real value, because they interpret his personal character. But the long discussion concerning the abolition of the whisky ration is of small importance except as an indication of the admiral's interest in the moral welfare of his men; and the official reports of the military operations during the civil war belong decidedly not to history, but to the material for history. Wherever Professor Hoppin has allowed himself a free pen he has used it to good advantage. His descriptions of engagements, as at Fort Henry and Fort Donelson, are all the better for being simple outlines. He has succeeded in his professed purpose "to keep on the exact level of truth;" he has done well to correct some fabulous newspaper stories, such as Admiral Foote's apocryphal reply to General Tilghman's surrender; and the reader's respect and even admiration for the subject of the biography will be enhanced by reason of the quiet and self-restrained style of the biographer.

POETRY.

OF the new poems in *The Legend of Jubal, and other Poems*, by GEORGE ELIOT (J. R. Osgood and Co.), the best is also the least pretentious—"Agatha." This is a simple and beautiful idyl, a picture none the less beautiful because so slight, of old-fashioned and somewhat mystical piety and saintliness. We rise from reading it with kindlier and warmer feelings for even the mistaken recluse who knows so little of the freedom and joyousness of Christian life that she can say,

"The years are light, dear lady: 'tis my sins
Are heavier than I would. And I shall go
All the way to Einsiedeln with that load:
I need to work it off."

It is a genuine poet's sympathy that enters so heartily and portrays so sympathetically and so appreciatingly such a heart as that of Agatha. There is no approximation to an incident; there is hardly a justification for the slightly dramatic form into which the poem is cast. But the painting is full of feeling, and feeling of the healthiest and happiest description. It is, indeed, in realistic pictures of life that George Eliot, whether as a poet or a novelist, excels, and neither in her prose nor in her poetry do we read any thing tenderer than this simple picture of Agatha. But when she turns aside from the actualities of life, and endeavors, as in the *Legend of Jubal*, to translate a mystical philosophy through the medium of a pure ideal, she is less successful. If we understand the meaning of this legend at all, it is that our only comfort in the death hour is our remembrance of our own past, and our only hope of immortality is that of living in the mem-

ories of others in our work, the soul itself being absorbed in the great All,

"Quitting mortality, a quenched sun-wave,
The All-creating Presence for his grave."

The philosophy is a pitiful and painful one. Were it truth, it still would *not* be poetry; there is in it nothing inspiring: no rhythmical attire, no poetic ornament, can redeem it from its essential coldness and lifelessness. In depicting the known and the present, George Eliot is almost without a peer. In attempting to soar into the unseen and unknown, she fails. To her there is, in truth, no unseen, no unknown. In an atmosphere so rarefied as that of *Jubal* the souls of most mortals will gasp and faint for want of any thing to sustain that hope and good cheer which are the soul's life. In the words of the *London Spectator*, "While the author invests her real self-knowledge or memories in a liquid cloud of soft external beauty she is truly poetical, though in a modest region of poetry; but when she embodies an impassioned faith of her own in an imaginative form she seems to us to show how far her visionary power lags behind her imaginative insight."

Sea and Shore (Roberts Brothers) should be read, as we read it a few weeks ago, with the ocean at our feet, breaking into spray upon the rocks, rolling in on the shelving beach of stone in endlessly reiterated cataracts of foam, or striking the jutting point of rock, and tossed by it in perpetually repeated but infinitely diversified fountains, with the sun painting evanescent and reappearing rainbows on a canvas ever forming and ever disappearing, and the illimitable blue of the sea in the far-distant horizon melting into the illimitable blue of the sky. It is a true interpreter of the voices of the sea to one who listens with a vague adoration to its eloquent unknown tongue; it is a delightful reminiscence of the sea, and, as we read it now, in our library, brings back the music and poetry and fragrance of the ocean. We do not know who is the compiler; we are at a loss to conceive why he should have kept his name from the public; but he loves both the sea and poetry, and his work is one not of a professional book-maker, but of a lover of the poetry of nature. We recall no volume so small that contains so much exquisite poetry, so many masterpieces, and pieces of such various forms of beauty and power.

MISCELLANEOUS.

NOT since in our boyhood days we eagerly devoured Mr. Dana's *Two Years Before the Mast* have we read a more interesting account of sea-life than *Nimrod of the Sea; or, The American Whaleman*, by WILLIAM M. DAVIS (Harper and Brothers). There is an attractive romance in the sailor's life, as well as a very prosaic and repulsive reality. Both aspects are presented with an apparent truthfulness by Mr. Davis. He professes to have wrought his account of the American whaleman from his own journal of an actual voyage in the fore-castle, and something of both the vigor and the rudeness of the fore-castle characterizes his pages. He is not without a certain poetic appreciation of the natural beauties of the scenes through which he conducts his readers; he enjoys thoroughly an adventure, whether it be one in which he is a participator, or one of which

he is only an auditor, and he imparts his own zest to his narrative. His humor is genuine, and if somewhat rude, as befits a humor bred in the forecastle, is not coarse nor unseemly. The privations, the hardships, and the moral and intellectual famine of the sailor's life are honestly portrayed, and no boy of intellectual capabilities will be attracted to abandon a good home for the experience which Mr. Davis describes. The moral and spiritual capabilities and needs of the sailor are appreciated and recognized, and no Christian reader can fail to be impressed with a sense of shame that modern Christianity does so little for those who are too often the sole representatives of Christian civilization in heathen ports. "A scant ship's library of uninteresting religious books, and an inexhaustible store of tracts entirely too childish for men famishing for intellectual food," constitute the sole nutriment we provide for Jack on shipboard; and, according to Mr. Davis, on shore there is, or was, but one Christian port on the west coast of America where there was "a door to welcome or a roof to shelter the sixteen thousand souls engaged in whaling, other than that of a gaming-house, a grog-shop, or a brothel." Jack's vicious companions and vicious habits on shore are less to his dishonor than to ours. The whaling trade has fallen off in relative importance since mineral oils have come generally into the market; but it is still a not unimportant branch of commerce. And incidentally Mr. Davis affords considerable information respecting it. By diagrams he makes plain the structure of the whale and the elements in its value; he describes its habits; he very graphically portrays the processes by which it is captured and killed, and by which it is afterward cut up and its oil extracted. A number of illustrations add to the attractiveness of the volume to juvenile readers rather than to its intrinsic value to adult readers.

The less that is said about the plot of *Scrope*; or, *The Lost Library* (Roberts Brothers), the better, for little or nothing can be said of it except in criticism. The book would be quite as well, or somewhat better, without a plot. The real attempt of the writer, Mr. F. B. PERKINS, is to render for New York somewhat of the service which Dickens rendered for certain phases of London life in his *Sketches*; and if the American author had made as unpretentious a book as that of Boz, he would have made a better one. No reader will become absorbed in the search for the lost library, and no one will be thrilled by the exciting incidents, as improbable as exciting, which are introduced in the latter half of the story, chiefly because a novel must have incidents, or it would fail to justify its title. The merit of *Scrope* lies in the fact that Mr. Perkins is familiar with certain aspects of metropolitan life—aspects not very flattering to our civilization—and has described them, with some pardonable exaggeration, but with real fidelity to the truth of things. The book auction; the old house on Hudson Street, relic of a past generation; the Shadowing Wings, with its patron president, Mrs. Button; Gowans's bookstore; the subscription-book publisher's office; "Paradise;" the gambling hell; the séance—are all painted by one who has seen the originals and caught their spirit. The painting is sometimes rough; the scenes themselves are sometimes of

a sort that do not deserve portraiture; the character sketching, as in the interview of Mr. Button, the subscription-book publisher, with Mr. Jacox, the agent, runs into caricature. But even the caricature is a counterpart of the original, and there are some truths that can be told only by exaggeration. The cultivated reader will perhaps object to what he will term an air of vulgarity in these pages; but, for the same reason, he would object to seeing the inside of "Paradise," or to investigating too deeply the religious spirit of Dr. Toomston's church and congregation. It is, however, well that the plague spots of our civilization should be disclosed to the public, and the man who makes the disclosures is to be commended for his courage and his candor, provided his own spirit is pure, even though the scenes and the society to which he introduces us may not be congenial.

The Principles of Science, by W. STANLEY JEVONS, of University College, London (Macmillan and Co.), is a contribution to what we may call the metaphysics of science. It is a discussion not of special sciences, but of the methods which, in the judgment of the author, must underlie all scientific investigation. The work is quite too abstruse for the ordinary reader in its thoughts, and is unnecessarily obscure at times in its forms of expression. But it is a book of radical thoughts, the product of a bold thinker, and deserves the careful consideration of scientific men, especially such as are engaged in the work of scientific investigation. The author directly combats the method of Francis Bacon, and declares that "hypothetical anticipation of nature is an essential part of inductive inquiry, and that it is the Newtonian method of deductive reasoning combined with elaborate experimental verification which has led to all the great triumphs of scientific research." He apparently regards all inductive knowledge as quantitative, all results based on induction as probable results only, and demurs "to the assumption that there is any necessary truth even in such fundamental laws of nature as the indestructibility of matter, the conservation of force, or the laws of motion." The importance of his conclusions in their bearing upon the relations of religion and science is indicated by his declaration of his "strong conviction that before a rigorous logical scrutiny the 'reign of law' will be found to be an unverified hypothesis, the 'uniformity of nature' an ambiguous expression, the certainty of our scientific inferences to a great extent a delusion." Of course sentiments so radical and so inconsistent with much of current scientific opinion are worthy of consideration only as they are sustained by a careful and thoughtful process of reasoning. Without pronouncing on Mr. Jevons's conclusions, we are very certain that they will be found sufficiently sustained to be entitled to the gravest and most serious study.

The author of *Prairie and Forest* (Harper and Brothers), PARKER GILMORE, justifies his pseudonym "Ubique," for in his pursuit of game and fish he appears to have been almost every where upon this continent, and his book affords a fuller description of the game of North America, their habits and haunts, than we have ever before seen. In his company you may hunt the bison on our Northwestern prairies, the musk-sheep in the wil-

dernesses of the Hudson Bay country (though that he has ever personally visited the latter region is not clear), the moose in the wilds of Maine, the caribou on the northern shores of the St. Lawrence, the wapiti deer among the upper waters of the Missouri, the Virginian deer in the Adirondacks or among the Alleghanies, the prong-horned antelope on the plains of Sonora and Northwestern Mexico, grizzly bears among the Rocky Mountains, wolves and foxes any where in the far West, and birds of all descriptions, from a snipe to an eagle. His counsel to the American people respecting the preservation of fish and game deserves to be heeded, but will not be. And the next generation will perhaps read in this volume of species, hunted in this age by "Ubique," which will in that age be extinct, or nearly so. For the hunter there are practical directions as to outfit, seasons, and methods which we judge to be valuable. We can speak from personal knowledge of the wisdom of his counsel only as to fishing tackle. The general reader will find some useful information as to the natural history of American birds and animals, and some entertaining adventures. Like most camp stories, there is occasionally room for suspicion that the incidents are colored and improved for the hearer's benefit. Yet they are simply told and modestly, and there is none either of that egotism or that palpable exaggeration which too often mars and sometimes quite destroys the value and even the true interest of books of hunting adventure. — Very timely is the little treatise on *Hydrophobia: Means of Avoiding its Perils and Preventing its Spread* (Harper and Brothers). The author, H.

BOULY, is described as a member of the Institute of France and general inspector of the veterinary schools of France, and it is evident from the language of his lecture that he has had a large personal experience in dealing with this dread disease. The translator, his pupil, A. Liantard, is a professor in the New York College of Veterinary Surgeons. The author describes in great detail the *early* symptoms of rabies in a dog. Most frequently manifesting itself in the canine species, it is also not unknown in other animals, and is even more dangerous in the cat; for the dog will obey his master even after the disease is considerably advanced; the cat will not. He warns us against the caresses of sick dogs, for if the saliva from the mouth comes in contact with even a scratch, there is danger that the poison may be communicated; and in the early stages of the disease the symptoms are not easily recognizable by any except one thoroughly familiar with it. He repudiates muzzling as useless, since the rabid dogs are almost uniformly those that have escaped from home, where they are never muzzled. He recognizes no remedy but an instant and vigorous cauterization of the wound, but shows from statistics that less than half of those persons who are bitten by even rabid animals die from the bite, which is therefore by no means necessarily fatal. The book, which is a pamphlet of only sixty-one pages, is not only helpful, but on the whole hopeful; we only wish it could have been published six months ago. It is worth reading, and the *résumé* at the close is worth cutting out and keeping for easy reference by all owners of dogs.

Editor's Scientific Record.

SUMMARY OF SCIENTIFIC PROGRESS.

OUR *Astronomical Record* for August begins with the announcement of the discovery of a new comet, the fifth of this year, on the 19th of the month, by Coggia, at Marseilles. The absence of Watson and Peters, and the short nights and long twilights of the summer season, seem to have combined to interfere with the search for asteroids, of which no new ones have been reported since June by either American or European observers.

In *Solar Physics* Professor Langley, of the Pittsburgh Observatory, announces that he has during the past year been at work upon the relative temperatures of different portions of the sun's surface. At the recent meeting of the American Association he stated that he had used a delicate thermopile, such as was first employed in similar investigations by Professor Henry, of the Smithsonian Institution. Langley's observations fully confirm those published in 1845 by Professor Henry, showing that the solar spots are colder than the adjacent photosphere, but not necessarily colder than the portions of the photosphere near the solar limb, since the heat from the latter is mainly absorbed by the sun's atmosphere.

Stone reports from the Cape of Good Hope that, at the recent solar eclipse observed by him, he certainly saw the Fraunhofer lines in the spectrum of the corona, and that at the moment of totality the spectrum of the disappearing edge of

the sun showed all the principal Fraunhofer dark lines reversed to bright ones: the former observations seem to show that the light of the corona is reflected from the photosphere of the sun.

The United States government expedition to the Southern Pacific Ocean for the observation of the transit of Venus has been heard from at the Cape of Good Hope, where the parties stopped on the 5th of August.

Professor Wright states as the result of some observations made with a delicate polariscope upon Coggia's comet that its light was polarized in a plane passing through the axis of the tail, that is, as nearly as could be estimated, in a plane passing through it and the sun. The percentage of polarized light was not large.

Secchi has also observed the appearance of Coggia's comet, and announces the undoubted evidence of polarization. The linear spectrum of the nucleus was by careful examination resolved into a banded spectrum.

The possibility that the diurnal rotation of the earth may be, within small limits, a somewhat irregular movement has been suggested by Professor Newcomb as a possible explanation of certain apparent inequalities of long period in the motion of the moon. A test as to the plausibility of this explanation was found by Newcomb in the observations of the eclipses of the satellites of Jupiter, and at his request the necessary numerical investigations have been made

by a young Russian astronomer, Mr. Glasenapp; from his results Newcomb concludes that although the observations are too uncertain, and the residuals too irregular to prove the hypothesis, yet it seems to be rendered worthy of reception as being in the present state of our knowledge the most probable explanation of the outstanding differences of long period between the theoretical and observed longitude of the moon.

Dr. Gould has communicated a few of the results arrived at by himself in the prosecution of his labors on the "Uranometria Argentina." He states that a great circle or zone of bright stars girds the southern sky, intersecting the Milky Way at the Southern Cross. A trace of this zone of bright stars is also perceptible in the northern sky.

To the two stars, Procyon and Sirius, whose irregular movements enabled astronomers to predict the places of their disturbing companions, Mr. Rogers, of Cambridge, adds a third, Eta Draconis, whose movements are also irregular.

Pogson, at Madras, announces that the means at his command have been lately increased so that he expects to clear away the large arrears of work accumulated at that observatory. Hitherto this has been impossible.

The formation at Prague of a mathematical society is announced.

In the study of the *Physics of the Globe* we notice that Mallet, having carefully examined the volcano of Stromboli, concludes that its mechanism is very similar to that of a geyser. He finds its special phenomena explained by assuming that the lowest portion of its crater, which is of a funnel shape, is prolonged as a tube to a depth of 400 feet or more, until it reaches to a little below the level of the sea. Into the lower end of the tube small quantities of lava find their way, thereby heating up the sea-water that percolates into the interior, and forcing out water, lava, and stones at regular spasmodic bursts. He finds that nothing distinct can be gathered from the inhabitants of the surrounding islands in support of the long-established tradition according to which atmospheric changes were supposed to produce the volcanic eruptions.

The changes of level that have been noticed in Great Salt Lake have been by some referred to the marked variations from year to year in the climate of the basin that drained into this lake, while others have very plausibly contended that besides meteorological influences there are others equally important to be considered; thus the slow seismic changes, by reason of which one portion of the basin may be elevated while another is depressed, may in a short time completely alter the relative depths of the water on opposite sides of the lake. As a standard to which to refer these changes, Dr. Park, of the Deseret University, has, at the request of Professor Joseph Henry, erected a monument near the shore at Black Rock: four such monuments on opposite sides of the lake would, we apprehend, be necessary in order to afford information sufficient to satisfactorily answer several interesting queries concerning this subject.

Captain Dutton, in some remarks on the contractional hypothesis as explanatory of the phenomena of volcanoes and earthquakes, concludes that Fourier's theorem relative to the cooling of

the earth shows that the greatest possible contraction due to secular cooling is insufficient to account for the phenomena attributed to it; by far the larger portion of this contraction must have taken place before the commencement of the paleozoic age, and the larger portion of the residue must have occurred before the beginning of the tertiary; and yet the whole of this contraction would not be sufficient to account for the disturbances which have occurred since the close of the cretaceous.

The earthquake of 1873, October 22, in Germany, has been made the subject of some study by Professor V. Lafaulx and Professor Kortum, of Bonn, who conclude that the origin of the shock was at a depth of between three and six English miles. The velocity with which the earthquake wave ran along the earth's surface was about eleven miles per minute.

Under the new organization of the *Meteorological* service of France, Rayet, astronomer at the Paris Observatory, has official care of the observations taken in France; Froat investigates the disturbances, and sends storm warnings to the principal French sea-ports; Sainte-Claire Deville is general inspector for meteorology. The storm warnings sent from England to the French sea-ports will probably also be continued.

The publication at Paris of the atlas of general movements of the earth's atmosphere having ceased some years ago, Hoffmeyer, director of the Danish Meteorological Office, proposes to publish an equivalent atlas for the North Atlantic and European stations, which work will respond to a long-felt desideratum.

In the last annual of the Hungarian Meteorological Institute Schenzl gives the results of observations made during eight years at Ofen on the temperature of the earth at depths of from four to twenty feet. On the average, he finds that twenty-one days are required by the temperature to penetrate to a depth of three feet. The stratum at which the temperature is constant is at Ofen not so deep as at Munich.

The first report has been received from the new Magnetic Observatory at Zi-ka-Wei, in China. This institution possesses a complete set of self-recording magnetic instruments, and promises to constitute an important station for magnetic observations, the only other prominent magnetic station in that country being that at Peking, under the direction of Fritsch.

In the *Molecular Sciences, Optics, Acoustics, Electricity*, etc., we note that Becquerel announces that experiments made at his suggestion on the possibility of rendering photographic plates sensitive to every color have been productive of remarkably interesting results. Following Dr. Vogel's idea of coating the plates with transparent films, he has been able by the use of chlorophyll to obtain a spectral image of much greater length than when plain collodion is used. The characteristic absorption band of chlorophyll dissolved in collodion was well photographed.

The fact that two differently colored spots, when viewed each with but one eye, are by the mind combined into a single spot of an intermediate color, exactly as if the two colors had been combined by a rapid rotation of each before the eye, has long been an inexplicable phenomenon, the solution of which seems at last to have been found by Von Bezold.

The modified form of the spectroscope suggested by Professor Eaton, of Philadelphia, promises to be exceedingly convenient and economical. Eaton's modification consists principally in attaching to one of the faces of an ordinary bisulphide of carbon prism or dense glass prism a thick plate of glass with *parallel sides*. With this apparatus the dispersion is four times greater than that of the ordinary sixty-degree prism.

Professor Mayer continues his experimental researches in acoustics, in which he has by a series of brilliant experiments laid bare the hidden processes of hearing in both insects and mankind.

Professor Barker, in an interesting discussion of the relations announced by Professor F. W. Clarke relative to atomic heats, urges the claims upon scientists of the "chemical physics," "a field of research avoided," as he says, "by the chemists, and ignored by the physicists."

Mr. Thayer, student in the physical laboratory at Harvard College, publishes some experiments showing that in the case of condensers made with solid dielectrics the slowly diminishing current which is observed when the plates of a polarization battery are connected may be due to a decomposition of the material separating the plates of tin-foil; the current was not sensible when the dielectrics were absolutely dry.

The theory elaborated during the past five years by Edlund, of Stockholm, as to the physical nature of electricity has lately received an excellent support by the review by Emsmann of all the arguments for and against its correctness. Edlund assumes, as we have formerly stated, no new imponderable substance, but merely makes use of that property of the ether of the opticians which was of no importance in the theory of light. He shows, namely, that the inertia and slightly imperfect elasticity of the ether molecules, by reason of which they require a small amount of time in order to effect their movements, is that property that gives rise to the peculiarities of electrical phenomena. In short, electricity, galvanism, and magnetism are but manifestations of the workings of that same ether that suffices to explain the phenomena of light and heat.

Among *Ethnological* communications worthy of notice we have one by Mr. Lawson Tait, in which he draws attention to an arrow-head, figured in a late number of the *Scientific American*, having a feathered edge, "so that if the weapon with which it was armed was propelled with any great rapidity its revolution would be a matter of necessity, and would result in a greater steadiness in its line of trajectory."

Evidence seems to be accumulating upon us that while mankind have invented many of the instruments of comfort and happiness, they have borrowed many from the animal world. In other words, man is not the only "tool-using" animal. Sir John Lubbock tells us, "Elephants break off boughs and use them as fans. Monkeys use clubs, and throw sticks and stones at those who intrude upon them. They also use round stones for cracking nuts." Mr. George J. Romanes several months ago called attention in *Nature* to the "care of monkeys for their dead." He has made experiments upon the same subject with reference to rabbits, and observed that rabbits shot near the warren crawl if

possible into it, and after dying will be brought out by their companions.

The seventh session of the International Congress of Anthropology and Prehistoric Archaeology, which was announced in a previous number of this magazine, was closed on Sunday, the 16th of August, at Stockholm. The meeting was a triumphant success, over half the members being present. The only American whose name we notice among the officers was Professor Whitney. The king and the city of Stockholm extended the most hearty welcome to the distinguished guests. The next meeting will be held at Buda-Pesth.

In the *Revue d'Anthropologie* M. Topinard discusses Camper's system of facial-angle measurement, and attributes the disrepute into which it has fallen to the carelessness and want of mutual understanding among those who have used it. The same may be said of every branch of ethnology. But the time has come for the establishment of a better and more uniform terminology. The abandonment of a merely geographical arrangement of objects, and a disposition to adopt a more rigidly scientific classification, will be instrumental in effecting greater uniformity of terms.

Under the head of *Microscopical Science* we notice in the July number of the *Quarterly Journal of Microscopical Science* the following simple and easily made cement, which is highly recommended by Mr. Busk, and possesses the advantage that it can be used under water or weak spirit, so that the cover can be affixed beneath the surface of the fluid, and the admission of air bubbles thus effectually prevented. This caoutchouc size, as he terms it, is prepared by melting caoutchouc in an iron or porcelain cup till it is reduced to a viscid tar. When cold it is dissolved in benzine to the consistency of thick gold size. After application to the edges of the glass cell it is allowed to dry fifteen minutes to evaporate the benzine; after which the cover, completely immersed in fluid if desired, is applied and pressed firmly into place. When the surfaces are dry, a solution of shellac or other varnish completes the mounting.

Careful microscopic examination has shown that caries in teeth is largely due not merely to the acids of the mouth, but to a vegetable parasite, *Leptothrix buccalis*. Besides this there are other vegetable and even animal growths; these are not much affected, except as to their abundance, by the ordinary means employed to clean the teeth, but soapy water appears to destroy them. The fungus attains its greatest size in the interstices of the teeth, and after the action of acids, taken with the food or in medicines, or such as are formed in the mouth itself by some abnormality in the secretions, which make the teeth more or less porous or soft, the fungi penetrate the canaliculi both of the enamel and of the dentine, and by their proliferation produce rapid softening and destructive effects. Those interested will find an able article upon this subject in the *Lancet*, December 13, 1873.

We find in the *Medical Record*, July, 1874, an account of two cases of the fatal malady called malignant pustule, and known, when occurring in cattle, as "the blood," and to which the French give the name charbon, and the Germans that of Milzbrand. A microscopic examination showed

in the blood and in the greenish-yellow spots and in the parenchyma of the gastric walls enormous quantities of Bacteria; the disease was communicated from the first patient to the *post-mortem* assistant of the hospital, and both cases were fatal. Subsequently, Dr. Orth inoculated a rabbit with the fresh blood of the second case, and from this one another, and so on till eight were injected. Masses of Bacteria were found in the blood and connective tissue of all these animals.

In *Zoology* the most interesting discovery is that of Professor E. Van Beneden, of Liege, who shows that of the two membranes of which the hydroid polyps are composed, the outer (ectoderm) gives rise to the testes and spermatozoa, and the inner to the ovaries, so that the outer layer is male and the inner female. He considers that the process of fecundation in animals consists in the union of an egg with a certain number of spermatozooids, this act having no other end than bringing together chemical elements of opposite polarity, which, after having united for a moment in the egg, separate again; for in most animals, as soon as the division of the yolk into two portions appears, the elements out of which the outer layer is formed are already separated from those which constitute the internal layer of the embryo. The new individual is formed at the moment when the union between the elements of opposed polarity is effected, as absolutely as the molecule of water is formed by the union of atoms of hydrogen and oxygen.

Van Beneden maintains, from the facts afforded by other embryologists, that the same sexual differences occur in the two embryonal layers of the vertebrates, and he thinks it probable they will be found to exist in all animals. This bears out the prevalent idea that the sex of animals is determined at the time of fecundation of the egg.

Through the explorations of Dr. Packard in the caves of Kentucky, Indiana, and Virginia, in connection with the geological survey of Kentucky, some forty additional species of insects have been added to our cave insect fauna. In the famous Weyer's Cave, near Staunton, Virginia, about twenty species were discovered where none were before known to exist. The larvæ of the two blind cave beetles (*Adelops* and *Anophthalmus*) were found, and many facts bearing on the distribution and origin of cave animals collected.

In the *Monthly Microscopical Journal* is appearing a series of papers on the nervous system of the sea-anemone (*Actinia*), by Professor P. Martin Duncan. In the August number he gives a *résumé* of our knowledge on the subject. He substantiates the discovery made by Schneider and Rötteken of isolated nerve cells near the pigment cells at the base of the tentacles of the *Actinia*, supposed to be eyes. In connection with these nerves are certain round refractive cells (Haimean bodies) and other long cells, called the Rötteken bodies. The former, he thinks, carry light more deeply into the tissues than the ordinary epithelial cells. This is also the case with the elongated Rötteken cells and others similar to them, called bacilli. All these, he believes, with Schneider and Rötteken, when in combination, concentrate light. "When they are brought together in this primitive form of eye they concentrate and convey light with greater power, so

as to enable it to act more generally on the nervous system, probably not to enable the distinction of objects, but to cause the light to stimulate a rudimentary nervous system to act in a reflex manner on the muscular system, which is highly developed." "The evolution of an eye," he adds, "probably took the path which is thus faintly indicated in the *Actinia*, which doubtless has an appreciation of the difference between light and darkness." Duncan discovers, as he thinks, very fine nervous filaments at the base of the body of the *Actinia*.

A noteworthy paper has been published by Mr. H. N. Moseley, of the *Challenger* expedition, in the proceedings of the Royal Society, on the anatomy and affinities of a singular terrestrial articulate animal known as *Peripatus*, and usually regarded as a worm. It seems, however, that the young breathe air through tracheæ, which are wanting in the adult. *Peripatus* would for other reasons be regarded as related to the insects were it not that the two nervous cords are widely separated, instead of being united at intervals into ganglia, as among true insects. Moseley shows that *Peripatus* has affinities both to the true insects and the myriopods. He then speculates on the derivation of insects from some form, such as *Peripatus*, and thinks it "may well be placed among Professor Hæckel's *Protracheata*." "If these speculations be correct," he adds, "the crustacea have [had] a different origin from the tracheata"—a view already suggested by Packard, who had previously, unknown to the author, regarded *Peripatus* as a stem form of insects, and connected them with the worms.

Professor Peters finds new coincidences between the development of the *Cæcilia* and other batrachians. He states that these creatures possess neither amnion nor allantois, that they are, at least in part, viviparous, and that at a certain period of the year they are aquatic.

M. Dareste gives in the *Archives of Experimental Zoology* a memoir on the origin and mode of formation of double monsters.

An interesting paper on the sound produced by European fishes, by M. Dufosse, appears in the *Annales des Sciences Naturelles*, while M. Baudelot prints in the *Archives de Zoologie Expérimentale* a paper on the scales of the bony fishes.

Some valuable contributions to *Agricultural Science* have appeared in the reports of the Connecticut Board of Agriculture for 1873, in which, among other articles, we find the proceedings of the winter meeting of the Board of Agriculture, and the reports of the pathologist, pomologist, and chemist of the board. The winter meeting, was, in fact, a large farmers' convention, in which lectures were delivered and discussions held of considerable scientific value. A lecture was delivered by Professor Atwater, on "Commercial Fertilizers at Home and Abroad," in which it was shown that the fertilizers are very much better and cheaper in Europe, and especially in England and Germany, than in our own country, and that this difference was largely due to the control exercised by means of chemical analysis over the trade in commercial fertilizers.

The establishment of an agricultural experiment station in Connecticut was discussed at the meeting, and steps taken for the presentation of

the subject to the people of the State, and of a petition to the Legislature for an appropriation of money to found and carry on a station.

The report of Professor Johnson, chemist of the board, contains analyses of thirty-one specimens of fertilizers in common use in the State. "The analyses of the manufactured fertilizers reveal perhaps but one positive adulteration, viz., a sample of ground bone largely mixed with oyster shells. They demonstrate, however, the fact that in most cases the consumer has no guarantee that he gets his money's worth, commercially considered, when he purchases them, and they confirm the view that he will never be able to buy with such assurance until he stipulates for so many pounds of this and that fertilizing element, nitrogen or phosphoric acid, as the case may be, in a well-defined state of solubility or availability, instead of buying so many tons of so-called ground bone or superphosphate, it may be on an old analysis, or without analysis at all."

Quite a good idea of the recent progress and present status of investigation in agricultural chemistry may be derived from the transactions of the "Section for Agricultural Chemistry" of the meeting of the German *Naturforscher und Aerzte*, held at Wiesbaden in September, 1873. Nearly forty persons were present, among whom were a number of the directors and chemists of the German experiment stations. The proceedings consisted chiefly of accounts of new investigations in animal and vegetable chemistry and in physiology.

Dr. Von Wolff reported a series of experiments on the digestive capacity of swine for various fodder materials. Cock-chafers (*Maikaefer*), which are sometimes collected in large quantities in Germany, were found to be quite nutritious, forty-four per cent. of the albuminoids and ten and a half per cent. of the fat being digested by the swine. The digestibility of barley, maize, beans, pease, cocoa-nut cakes, was also tested. The high digestive capacity of swine for carbo-hydrates was strikingly demonstrated. The opinion which has been maintained that the fats of the animal body are made from the albuminoids of the food alone was controverted by some of these experiments in which the albuminoids of the food were insufficient to cover the increase of fat in the bodies of the swine, so that the carbo-hydrates appear also to have taken part in the formation of the fat.

Dr. Von Wolff reported also some experiments on the digestive capacity of sheep for hay when fed alone, and with turnips. Previous experiments have shown that when to "crude fodder materials," as hay, materials rich in carbo-hydrates but poor in albuminoids, as potatoes, meal, or starch, are added, the digestion of the crude fodder, and particularly of its albuminoids, is thereby decreased. In this case the decrease in digestion of the albuminoids of the hay when turnips were added was considerably less than had been found to be the case with potatoes or starch.

Professor Mayer, of the University of Heidelberg, gave accounts of experiments on the absorptive power of leaves and other superterraneous parts of plants for ammonia. Various plants were found capable of absorbing carbonate of ammonia in the gaseous form and in solution. No special facility on the part of legumi-

nous plants for absorbing combined atmospheric nitrogen appeared from these experiments.

Dr. Fleischen, of the experiment station at Weende, reported a new respiration experiment with sheep, in continuation of and with similar results to those which have been going on for some years past at his station.

Other investigations by Wolff on the influence of different amounts of phosphoric acid upon the development of oat plants grown in aqueous solutions, and by Weiske and Wildt on the excretion of hippuric acid, our space will not allow us to describe.

Accounts lately received of the transactions of the first meeting of the directors of the Italian experiment stations, held at Rome in January, 1873, show that a considerable amount of valuable work has already been done, and that the prospect for the success of these institutions, lately established in Italy, is very encouraging. No less than twelve stations were represented at the meeting.

In the department of *Engineering* we may chronicle the proposition to build another international bridge across the Niagara River at Grand Island. Charters for this purpose have already been granted by the Legislatures of Canada and New York. Another project of considerable importance is that of a company to bridge the Mississippi at Carondelet, which meets, however, with much opposition. A board of engineers has been sitting in St. Louis during the past month to consider the plans and location of the bridge, acting under instructions from the Secretary of War.

Work on the East River Bridge continues. The key-stones of the arches in the Brooklyn tower were raised to their places August 8. They weigh eleven tons each. This tower is now 225 feet above high tide, and will probably be finished by November. The New York tower is now 148 feet above high tide, and it is expected will be carried above the spring of the arches before cold weather. The Brooklyn anchorage is now forty feet up, but that on the New York side is not yet begun. The Brooklyn City Council has voted an additional \$2,000,000 to the enterprise.

From the Hoosac Tunnel we have the report that much additional arching will be required to make transit perfectly safe, and the work is being executed by the Messrs. Shanly, who completed the excavation of the tunnel. Apropos of the much-discussed Channel Tunnel, the *Engineer* records the statement that the Great Northern Railway of France has volunteered to contribute its share of £80,000, provided the British railway lines contribute their portion, for the purpose of meeting the estimated cost of running preparatory driftways to determine the character of the bed of the Channel, and thus set at rest the question of the ultimate practicability of the project.

The recently launched iron steam-ship *City of Peking* has made her trial trip with great satisfaction. Mr. John Roach, her constructor, has received a contract to construct three additional steam-ships for the same line.

The Henderson hydraulic brake, which has of late received much attention, was given an experimental trial some weeks ago on the West Chester and Philadelphia Railroad. The train

consisted of five passenger cars and one baggage car, attached to a powerful locomotive, which were run about ten miles up the road, making a number of stops to test the efficiency of the brake. Three stops were made with the following results: 1st. Grade descending 15 feet to the mile; speed, 35 miles per hour; train stopped in distance of 630 feet, and in $20\frac{1}{4}$ seconds time; boiler pressure, 105 pounds. 2d. Grade as above; speed, 32 miles; stopped in 540 feet; boiler pressure, 115 pounds. 3d. Level; speed, 35 miles; stopped in 840 feet, in $28\frac{1}{4}$ seconds; pressure, 105 pounds. These results will compare favorably with those obtained by the most approved forms of power brakes. The construction of the Henderson brake, to which allusion has already been made in these columns, is extremely simple, a fact which constitutes one of its principal merits.

The last month was signalized by the meeting of the American Association for the Advancement of Science, at Hartford. The number of papers presented was quite large. The only one, however, which falls within the scope of this department is that of Professor T. Sterry Hunt on a new wet process of copper extraction. The process, which is too long to describe in detail, involves the employment of protochloride of iron, which converts the oxide of copper into a soluble chloride. From this solution the copper is precipitated by metallic iron. The speaker affirmed that in this process the injurious elements of the ores, such as arsenic, antimony, and tin, remain undissolved, and the metallic copper obtained is so pure that it can be made into fine copper by a single fusion.

The Chief of the Bureau of Statistics furnishes the following statement of the principal exports from Great Britain to the United States during the seven months ending July 31, 1874, as compared with the corresponding period of 1873:

Articles.	1873.	1874.
Copper (unmanufactured).....cwt.	43,804	724
Copper (manufactured).....cwt.	1,286	707
Hardware and cutlery.....£	479,895	864,334
Iron and steel (bar, bolt, etc.)...tons.	21,095	2,397
Iron (railroad of all kinds).....tons.	134,393	72,631
Iron (hoop, sheet, boiler).....tons.	13,834	3,396
Tin plates.....tons.	58,462	53,405
Old iron.....tons.	27,400	5,269
Steel.....tons.	12,624	7,603
Lead (pig, etc.).....tons.	2,287	1,455
Machinery.....£	348,904	135,791

The comparison is instructive, as showing a heavy decrease in every item given.

From reports recently made to the government Land-office the following statistics indicate the extent and distribution of the Rocky Mountain coal-field:

Locality.	Area.	Coal Area.
	Square Miles.	Square Miles.
Texas.....	237,000	30,000
Indian Territory.....	69,000	40,000
New Mexico.....	122,000	20,000
Kansas.....	80,000	80,000
Missouri.....	67,000	24,000
Nebraska.....	84,000	84,000
Iowa.....	55,000	24,000
Wyoming.....	68,000	20,000
Colorado.....	102,000	20,000
Montana.....	145,000	74,000
Dakota.....	150,000	100,000
Total.....	1,182,000	516,000
Approximate coal area of British Amer..		737,000

SEVEN ASTRONOMERS ROYAL.

In connection with the valuable astronomical papers published in this Magazine during the present year—a year of unusual significance in this department of science—the following summary, copied from a recent number of the *Edinburgh Review*, and showing the work accomplished by the astronomers of the Royal Observatory at Greenwich since 1674, will be of great interest to our readers. The record has special reference to lunar observations.

The Royal Observatory at Greenwich was built in the reign of Charles II., “for the rectifying the tables of the motions of the heavens, and the places of the fixed stars, so as to find out the longitudes of places for the perfecting the art of navigation.” Flamsteed, a contemporary of Newton, was appointed the first “Astronomical Observer” of the king, or “Astronomer Royal,” in 1674, and the work of the observatory was commenced in 1676. The earliest mural circle, or large circle attached to the face of a wall, with a graduated scale, for exact observations in the meridian, was constructed by Flamsteed at his own expense in 1689; and with this exact instrument the systematic study of the moon’s movements was initiated, two years after the publication of the *Principia*, which contained the final development of Newton’s great theory. In 1694 Flamsteed supplied Newton with a series of observed places of the moon for use in his calculations. A notable illustration is afforded of the appreciation which was given to astronomical science at this time in the fact that the first mural circle in the observatory was constructed at Flamsteed’s own expense; that Flamsteed’s salary for his public service was £100 per annum, with a deduction of £10 per annum for a tax, and was coupled with the condition that he should instruct two of the Christ-church school-boys in nautical astronomy, and that the salary of an indispensable assistant was also paid by him. Flamsteed died on the last day of the year 1719, being at that time sixty-four years of age. His observations were printed five years after his death, under the title, *Historia Cælestis Britannica*, and the second volume of this work contained places of the moon computed from observation.

Flamsteed was succeeded in the Royal Observatory by Edmund Halley, who was also a contemporary of Newton, and who began his work at the observatory when he was sixty-four years old. It is probable that he was induced to enter upon so laborious an office at such an advanced period of his life on account of the great advantage the position afforded him for prosecuting certain researches into the moon’s movements upon which he was already engaged. He constructed a new transit instrument and a mural quadrant, and pursued his investigations with these. About ten years after his accession at Greenwich the reflecting quadrant—the mechanical contrivance which rendered lunar observations at sea for the determination of the longitude possible—was discovered independently by Hadley in England and by Godfrey in America. Tables of the comparison of observed and computed places of the moon from 1722 to 1739 were constructed by Halley, and these were subsequently printed. Edmund Halley died in 1742.

The third Astronomer Royal was James Bradley, whose name is inscribed in the annals of science in imperishable characters on account of his being the inventor of the zenith sector, and the discoverer of the aberration of light, and of the nutation of the earth's axis. He administered the affairs of the Royal Observatory from 1742 to 1761, and the era of what is termed the "exact observations" of Greenwich is generally considered to date from about this time, or, more exactly, from 1750. His observations were printed after his death by the University of Oxford.

During the rule of Bradley at the Royal Observatory the French astronomer Lacaille determined the horizontal parallax of the moon, or, in other words, its distance from the earth, with much greater precision than had been found possible previously; and Mayer, of Göttingen, also completed a series of lunar tables, based on observations of eclipses and of occultations of fixed stars by the moon, which were found to give the proper places of the moon within a minute and a half of celestial longitude. These tables took into account fifteen distinct forms of irregularity. Bradley compared the actual corresponding places of the moon with the forecasts of these tables, and reported in regard to them that they unquestionably rendered it possible for sailors to find their position in the open sea, by observing the distance of the moon from certain standard fixed stars, within one degree of longitude, and that they therefore virtually fulfilled the object for which a public reward had been offered. Mayer's wife, in consequence, after his death received the sum of £3000 from the British government in recognition of the important service thus rendered to the science of navigation. Mayer's tables were extended and otherwise improved twelve years afterward by Mason, and the possible errors in observing and calculating longitude at sea were pronounced to be then further diminished very nearly one-third.

In the last year of Bradley's life, John Harrison, a Yorkshire carpenter and mechanic, rendered the construction of the chronometer so perfect that it became possible for the sailor to carry Greenwich time with him through long voyages, so that thenceforth he could make the chronometer serve the same purpose as observing the distance between the moon and a star. In 1761 Harrison sent a chronometer to Jamaica which went wrong only five seconds and a tenth during the voyage, and this it was found would not have involved an error in longitude for the ship's place of more than two miles. The sum of £20,000 was awarded to Harrison by an act of Parliament for this improvement of the marine chronometer. The observation of lunar distances at sea became of only secondary importance after this. But it was still held of great consequence, on account of its supplying the means of checking and verifying the performance of the chronometers, and of replacing them altogether in case of accident.

In the year in which Harrison perfected the construction of the marine chronometer, Dr. Bliss succeeded Bradley as Astronomer Royal. But he died within four years, and so left no material contribution to the efficiency of the observatory. Neville Maskelyne followed him in 1765, and continued his distinguished services as Astronomer Royal for the long term of forty-six

years. He had been so fortunate as to have been previously engaged in observing the transit of Venus at St. Helena in 1761, and co-operated in the subsequent observation of this phenomenon eight years afterward, on the historical occasion when Cook was sent to Otaheite. Maskelyne introduced at the Royal Observatory the method of noting the transits of celestial bodies over a system of five vertical wires placed in the field of the telescope, and first ventured upon the refinement of reckoning the meridian passage of a star within tenths of seconds. The distinguished honor also belongs to him of having commenced the publication of the *Nautical Almanac*, which first appeared two years after his appointment as Astronomer Royal. He was engaged with the preparation of a fine mural circle for the observatory when his useful life was brought to a close, at the advanced age of seventy-nine years.

During the reign of Maskelyne at the Royal Observatory the French mathematicians Laplace and Lagrange had been making important progress in investigating theoretically the moon's movements. A slight continued acceleration of the moon's rate of traveling, and a gradual shifting of the points where the planes of the orbits of the moon and of the earth cross each other, and of the situation of the moon's farthest departure from the earth in each turn of its revolution, were traced to a gradual diminution in the eccentricity of the earth's orbit. The disturbing influence of the equatorial bulging of the earth, and of the varying distance of the sun, had also been detected. In consequence of these rapid and important advances in theoretical knowledge the French Academy of Sciences thought it well to offer a prize for new tables of the moon in which all these discoveries should be taken into account. Tables were published in answer to this appeal in 1802, by Tobias Burg, of Vienna, and these were still further developed, as it was then thought, in 1811, by the astronomer Burckhardt, who discussed no less than four hundred observations of the moon for this purpose. The extended tables of Burckhardt were thenceforth adopted in the preparation of the *Nautical Almanac*, under the impression that they were the best then available; but it unfortunately happened that a complicated and involved form of expression had been used in them, which served to conceal for a long time certain inherent imperfections. It was only in subsequent years that it was discovered these tables allowed errors in the moon's calculated place as large as half a minute of longitude.

John Pond succeeded Maskelyne at the Royal Observatory, and he had the satisfaction of adding a large transit instrument to the equipment of the place. He gave great attention to establishing the positions of standard fixed stars that could be used as the graduations of the heavens from which the moon's movements had to be measured. The great improvement, however, which he introduced into observational astronomy, and which enabled him to accomplish his object of getting more exact observations of the fixed stars, was the very beautiful method of observing the image of the star reflected from the still surface of mercury at the same instant that the star was seen through the telescope. The half of the angular measure that was included between the lines of sight in which the two observations were made of necessity gave the height

of the star above the horizon. In this way all levels and plumb-lines for getting the bearing of the horizon were summarily dispensed with. The observation found its own horizon by the simple expedient of establishing reflection from an absolutely horizontal surface. This method of getting observations above the horizon is of the most exquisite perfection of delicacy and exactness, and is so entirely satisfactory that it is still in use in observing altitudes and polar distances with the great meridian instruments at Greenwich.

The seventh individual in the series of distinguished men, which completes the list of the Astronomers Royal of Great Britain, is Sir George Biddell Airy, who succeeded Pond in 1835, and still happily fills the place of "astronomical observer" at the great national observatory. It would not be an easy task to enumerate all the good services that this energetic veteran has rendered in his long term of thirty-nine years' service. But some of these must be named on account of the direct bearing they have upon the perturbational history of the moon and the perfection of the tables of the moon's movements. While Mr. Airy was yet directing the operations of the observatory of the University of Cambridge he introduced the admirable and most important practice of having all current observations at once reduced, with the necessary refinements of correction, and printed side by side with the corresponding terms of the tables that presumably represent them, so that each particular failure in the table might be apparent at a glance. Before this period all the moon observations had been taken by meridian instruments; that is to say, the place of the moon was noted on the instant that it crossed the meridian, by measuring its height in declination above some standard fixed star, and its distance in right ascension from the same star counted in seconds of time that elapsed between the consecutive meridian passages of the moon and star. This method of observing is very exact, but it of necessity limits very materially the number of moon observations that can be made. As soon, therefore, as the present Astronomer Royal had fairly entered upon his career of public service, he set himself to add to the equipment of the observatory an instrument by which good observations of the moon could be taken *out of the meridian*. The instrument which he constructed for this purpose was the fine altazimuth, that is still in use, and that answers the end for which it was contrived admirably. With it the position of the moon is compared with that of standard fixed stars when it is still far from the meridian on either side, and, what is of still greater importance, the moon is also observed in a part of its orbit in which no observation at all can be taken upon the meridian, and in which part, therefore, there was previously no means of checking off its irregularities of pace. By this expedient of extra-meridional observation the number of satisfactory observations of the moon has been trebled. In the year 1848 Mr. Airy printed the reduced and corrected observations of eight thousand places of the moon that had been made at the Royal Observatory between 1750 and 1830, and which had, up to that time, been of no practical avail, on account of not having had these essential reductions and corrections applied.

Other notable improvements in instrumental work that have been effected by the present Astronomer Royal are the adoption of a plan, which he himself devised, of taking the observation of both the direct and reflected images of a star upon the meridian by the same instrument, instead of employing two instruments for the purpose, as was previously done; and the fusion of the two great meridian instruments, namely, the transit and the mural circle, into one, so that both declinations and right ascensions can be read off at one observation, instead of requiring two instruments and two observers. The transit circle which has thus been introduced at Greenwich has now superseded the double-instrument system at all the best observatories.

The near approach to perfection which the lunar theory and the tables of the moon have made has mainly resulted from two centuries of unintermittent work at the national observatory, which commenced with Flamsteed, and which, happily, has not yet ended with Airy. It is, at the present time, just two full centuries since the warrant was issued by the second Charles for the appointment of an "astronomical observer" to look after the scientific interests of navigation, and it is certainly a notable circumstance that through this long stretch of two hundred years there have been only seven Astronomers Royal. If the one exceptionally short-lived Astronomer Royal be withdrawn from the list, the official lives of the remaining six make up the term of one hundred and ninety-six years, and this gives very nearly thirty-three years for the official life of each individual of the series—a very fair allowance indeed, considering the work that is accomplished in the time.

THE SPECIES OF AMERICAN SQUIRRELS.

Mr. J. A. Allen, well known as one of the most accomplished and thorough of American zoologists, has lately published a synopsis of the general results obtained by him from an investigation of the American *Sciuridae*, or mammals belonging to the squirrel group, including the squirrels proper, the flying-squirrels, ground-squirrels, marmots, etc. As the result of his inquiries, based upon the immense amount and variety of material in the National Museum at Washington, he has occasion to reduce the number of species still lower than that allowed by Professor Baird in his monographs of the same forms, finding that many of those which have hitherto been considered as species are in reality merely climatic or geographical races, several of which are referable to a common type.

A striking generalization obtained in his investigations has reference to the increasing intensity of color of the species in proceeding from the north southward, this being very evident in the fox-squirrel of the Mississippi Basin, the belly of which in the northern part of its range is almost white, while in specimens from Lower Louisiana it is reddish-fulvous, or a deep orange. Equally decided differences exist in specimens of the same species as they proceed from east to west.

Mr. Allen now considers that we have at least five more or less well marked areas characterized by certain peculiarities of color variation in mammals and birds, as well as by a close relation between the areas, the prevalent tendencies of change of color, and the amount of aqueous pre-

precipitation. The first of these regions is that of the Atlantic slope, which includes not only the country east of the Alleghanies, but a large part of the British possessions, extending westward as far as Fort Simpson, and northward and westward to Alaska, including, apparently, all that territory north of the Alaskan Mountains and having an annual rain-fall of about thirty-five to forty-five inches. This region, in view of its great extent, he selects as representing the average or normal type of color, the variation in other regions being in the direction of intensity.

The second region embraces the Mississippi Valley, or more properly the Mississippi Basin, and is termed the *Mississippi Region*. Here the annual rain-fall reaches forty-five to fifty-five inches, and sometimes more. In this region the tendency is to an increase of fulvous and rufous tints, these reaching their maximum in the limited area of greatest humidity, although a general increase of color is more or less characteristic of the region.

The central portion of the Rocky Mountains forms the third region, to be called the *Colorado Region*, as including the greater part of that Territory within its limits. Here the general tendency is to an increase of intensity of colors, as compared with the region west of it, with a development of rufous and fulvous tints. The humidity here is less than that in either of the other regions named, the rain-fall being only from twenty-four to thirty inches.

The fourth area Mr. Allen calls the *Campestrian Region*, and includes the arid plains and deserts of the continent, containing not only the "great plains," so called, but the plains of Utah, Nevada, Western Colorado, New Mexico, Arizona, and southwest to Lower California. Here the rain-fall ranges from three inches to twenty, being below fifteen generally. Here a general paleness of color is the distinctive feature.

The fifth region, called the *Columbian Region*, begins on the Pacific coast at about the fortieth parallel, and embraces a comparatively narrow belt to Sitka. Its peculiarities are most strongly developed west of the Cascade Range north of 45°, and prevail eastward nearly to the main chain of the Rocky Mountains. The average rain-fall is from fifty-five to sixty-five inches. The prevalent tendency in color is to dusky and fuscous rather than rufous tints.

Other subdivisions of a similar character Mr. Allen thinks may be desirable, and may need to be made hereafter, especially for the southern half of Florida, which is characterized by excessive humidity and a subtropical intensity of color; and it may be necessary to recognize as a distinct district the almost rainless portions of the *Campestrian Region*.

Mr. Allen in this communication refers again to the relation between color and humidity previously enunciated by him, remarking that the best mode of expressing it is to say that a decrease of humidity is accompanied by the decrease of intensity of color, this evidently resulting from exposure to the bleaching effect of intense sunlight and a dry, often intensely heated, atmosphere. He refers to the condition of *melanism* as a race characteristic in mammals, and confirms the generalization of Professor Baird that but few mammals possess this in a specific form, and that where it occurs in such groups as

the squirrels, the wolves, foxes, cats, etc., the individual must be considered as a melanistic form of some race the normal color of which is different, generally fulvous or rufous.

Mr. Allen's paper embraces a list of the species of North American *Sciuridae* which he considers permanent, and among the true squirrels he allows but five that are permanent where Audubon gives twenty-four. He, however, recognizes in addition seven geographical varieties, making the whole number of permanently distinct forms twelve. Of flying-squirrels he allows but *one species*; of the genus *Tamias*, or the ground-squirrels, he gives *three*; of the *Spermophilus*, *eleven*; of the prairie-dogs, *two*; and of the true marmots, *three*—making twenty species in all.

THE ATMOSPHERE OF JUPITER.

Dr. Lohse has investigated the velocity of the rotation of the cloud layers of Jupiter at different degrees of latitude on that planet. He finds that, in general, in the middle latitudes of Jupiter, there is a greater stability in the upper strata of the atmosphere than in the neighborhood of the equator, where the velocity of the rotating masses is increased by wind. He sees in this fact a probability that trade-winds prevail there as upon our earth.

THE THEORY OF ERRORS OF OBSERVATION.

Mr. C. S. Peirce, in an interesting article on the laws of errors of observation, and the nature of the so-called personal equation, gives the results of some experiments made upon an entirely untrained observer, a young man about eighteen years of age, who had had no previous experience whatever in observations. He was required to answer a signal consisting of a sharp sound like a rap, his answer being made by tapping upon a telegraph operator's key nicely adjusted. Both the original rap and the observer's tap were recorded by means of a delicate chronoscope, and five hundred observations were made on every week-day during a month. It was found that on the first day the observations were scattered through a very large range of error, the difference in time between the records of the event and of the observation varying in fact between the extreme values from 0.16 to 0.98 of a second. The personal equation proper on the second day was between 0.2 and 0.3 of a second, and from that time it steadily decreased until it amounted only to one-seventh of a second; it then gradually increased until the twelfth day, when it amounted to 0.22 of a second. While this variation in personal equation occurred, the range of errors or discordances was constantly decreasing, until on the twenty-fourth day the probable error of the result does not exceed one-eightieth of a second. This is considered to clearly demonstrate the value of such practice in training the nerves for observation; and he recommends that transit observers be kept in constant training by means of similar observation of an artificial event, which can be repeated with ease and rapidity, it not being essential, he thinks, that those observations should very closely imitate the transit of a star over the wires of a telescope, inasmuch as it is the general condition of the nerves which it is important to keep in training more than any thing peculiar to this or that kind of observation.

Editor's Historical Record.

POLITICAL.

OUR Record is closed on the 24th of September.—Numerous political State Conventions have been held, as follows: Alabama Republican, at Montgomery, August 22, nominating Mr. White and Mr. Street for Congressmen at large; Ohio Democratic, at Columbus, August 25, nominating William Bell for Secretary of State; Michigan Republican, at Lansing, August 26, nominating J. J. Bagley for Governor; Illinois Democratic, at Springfield, August 26, nominating Charles Carroll for State Treasurer; Kansas Republican, at Topeka, August 26, nominating Thomas A. Osburne for Governor; Pennsylvania Democratic, at Pittsburg, August 26, nominating W. J. Woodward for Supreme Judge; Virginia Conservative, at Richmond, August 27, nominating for Governor ex-Governor Gilbert C. Walker; Missouri Democratic, at St. Louis, August 27, nominating Charles H. Hardin for Governor; New Jersey Republican, at Trenton, August 27, nominating George A. Halsey for Governor; Ohio Republican, at Columbus, September 2, nominating A. T. Wikoff for Secretary of State; Nebraska Republican, at Lincoln, September 2, nominating Silas Garber for Governor; Missouri People's, at Jefferson City, September 2, nominating William Gentry for Governor; Nebraska Independent, at Lincoln, September 8, nominating J. F. Gardener for Governor; Arkansas Democratic, at Little Rock, September 8, approving the new State constitution, and nominating Elisha T. Baxter for Governor; South Carolina Republican, at Columbia, September 8, nominating D. H. Chamberlain for Governor; New York Liberal, at Albany, September 9, but after passing resolutions adjourned to the 29th, making no nominations; Massachusetts Democratic, at Worcester, September 9, nominating William Gaston for Governor; Michigan Democratic, at Kalamazoo, September 10, nominating Henry Chamberlin; New Jersey Democratic, at Trenton, September 15, nominating Judge Bedle for Governor; New York Democratic, at Syracuse, September 16, nominating Samuel J. Tilden for Governor; New York Republican, at Utica, September 23, nominating John A. Dix for Governor.

In nearly all of the Democratic State Conventions resolutions were passed denouncing the Civil Rights Bill and the third term. The South Carolina Republican Convention openly advocated a third term for President Grant.

The majority in Ohio against the new constitution is officially reported as 147,284.

The election in Vermont, September 1, resulted in the choice of Peck (Republican) for Governor by a majority of about 22,000. Luke P. Poland was not returned to Congress. The Republicans elected 183 members of the lower branch of the State Legislature, the Democrats 48, while there are four members representing neither party. The last House consisted of 216 Republicans and 32 Democrats and Liberals.

The election in Maine, September 14, resulted in the choice of Dingley (Republican) for Governor by a majority of between 11,000 and 12,000.

By the September election in Wyoming Territory Mr. Steele, the Democratic candidate for

Delegate, was returned to Congress by a majority of from 500 to 600.

There have been local disturbances in the South arising out of conflicts between the white and colored people. A riot in Lancaster County, Kentucky, August 19-22, reached such proportions that Governor Leslie called upon the State militia to restore order. In Trenton, Gibson County, Tennessee, a jail was broken into, August 25, and a number of colored prisoners were murdered. In the same place Julia Hayden, a colored school-teacher, was murdered. Governor Brown has succeeded in arresting the perpetrators of these outrages.

In Louisiana the conflict temporarily assumed an alarming aspect. The sentiment which became the basis of the secret organization known as the White League—a sentiment sufficiently indicated by the name of the order—was reinforced by the feeling of dissatisfaction among the citizens with the existing State government. These combined elements found expression in a mass-meeting in New Orleans, September 14, called together to protest against the seizure of arms of private citizens. The meeting led to the appointment of a committee commissioned to call upon Governor Kellogg and to request him to abdicate his office. The request was refused. The members of the White League and other citizens in arms stationed themselves at the intersection of the streets on the south side of Canal Street, from the river to Claiborne Street. In the mean time D. B. Penn, the candidate in the last State election for Lieutenant-Governor, had issued a proclamation charging Kellogg with having usurped the government, and calling upon "the militia of the State, embracing all males between the ages of eighteen and forty-five years, without regard to color or previous condition, to arm, and assemble under their respective officers for the purpose of driving the usurpers from power." Barricades were erected by the citizens, and when the Metropolitan Police appeared on Canal Street a sharp conflict followed, in which the police were defeated. On the citizens' side eight were killed and eighteen wounded. On the side of the police nine were killed and fourteen wounded. Within twenty-four hours after the first outbreak the entire State government was revolutionized, and Governor Kellogg was a refugee in the Custom-house. On the 16th President Grant issued a proclamation calling upon the disturbers of the peace to disperse within five days. On the 18th the government was surrendered to Kellogg under protest. There was no conflict between the citizens and the United States troops.

There have been conflicts with the hostile Indians in Texas and Indian Territory, in which the United States' forces have been uniformly successful.

The military head-quarters of the United States army was removed from Washington, D. C., to St. Louis, Missouri, by order of General Sherman, dated September 5, to take effect October 14.

On the 5th of September the hundredth anniversary of the first meeting of the Continental Congress was celebrated in Carpenters' Hall,

Philadelphia. An oration was delivered by Henry A. Brown.

Senator Brownlow, of Tennessee, has written a letter to Truman Smith in which he says that the effect of the Civil Rights Bill will be "the destruction of the Republican party in the South, and the certain injury of the colored people."

Four hundred Mormons sailed from Liverpool for this country September 2.

An unsuccessful attempt was made, August 24, to assassinate President Prado, of Peru.

The Bishop of Yucatan has issued an edict threatening to excommunicate all Roman Catholics who contract civil marriages.

Don Carlos, August 6, issued a manifesto "to the Christian powers," claiming that his is the party of order, and protesting against the calumnies that have been published against him and his adherents. The Carlists have sustained several defeats.

The Spanish ministry of Señor Zabala resigned early in September, and a new ministry was formed by Señor Sagasta.

The Bonapartists, encouraged by local successes in some of the departments of France, have recently assumed a bolder tone. M. Berger, their candidate for the Assembly from Maine-et-Loire, openly proclaimed his hope for the restoration of the empire. The result of the election was not promising, however. He obtained only 25,000 votes, while the Republican candidate received 45,000, and the government candidate 25,000.

Great Britain and Turkey declined to sign the protocol of the Brussels International Congress.

The Grand Duke Vladimir of Russia was married to the Duchess of Mecklenburg, August 28.

Advices from India of August 24 stated that 8,000,000 persons were still dependent on the government on account of the Bengal famine.

MISCELLANEOUS.

A monument to General Nathaniel Lyon was dedicated in Lyon Park, St. Louis, Missouri, September 13.

Prominent among the charities instituted by the St. John's Guild are the summer excursions for the benefit of poor sick children. Thus far there have been eighteen of these excursions. Some idea of the magnitude of this praiseworthy effort is conveyed by the statistics of the first nine of these excursions, the benefits of which were shared by 7441 persons. The provisions consumed consisted of 2670 pounds of beef, 3530

quarts of milk, 2100 loaves of bread, two barrels of sugar, 190 pounds of tea, 1100 pounds of rice, and 254 pounds of butter. This society is accomplishing important results. It has divided the entire city into medical districts, furnishing for each one competent physician, to reach the needs of those not cared for by the dispensaries; and it furnishes medicines and pays for prescriptions. Last winter in its various fields of charity this society had 35,000 beneficiaries.

John F. Lacey, September 1, crossed Long Island Sound in a row-boat twelve feet long, drawn by a kite. The distance was twenty-two miles. There were two men in the boat.

DISASTERS.

September 19.—Burning of the Granite Mill No. 1 in Fall River, Massachusetts. Over twenty operatives, mostly girls, were killed, and thirty-six injured.

September 22.—Collision on the Belvidere Railroad, near Warren, New Jersey, caused by an open switch. One killed and several wounded.

August 24.—Colliery explosion near Hanley, Staffordshire, England. Eight miners killed.

September 7.—Great fire in Meiningen, Germany. Loss in buildings alone \$3,000,000. Nearly 700 families made homeless.

September 11.—Collision on the Great Eastern Railway, near Norwich, England. Twenty killed and fifty injured.

OBITUARY.

August 23.—In New York city, Colonel William C. Alexander, President of the Equitable Life Insurance Company, aged sixty-eight years.

September 2.—At Nashua, New Hampshire, Major-General John G. Foster, U.S.A., aged fifty years.—At Springfield, Ohio, the Right Rev. Thomas H. Morris, senior bishop of the Methodist Church, aged eighty years.

September 7.—In Manchester, Massachusetts, Frederick B. Conway, the actor, aged fifty-four years.

September 15.—At Newport, Rhode Island, the Hon. Benjamin R. Curtis, the distinguished jurist, aged sixty-five years.

August 24.—At his country-seat, Cotswold Hills, near Gloucester, England, Sidney Dobell, the poet, aged fifty years.

August 27.—In England, John Henry Foley, sculptor.

September 13.—At his residence in Valricher, France, François Pierre Guillaume Guizot, statesman and author, aged eighty-seven years.

Editor's Drawer.

BEFORE the destruction, in part, of the Library of the United States at Washington city several years ago, there was in that library a pamphlet which contained an account of a transaction at Annapolis, Maryland, which ought not to pass into oblivion.

Prior to the commencement of the American Revolution Dr. Gustavus Warfield, distinguished for his intelligence and patriotism, resided on Elk Ridge, in Anne Arundel County, Maryland, and was captain of a volunteer uniformed company

of cavalry. A friend at Annapolis, the seat of government of Maryland, notified the doctor that two ships loaded with tea were at anchor in the harbor of that city, and were about to land their cargoes. Determined to arrest the proceeding, Dr. Warfield distributed promptly invitations to the members of his troop of horse and to his neighbors generally to a dinner, to be served up in a grove near his residence. A large company assembled, and, after enjoying the dinner, resolved unanimously that the landing of the tea

at Annapolis ought to be arrested at all hazards. Every member of the doctor's cavalry company volunteered for the required service, and forthwith followed the lead of their captain to Annapolis, where they compelled the merchants who had received portions of the tea which had been landed to throw it into the harbor, and compelled the captain of the ship from which the tea had not been landed to throw his cargo overboard; and they then returned to their homes.

It is due to the participants in this affair to say that it antedates the occurrence when the tea was thrown into the harbor of Boston.

A ludicrous incident at the dinner of Dr. Warfield served to light up with merriment the stern faces of those who had resolved to do what was then rightly considered a daring deed.

Among the assembled guests there was an old man who was not accustomed to see at his own home piles of provisions such as met his eye when the dinner was spread. Feeling his appetite stimulated by the prospect before him, he took possession of a loaf of bread and a ham, and having walked to a distance and seated himself in the shade of a spreading oak, soon, with the aid of his jackknife, disposed of his share of the feast. Then walking back to join the crowd, wiping his knife on his leather breeches, which had neither been changed nor cleaned for long years, and with a countenance glowing with gratification, he exclaimed, "Well, neighbors, if this be war, God grant we may never have peace again!"

SOME time since a party of ladies and gentlemen went on a tour of inspection through Durham Castle. The "lions" were shown to them by an elderly female of a sour, solemn, and dignified aspect. In the course of their peregrinations they came to the celebrated tapestry for which the castle is so famed.

"These," said the guide, in true showman style, flavored with a dash of piety to suit the subject, and pointing to several groups of figures upon the tapestry—"these represent scenes in the life of Jacob."

"Oh yes—how pretty!" said a young lady; and with a laugh, pointing to two figures in somewhat close proximity, she continued, "I suppose that is Jacob kissing Rachel?"

"No, madam," responded the indignant guide, with crushing dignity, "that is *Jacob wrestling with the angel*."

The men haw-hawed, the young lady subsided, and offered no further expository remarks, but groaned under a sense of unworthiness during the rest of the visit.

"SOME years ago," says the correspondent who furnished the above, "I had business which necessitated a journey to a small hamlet about ten miles distant from Nottingham, England, where I was then residing. There being no railway connecting with the place, I was compelled to make the trip on horseback; and as the weather was bitterly cold, I was pretty well frozen by the time I arrived at my destination. After transacting my business, I was about to prepare for return, when my host, a quaint specimen of an almost extinct species, the English yeoman, turning to his wife, said,

"Missis, p'raps Mr. Stone 'd like to take a

glass o' hot rum an' watter. It ud warm him up a bit a-goin' home."

"The old dame, darting at him a look containing several condensed curtain lectures, replied,

"'Rum an' watter! I'd like to know where the rum an' watter's to come from! We only had a quartern at first, *an' you've had the stomachache three times since I got it!*'"

"I stifled my feelings until I got outside, and then I 'exploded,' the naïve confession of the old lady as to her husband's device for procuring a drop of the 'crater' being altogether too much for my gravity."

THE Atlanta (Georgia) News contains an amusing account of the marriage of two colored persons, Andrew and Susy, field hands, of unimpeachable Guinea blood, each of whom was over fifty years of age. With the utmost gravity the preacher began:

"Andrew, does you lub dis yer woman?"

"I duz so," was the reply.

"Will you promise to stick close froo time an' 'tarnity, renouncin' all oders an' cleabin' to her for eber an' eber an' amen?"

"I will dat."

"Will you lub, honor, an' 'bey—"

"Hold on dar, Ole Jack!" interrupted the groom, with no little show of indignation; "'tain't no use talkin' to dis nigger 'bout 'beyin' de wimmen-folks—enny 'cept ole miss!"

"Silence, dar, you owdumptions nigger!" roared the wrathful preacher. "What fur you go fur spilin' de grabity ob de 'casion? Dis yer's only matter ob form, an' in'spensible to de 'casion. Now don't you go fur to open your black mouf until de time fur you to speak. Will you promise to lub, honor, an' 'bey' (Andrew still shaking his head ominously at the obnoxious word) "dis yer nigger, Susy, furnishin' her wid all tings needed fur comfort an' happiness, an' protectin' from sufferin' an' makin' smooove de path of all her precedin' days to come?"

"I suppose I mus' say yes to dat," said Andrew, meekly.

"Den I pronounce dese yer two couples to be man an' wife, an' whom de Lord has joined togedder let no man go fur to put dem asunder."

Here an uproar arose among the blacks, betokening a dilemma entirely unforeseen by Old Jack. For, inasmuch as he had forgotten to require the usual vows of Susy, they insisted that, however firmly Andrew might be bound by the bonds of matrimony, Susy was still single, and the pair were but half married. The matter was at last adjusted by the preacher commencing the ceremony over again, by which means the couple were firmly united, to the satisfaction of all.

A VERY entertaining book is *Hampton and its Students*, and "Two of its Teachers" give some curious instances of the ways and humors of the colored man. The following dialogue is from a chapter on "Incomplete Sanctification," in which a negro is stating his "experiences":

"When you've got de glory in your soul, you can't help a-hollerin' an' a-shoutin'."

"Then, as you have experienced religion, Mr. Jarvis, I suppose you have forgiven your old master, haven't you?"

"It was an unexpected blow. The glow died

out of his face, and his head dropped. There was evidently a mental struggle. Then he straightened himself, his features set for an inevitable conclusion, 'Yes, Sah! I's forgub him; de Lord knows I's forgub him; but—and his eye kindled as the human nature burst forth—'but *I'd gib my oder leg to meet him in battle!*'"

An old negro woman relates how her fourteen children had been sold away from her, and what her feelings were when, at the time of the war, she saw the Union flag hanging across the street, a sign that deliverance was at hand:

"An' den I spreads out my two arms wide—so—an' I hugs dat ole flag up to my bress—so—an' I kisses it, an' I kisses it, an' I says, 'Oh! bress you, bress you, bress you! Oh! why didn't you come sooner, an' sabe jes one ob my chil'en!' An' den de Yankees come a-marchin' up de street, wid de band a-playin', an' de people a-shoutin', an' I was cryin' so I couldn't see nuffin, till all at once I 'membered what my ole missis tell me, an' I wiped my eyes, an' looked to see ef dey did hab horns fur sartin."

A MORE characteristic sketch is that of a colored preacher, Father Parker. His ambition seems to have been fully satisfied when he headed the procession in Norfolk on the day when the Emancipation was proclaimed in 1863:

"I went an' headed dem colored people, a-ridin' in dat yer carriage, a-settin' back on dem yer cushions. An' I sot back—so—an' I lifted up my eyes, an' seed de Union flag a-wavin' an' a-wavin' ober my head—so—an' de music a-playin' an' de people a-shoutin', an' I said, 'O Lord! can dis be me, ole Bill Parker, slave forty year, a-settin' back in dis yer carriage, on dese yer cushions, wid de ole flag a-flyin' ober my head, a-ridin' along at de head ob dis percession of free men?' An' I sot back!"

THE latter part of the book contains cabin and plantation songs, some of which are sung by the Jubilee Singers. The negro melody is commonly very sweet, but the negro theology is somewhat grotesque, judging from the following hymn:

O saints an' sinners! will you go
See de hebbenly land?
I'm gwine up to hebben fur to see my robe—
Gwine to see my robe, an' try it on:
It's brighter dan dat glitterin' sun.

I'm a-gwine to keep a-climblin' high,
Till I meet dem angels in de sky;
Dem pooty angels I shall see:
Why don't de debbel let me be?

I tell you what I like de best—
It is dem shoutin' Methodess;
We shout so loud de debbel look,
An' he gets away wid his clooven foot.
See de hebbenly land.

THE London Court Circular is a paper given almost exclusively to records of what is doing and about to be done among the nobility and gentry of England. The paper is enlivened somewhat by a column of what purports to be English humor, the average quality of which may be inferred from the following specimen:

"A recent story of a hapless visitor to the seaside who found that the rooms he was going to occupy with his family had just been vacated by a gentleman who had died of confluent small-

pox and left the place a corpse reminds me of another story in which the gay *cadaver* figures. A traveler once alighted at a way-side inn, and found there was only one bed vacant. On his expressing his willingness to take that, he noticed a certain hesitation on the part of his hostess, but she eventually agreed to let him have it. He went to bed and slept well enough, and on awaking in the morning he had a look round the room. Finding a long chest of strange construction under the bed, he was curious enough to investigate it, and found therein the remains of an old gentleman carefully salted down. I regret to say that when he paid his bill he was heartless enough to suggest that the gentleman under the bed should pay for half of the accommodation, when the hostess burst into tears, and exclaimed, 'That's grandfeyther, and we've salted him down till we've time to bury him.'"

A WAG is "Max Adeler," and his book, *Out of the Hurly-Burly*, contains much that should cheer the dyspeptic and desponding. In his obituary notices are a few choice bits of poesy that seem, as it were, to "fill the bill." Thus:

The death-angel smote Alexander M'Glue,
And gave him protracted repose;
He wore a checked shirt and a Number Nine shoe,
And he had a pink wart on his nose.
No doubt he is happier dwelling in space
Over there on the evergreen shore.
His friends are informed that his funeral takes place
Precisely at quarter past four.

Another, still more touching:

We have lost our little Hanner in a very painful manner,
And we often asked, How can her harsh sufferings
be borne?
When her death was first reported, her aunt got up
and snorted
With the grief that she supported, for it made her
feel forlorn.

She was such a little seraph that her father, who is
sheriff,
Really doesn't seem to care if he ne'er smiles in life
again;
She has gone, we hope, to heaven, at the early age of
seven
(Funeral starts off at eleven), where she'll never
more have pain.

IN Missouri fact and poesy—the irregular "appropriation" of other people's horses and the painful result following—find rhythmic expression in words to this effect, to wit, viz.:

He found a rope, and picked it up,
And with it walked away:
It happened that to t'other end
A horse was hitched, they say.

They found a tree, and tied the rope
Unto a swinging limb:
It happened that the other end
Was somehow hitched to him.

IN Lord Cockburn's *Memorials*, recently published, some pages are devoted to the Rev. Dr. Chalmers, whom his lordship held in the highest esteem. In May, 1833, Dr. Chalmers delivered a speech in the General Assembly, of which Lord Cockburn writes that "all his views and statements blazed with the fire of his volcanic imagination. How he burns! I shed more tears of pure admiration than I have done since they were forced from me by the magnificence of Mrs. Siddons. And every syllable written in his condensed short-hand. I was sitting next

him, and stole a page of his notes, from which he spoke with intense eloquence for about twenty minutes. When he was done, and began to collect his materials, he missed this page, and upset all the hats and made all the pockets near him be emptied in search of it. I was obliged to confess the theft, when he allowed me to keep the trophy." In 1835 Dr. Chalmers made a long and eloquent written report to the General Assembly in favor of endowment. "As soon as Chalmers had closed," writes Lord Cockburn, "somebody moved a vote of thanks to him; but another member, thinking this not enough, moved that they should first return thanks to God. Some little discussion arose, which the Moderator ended by reading in a technical style from his paper that the question before the house was whether they should return thanks to Dr. Chalmers or, by prayer, to God. On this there was a general and confused cry of 'Dr. Chalmers!' 'Dr. Chalmers!' and 'Prayer!' 'Prayer!' when the Moderator declared that Dr. Chalmers had it, and proceeded to eulogize him accordingly, and the prayer did not take place till a considerable time afterward."

In the Little Rock (Arkansas) *Gazette* of September 15 might have been perused the following advertisement, which would seem to meet the requirements of almost any body who wanted almost any thing:

WANTED—A SITUATION.—A practical printer, who is competent to take charge of any department in a printing and publishing house. Would accept a professorship in any of the academies. Has no objection to teach ornamental painting and penmanship, geometry, trigonometry, and many other sciences. Is particularly suited to act as pastor to a small evangelical church, or as local preacher. He would have no objection to form a small but select class of young ladies to instruct them in the highest branches. To a dentist or chiropodist he would be invaluable, as he can do almost any thing. Would cheerfully accept a position as bass or tenor singer in a choir. Would prefer to run a blacksmith's or shoe-maker's shop, a dancing-school, or saw-mill.

"THE frequent allusions to Platt Evans in your Editor's Drawer," writes a Boston correspondent, "call to mind a characteristic anecdote I heard him tell nearly forty years ago. I was a clerk then in a cloth-importing house in Maiden Lane. Platt came on twice a year to buy goods, and we boys always used to anticipate his coming with great joy, as did our employers, and with the added reason to them that he was always a generous buyer and excellent pay."

"After his purchases came the fun, to which his Jew's-harp always largely contributed. He was the only one I ever heard that really made music on the Jew's-harp. One season when he came he told us he had been newly fitting up his store, and among other things putting in polished mahogany counters, or, as he expressed it, 'spl-splen-did-did coun-counters. N-noth-nothing like them in Cin-cin-na-na-ti.' One day a fellow came in from the country to see about having some city clothes made; and lounging and gawking about, leaning against the counters, etc., at last took out his jackknife, and began whittling the edges. Platt soon saw what he was doing, and caught up his shears, and quietly slipped round behind the man and cut off the whole tail of his coat (they wore swallow-tailed coats in those days), and then said to him, with an expletive not necessary to repeat, 'You

m-m-mend my c-c-coun-counter, and I'll m-m-mend your c-c-coat.'"

THUNDER-STORMS are almost unknown in the Willamette Valley. Occasionally, writes a friend in Salem, Oregon, we hear the low muttering sound, and see the lightning flash off on the mountain-side, consequently those that have been raised here have never enjoyed a regular old Eastern thunder-storm. About a year ago a merchant of Salem sold out and went into the stock business in Eastern Oregon, and moved his family to the Dalles, where they occasionally have a thunder-shower. Some time after they had been there they received a visit from one of the heaviest. A ten-year-old boy was out in the yard when a sharp flash of lightning, followed immediately by a heavy clap of thunder, frightened the boy, and he ran to his mother:

"Mamma! oh, mamma! something busted up there, and it made the fire fly in great long strings!"

THE Drawer for June contained some anecdotes about the "good Mr. Bergh," as the children call him. Here are one or two more:

When Mr. Bergh first began to enforce the laws against dog-fighting, he was waited on by Kit Burns, the proprietor of the largest den in the city where this brutal sport was carried on.

"Mr. Bergh," said Kit, "I sympathize, deeply sympathize, with you and your society in the humane efforts you are making to prevent cruelty to animals. The object is a noble one. But, Sir, let me warn you that the moment your society attempts to interfere with dog-fighting, that moment it will dig its own grave!"

Once when urging the passage by the Legislature of a bill which would more effectually suppress cruelty to animals, a Senator on the committee said he "entirely approved of the objects of the society, but was afraid it might go too far."

"Yes," replied Mr. Bergh, "there were quite a number of persons during the late war who were always afraid the North would 'go too far'; and I never prosecute an offender for some outrageous act of cruelty but the same idea is urged by his counsel as a reason why the jury ought not to convict him—they might go too far."

Last spring there was a strike for higher wages by the drivers of nearly all the city omnibus lines. The horses on these lines are generally emaciated and poorly fed, and numerous complaints have repeatedly been prosecuted by the society against the owners for ill treatment of them. The result of the strike was that for several days Broadway looked nearly deserted—not an omnibus to be seen. On one of these days Mr. Bergh was observed looking on the empty street with a smile of intense satisfaction.

"You look pleased, Mr. Bergh," observed a by-stander.

"Yes," replied the zoophilist, "I am; intensely so. For years and years these omnibus proprietors have worked these poor brutes to death, and only half fed them. Now for a week they have been eating their heads off at their owners' expense, without doing one step of work. How delighted they must be! *What a beautiful instance of retributive justice!*"

One of the members of the society has a pet weakness for horse-racing. He met Mr. Bergh

shortly after one of the stated meetings at Jerome Park, and commented in glowing terms on the beauty of the course, the excitement of the race, and his regret that Mr. Bergh had not been present with him.

"And you enjoyed it?" queried Mr. Bergh.

"Indeed I did," was the reply.

"I was afraid so," responded Mr. Bergh, "*because the pleasures of sin are proverbially sweet.*"

A CORRESPONDENT at Brownsville, Pennsylvania, communicates the following:

Some time ago a worthless white vagabond named Hardin, living near the town of Brownsville, left his home, and after night-fall brought up at the hen-roost of an African residing in the burg. Knowing the propensities of a certain class of his fellow-men, the African kept a watch over his bipeds during the dark hours. No sooner had Hardin possessed himself of the feathered prize than the guard laid hands upon him. Complaint was made before Justice H. J. R——n, a Democrat of the azoic period, and in due time Hardin and his sable accuser were *vis-à-vis* with the aged justice. The testimony was patiently heard, and was overwhelming, and all expected to hear the sentence of the law pronounced upon the prisoner; but, to the astonishment and amusement of all, the justice stated: "The Legislature never contemplated such a case as this when it enacted a law against petit larceny. They knew that Africans were in the habit of stealing chickens from the whites, but the idea of a white man so bemeaning himself as to steal chickens from an African was preposterous and absurd. Therefore, the laws of Pennsylvania having provided no remedy, the prisoner is discharged, and complainant must pay the costs."

DURING divine service at the Baptist church, Davisville, Pennsylvania, the following incident happened recently:

The pastor gave out a hymn, and as the church contained no musical instrument, the singing was conducted in the "good old way," one of the congregation raising the tune. After he had sung a line, it seemed to the minister that the singer had pitched the tune too high, and accordingly he sung out from the pulpit,

"Hold on there; you have got that too high."

The singer stopped, and coolly replied,

"Will you please lower it?"

The minister "lowered" the tune, and the services were continued without further interruption.

Forty years ago rumors in Washington city imputing misconduct to members of Congress were seldom in circulation. The writer, then residing in that city, heard only one report prejudicial to the character of either a Senator or member of the House of Representatives. And as its *dénouement* illustrated the sagacity of Senator Grundy, of Tennessee, it is communicated.

The writer was seated in that Senator's room when a gentleman entered and said,

"A report is in circulation highly injurious to the character of a Senator of the United States."

"Stop!" said Mr. Grundy; "before it is stated I will make a prediction. If a Western Senator is implicated, the government has been cheated out of public land; if the Senator involved is

from the South, a negro has been wronged; but if there is some trick concerning a patent right, the Senator is from New England."

The facts of the case being stated, it appeared that a Senator from a New England State had charged one of his constituents ten dollars for obtaining a patent for an improvement in door locks. This deviation from propriety forty years ago caused more denunciation than that awakened at this day by a well-known disreputable practice of Senators and members of Congress who receive fees for the exercise of their influence to procure appointments, or to cover up official delinquency.

A MEDICAL friend in Cincinnati is kind enough to send us this:

Many years ago the writer of this remembers being made acquainted with the following serio-comic incident: Being engaged in locating wild lands in the northwestern part of the then newly admitted State of Michigan, I one day stopped for dinner at a pretentious "hotel" in the embryotic village of Otsego, Allegan County, and was ushered into the parlor to await the preparation of the meal. Seating myself on one of the high-backed, splint-bottomed chairs that furnished the only sitting accommodation, I made a mental inventory of the contents of the room. No carpet; not a painting, picture, book, or paper of any kind was to be seen, and yet the literature of the apartment was abundant, though peculiar. On the plastered walls were penciled in every conceivable style of chirography the names of the former guests of the house.

On the right-hand jamb of the whitely painted mantel-piece was drawn, with considerable art, the similitude of a grave, with head and foot stones complete. In regular form across the head-stone was written, in a neat text-hand, the following inscription:

Sacred
to the memory of
WARREN A. GAULT,
who died a moral death
by stealing a pair of socks,
Tuesday, June 14,
1838.

If Heaven be pleased when sinners cease to sin,
If Hell be pleased when sinners enter in,
If Earth be pleased when rid of a knave,
Then all are pleased, for Gault is in his grave!

Before leaving the house I was made acquainted with the history of this mortuary tribute to moral obliquity. It appeared that a party of civil engineers, while engaged in running the line for a hypothetical railroad through the wilderness in the vicinity of the village, had made this "hotel" their head-quarters, and while there one night, Gault, one of the chain-bearers, pilfered from Wilder, another of the company, a pair of woolen socks. A suit before the village "squire" fixed the theft where it belonged; the culprit was forced to make restitution of the stolen property, and was fined, and Wilder, the draughtsman of the party, sketched his grave, and inscribed the epitaph thereon.

A GENTLEMAN connected with the Western Union Telegraph Company writes us from Northport, Long Island:

"A young man lately employed by a farmer in this neighborhood is now in the county jail on a charge of burglary. In a letter to his parents he

says, among other useful and entertaining information, there is one old *farmer* here; all the rest are *gentlemen*."

THE recent celebration of the centenary of the discovery of oxygen by Dr. Priestley recalls an amusing doggerel poem, published at the time of the burning of the doctor's meeting-houses, home, and papers. "There was a small attempt by a few people to drive off the rabble, but they were compelled to show their heels by a shower of brickbats."

The famous Dr. Priestley,
Though he preached to admiration,
Yet he never could persuade
The unruly cavalcade
Not to show their detestation.
They burned down both the meetings,
His manuscripts and paper,
And they swore it in their wrath
That they would not leave him worth
A single farthing taper.
His house and all the utensils,
Out-offices and stable;
Nor durst the doctor stay,
But prudently got away,
And rejoiced that he was able.

Before Priestley died the Rev. David Davis, one of the wits of the time, wrote the following epitaph, which the doctor is said to have laughed over heartily:

Here lie at rest,
In oaken chest,
Together packed most nicely,
The bones and brains,
Flesh, blood, and veins,
And soul of Dr. Priestley."

FRIEND A—— was a very intelligent Quaker, a man of character and influence, and highly esteemed in the neighborhood where he lived. He had a keen sense of the ridiculous, and was noted for his prompt and often witty replies to any sallies of humor on the part of his friends, who knew and enjoyed this peculiar trait on his part. One day, as he was standing at his front gate, two of his friends who were walking together came toward him. "Now," said one to the other, "I'll get a joke on Uncle A——;" and carrying out his intention, as they came up to the gate, he said, very gravely, and as if asking an important question,

"Uncle A——, can thee tell us the way to Fool's Town?"

"Instinct will tell thee, Friend B——," was the prompt answer, given with the utmost gravity, and as if the right direction were of the utmost importance.

OUR Irish friends fill a large place in the Drawer, and not unjustly, for there seems no end to their blunders and their wit. The following addition to their store-house of credit is literally a fact:

Mr. H—— sent his Irish servant to one of his neighbors, about a mile distant, to bring home a pig that he had bought. Patrick started off on a nice little pony that belonged to his employer, and in due time was seen coming back again with the pig, his legs safely tied, slung over his shoulder.

"Why, Pat," said his master, "why didn't you lay the pig over the pony, and not carry that weight all the way on your own shoulder?"

"An' sure, Sor," said Pat, "the pony is little,

an' I'm of pretty good size, Sor, an' I thought 'twas too bad to put any more weight on the pony, an' so I'd jist carry the pig meself!"

A VINDICATION OF "LADY CLARA VERE DE VERE."

[TENNYSON'S well-known poem with this title was an eloquent reproach to the aristocratic class, represented by a high-born coquette. The following reply, from the pen of a young English lady of noble birth and high rank, will be interesting. Both sides should be heard, certainly.]

Lady Clara Vere de Vere
Ne'er sought of you to win renown,
Or thought to "break a country heart
For pastime ere she went to town."
She smiled in courtesy, and thought
You somewhat churlish, we confess;
"The daughter of a hundred earls,"
Her kindness why should she repress?

Lady Clara Vere de Vere,
John Smith, or Lawrence—any name
Unsullied may be proudly borne.
She gladly knows from whence she came,
And never wished to break a heart,
But merely thought, as hostess here,
There was no need to draw stern lines—
You teach her all there was to fear.

Lady Clara Vere de Vere
Had sadly learned a lesson true:
The cold distinctions man has drawn,
At which she smiled, she must renew.
In pleasant converse churls see love!
And dare reply, with scornful glee,
That they are cold, and know her wiles,
While innocent of guile is she!

Lady Clara Vere de Vere,
As is her wont, the neighbors sought,
With humble students converse held,
Nor dreamed of ill in word or thought.
The o'erwrought brain and feeble frame
Were more to blame than her "sweet eyes;"
Young Lawrence surely would have died
Had he been deaf to "low replies."

Lady Clara Vere de Vere
Fearless has sought his mother's side,
And soothed her grief with sympathy,
And of her passion stemmed the tide.
Remorsefully the "bitter word"
Was taken back, which she did hear,
And bore with all the calm "repose"
Which stamps the caste of Vere de Vere."

Lady Clara Vere de Vere
Has sorrows in her stately hall
In common with all human hearts;
But she can bear them without gall.
"Noblesse oblige" she knows full well;
Yet she has faith in modest worth.
Young Lawrence knew the gulf between,
And revered her noble birth.

The Lady Clara Vere de Vere
Believes in "heaven above us bent,"
But thinks "the gardener and his wife,"
With Lawrence, value long descent.
She heeds not what it seems to you;
She knows 'tis noble to be good;
And kind hearts beat 'neath ermined robes,
And faith flows pure through noble blood.

You know not Clara Vere de Vere!
She finds around her halls and towers
Full scope for tender woman's work,
Which amply fills "the rolling hours."
But if her work is thus misread,
Her daughters in far future years
Her course will scarcely imitate,
Withheld by her well-founded fears.

The Lady Clara Vere de Vere
Finds time not "heavy on her hands."
Her people bless her in the gates;
No want is felt upon her lands.
But may the yeoman wise beware,
Nor let the boundary lines be stirred,
Or gentle ladies well may fear
To grant such bores a kindly word.
